HELMHOLTZ THEOREM FOR STOCHASTIC
HAMILTONIAN SYSTEMS

FRÉDÉRIC PIERRET

Abstract. We derive the Helmholtz theorem for stochastic Hamilton-
ian systems. Precisely, we give a theorem characterizing Stratonovich
stochastic differential equations, admitting a Hamiltonian formulation.
Moreover, in the affirmative case, we give the associated Hamiltonian.
This result show coherence with the approach of Milstein et al. (2002)
where the authors answered to this problem through the preservation of
the symplectic form but without providing the Hamiltonian associated.

1. Introduction

A classical problem in Analysis is the well-known Helmholtz’s inverse
problem of the calculus of variations: find a necessary and sufficient condi-
tion under which a (system of) differential equation(s) can be written as an
Euler–Lagrange or a Hamiltonian equation and, in the affirmative case, find
all the possible Lagrangian or Hamiltonian formulations. This condition is
usually called Helmholtz condition.

The Lagrangian Helmholtz problem has been studied and solved by J.
Douglas [Douglas (1941)], A. Mayer [Mayer (1896)] and A. Hirsch [Hirsch (1897)].

2010 Mathematics Subject Classification. 60H10, 37K05, 65P10.
Key words and phrases. stochastic differential equations, stochastic calculus of varia-
tions, stochastic Hamilton’s equations, stochastic inverse problem of calculus of variations.
The Hamiltonian Helmholtz problem has been studied and solved up to our knowledge by R. Santilli in his book Santilli (1978).

Generalization of this problem in the discrete calculus of variations framework has been done in Bourdin and Cresson (2013) and Hydon and Mansfield (2004) in the discrete Lagrangian case. For the Hamiltonian case it has been done for the discrete calculus of variations in Albu and Opris (1999) using the framework of Marsden and West (2001) and in Cresson and Pierret (2015b) using a discrete embedding procedure derived in Cresson and Pierret (2015a). In the case of time-scale calculus, i.e. a mixing between continuous and discrete sub-intervals of time, it has been done in Pierret (2015).

In this paper we generalize the Helmholtz theorem for Hamiltonian systems in the case of Stratonovich stochastic calculus. We recover the classical case when there is no stochastic counterpart.

The paper is organized as follows: In section 2, we give some generalities and notations about the Stratonovich stochastic calculus. In section 3, we remind definitions and results about classical and stochastic Hamiltonian systems. In section 4, we give a brief survey of the classical Helmholtz Hamiltonian problem and then we prove the main result of this paper, the stochastic Hamiltonian Helmholtz theorem. Finally, in section 5, we conclude and give some prospects.

2. Generalities and Notations

In this section we remind the basic definitions and notations of stochastic processes following closely the presentation done in the book of B. Øksendal Øksendal (2003) for which we refer for more details and proofs.

In all the paper, we consider $(\Omega,\mathcal{F},P)$ to be a probability space.

**Definition 1.** Let $B(t)$ be a $n$-dimensional Brownian motion. Then we define $\mathcal{F}_t = \mathcal{F}_t^{(n)}$ to be the $\sigma$-algebra generated by the random variable $\{B_i(s)\}_{1 \leq i \leq n, 0 \leq s \leq t}$.

**Definition 2** (Definition 3.3.2 p. 35, Øksendal (2003)). Let $W_H(a,b)$ be the class of functions $f : [0, +\infty) \times \Omega \rightarrow \mathbb{R}$ $(t,\omega) \mapsto f(t,\omega) = f_t(\omega)$ such that

1. $(t,\omega) \rightarrow f(t,\omega)$ is $\mathcal{B} \times \mathcal{F}$-measurable, where $\mathcal{B}$ denotes the Borel $\sigma$-algebra on $[0, +\infty)$.
2. There exist a filtration $\mathcal{H}$ on $(\Omega,\mathcal{F})$ defining an increasing family of $\sigma$-algebras $\mathcal{H}_t, t \geq 0$ such that
(a) $B_t$ is a martingale with respect to $\mathcal{H}_t$

(b) $f_t$ is $\mathcal{H}_t$-adapted

(3) $P \left( \int_a^b f(s, \omega)^2 ds < \infty \right) = 1.$

We put $W_{\mathcal{H}} = \bigcap_{b>0} W_{\mathcal{H}}(0, b)$.

**Definition 3.** Let $W_{\mathcal{H}}^{d \times n}(a, b)$ to be the set of $d \times n$ matrices $v = [v_{ij}(t, \omega)]$ where each entry $v_{ij}(t, \omega) \in W_{\mathcal{H}}(a, b)$. We also put in the same manner as the previous definition, $W_{\mathcal{H}}^{d \times n} = \bigcap_{b>0} W_{\mathcal{H}}^{d \times n}(0, b)$.

We now can introduce the set of Itô processes (see Definition 4.1.1 p. 44 in Øksendal (2003))

**Definition 4** (1-dimensional Itô processes). Let $B(t)$ be a 1-dimensional Brownian motion on $(\Omega, \mathcal{F}, P)$. A 1-dimensional Itô process is a stochastic process $X(t)$ on $(\Omega, \mathcal{F}, P)$ of the form

$$X(t) = X(0) + \int_0^t u(s, \omega) ds + \int_0^t v(s, \omega) dB(s),$$

(1)

where $v \in W_{\mathcal{H}}$, $u$ is $\mathcal{H}_t$-adapted and is such that

$$P \left( \int_0^t |u(s, \omega)| ds < \infty \text{ for all } t \geq 0 \right) = 1.$$

In the differential form, $X_t$ is written as

$$dX(t) = u(t, x(t)) dt + v(t, x(t)) dB_t$$

(2)

We now turn in higher dimensions (see Øksendal (2003), Section 4.2 p. 48)

**Definition 5** (d-dimensional Itô processes). Let $B(t)$ be a $n$-dimensional Brownian motion on $(\Omega, \mathcal{F}, P)$. A d-dimensional Itô process is a stochastic process $X(t)$ on $(\Omega, \mathcal{F}, P)$ of the form

$$X(t) = X(0) + \int_0^t u(s, \omega) ds + \int_0^t v(s, \omega) dB(s),$$

(3)

where $u$ is a $d$-dimensional vector and $v$ is a $d \times n$ matrix such that each entry $u_i(t, \omega)$ and $v_{i,j}(t, \omega)$ defined a 1-dimensional Itô process, for $i = 1, \ldots, d$ as in the previous definition. Generally, when $u(t, \omega) = \mu(t, X(t))$ and $v(t, \omega) = \sigma(t, X(t))$ where $\mu : \mathbb{R}^{d+1} \to \mathbb{R}^d$, $\sigma : \mathbb{R}^{d+1} \to \mathbb{R}^{d \times n},$

$$dX(t) = \mu(t, X(t)) dt + \sigma(t, X(t)) dB(t)$$

(4)

is called an Itô stochastic differential equation

We now define the Stratonovich integral from the Itô integral (see Øksendal (2003), Paragraph “A comparison of Itô and Stratonovich integrals” p. 35 and Section 6.1 p. 85)
Theorem 7 (Stratonovich integration by parts formula). Let $X, Y \in \mathcal{S}([a,b], \mathbb{R}^d)$. We have

$$\int_a^b X(t) \circ dY(t) = X(b) \cdot Y(b) - X(a) \cdot Y(a) - \int_a^b Y(t) \circ dX(t).$$

We now introduce the definition of stochastic field

Definition 8. A stochastic field $X(Z(t))$ associated to a stochastic process $Z(t) \in \mathcal{S}([a,b], \mathbb{R}^d)$ is the data of its deterministic part and its purely stochastic part as follows: $X(Z(t)) = \{\mu(t, Z(t)), \sigma(t, Z(t))\}$. 

We define the set $\mathcal{S}([a,b], \mathbb{R}^d)$ as the set of $d$-dimensional Stratonovich processes defined in the Definition 6 over the interval of time $[a,b]$. We formally introduce the set $\mathcal{S}^*([a,b], \mathbb{R}^d)$ as the set of Stratonovich stochastic process in their differential form, i.e. a element $x \in \mathcal{S}^*([a,b], \mathbb{R}^d)$ correspond to a element $X(t) \in \mathcal{S}([a,b], \mathbb{R}^d)$ such that $x = dX(t)$. We also define $\mathcal{S}_0([a,b], \mathbb{R}^d) = \{X \in \mathcal{S}([a,b], \mathbb{R}^d), X(a, \omega) = X(b, \omega) = 0 \text{ for all } \omega\}$. 

From Theorem 4.1.5 in Øksendal (2003), we have the following integration by parts formula for Stratonovich processes defined in the Definition 6 over the interval of time $[a,b]$. We formally introduce the set $\mathcal{S}^*([a,b], \mathbb{R}^d)$ as the set of Stratonovich stochastic process in their differential form, i.e. a element $x \in \mathcal{S}^*([a,b], \mathbb{R}^d)$ correspond to a element $X(t) \in \mathcal{S}([a,b], \mathbb{R}^d)$ such that $x = dX(t)$. We also define $\mathcal{S}_0([a,b], \mathbb{R}^d) = \{X \in \mathcal{S}([a,b], \mathbb{R}^d), X(a, \omega) = X(b, \omega) = 0 \text{ for all } \omega\}$. 

From Theorem 4.1.5 in Øksendal (2003), we have the following integration by parts formula for Stratonovich processes.

Theorem 7 (Stratonovich integration by parts formula). Let $X, Y \in \mathcal{S}([a,b], \mathbb{R}^d)$. We have

$$\int_a^b X(t) \circ dY(t) = X(b) \cdot Y(b) - X(a) \cdot Y(a) - \int_a^b Y(t) \circ dX(t).$$

We now introduce the definition of stochastic field

Definition 8. A stochastic field $X(Z(t))$ associated to a stochastic process $Z(t) \in \mathcal{S}([a,b], \mathbb{R}^d)$ is the data of its deterministic part and its purely stochastic part as follows: $X(Z(t)) = \{\mu(t, Z(t)), \sigma(t, Z(t))\}$. 

We define the set $\mathcal{S}([a,b], \mathbb{R}^d)$ as the set of $d$-dimensional Brownian motion on $(\Omega, \mathcal{F}, P)$ and let $X(t)$ a $d$-dimensional Itô process such that

$$X(t) = X(0) + \int_0^t \{\mu(s, X(s)) + \tilde{\mu}(s, X(s))\} ds + \int_0^t \sigma(s, X(s)) dB(s),$$

where $\mu, \tilde{\mu}: \mathbb{R}^{d+1} \to \mathbb{R}^d$, $\sigma: \mathbb{R}^{d+1} \to \mathbb{R}^{d \times n}$, and where for all $1 \leq i \leq d$ we have

$$\tilde{\mu}_i(t, x) = \frac{1}{2} \sum_{j=1}^n \sum_{k=1}^d \frac{\partial \sigma_{ij}}{\partial x_k} \sigma_{kj}.$$ 

The term

$$\int_0^t \tilde{\mu}(s, X(s)) ds + \int_0^t \sigma(s, X(s)) dB(s)$$

defines the Stratonovich integral (see Øksendal (2003), p. 24, 2) and it is written as

$$\int_0^t \sigma(s, X(s)) \circ dB(s) = \int_0^t \tilde{\mu}(s, X(s)) ds + \int_0^t \sigma(s, X(s)) dB(s).$$

Then, the corresponding Stratonovich process is written as

$$X(t) = X(0) + \int_0^t \mu(s, X(s)) ds + \int_0^t \sigma(s, X(s)) \circ dB(s),$$

or in differential form as

$$dX(t) = \mu(s, X(s)) ds + \sigma(s, X(s)) \circ dB(s).$$

which is called a Stratonovich stochastic differential equation.
In what follows, we omit for notations convenience, when there is no misleading, the explicit dependence in $\omega$ and we put the dependency in time $t$ as a subscript when there is no possible confusion with the coordinates.

3. Reminder about Hamiltonian systems

3.1. Classical Hamiltonian systems. For simplicity we consider time-independent Hamiltonian. The time-dependent case can be done in the same way.

**Definition 9** (Classical Hamiltonian). A classical Hamiltonian is a function $H : \mathbb{R}^d \times \mathbb{R}^d \to \mathbb{R}$ such that for $(q, p) \in C^1([a, b], \mathbb{R}^d) \times C^1([a, b], \mathbb{R}^d)$ we have the time evolution of $(q, p)$ given by the classical Hamilton’s equations

$$
\begin{align*}
\dot{q} &= \frac{\partial H(q, p)}{\partial p}, \\
\dot{p} &= -\frac{\partial H(q, p)}{\partial q}
\end{align*}
$$

(10)

A vectorial notation is obtained posing $z = (q, p)^T$ and $\nabla H = \left(\frac{\partial H}{\partial q}, \frac{\partial H}{\partial p}\right)^T$ where $T$ denotes the transposition. The Hamilton’s equations are then written as

$$
\frac{dz}{dt} = J \cdot \nabla H,
$$

(11)

where $J = \begin{pmatrix} 0 & I_d \\ -I_d & 0 \end{pmatrix}$ with $I_d$ the identity matrix on $\mathbb{R}^d$ denotes the symplectic matrix.

An important property of Hamiltonian systems is that there solutions correspond to critical points of a given functional, i.e. follow from a variational principle.

**Theorem 10.** The points $(q, p) \in C^1([a, b], \mathbb{R}^d) \times C^1([a, b], \mathbb{R}^d)$ satisfying Hamilton’s equations are critical points of the functional

$$
L_H : \ C^1([a, b], \mathbb{R}^d) \times C^1([a, b], \mathbb{R}^d) \to \mathbb{R}
$$

$$
(q, p) \mapsto L_H(q, p) = \int_a^b L_H(q(t), p(t), \dot{q}(t), \dot{p}(t))
$$

(12)

where $L_H : \mathbb{R}^d \times \mathbb{R}^d \times \mathbb{R}^d \times \mathbb{R}^d \to \mathbb{R}$ is the Lagrangian defined by

$$
L_H(x, y, v, w) = y \cdot v - H(x, y).
$$

3.2. Stochastic Hamiltonian systems. Stochastic Hamiltonian systems are formally defined as

**Definition 11.** A stochastic differential equation is called stochastic Hamiltonian system if we can find $H = \{H_D, H_S\}$ with $H_D : \mathbb{R}^{2d} \to \mathbb{R}$ and
\( H_S : \mathbb{R}^{2d} \rightarrow \mathbb{R}^n \) such that

\[
\begin{aligned}
    dQ &= \frac{\partial H_D}{\partial P} dt + \frac{\partial H_S}{\partial Q} \circ dB_t \\
    dP &= -\frac{\partial H_D}{\partial Q} dt - \frac{\partial H_S}{\partial P} \circ dB_t.
\end{aligned}
\] (13)

We recover the classical algebraic structure of Hamiltonian systems. The main properties supporting this definition are the following one, already proved in Bismut (1981):

- **Liouville's property** Let \((Q, P) \in \mathbb{R}^{2d}\), we consider the stochastic differential equation

\[
\begin{aligned}
    dQ &= f(P, Q) dt + \sigma(P, Q) \circ dB_t; \\
    dP &= g(P, Q) dt + \gamma(P, Q) \circ dB_t.
\end{aligned}
\] (14)

The phase flow of (14) preserves the *symplectic structure* if and only if it is a stochastic Hamiltonian system.

- **Hamilton's principle** Solutions of a stochastic Hamiltonian system correspond to critical points of a stochastic functional defined by

\[
\mathcal{L}_H(Q, P) = \int_a^b L_{H_D}(Q(t), P(t)) dt + L_{H_S}(Q(t), P(t)) \circ dB_t.
\] (15)

4. **Stochastic Helmholtz problem**

In this Section, we solve the inverse problem of the stochastic calculus of variations in the Hamiltonian case. We first recall the usual way to derive the Helmholtz conditions following the presentation made by R. Santilli (1978). We have two main derivations

- One is related to the characterization of Hamiltonian systems via the *symplectic two-differential form* and the fact that by duality the associated one-differential form to a Hamiltonian vector field is closed. Such conditions are called *integrability conditions*.

- The second one use the characterization of Hamiltonian systems via the self-adjointness of the Fréchet derivative associated to the differential operator associated to the equation. These conditions are usually called *Helmholtz conditions*.

Of course, we have coincidence of the two procedures in the classical case. In the stochastic case the first characterization has been studied by Milstein et al. (2002). As a consequence, we follow the second way to obtain the stochastic analogue of the Helmholtz conditions and we show that there is coherence between the two approach.

4.1. **Helmholtz conditions for Hamiltonian systems**.
4.1.1. **Symplectic scalar product.** In this Section we work on $\mathbb{R}^{2d}, d \geq 1, d \in \mathbb{N}$. The symplectic scalar product $\langle \cdot, \cdot \rangle_J$ is defined for all $X, Y \in \mathbb{R}^{2d}$ by

$$\langle X, Y \rangle_J = \langle X, JY \rangle,$$

where $\langle \cdot, \cdot \rangle$ denotes the usual scalar product. We also consider the $L^2$ symplectic scalar product induced by $\langle \cdot, \cdot \rangle_J$ defined for $f, g \in C^1([a,b], \mathbb{R}^{2d})$ by

$$\langle f, g \rangle_{L^2,J} = \int_a^b \langle f(t), g(t) \rangle_J dt.$$  

(17)

4.1.2. **Adjoin of a differential operator.** In the following, we consider first order differential equations of the form

$$\frac{d}{dt} \begin{pmatrix} q \\ p \end{pmatrix} = \begin{pmatrix} X_q(q,p) \\ X_p(q,p) \end{pmatrix}. $$

(18)

The associated differential operator is written as

$$O^a_{X}(q,p) = \begin{pmatrix} \dot{q} - X_q(q,p) \\ \dot{p} - X_p(q,p) \end{pmatrix}.$$  

(19)

A natural notion of adjoint for a differential operator is then defined.

**Definition 12.** Let $A : C^1([a,b], \mathbb{R}^{2n}) \rightarrow C^1([a,b], \mathbb{R}^{2n})$. We define the adjoint $A^*_J$ of $A$ with respect to $\langle \cdot, \cdot \rangle_{L^2,J}$ by

$$\langle A \cdot f, g \rangle_{L^2,J} = \langle A^*_J \cdot g, f \rangle_{L^2,J}.$$  

(20)

An operator $A$ will be called self-adjoint if $A = A^*_J$ with respect to the $L^2$ symplectic scalar product.

4.1.3. **Hamiltonian Helmholtz conditions.** The Helmholtz’s conditions in the Hamiltonian case are given by (see Theorem. 3.12.1, p.176-177 in Santilli (1978))

**Theorem 13** (Hamiltonian Helmholtz theorem). Let $X(q,p)$ be a vector field defined by $X(q,p)^T = (X_q(q,p), X_p(q,p))$. The differential equation (18) is Hamiltonian if and only the associated differential operator $O^a_{X}$ given by (19) has a self adjoint Fréchet derivative with respect to the symplectic scalar product.

In this case the Hamiltonian is given by

$$H(q,p) = \int_0^1 \left[p \cdot X_q(\lambda q, \lambda p) - q \cdot X_p(\lambda q, \lambda p)\right] d\lambda.$$  

(21)

The conditions for the self-adjointness of the differential operator can be made explicitly. They coincide with the integrability conditions characterizing the exactness of the one-form associated to the vector field by duality (see Santilli (1978), Theorem.2.7.3 p.88).
Theorem 14 (Integrability conditions). Let $X(q,p)^T = (X_q(q,p), X_p(q,p))$ be a vector field. The differential operator $O^a_b X$ given by (19) has a self adjoint Fréchet derivative with respect to the symplectic scalar product if and only if
\[
\frac{\partial X_q}{\partial q} + \left( \frac{\partial X_p}{\partial p} \right)^T = 0, \quad \frac{\partial X_q}{\partial p} \text{ and } \frac{\partial X_p}{\partial q} \text{ are symmetric.} \tag{22}
\]
Of course, the first condition corresponds to the fact that Hamiltonian systems are divergence free, i.e. we have $\text{div} X = 0$.

4.2. Stochastic Helmholtz’s conditions. We derive the main result of the paper giving the characterization of stochastic differential equations which are stochastic Hamiltonian systems.

4.2.1. Stochastic symplectic scalar product. Following the classical case, we introduce a stochastic analogue of the symplectic scalar product and the notion of self-adjointness for stochastic differential equations.

Consider two stochastic processes $X_t, Y_t \in S([a,b], \mathbb{R}^d)$ written as $dX_t = A(t, X_t)dt + B(t, X_t) \circ dB_t$ and $dY_t = C(t, Y_t)dt + D(t, Y_t) \circ dB_t$. We define

Definition 15 ($L^2$-Stratonovich scalar product). We define the $L^2$-Stratonovich scalar product of $X_t$ and $dY_t$ as
\[
<X_t, dY_t>_{L^2, \text{Strato}} = \int_a^b X_t \circ dY_t \tag{23}
\]
The symplectic version is obtained as in the classical case.

Definition 16 ($L^2$-Stratonovich symplectic scalar product). We define the $L^2$-Stratonovich symplectic scalar product of $X_t$ and $dY_t$ such as
\[
<X_t, dY_t>_{L^2, J, \text{Strato}} = <X_t, J \cdot dY_t>_{L^2, \text{Strato}} \tag{24}
\]
4.2.2. Adjoin of a stochastic differential operator. We consider the stochastic differential equations of the form
\[
\begin{pmatrix}
    dQ \\
    dP
\end{pmatrix}
= \begin{pmatrix}
    X_Q, Ddt + X_Q, S \circ dB_t \\
    X_P, Ddt + X_P, S \circ dB_t
\end{pmatrix}. \tag{25}
\]
The stochastic differential equations (25) is associated with the stochastic field $X(Q, P) = \{X_D(Q, P), X_S(Q, P)\}$. Its associated stochastic differential operator is written as
\[
O_X(Q, P) = \begin{pmatrix}
    dQ - X_Q, Ddt - X_Q, S \circ dB_t \\
    dP - X_P, Ddt - X_P, S \circ dB_t
\end{pmatrix}. \tag{26}
\]
A notion of symplectic adjoin for stochastic differential operators can be defined.
Definition 17. Let $A : \mathcal{S}([a, b], \mathbb{R}^{2d}) \rightarrow \mathcal{S}^*([a, b], \mathbb{R}^{2d})$. We define the ad-join $A_j^* : \mathcal{S}([a, b], \mathbb{R}^{2d}) \rightarrow \mathcal{S}^*([a, b], \mathbb{R}^{2d})$ of $A$ with respect to $\langle \cdot, \cdot \rangle_{L^2, J, \text{Strato}}$ by

$$< A \cdot X_t, dY_t >_{L^2, J, \text{Strato}} = < A_j^* \cdot dY_t, X_t >_{L^2, J} \quad (27)$$

As in the classical case, a main role will be played by self-adjoint stochastic differential operators.

Definition 18. A stochastic differential operator $A$ is said to be self-adjoint with respect to the symplectic scalar product $\langle \cdot, \cdot \rangle_{L^2, J, \text{Strato}}$ if $A = A_j^*$.

4.2.3. Stochastic Helmholtz conditions. The main result of this Section is the stochastic analogue of the Hamiltonian Helmholtz conditions for stochastic differential equations.

Proposition 19. Let $U, V \in \mathcal{S}_0([a, b], \mathbb{R}^d)$. The Fréchet derivative $DO(Q, P)$ of (26) is given by

$$DO(Q, P)(U, V) =$$

$$\begin{pmatrix}
    dU - \left[ \frac{\partial X_{Q, D}}{\partial Q} \cdot U + \frac{\partial X_{Q, D}}{\partial P} \cdot V \right] dt - \left[ \frac{\partial X_{Q, S}}{\partial Q} \cdot U + \frac{\partial X_{Q, S}}{\partial P} \cdot V \right] \circ dB_t \\
    dV - \left[ \frac{\partial X_{P, D}}{\partial Q} \cdot U + \frac{\partial X_{P, D}}{\partial P} \cdot V \right] dt - \left[ \frac{\partial X_{P, S}}{\partial Q} \cdot U + \frac{\partial X_{P, S}}{\partial P} \cdot V \right] \circ dB_t
\end{pmatrix} \quad (28)$$

and his adjoin $DO_j^*(Q, P)$ with respect to the symplectic scalar product $\langle \cdot, \cdot \rangle_{L^2, J, \text{Strato}}$ is given by

$$DO_j^*(Q, P)(U, V) =$$

$$\begin{pmatrix}
    dU - \left[ -\left( \frac{\partial X_{P, D}}{\partial P} \right)^T \cdot U - \left( \frac{\partial X_{Q, D}}{\partial Q} \right)^T \cdot V \right] dt - \left[ -\left( \frac{\partial X_{P, S}}{\partial P} \right)^T \cdot U - \left( \frac{\partial X_{Q, S}}{\partial Q} \right)^T \cdot V \right] \circ dB_t \\
    dV - \left[ -\left( \frac{\partial X_{P, D}}{\partial Q} \right)^T \cdot U - \left( \frac{\partial X_{Q, D}}{\partial P} \right)^T \cdot V \right] dt - \left[ -\left( \frac{\partial X_{P, S}}{\partial Q} \right)^T \cdot U - \left( \frac{\partial X_{Q, S}}{\partial P} \right)^T \cdot V \right] \circ dB_t
\end{pmatrix} \quad (29)$$

Remark 1. The notation $^T$ correspond to a transposition as follows:

As $X_{Q, S}$ and $X_{P, S}$ are in $\mathbb{R}^{d \times n}$ then each partial derivative with respect to $Q$ or $P$ are in $\mathbb{R}^{d \times n \times d}$. For example, $\frac{\partial X_{Q, S}}{\partial Q} = \left( \frac{\partial (X_{Q, S})_{i,j}}{\partial Q_k} \right)_{1 \leq i \leq d, 1 \leq j \leq n, 1 \leq k \leq d}$ and then $\left( \frac{\partial X_{Q, S}}{\partial Q} \right)^T = \left( \frac{\partial (X_{Q, S})_{i,j}}{\partial Q_k} \right)^T_{1 \leq i \leq d, 1 \leq j \leq n, 1 \leq k \leq d}$ with respect to the same indices.
DO
FRÉDÉRIC PIERRET

Proof. Let \( U, V \in \mathcal{S}(\mathbb{R}^d) \) and \( F, G \in \mathcal{S}(\mathbb{R}^d) \). The Fréchet derivative \( DO(Q, P) \) follows from simple computations and is given by

\[
(DO(Q, P)(U, V), (F, G))_{L^2, J, \text{Strato}} = \\
\int_a^b \left( dU \cdot G - \left[ \left( \frac{\partial X_{Q,D}}{\partial Q} \right)^T \cdot U + \left( \frac{\partial X_{Q,D}}{\partial P} \right)^T \cdot V \right] \cdot G \right) dt - \left\{ \left[ \left( \frac{\partial X_{Q,S}}{\partial Q} \right)^T \cdot U + \left( \frac{\partial X_{Q,S}}{\partial P} \right)^T \cdot V \right] \circ dB_t \right\} \cdot G \\
- dV \cdot F + \left[ \left( \frac{\partial X_{P,D}}{\partial Q} \right)^T \cdot U + \left( \frac{\partial X_{P,D}}{\partial P} \right)^T \cdot V \right] \cdot F \right) dt + \left\{ \left[ \left( \frac{\partial X_{P,S}}{\partial Q} \right)^T \cdot U + \left( \frac{\partial X_{P,S}}{\partial P} \right)^T \cdot V \right] \circ dB_t \right\} \cdot F \right)
\]

Using the Stratonovich integration by parts formula, we obtain

\[
(DO(Q, P)(U, V), (F, G))_{L^2, J, \text{Strato}} = \\
\int_a^b \left( - U \cdot dG - \left[ \left( \frac{\partial X_{Q,D}}{\partial Q} \right)^T \cdot G \right) \cdot U + \left( \frac{\partial X_{Q,D}}{\partial P} \right)^T \cdot U \right) \cdot G \right) dt \\
- \left\{ \left[ \left( \frac{\partial X_{Q,S}}{\partial Q} \right)^T \cdot U \right) \cdot G \right) \circ dB_t \right\} \\
- V \cdot dF + \left[ \left( \frac{\partial X_{P,D}}{\partial Q} \right)^T \cdot F \right) \cdot U + \left( \frac{\partial X_{P,D}}{\partial P} \right)^T \cdot V \right) \cdot F \right) dt \\
+ \left\{ \left[ \left( \frac{\partial X_{P,S}}{\partial Q} \right)^T \cdot F \right) \circ dB_t \right\} \\
- \left\{ \left[ \left( \frac{\partial X_{P,S}}{\partial P} \right)^T \cdot F \right) \cdot dB_t \right\} \cdot V
\]

As a consequence, the symplectic stochastic adjoin of \( DO(Q, P) \) is given by

\[
DO'(Q, P)(F, G) = \\
\begin{pmatrix} \\
\left. \frac{\partial X_{Q,D}}{\partial Q} \right)^T \cdot F + \left. \frac{\partial X_{Q,S}}{\partial Q} \right)^T \cdot G \right) \circ dB_t \\
\left. \frac{\partial X_{Q,D}}{\partial P} \right)^T \cdot F + \left. \frac{\partial X_{Q,S}}{\partial P} \right)^T \cdot G \right) \circ dB_t \\
\right\} \\
which concludes the proof.
\]

It follows directly, an explicit characterization of stochastic vector fields satisfying the stochastic Hamiltonian Helmholtz conditions. By coherence with the classical case, we call them stochastic integrability conditions.

**Proposition 20** (Stochastic integrability conditions). The operator \( O_X \) defined by (26) has a self-adjoin Fréchet derivative at \( (Q, P) \in \mathcal{S}(\mathbb{R}^d) \) if and only if the conditions

\[
\frac{\partial X_{Q,D}}{\partial Q} + \left( \frac{\partial X_{P,D}}{\partial P} \right)^T = 0, \\
\frac{\partial X_{Q,D}}{\partial P} = \left( \frac{\partial X_{Q,D}}{\partial P} \right)^T \quad \text{and} \quad \frac{\partial X_{P,D}}{\partial Q} = \left( \frac{\partial X_{P,D}}{\partial Q} \right)^T, \\
\frac{\partial X_{Q,S}}{\partial Q} + \left( \frac{\partial X_{P,S}}{\partial P} \right)^T = 0, \\
\frac{\partial X_{Q,S}}{\partial P} = \left( \frac{\partial X_{Q,S}}{\partial P} \right)^T \quad \text{and} \quad \frac{\partial X_{P,S}}{\partial Q} = \left( \frac{\partial X_{P,S}}{\partial Q} \right)^T,
\]

are satisfied over \([a, b]\).

**Remark 2.** These conditions are the same that the authors in Milstein et al. (2002) obtained. It means, as in the classical case, there is coherence between the conservation of the symplectic form associated with the stochastic field \(X(Q, P)\) and the self-adjointness of the stochastic differential operator \(O_X\).

**Theorem 21** (Stochastic Hamiltonian Helmholtz theorem). Let \(X(Q, P) = \{X_D(Q, P), X_S(Q, P)\}\) be a stochastic field. The stochastic differential equations (25) is a stochastic Hamiltonian equation if and only if the operator \(O_X\) defined by (26) has a self-adjoint Fréchet derivative with respect to the symplectic scalar product \(<\cdot, \cdot>_{L^2,J,\text{Strato}}\).

Moreover, in this case, the Hamiltonian \(H = \{H_D, H_S\}\) is given by

\[
H_D(Q, P) = \int_0^1 \left[ P \cdot X_{Q,D}(\lambda Q, \lambda P) - Q \cdot X_{P,D}(\lambda Q, \lambda P) \right] d\lambda, \\
H_S(Q, P) = \int_0^1 \left[ P \cdot X_{Q,S}(\lambda Q, \lambda P) - Q \cdot X_{P,S}(\lambda Q, \lambda P) \right] d\lambda,
\]

**Proof.** If \(X\) is a stochastic Hamiltonian field then there exist a function \(H_D \in C^2(\mathbb{R}^d \times \mathbb{R}^d, \mathbb{R})\) and \(H_S \in C^2(\mathbb{R}^d \times \mathbb{R}^d, \mathbb{R}^n)\) such that \(X_{Q,D} = \partial H_D / \partial P, X_{P,D} = -\partial H_D / \partial Q\) and \(X_{Q,S} = \partial H_S / \partial P, X_{P,S} = -\partial H_S / \partial Q\). The stochastic integrability conditions are satisfied by the Schwarz lemma.

Reciprocally, we suppose that \(X\) satisfies the stochastic integrability conditions. First, we compute \(\partial H_D / \partial Q\). We denote \((*) = (\lambda Q, \lambda P)\) and we have

\[
\frac{\partial H_D}{\partial Q}(Q, P) = \int_0^1 \left( \lambda P \cdot \left( \frac{\partial X_{Q,D}(*)}{\partial Q} \right)^T - X_{Q,D} - \lambda Q \cdot \left( \frac{\partial X_{P,D}(*)}{\partial Q} \right)^T \right) d\lambda
\]

Using the stochastic integrability conditions for the deterministic part, we obtain

\[
\frac{\partial H_D}{\partial Q}(Q, P) = \int_0^1 \left( -\lambda P \cdot \frac{\partial X_{P,D}(*)}{\partial P} - X_{Q,D} - \lambda Q \cdot \frac{\partial X_{P,D}(*)}{\partial Q} \right) d\lambda
\]

Remarkating that

\[
\frac{\partial X_{P,D}(*)}{\partial \lambda} = \frac{\partial X_{P,D}(*)}{\partial P} \cdot P + \frac{\partial X_{P,D}(*)}{\partial Q} \cdot Q,
\]

we deduce

\[
\frac{\partial H_D}{\partial Q}(Q, P) = \int_0^1 -\frac{\partial}{\partial \lambda} (\lambda X_{P,D}(*)) d\lambda
\]

and finally, integrating with respect to \(\lambda\)

\[
\frac{\partial H_D}{\partial Q}(Q, P) = -X_{P,D}(Q, P)
\]
In the same way we obtain
\[ \frac{\partial H_D}{\partial P}(Q, P) = X_{Q,D}(Q, P). \]

Second, we compute \( \frac{\partial H_S}{\partial Q} \). We have
\[
\frac{\partial H_S}{\partial Q}(Q, P) = \int_0^1 \left( \lambda P \cdot \left( \frac{\partial X_{Q,S}(\cdot)}{\partial Q} \right)^T - X_{Q,S} - \lambda Q \cdot \left( \frac{\partial X_{P,S}(\cdot)}{\partial Q} \right)^T \right) d\lambda
\]

Using the stochastic integrability conditions for the purely stochastic part, we obtain using the same trick as previous
\[
\frac{\partial H_S}{\partial Q}(Q, P) = -X_{P,S}(Q, P) \quad \text{(37)}
\]
and
\[
\frac{\partial H_S}{\partial P}(Q, P) = X_{Q,S}(Q, P) \quad \text{(38)}
\]
This concludes the proof. \( \square \)

**Remark 3.** The Stratonovich calculus seems to be more appropriate for such computations and also for its result about the variational structure developed by J-M Bismut in [Bismut, 1981] contrary to the Itô calculus. However, one can define a notion of Itô Hamiltonian systems following the self-adjointness characterization. Indeed, the definition of Stratonovich symplectic scalar product can be also defined with the Itô integral. But one will have a counterpart in the integration by parts in the proof of Proposition [19]. It leads to an additional set of conditions on the deterministic part of the stochastic field due to the extra term appearing with the Itô formula which can be very restrictive.

Also, in the Stratonovich calculus, the Hamiltonian defined is a first integral over the solutions of the stochastic differential equations considered, i.e. a constant process, as in the classical case. Whereas the definition obtained with the Itô calculus as explained previously leads to a second extra set of conditions in order to have the Hamiltonian defined as a first integral. It leads to a real need of interpretation of Hamiltonian systems for stochastic calculus.

### 5. Conclusion and prospects

We proved a result on Stratonovich stochastic differential equations which allows us to find the existence of a Hamiltonian structure associated and in the affirmative case to give the Hamiltonian. Our result cover the classical case when there is no purely stochastic counterpart.

An important extension of this result concern the stochastic time-scale calculus and more precisely the stochastic calculus on time scales developed in [Sanyal, 2008] and [Bohner et al., 2013]. First, the work is to define a notion of Stratonovich calculus on time-scale as it has been done for Itô calculus in [Sanyal, 2008] and [Bohner et al., 2013]. Second, the work is to
define a natural notion of stochastic Hamiltonian on time scales and then to give the stochastic time-scale version of Theorem \(^\text{[21]}\). This extension is a work in progress and will be the subject of a future paper.
