Gravitational Waves in Brane World
— A Midi-superspace Approach —

Abstract
It is important to reveal the brane-bulk correspondence for understanding the brane
world cosmology. When gravitational waves exist in the bulk, however, it is difficult
to make the analysis of the interrelationship between the brane and the bulk. Hence,
the minimal model which allows gravitational waves in the bulk would be useful. As
for such models, we adopt the Bianchi type midi-superspace models. In particular,
the effects of gravitational waves in the bulk on the brane cosmology is examined
using the midi-superspace approach.

1 Introduction
The idea of the brane world has provided an active area in the field of cosmology. The main attractive
point of this idea is its testability. However, to make a definite prediction, we need to understand the role
of the bulk on the brane world cosmology. Before considering the complicated cosmological perturbation
theory, we would like to try to understand the essence of the problem in the simple models. The aim of this
paper is to study some aspects of the brane-bulk correspondence in the Bianchi Type I midi-superspace
model.

Let us start to describe the \( Z_2 \) symmetric brane world model which we want to analyze from now on.
The action for it is given by
\[ S = \frac{1}{2} \kappa^2 \int d^5 x \sqrt{-g} \left( R^5 + \frac{12}{l^2} \right) - \sigma \int d^4 x \sqrt{-g_{brane}} + \int d^4 x \sqrt{-g_{brane}} \mathcal{L}_{matter} \]

(1)
where \( l \) denotes the curvature radius of the AdS spacetime, \( \kappa^2 \) is the gravitational constant in the 5
dimensional spacetime, and \( \sigma \) and \( g_{brane} \) represent the brane tension and the induced metric on the brane
respectively. Here we assume the relation \( \kappa^2 \sigma = 6/l \) which is necessary to have the Minkowski vacuum.

From the above action, we obtain the 5-dimensional Einstein equations;
\[ G^M_N = \frac{6}{l^2} \delta^M_N + \kappa^2 \frac{\sqrt{-g_{brane}}}{\sqrt{-g}} T^M_N, \ (M, N = y, t, x^i) \]

(2)
As for the matter confined to the brane, we consider the perfect fluid
\[ T^M_N = \text{diag}(0, -\rho, p, p, p) \delta(y) \]

(3)

First, let us consider the FRW cosmology. The cosmological principle restricts the bulk metric in the
following form:
\[ ds^2 = e^{2\beta(y,t)}(-dt^2 + dy^2) + e^{2\alpha(y,t)} \delta_{ij} dx^i dx^j \]

(4)
Then, the induced metric on the brane becomes
\[ ds^2 = -dt^2 + e^{2\alpha_0(t)} \delta_{ij} dx^i dx^j \]

(5)
Due to the generalized Birkhoff’s theorem, only AdS-Schwarzschild black hole solutions are allowed. Cor-
respondingly, the cosmology on the brane is also simple. Putting \( 8\pi G_4 = \kappa^2/l \), we get the effective
Friedmann equation as
\[ \dot{a}_0^2 = \frac{8\pi G_4}{3} \rho + \frac{\kappa^4 \rho_0^2}{36} + e^{-4\alpha_0} C_0 \]

(6)
where the parameter $C_0$ corresponds to the mass of the black hole. It should be noted that there exists no gravitational waves in this background. This makes the understanding of brane-bulk correspondence easier.

To proceed to the cosmological perturbation theory is a natural next step for understanding cosmology. To reveal the nature of the cosmological perturbation, we need to consider the bulk spacetime with gravitational waves. However, it is too complicated to analyze in detail.

In this circumstances, we take the midi-superspace approach to attack the issue. Namely, we consider the minimal model which can allow the bulk gravitational waves. We shall consider the Bianchi type midi-superspace models:

$$ds^2 = e^{2\beta(y,t)}(-dt^2 + dy^2) + e^{2\alpha(y,t)}g_{ij}(y,t)\omega^i\omega^j.$$  (7)

Apparently, there can exist (nonlinear) gravitational waves in this bulk spacetime. The induced cosmology on the brane is nothing but the anisotropic bianchi type cosmology:

$$ds^2 = -dt^2 + e^{2\alpha_0(t)}g_{ij}(t)\omega^i\omega^j.$$  (8)

It includes FRW model as a special case. Hence, it should have implications into the cosmological perturbations. For simplicity, we will consider only the Bianchi type I model in this paper, although the generalization is straightforward.

### 2 Anisotropic Cosmology

Bianchi Type I midi-superspace metric is given by

$$ds^2 = e^{2\beta(y,t)}(-dt^2 + dy^2) + e^{2\alpha(y,t)} \left( e^{2(\chi_+ + \chi_-)}dx_1^2 + e^{2(\chi_+ - \chi_-)}dx_2^2 + e^{-4\chi_+(y,t)}dx_3^2 \right).$$  (9)

As is mentioned previously, gravitational waves can propagate in the bulk. From the above metric, it is easy to calculate the components of the Einstein tensor relevant to the junction conditions as

$$C^0_0 = -3e^{-2\beta}(\dot{\alpha}^2 + \alpha'\beta' - \alpha'' - 2\alpha'^2 + \alpha'\beta - \chi_+^2 - \chi_-^2 - \chi_+^2 - \chi_-^2)$$  (10)

$$C^1_1 = e^{-2\beta}(-2\ddot{\alpha} - 3\dot{\alpha}^2 - \ddot{\beta} + 2\alpha'' + 3\alpha'^2 + \beta'' + \chi_+ + \sqrt{3}\chi_- - \chi_-^2 - \sqrt{3}\chi_-)$$  (11)

$$C^2_2 = e^{-2\beta}(-2\ddot{\alpha} - 3\dot{\alpha}^2 - \ddot{\beta} + 2\alpha'' + 3\alpha'^2 + \beta'' + \chi_+ - \sqrt{3}\chi_- - \chi_-^2 + \sqrt{3}\chi_-)$$  (12)

$$C^3_3 = e^{-2\beta}(-2\ddot{\alpha} - 3\dot{\alpha}^2 - \ddot{\beta} + 2\alpha'' + 3\alpha'^2 + \beta'' - 2\chi_+ + 2\chi_-)$$  (13)

The power series expansion near the brane

$$\alpha(y, t) = \alpha_0(t) + \alpha_1(t)|y| + \frac{\alpha_2(t)}{2}y^2 + \cdots$$  (14)

defines our notations. From the Einstein equation, we get the junction conditions

$$\alpha_1(t) = -\frac{1}{l} - \frac{\kappa^2 \rho(t)}{6},$$

$$\beta_1(t) = -\frac{1}{l} + \frac{\kappa^2 \rho(t)}{3} + \frac{\kappa^2 p(t)}{2},$$

$$\chi_+ = 0,$$

$$\chi_- = 0,$$  (15)

where we set $e^{\beta_0(t)} = 1$. 

2
The other components of the Einstein tensor
\[ G^y_y = 3e^{-2\beta}(-\ddot{\alpha} - 2\dot{\alpha}^2 + \ddot{\alpha}\dot{\beta} + \alpha'^2 + \alpha'\beta' - \dot{\chi}^2 - \dot{\chi}'^2 - \chi'^2 - \chi''^2) \]  
\[ G^0_y = -3e^{-2\beta}(\beta'\dot{\alpha} + \alpha'\dot{\beta} - \dot{\alpha}\dot{\beta}' - 2\dot{\chi}_+\chi'_+ - 2\dot{\chi}_-\chi'_-) \]  
give equations on the brane
\[ \ddot{\alpha}_0 + 2\dot{\alpha}_0^2 = \frac{\kappa^2}{2l} \left( \frac{\rho}{3} - p \right) - \frac{\kappa^4 \rho (\rho + 3p)}{36} - \chi^2 - \chi'_2 \]
\[ \dot{\rho} + 3\dot{\alpha}_0 (\rho + p) = 0 . \]

From these equations, we can deduce the Friedmann equation as
\[ H^2 = \frac{8\pi G_4}{3}\rho + \dot{\chi}^2 + \chi^2 \]  
\[ + \frac{\kappa^4}{36} \rho^2 + C_0 e^{-4\alpha_0} - e^{-4\alpha_0} \int d\alpha_0 e^{-2\alpha_0} \frac{d}{d\alpha_0} [e^{6\alpha_0} (\dot{\chi}^2 + \chi^2)] \]  
\[ = \frac{8\pi G_4}{3}\rho + \dot{\chi}^2 + \chi^2 + \frac{\kappa^4}{36} \rho^2 + C_0 e^{-4\alpha_0} - 2e^{-4\alpha_0} \int dt e^{4\alpha_0} [\dot{\chi}_+\chi_+ + \dot{\chi}_-\chi_-] \]  
where we have used equations for \( \chi_{\pm,0} \) to obtain the last line.

The last term represents the effect of gravitational waves in the bulk on the brane world cosmology. This correction term is apparently non-local and hence we need the information of the bulk.

3 Vacuum Brane

As we want to understand the effects of gravitational waves on the brane cosmology, the existence of the matter is not essential. Hence, we consider the vacuum brane.

3.1 Trivial bulk and boundary theory

It is well known that there exist exact solutions in the form
\[ ds^2 = \left( \frac{l}{y} \right)^2 [dy^2 + g_{\mu\nu}(x^\lambda)dx^\mu dx^\nu] , \]
where \( g_{\mu\nu} \) is the 4-d vacuum metric. All of the Bianchi type vacuum solutions can be elevated to the exact brane world solutions.

In the case of the Bianchi type I model, we have the exact Kasner type solution \[ ds^2 = \left( \frac{l}{y} \right)^2 (-dt^2 + dy^2 + t^{2p_1}dx_1^2 + t^{2p_2}dx_2^2 + t^{2p_3}dx_3^2) . \]

Notice that the brane is located at \( y = l \) in this coordinate system. As is usual, the parameters are constrained by the following relations
\[ p_1 + p_2 + p_3 = 1 , \]  
\[ p_1^2 + p_2^2 + p_3^2 = 1 . \]

It would be interesting to consider the free scalar field on this background. As this system is separable, we can put
\[ \phi = \chi(t) f(y)e^{ik_1 x_1 + ik_2 x_2 + ik_3 x_3} \]
then the Klein-Gordon equation leads to
\[ \ddot{\chi} + \frac{1}{7} \dot{\chi} + \omega^2 \chi + (k_1^2 t^{1-2p_1} + k_2^2 t^{1-2p_2} + k_3^2 t^{1-2p_3}) \chi = 0 , \]
\[ -f'' + \frac{3}{y} f' = \omega^2 f . \]

Thus, we can define the boundary field theory as is done in AdS case. It is a generalization of the AdS/CFT correspondence to Gravity/Quantum Field Theory correspondence.
3.2 Effects of non-trivial bulk

Now we would like to consider how the cosmogical evolution on the brane is affected by the gravitational waves in the bulk. The strategy we take is the following. First we solve the equation on the brane which can be written using the variables solely on the brane. We call this type of the equation as the constraint equation. Then we calculate the non-local term from the explicit solution and identify its effective equation of state.

The constraint equation on the brane is given by
\[ \ddot{\alpha}_0 + 2\dot{\alpha}_0^2 + \dot{\chi}_0^2 + \dot{\chi}_0^2 = 0. \] (27)

An interesting subclass of the solutions is
\[ \alpha_0 = A \log t, \chi_0 = B \pm \log t. \] (28)

Substitution this ansatz into the constraint equation gives the relation:
\[ 2(A - \frac{1}{4})^2 + B^2_+ + B^2_- = \frac{1}{8}. \] (29)

Allowed region for \( A \) becomes \( 0 \leq A \leq \frac{1}{2} \). The previous relations now become
\[ p_1 + p_2 + p_3 = 3A, \]
\[ p_1^2 + p_2^2 + p_3^2 = 6A - 9A^2. \] (30) (31)

In case \( A = 1/3 \), this reduces to exact Kasner type solution. For \( B_\pm = 0, A = 1/2 \), we obtain the dark radiation dominated universe.

From the above solutions, we get \( \chi_{\pm 2} = (3A - 1)B_\pm / t^2 \). Using the previous formula, the effective Friedmann equation can be deduced as
\[ H^2 = \dot{\chi}_0^2 + \dot{\chi}_0^2 + A(3A - 1)e^{-2\alpha_0/A}. \] (32)

If \( A > 1/3 \), the bulk effect accelerate the expansion. The holographic projection of gravitational waves behaves as the fluid:
\[ p = w\rho, \quad w = \frac{2}{3A} - 1. \] (33)

In case \( A < 1/3 \), the sound speed exceeds the velocity of light. So it violates the holographic principle formulated by Fishler and Susskind.

4 AdS/CFT correspondence

To analyze more general situations, we need a new apparatus. Here, we propose to use the AdS/CFT correspondence for that purpose. From AdS/CFT correspondence, we can deduce the low energy effective action for the brane world as
\[ S_{5-dEH} + \sigma \int d^4x \sqrt{g_{brane}} + S_{matter} = \frac{1}{16\pi G} \int d^4x \sqrt{g_{brane}} R + S_{matter} + W_{CFT} - \frac{1}{8\kappa^2} \log \epsilon \int d^4x \sqrt{g_{brane}} \left[ R_{\mu\nu}R_{\mu\nu} - \frac{1}{3} R^2 \right], \] (34)

where \( \epsilon \) denotes the arbitraly parameter. In the case of FRW cosmology, the last term vanishes like as
\[ \int d^4x \sqrt{g_{brane}} \left[ R_{\mu\nu}R_{\mu\nu} - \frac{1}{3} R^2 \right] = 4 \int dt \frac{d}{dt}[\dot{a} / N]^3] = 0. \] (35)

This result is consistent with the low energy effective Friedmann equation
\[ \dot{\alpha}_0^2 = \frac{8\pi G \rho}{3} + e^{-4\alpha_0C_0}. \] (36)
In contrast, for the Bianchi type I model, we have
\[ \int d^4x \sqrt{g_{\text{brane}}} \left[ R^\mu\nu R_{\mu\nu} - \frac{1}{3} R^2 \right] \]
\[ = 6 \int dt e^{3\alpha} \left[ (\ddot{\chi} + 3\dot{\alpha}\dot{\chi})^2 + (\ddot{\chi} - 3\dot{\alpha}\dot{\chi})^2 + 4(\dot{\chi}^2 + \dot{\chi}^2) + 2(\ddot{\alpha} - \dot{\alpha}^2)(\dot{\chi}^2 + \dot{\chi}^2) \right] . \] (37)
This does not vanish in general. Hence, the correction which we found in this work must be identified with this term. It would be interesting to analyze the effects of the gravitational waves on the brane world cosmology using this correspondence.

5 Conclusion

First we have suggested a possible extension of the AdS/CFT correspondence to Gravity/Quantum Field Theory correspondence in the case of the Kasner type exact solution
\[ ds^2 = \left( \frac{1}{y} \right)^2 (-dt^2 + dy^2 + t^{2p_1} dx_1^2 + t^{2p_2} dx_2^2 + t^{2p_3} dx_3^2) . \]
We have also shown that the bulk gravitational waves affect on the brane evolution as a perfect fluid with equation of state, \( p = w \rho \), \( w = 2/3A - 1 \). As \( 0 \leq A \leq 1/2 \), we obtain \( w \geq 1/3 \). In particular, if \( A \leq 1/3 \), the bulk effect is very stiff. Hence, it seems that the holographic principle is violated in the brane world. It is also pointed out that the effects of gravitational waves on the brane world cosmology can be investigated using the effective action derived from the AdS/CFT correspondence.
