Abstract

OBJECTIVE: To describe the benefits and safety of using Carbon Dioxide Laser in multi-pulse modalities when performing labiaplasty and anatomical variants approach for functional and cosmetic indications.

DESIGN: This is a prospective, descriptive case series study.

SETTING: Private Practice Quirofano Calculaser Megacentro Pinares Pereira Colombia.

POPULATION: One Hundred and twelve women seeking labia minora labiaplasty for functional and cosmetic reasons were enrolled in the study protocol from June 2013 to June 2016. Labia minora labiaplasty and anatomical variants approach were performed with Carbon Dioxide laser Multi-pulse modalities DEKA M.EL.A Florence Italy

MAIN OUTCOME MEASURES: Good Cosmetic results, functional and sexual improvement

RESULTS: Dramatic changes in the VAS and VSQ were detected after the surgical procedure. All the participants reported a high degree of satisfaction, felt more confident with their partners during sexual encounters, and the procedure was well tolerated.

CONCLUSION: Laser Carbon Dioxide Laser with a new pulse profile and shape seems to be a safe and precise surgical tool to perform this type of procedures, optimal biophysical and bio stimulative laser-tissue interactions allow delicate vulvar tissues to shorten downtime.

Introduction

Increasing number of patients are seeking medical attention, due to concerns about labia minora hypertrophy related to cosmetic, functional, and sexual concerns [1]. Gynecologists from around the world are nowadays confronted with an increasing demand for labia reduction surgery, the National Health Service (NHS) in the United Kingdom reported at least the doubling of the number of labia reductions carried out in the UK in 2004 compared with 1998 [2]. Hodgkinson was one of the firsts to publish a description of a labiaplasty procedure in 1983 [3]. Rouzier and colleagues presented their experience with a large series of patients [4]. Labiaplasty technique has also been described by many other authors, such as Munhoz [5], Maas [6], Giraldo [7], and Rauso [8]. These techniques were performed with common surgical techniques, without the aid of...
energy source or laser devices. Pardo and colleagues reported hemostatic advantages of using laser devices when performing this procedure, with high rates of patient satisfaction and few rate of complications [9].

Laser energy sources have been used in gynaecology for more than three decades [10]. There are many described advantages, such as bactericidal, bio-regenerative and bio-stimulating effects on tissues, which allows better healing, faster recovery, less pain and better aesthetic results.

This study aimed to demonstrate the benefits and safety of multi-pulsed CO₂ Laser when performing a labiaplasty procedure and to demonstrate with histological samples the lateral thermal damage between the different pulses.

Materials and Methods

In the present study protocol, were enrolled one hundred and twelve women aged between 15 and 62 years (mean 32.63) attending a private cosmetic gynaecology unit from January 2013 to January 2016, seeking labia minora labiaplasty for functional and cosmetic indications. The main indications for labiaplasty were identified as: functional (40%), cosmetic (30%), sexual (20%), and cultural (10%).

The Gonzalez Labia Minora Hypertrophy Classification was used to determine the degree of hypertrophy and to choose the best technique to be performed in each patient [11]. The Visual Analog Scale (VAS) was used to compare the degree of satisfaction and comfort with sexual partners during intercourse. The Vulvovaginal Symptom Questionnaire (VSQ) was used to measure symptoms, emotions, life-impact, and sexual-impact before and after surgery. The first seven questions of the VSQ comprise symptoms subscale (itching, burning, hurting, irritation, dryness, discharge, and odour). Women who answered “Yes” to any of the first seven symptoms questions were considered to have vulvovaginal symptoms, and sexual impact (Yes to ≥1 out of 4 sexual impact subscale items).

Statistical analysis was performed using SPSS 11.5.1 (SPSS, Chicago, Illinois, the USA). Quantitative variables deal with the following parameters: mean, median, and standard deviation before and after surgery.

Labiaplasty was performed with a Carbon Dioxide Laser 10,600 nm (Deka M.E.L.A., Florence, Italy) in different pulse modes, profile, and shape, to achieve efficient cutting and coagulation during the procedure. Labiaplasty was carried out in the surgical room under regional or general anaesthesia; meantime procedure was about 60 minutes. The surgeon preferred technique was the Gres technique [12], which allows the appropriate approach of common vulvar anatomical variants.

Results

Outcomes were analyzed with validated tools: Vulvovaginal Symptom Questionnaire (VSQ) and Visual Analog Scale (VAS) before and at least one month after CO₂ Laser labiaplasty. An image report has been carried out (Fig. 1).

![Figure 1: a) Labia minora hypertrophy II-A-A (Gonzalez Classification); b) Pre-surgery markings; c) Immediate post-surgery; Right side DP mode; Left side SP mode; d) 2-month post-surgery](https://www.id-press.eu/mjms/index)

All the patients completed the study, scores for overall satisfaction and comfort with partners during sexual intercourse were dramatically improved after surgery in both groups respectively 7.3 ±1.6 to 2.3 ± 0.89, and 7.4 ± 1.0 to 1.89 ± 0.74 (Tables 1 and 2).

| Visual Analogue Scale (VAS) | Before Surgery | After Surgery |
|-----------------------------|---------------|--------------|
| Baseline                    | 7.3 ± 1.0     | 2.3 ± 0.89   |

Overall Vulvovaginal Symptom Questionnaire (VSQ) before surgery was 7.0 ± 0.79 and after Labiaplasty 0.65 ± 0.63.

| Visual Analogue Scale (VAS) | Before Surgery | After Surgery |
|-----------------------------|---------------|--------------|
| Baseline                    | 7.4 ± 1.0     | 1.89 ± 0.74  |

For women reporting one or more vulvovaginal symptom, before surgery 70.5% (n = 79/112) reported emotional impact (Yes to ≥1 out of 4 emotional impact subscale items) and 94.6% (n = 106/112) reported lifestyle impact (Yes to ≥1 out of 5 lifestyle impact subscale items) from these symptoms. For sexually active women reporting vulvovaginal symptoms, 83% (n = 93/112) reported sexual impact (Yes to ≥1 out of 4 sexual impact subscale items).

One month after surgery the percentage was
found to be dramatically lower as follows: for women reporting one or more vulvovaginal symptom, after surgery 10% (n = 11/112) reported emotional impact (Yes to ≥1 out of 4 emotional impact subscale items), and 8% (n = 7/112) reported lifestyle impact (Yes to ≥1 out of 5 lifestyle impact subscale items) from these symptoms.

Table 3: Domains of vulvovaginal symptoms from the Vulvo Vaginal Symptom Questionnaire (VSVQ), expressed as a percentage. n is the correlated number of women over the total 112 enrolled ones

|                           | Before Surgery | After Surgery |
|---------------------------|----------------|---------------|
| VSVQ Score                |                | 0.68 ± 0.63   |
| Emotional Impact          | 70.5% (n=79)   | 10% (n=11)    |
| Lifestyle Impact          | 94.6% (n=106)  | 8% (n=7)      |
| Sexual Impact             | 83% (n=93)     | 7% (n=6)      |

For sexually active women reporting vulvovaginal symptoms, 7% (n = 6/112) reported sexual impact (Yes to ≥1 out of 4 sexual impact subscale items) (Table 3).

Biopsies of the excess skin of the vulva were obtained to corroborate histological changes after CO₂ Laser Labiaplasty (Fig. 2). Lateral thermal damage (TRT) was measured in millimetres with traditional staining methods Hematoxylin and Eosin (Fig. 3).

Discussion

Vulvovaginal symptoms are common and present in an important percentage of patients with labia minora hypertrophy. Many of these patients have emotional, lifestyle, and sexual discomforts due to these symptoms. A labiaplasty with the right indication and performed by a high skilled cosmetic gynaecology surgeon can improve sexuality, self-esteem and overall satisfaction in symptomatic patients suffering from this condition.

CO₂ Laser with new pulse profile and shape seems to be a safe and precise surgical tool to perform this type of procedure. Optimal biophysical and bio-stimulating laser-tissue interactions allow delicate vulvar tissues to shorten downtime.
