ON THE SET OF GÂTEAUX DIFFERENTIABILITY OF THE $L^1$ NORM

JULIO DELGADO AND ANDRÉS F. MUÑOZ-TELLO

Abstract. Let $(\Omega, \mathcal{M}, \mu)$ be a measure space. In this paper we establish the set of Gâteaux differentiability for the usual norm of $L^1(\Omega, \mu)$ and the corresponding derivative formulae at each point in this set.

1. Introduction

The investigation on the sets of differentiability of Lipschitz functions goes back to the classical Rademacher’s Theorem [1] of 1919. This theorem states that:

Every Lipschitz function $f : \mathbb{R}^n \to \mathbb{R}$ is differentiable almost everywhere.

Regarding the converse of Rademacher’s Theorem it has been recently established by Preiss and Speight (cf. [2]) that: if $n > 1$ then there exists a Lebesgue null set in $\mathbb{R}^n$ containing a point of differentiability of each Lipschitz function $f : \mathbb{R}^n \to \mathbb{R}^{n-1}$. A more detailed discussion around the Rademacher’s Theorem and some converse versions can be found in [3]. An extension of Rademacher’s Theorem to functions defined on separable Banach spaces and valued into Banach spaces was established by Phelps in [4]:

Theorem 1.1 (Phelps). Let $E$ be a separable real Banach space and $F$ a real Banach space with the Radon-Nikodým property (RNP). If $T : G \to F$ is a locally Lipschitz mapping defined on a nonempty open subset $G$ of $E$. Then $T$ is Gâteaux differentiable in the complement of a Gaussian null subset of $G$.

Other extensions of Rademacher Theorem to Lipschitz maps between infinite-dimensional Banach spaces have been investigated by several authors e.g. Aronszajn [5], Bongiorno [6], Mankiewicz [7], Phelps [4], Preiss and Zajíček [8], among others). The research on the differentiability on Banach spaces has been a very active field in the last decades. We just quote some few recent examples: In Potapov and Sukachev’s

2020 Mathematics Subject Classification. Primary 58C20; Secondary 58C25.

Key words and phrases. Gâteaux differentiability, Set of differentiability.

The first author was supported by Grant CI71234 Vic. Inv. Universidad del Valle.
work [9], they answer to a question in the theory of Schatten- Von Neu-
mann ideals of whether their norms have same differentiability proper-
ties as the norms of their commutative counterparts. On the other hand
Lindenstrauss et al. [10] prove that a real valued Lipschitz function on
an Asplund space has points of Fréchet differentiability. In in [11] Goldys and Gozzi apply the Phelps Theorem in the proof of existence
and uniqueness of solutions of second order parabolic Hamilton-Jacobi-
Bellman equations in Hilbert spaces, obtaining optimal feedback for
first order stochastic PDEs that arise in economic theory, the theory
of population dynamics and financial models.

The study of the set of differentiability of Lipschitz functions on
Banach spaces has been carried out for instance in Deville et al. [12],
Diestel [13], Dore and Maleva [14] among others. For the $L^p(Ω)$ space
where $Ω$ is a bounded domain and $1 < p < ∞$, it is well known (cf.
[13]) that the norm $∥f∥_{L^p} = (∫_Ω |f(w)|^p dw)^{1/p}$ is Fréchet differentiable
and moreover its derivative is given by

$$\partial_F∥f∥_{L^p} = \frac{|f|^{p-1} \text{sign}(f)}{∥f∥_{L^p}^{p-1}},$$ (1.1)

for any $f ≠ 0$. The case of Fréchet differentiability for $p = 1$ is more
pathological. Here we will explicitly find the set of Gâteaux differenti-
ability for the $L^1(Ω, μ)$ norm, where $(Ω, M, μ)$ is a measure space.
The characterization of this set is given in Theorem 3.3 of Section 3.

2. Preliminaries

In this section we briefly give a basic background in our context. We
start with the two most classical notions of differentiability on Banach
spaces. The most simple one is that of Gâteaux differentiability. Let
$X, Y$ be Banach spaces and $Ω ⊆ X$ an open set. A function $f : Ω → Y$
is Gâteaux differentiable ($G$-differentiable) at a point $a ∈ Ω$, if

$$\lim_{t→0} \frac{f(a + th) - f(a)}{t} = u(h)$$

exists for all $h ∈ X$, and $u$ defines a bounded linear operator from $X$
into $Y$. The operator $u$ is called the Gâteaux derivative of $f$ at the
point $a$ and is denoted by $\partial_G f(a)$.

A function $f : Ω → Y$ is Fréchet differentiable ($F$-differentiable) at
$a$, if there is a bounded linear operator $u$ such that

$$f(a + h) - f(a) - u(h) = r(h)$$

where $\lim_{h→0} \frac{∥r(h)∥_Y}{∥h∥_X} = 0$. The operator $u$ is called the Fréchet derivative
of $f$ at the point $a$ and is denoted by $\partial_F f(a)$.

It is not difficult to see that, if $f$ is $F$-differentiable at $a$ then $f$ is
$G$-differentiable at $a$ and in that case $\partial_F f(a) = \partial_G f(a)$. For a given
function \( \varphi : X \to Y \), we say that \( B \) is the set of \( G \)-differentiability or \( F \)-differentiability of \( \varphi \), if respectively for every element of the set \( B \) the function \( \varphi \) is \( G \)-differentiable or \( F \)-differentiable.

On the other hand, a set is called a \( G_\delta \) set if it can be expressed as a countable intersection of open sets. This type of set is fundamental in the definition of the \( F \)-Asplund and \( G \)-Asplund spaces, since these respectively are Banach spaces in which all convex and continuous function defined in an open and convex subset is \( F \)-differentiable (resp. \( G \)-differentiable) in a dense and \( G_\delta \) set. The following theorem shows important examples of \( G \)-Asplund spaces.

**Theorem 2.1** (Mazur). Every separable Banach space is a \( G \)-Asplund space.

Moreover, it is well known that the set of all \( F \)-Asplund spaces is strictly contained in the set of all \( G \)-Asplund spaces. In fact, as proved in Deville et al. [12], the usual norm of \( \ell^1(\mathbb{R}) \) is not \( F \)-differentiable at any point of the space \( \ell^1(\mathbb{R}) \). Then \( \ell^1(\mathbb{R}) \) is not a \( F \)-Asplund space; but \( \ell^1(\mathbb{R}) \) is a separable Banach space and therefore a \( G \)-Asplund space by Mazur’s theorem.

As we have quoted before, the \( L^p \) norm is \( F \)-differentiable at any point in the case \( 1 < p < \infty \) and its corresponding derivative is given by \( \varphi(f) = \int |f(x)| d\mu(x) \). Moreover, since the dual of \( L^p(\Omega) \) is \( L^q(\Omega) \), for \( 1 < p < \infty \) and \( \frac{1}{p} + \frac{1}{q} = 1 \), and they are separable Banach spaces, by Theorem 2.12 in Phelps [15] the space \( L^p(\Omega) \) is a \( F \)-Asplund space for \( 1 < p < \infty \).

**Remark 2.2.** In the special case of the \( L^1(\Omega, \mathcal{M}, \mu) \) norm we observe the following regarding the set of \( G \)-differentiability. It is well known that, (cf. [16]) \( L^1(\Omega, \mathcal{M}, \mu) \) is separable provided \( \mu \) is \( \sigma \)-finite and the \( \sigma \)-algebra \( \mathcal{M} \) is countably generated. Since \( \mathbb{R} \) has the RNP, then the \( L^1(\Omega, \mu) \) norm satisfies the conditions of Phelps’s Theorem. Therefore, the Gaussian measure of the complement of the \( G \)-differentiability set is zero and by Mazur’s Theorem this \( G \)-differentiability set is dense and a \( G_\delta \) set.

In the next section we will give an explicit description of the set of \( G \)-differentiability for the usual norm of \( L^1(\Omega, \mathcal{M}, \mu) \) without assuming the condition of separability.

### 3. The \( G \)-Differentiability Set for the \( L^1(\Omega, \mu) \) Norm

Given a measure space \((\Omega, \mathcal{M}, \mu)\), we denote by \( L^1(\Omega, \mu) \) the space of the real valued integrable functions over \( \Omega \). On \( L(\Omega, \mu) \) one defines the pseudonorm \( \varphi(f) = \int |f(x)| d\mu(x) \). One also defines on \( L(\mu) \) an equivalence relation \( \mathcal{R} \) by \( f \mathcal{R} g \iff f = g \mu - a.e. \). The equivalence class of \( f \) is denoted by \( \tilde{f} \). Thus, the quotient \( L(\Omega, \mu) / \mathcal{R} \) defines the classical Banach space \( L^1(\Omega, \mu) \) endowed with the norm \( \varphi(\tilde{f}) = \int |f(x)| d\mu(x) \).
We also recall that the signature sign \( x \) of a real number \( x \), is defined by \( \text{sign}(x) = \frac{x}{|x|} \) if \( x \neq 0 \), and \( \text{sign}(x) = 0 \) if \( x = 0 \).

In order to prepare the proof of the main theorem we first establish a mild lemma which will help to obtain a pointwise formulae for the Gâteaux derivative.

**Lemma 3.1.** Let \( f, h : \Omega \to \mathbb{R} \) be functions and \( x \in \Omega \) such that \( h(x) \neq 0 \). Then

\[
\lim_{t \to 0} \frac{|f(x) + th(x)| - |f(x)|}{t} = \text{sign}(f(x))h(x).
\]

**Proof.** If the limit (3.1) exists and \( f(x) = 0 \), then the limit

\[
\lim_{t \to 0} \frac{|th(x)|}{t} = \lim_{t \to 0} \frac{|t||h(x)|}{t}
\]
does not exists, which is a contradiction, hence \( f(x) \neq 0 \).

We now assume \( f(x) \neq 0 \). Since \( h(x) \neq 0 \), we can choose \( \delta = \frac{|f(x)|}{2|h(x)|} \) and observe that for \( |t| < \delta \) we have

\[
\text{sign}(f(x) + th(x)) = \text{sign}(f(x)).
\]

Hence

\[
\frac{|f(x) + th(x)| - |f(x)|}{t} = \frac{\text{sign}(f(x) + th(x))(f(x) + th(x)) - \text{sign}(f(x))f(x)}{t}
\]

\[
= \frac{\text{sign}(f(x))th(x)}{t}
\]

\[
= \text{sign}(f(x))h(x).
\]

Therefore

\[
\lim_{t \to 0} \frac{|f(x) + th(x)| - |f(x)|}{t} = \text{sign}(f(x))h(x).
\]

\( \square \)

We now consider a measure space \((\Omega, \mathcal{M}, \mu)\). As a consequence of the lemma above we obtain the following corollary.

**Corollary 3.2.** Let \( f, h : \Omega \to \mathbb{R} \) be measurable functions such that \( h(x) \neq 0 \) \( \mu \)-a.e. Then

\[
\lim_{t \to 0} \frac{|f(x) + th(x)| - |f(x)|}{t} \text{ exists } \mu - a.e
\]

if and only if \( f(x) \neq 0 \) \( \mu \)-a.e. Moreover, if that is the case the formula (3.2) holds.
ON THE SET OF GÅTEAU DIFFERENTIABILITY OF THE $L^1$ NORM

Proof. We suppose that $h(x) \neq 0$ for all $x \in A$, with $\mu(A^c) = 0$ and first assume that the limit (3.4) exists $\mu$-a.e. Hence, $f(x) \neq 0$ for every $x \in A$ by Lemma 3.1 thus $f(x) \neq 0$ $\mu$-a.e.

On the other hand, if $f(x) \neq 0$ $\mu$-a.e. Then there exists a set $D \in \mathcal{M}$ such that $\mu(D^c) = 0$ and $f(x) \neq 0$ for all $x \in D$. By taking $x \in A \cap D$ we have that $f(x), h(x) \neq 0$. Then by Lemma 3.1 the limit (3.4) exists for every $x \in A \cap D$. Therefore the limit (3.4) exists $\mu$-a.e.

The last part of the statement clearly follows from the last part of Lemma 3.1 by applying the formula (3.2) in a set $\Gamma$ where we have $f(x), h(x) \neq 0$ and $\mu(\Gamma^c) = 0$. □

We are now ready to present our main result. We consider a measure space $(\Omega, \mathcal{M}, \mu)$ and the following condition:

(A1) For every $I \in \mathcal{M}$ with $\mu(I) = \infty$, there exists a set $F \subset I$ with $F \in \mathcal{M}$ such that $0 < \mu(F) < \infty$.

Every $\sigma$-finite measure that is not the trivial null measure satisfies the condition (A1). The counting measure on the power set of $\mathbb{R}$ satisfies the condition (A1) and is not $\sigma$-finite. On the other hand, every non-atomic measure also satisfies the condition (A1).

The following theorem gives a precise description of the $G$-differentiability set for the usual $L^1(\Omega, \mu)$ norm and the corresponding formulae for the Gâteaux derivative.

Let $G$ be the subset of $L^1(\Omega, \mu)$ consisting of equivalence classes $\tilde{f}$ such that $f \neq 0$ $\mu$-a.e., for some representative $\tilde{f}$ of the class $\tilde{f}$. It is clear that if $\tilde{f} \in G$, any representative of the class $\tilde{f}$ satisfies the condition defining $G$.

Theorem 3.3. Let $(\Omega, \mathcal{M}, \mu)$ be a measure space satisfying the condition (A1). Let $B$ be the subset of $L^1(\Omega, \mu)$ above defined. Then the set of $G$-differentiability of the norm $\varphi$ is $G$. Moreover, the Gâteaux derivative of $\varphi$ for $\tilde{f} \in G$ and the direction $h \in L^1(\Omega, \mu)$ is given by

$$\partial_G \varphi(\tilde{f})(h) = \int_{\Omega} \text{sign}(f(x))h(x)d\mu(x),$$

(3.5)

where $f$ is any representative of the class $\tilde{f}$.

Proof. We assume $\tilde{f} \in G$ and that $f$ is a representative of the class $\tilde{f}$. We start by observing that for any $h \in L^1(\Omega, \mu)$ the right hand side of the formula (3.5) is independent of the representative in the class $\tilde{f}$.

We are now going to prove the $G$-differentiability of $\varphi$ at $\tilde{f}$. Let $h \in L^1(\Omega, \mu) \setminus \{0\}$, an application of the Lebesgue dominated convergence
Theorem gives us
\[
\lim_{t \to 0} \frac{\varphi(f + th) - \varphi(f)}{t} = \lim_{t \to 0} \frac{\int_{\Omega} |f(x) + th(x)| d\mu(x) - \int_{\Omega} |f(x)| d\mu(x)}{t}
= \lim_{t \to 0} \frac{\int_{\Omega} (|f(x) + th(x)| - |f(x)|) d\mu(x)}{t}
= \int_{\Omega} \lim_{t \to 0} \frac{(|f(x) + th(x)| - |f(x)|)}{t} d\mu(x).
\]

Since \( h(x) \neq 0 \) \( \mu \)-a.e. and \( f(x) \neq 0 \) \( \mu \)-a.e., by applying Corollary 3.2 we have
\[
\lim_{t \to 0} \frac{|f(x) + th(x)| - |f(x)|}{t} = \text{sign} (f(x)) h(x)
\]
\( \mu \)-a.e., and
\[
\lim_{t \to 0} \frac{\varphi(f + th) - \varphi(f)}{t} = \int_{\Omega} \text{sign} (f(x)) h(x) d\mu(x).
\]

We now assume that \( \tilde{f} \in G^c \) and we will show that \( \varphi \) does not have \( G \)-derivative in \( \tilde{f} \). For the set \( Z_1 = \{ x \in \Omega : f(x) = 0 \} \) we have \( \mu(Z_1) > 0 \). If \( \mu(Z_1) = \infty \) by condition (A1) we can choose a subset \( Z \) of \( Z_1 \) such that \( 0 < \mu(Z) < \infty \). We consider \( h = 1_Z \), thus \( h \in L^1(\Omega, \mu) \setminus 0 \). Since \( h = 0 \) on \( Z^c \), for \( t \in \mathbb{R} \) we have \( |f + th| - |f| = |f| - |f| = 0 \) on \( Z^c \). Hence, for the calculation of the \( G \)-derivative of \( \varphi \) at \( f \) in the direction \( h \), is enough to consider the integration on \( Z \). For \( t \neq 0 \) we have
\[
\frac{\varphi(f + th) - \varphi(f)}{t} = \frac{\left( \int_{Z} |f(x) + th(x)| d\mu(x) - \int_{Z} |f(x)| d\mu(x) \right)}{t}
= \frac{\int_{Z} |t| d\mu(x)}{t}
= \frac{|t|}{t} \mu(Z)
= \text{sign}(t) \mu(Z).
\]

Hence, we have \( (\partial^-_G \varphi) f(h) = \mu(Z) \) and \( (\partial^+_G \varphi) f(h) = -\mu(Z) \). Therefore the \( G \)-derivative of \( \varphi \) at \( f \) does not exists.

It is clear that the formula (3.5) defines a bounded linear operator from \( L^1(\Omega, \mu) \) into \( \mathbb{R} \) for every \( \tilde{f} \) in \( G \), and this concludes the proof of the theorem. \( \square \)

Remark 3.4. (1) In the case \( \Omega = \mathbb{N} \) and the counting measure, Theorem 3.3 absorbs a more classical result on the Gâteaux differentiability of
the $\ell^1(\mathbb{N})$-norm, namely that the set of Gâteaux differentiability of the $\ell^1(\mathbb{N})$-norm is the set $G \subset \ell^1(\mathbb{N})$ of sequences $(x_n)_n$ such that $x_n \neq 0$ for all $n$, and the Gâteaux derivative of $\varphi$ at $x$ and in the direction $h$ is given by

$$\partial_G \varphi(x)(h) = \sum_n \text{sign}(x_n)h_n.$$  

(2) The condition (A1) allows $L^1$ to be be non-separable. Therefore, Theorem 3.3 gives a description of the set of differentiability beyond the scope of Phelps’s and Mazur’s theorem.

In the special separable case, as a consequence of Theorem 3.3 and Phelps Theorem 1.1 we have:

**Corollary 3.5.** Let $(\Omega, \mathcal{M}, \mu)$ be a measure space satisfying the condition (A1) and such that $L^1(\Omega, \mathcal{M}, \mu)$ is separable. Then, the set of Gâteaux differentiability of the $L^1$-norm is $G$, $G$ is a $G_\delta$ set and $G^c$ is a Gaussian null set.

As quoted before $L^1(\Omega, \mathcal{M}, \mu)$ is separable provided $\mu$ is $\sigma$-finite and the $\sigma$-algebra $\mathcal{M}$ is countably generated. If the measure $\mu$ is not the trivial null measure then $\mu$ satisfies the condition (A1).
