1. Introduction

The well-known ML (Mittag-Leffler) function with one parameter is defined by

\[ \varepsilon_a(z_1) = \sum_{l=0}^{\infty} \frac{z_1^l}{\Gamma(al + 1)} \quad (a \in \mathbb{C}; \Re(a) > 0, z_1 \in \mathbb{C}). \]  

(1)

The generalization of (1) with two parameters defined by

\[ \varepsilon_{a,b}(z_1) = \sum_{l=0}^{\infty} \frac{z_1^l}{\Gamma(al + b)} \quad (a, b \in \mathbb{C}; \Re(a) > 0, \Re(b) > 0) \]  

(2)

was presented and contemplated by Mittag-Leffler [1–7] and other researchers. In [8], the generalization of (1) was given by

\[ \varepsilon_{a,b}^{\kappa}(z_1) = \sum_{l=0}^{\infty} \frac{(\kappa)_l}{\Gamma(al + b)} \frac{z_1^l}{l!} \quad (a, b, \kappa \in \mathbb{C}; \Re(a) > 0, \Re(b) > 0). \]  

(3)

Shukla and Prajapati [9] defined the following generalization of the ML function by

\[ \varepsilon_{a,b}^{\kappa,q}(z_1) = \sum_{l=0}^{\infty} \frac{(\kappa)_l}{\Gamma(al + b + q)} \frac{z_1^l}{l!} \quad (a, b, \kappa, q \in \mathbb{C}; \Re(a) > 0, \Re(b) > 0, \Re(q) > 0). \]  

(4)

Rahman et al. [10] defined the following extension of generalized ML function by

\[ \varepsilon_{a,b,c}^{\kappa,d}(z_1) = \sum_{l=0}^{\infty} \frac{B(\kappa + lq; c - \kappa)(\kappa)_l}{B(c - \kappa)\Gamma(al + b)} \frac{z_1^l}{l!}, \]  

(5)

where \( a, b, \kappa, c \in \mathbb{C}; \Re(c) > 0, \Re(a) > 0, \Re(b) > 0, \Re(p) > 0, \)
\( q > 0 \), and \( B_{q}(x,y) \) is the extension of beta function (see [11]).

Moreover, the generalization of ML function (3) was presented by [12] as follows:

\[
\epsilon_{a,b,p}(z) = \sum_{\ell=0}^{\infty} \frac{(\kappa; p)_\ell}{(a+b+\ell)!} \frac{z^\ell}{\ell!} \quad (p \geq 0, a, b, \kappa \in \mathbb{C}; \Re (a) > 0, \Re (b) > 0, \Re (p) > 0),
\]

(6)

where \((\kappa; p)_\ell\) is the Pochhammer symbol which is defined as

\[
(\lambda; \sigma)_\mu = \begin{cases} 
\frac{\Gamma(\lambda + \mu)}{\Gamma(\lambda)}, & \Re (\sigma), \lambda, \mu \in \mathbb{C}, \\
(\lambda)_\mu, & \sigma = 0, \lambda, \mu \in \mathbb{C} \setminus \{0\}.
\end{cases}
\]

(7)

The researchers studied these extensions (6) and (7) and investigated their further extensions and associated properties and applications. (The readers may consult [13–16].) Recently, Srivastava et al. [17] have presented and concentrated in a fairly productive way the following extension of the generalized hypergeometric function:

\[
_{r}F_{s}[\{\delta_j; \rho, v\}, \{\zeta_i\}; z] = \sum_{\ell=0}^{\infty} \frac{(\delta_1; \rho, v)_\ell (\zeta_1; \ell)_\ell}{(\kappa_1; \ell)_\ell} \frac{z^\ell}{\ell!},
\]

(8)

where \(\delta_j \in \mathbb{C}\) for \(j = 1, 2, \cdots, s\), \(\zeta_k \in \mathbb{C}\) for \(k = 1, 2, \cdots, t\), and \(\zeta_\ell \neq 0, -1, -2, \cdots\), and where \((\mu; \omega, a)_\eta\) is the extension of the generalized Pochhammer symbol defined by [23]:

\[
(\mu; \omega, a)_\eta = \begin{cases} 
\frac{\Gamma_a(\mu + \eta; \omega)}{\Gamma(\mu)}, & \Re (\omega), \Re (a) > 0, \mu, \eta \in \mathbb{C}, \\
(\mu; \omega, a)_\eta, & a = 0, \mu, \eta \in \mathbb{C} \setminus \{0\}.
\end{cases}
\]

(9)

The integral representation of \((\mu; \omega, a)_\eta\) is explained by

\[
(\mu; \omega, a)_\eta = \sqrt{2\omega} \frac{1}{\pi} \frac{1}{\Gamma(\mu)} \int_0^{\infty} s^{\mu-3/2} \cdot e^{-\frac{\omega}{s}} K_{a+1/2}(\frac{\omega}{s}) ds,
\]

(10)

where \(K_{a}(\cdot)\) is the modified Bessel function of order \(a\). Clearly, when \(a = 0\) in (10), at that point, by utilizing the way that \(K_{1/2}(t) = \sqrt{\pi/2t} e^{-t}\), it will lead to formula [(31)]:

\[
(\mu; \omega, 0)_\eta = (\mu; \omega)_\eta = \frac{1}{\Gamma(\mu)} \int_0^{\infty} s^{\mu-1/2} e^{-s} ds.
\]

(11)

Specifically, the relating extensions of the confluent hypergeometric function \(1_{F_1}\) and the Gauss hypergeometric function \(2_{F_1}\) are given by

\[
_{2}F_{1}[\{\delta_1; \rho, v\}, b; \kappa; z] = \sum_{\ell=0}^{\infty} \frac{(\delta_1; \rho, v)_\ell (b; \ell)_\ell}{(\kappa; \ell)_\ell} \frac{z^\ell}{\ell!},
\]

(12)

The extension of generalized hypergeometric function \(_{r}F_{s}\) of \(r\) numerator and \(s\) denominator parameters was investigated by [18]. Recently, the researchers defined various extensions of special functions and their associated properties and applications in the diverse field. (The interested readers may consult [19–22].) In [23–25], the authors introduced an extension of fractional derivative operators based on the extended beta functions.

Next, motivated by the above such extensions of special functions, we define an extension of ML function (6) in terms of the generalized Pochhammer symbol (9) and investigate its certain variations.

## 2. Extension of ML Function

We present an extension of the generalized ML function in (6) regarding the extended Pochhammer symbol in (9) as follows:

\[
\epsilon_{a,b,p,v}(z) = \sum_{\ell=0}^{\infty} \frac{(\kappa_1; p, v)_\ell (\zeta_1; \ell)_\ell}{(a+b+\ell)_\ell} \frac{z^\ell}{\ell!},
\]

(13)

given that the series on the right hand side converges.

Clearly, it diminishes to the extended generalized ML function (6) for \(v = 0\). The special case for \(a = 1\) in (14) can be communicated regarding extended confluent hypergeometric function (13) as follows:

\[
\epsilon_{1,b,p,v}(z) = \frac{1}{\Gamma(b)} \cdot F_{1}[\{\kappa_1; p, v\}; b; z] = \frac{1}{\Gamma(b)} \Phi[\{\kappa_1; p, v\}; b; z].
\]

(15)

## 3. Basic Properties of \(\epsilon_{a,b,p,v}(z)\)

In this section, we present certain basic properties and integral representations of the extended generalized ML function \(\epsilon_{a,b,p,v}(z)\) in (14).

**Theorem 1.** For the function \(\epsilon_{a,b,p,v}(z)\) in (14), the following relation holds true:

\[
\epsilon_{a,b,p,v}(z) = b \cdot \frac{d}{dz} \epsilon_{a+1,b,p,v}(z) + \frac{az}{2} \cdot \epsilon_{a,b+1,p,v}(z)
\]

(16)

\(a, b, \kappa \in \mathbb{C}; \Re (a) > 0, \Re (b) > 0, \Re (p) > 0, p \geq 0, v \geq 0\).
Specifically, we have
\[ E_{a,b,p}(z_1) = b E_{a,b+1,p}(z_1) + az_1 \frac{d}{dz_1} E_{a,b+1,p}(z_1). \] (17)

Proof. From (14), we have
\[
be_{a,b+1,p,v}(z_1) + az_1 \frac{d}{dz_1} e_{a,b+1,p,v}(z_1) = \sum_{l=0}^{\infty} \left( \frac{(k,p,v)_l}{(al+b+1)!} z_1^l + a z_1 \sum_{l=0}^{\infty} \frac{(k,p,v)_l}{(al+b+1)!} z_1^l \right).
\]

From (14), we have
\[
\left( \frac{d}{dz_1} e_{a,b+1,p,v}(z_1) \right) = \sum_{l=0}^{\infty} \frac{(k,p,v)_l}{(al+b+1)!} z_1^l + a \sum_{l=0}^{\infty} \frac{(k,p,v)_l}{(al+b+1)!} z_1^l.
\]

\[
\frac{dz}{dz_1} \left[ z_1^{b-1} \Phi((k,p) ; b ; \omega z_1) \right] = \Gamma(b) \left( \frac{dz}{dz_1} \right)^m \left[ z_1^{b-1} \Phi((k,p) ; b ; \omega z_1) \right] = \frac{\Gamma(b)}{(b-m)} \left[ z_1^{b-m-1} \Phi((k,p) ; b ; m ; \omega z_1) \right].
\] (24)

Proof. Operating term wise differentiation \( m \) times on (14), we get
\[
\left( \frac{d}{dz_1} \right)^m e_{a,b,p,v}(z_1) = \left( \frac{d}{dz_1} \right)^m \sum_{l=0}^{\infty} \frac{(k,p,v)_l}{(al+b)!} z_1^l.
\]

Equation (17) can be obtained from (16) when we put \( v = 0 \).

Theorem 2. For the function \( e_{a,b,p,v}(z_1) \) in (14), the following higher order differentiation formulas hold true:
\[
\left( \frac{d}{dz_1} \right)^m e_{a,b,p,v}(z_1) = (k)_m e_{a,b+m,p,v}(z_1),
\] (19)
\[
\left( \frac{d}{dz_1} \right)^m \left[ z_1^{b-1} \Phi((k,p,v) ; b ; \omega z_1) \right] = z_1^{b-1} \Phi((k,p,v) ; b ; \omega z_1) \Phi((m,k) ; b ; \omega z_1),
\] (20)
\[
\left( \frac{d}{dz_1} \right)^m \left[ z_1^{b-1} \Phi((k,p,v) ; b ; \omega z_1) \right] = \Gamma(b) \left( \frac{dz}{dz_1} \right)^m \left[ z_1^{b-1} \Phi((k,p,v) ; b ; \omega z_1) \right] = \frac{\Gamma(b)}{(b-m)} \left[ z_1^{b-m-1} \Phi((k,p,v) ; b ; m ; \omega z_1) \right],
\] (21)

where \( a, b, \kappa \in \mathbb{C} ; \Re(a) > 0, \Re(b) > 0, \Re(p) > 0, p \geq 0, v \geq 0 \).

Specifically, we have
\[
\left( \frac{d}{dz_1} \right)^m E_{a,b}(z_1) = (k)_m E_{a,b+m}(z_1),
\] (22)
\[
\left( \frac{d}{dz_1} \right)^m \left[ z_1^{b-1} E_{a,b}(\omega z_1) \right] = z_1^{b-1} E_{a,b+m}(\omega z_1),
\] (23)

In a similar manner from (20), we get
\[
\left( \frac{d}{dz_1} \right)^m \left[ z_1^{b-1} \Phi((k,p,v) ; b ; \omega z_1) \right] = \left( \frac{d}{dz_1} \right)^m \sum_{l=0}^{\infty} \frac{(k,p,v)_l}{(al+b)!} \left( \omega z_1 \right)^l.
\]

Moreover, putting \( a = 1 \) in (20) gives (21). For the special case of (19), (20), and (21), when we put \( v = 0 \), we get (22), (23), and (24), respectively.

Corollary 3. The following integral representations for ML function \( e_{a,b,p,v}(z_1) \) (14) hold true:
\[
\int_0^\infty t^{b-1}E_{a,b,p,v}(\omega t^q)dt = z_1^bE_{a,b,1,p,v}(\omega z_1^q),
\]
\[
\int_0^\infty t^{b-1}\Phi((\kappa,p,v);b;\omega t)dt = \frac{1}{\Gamma(b)}z_1^b\Phi((\kappa,p,v);b+1;\omega z_1),
\]
(27)

where \(a, b, \kappa, \omega \in \mathbb{C}; \Re(a) > 0, \Re(b) > 0, \Re(p) > 0, p \geq 0, v \geq 0\).

Specifically, we have
\[
\int_0^\infty t^{b-1}E_{a,b,p,v}(\omega t^q)dt = z_1^bE_{a,b,1,p,v}(\omega z_1^q),
\]
(28)

4. Representation of \(e_{a,b,p,v}^\kappa(z_1)\) in terms of Generalized Hypergeometric Function

Here, we establish the representation of \(e_{a,b,p,v}^\kappa(z_1)\) (14) in terms of generalized hypergeometric function as follows.

**Theorem 4.** The function \(e_{a,b,p,v}^\kappa(z_1)\) defined in (14) for \(a \in \mathbb{N}\) can be represented in the form of generalized hypergeometric function as given by

\[
e_{a,b,p,v}^\kappa(z_1) = \frac{1}{\Gamma(b)} \sum_{n=0}^\infty \frac{(k(p,v))_n z_1^n}{(q)_{n+1} B(n+1, b+1/q)} \pmb{F}_q \left[ \begin{array}{c} b, b+1, \ldots, b+k-1 \\ q \end{array} ; z_1 \right],
\]
(29)

where \(q \in \mathbb{N}\) and \(\Delta(q; b)\) is an array of parameters \(b/q, (b+1)/q, \ldots, (b+q-1)/q\).

**Proof.** Taking \(a = q \in \mathbb{N}\) in (14) and utilizing the well-known multiplication formula for the gamma function, we have

\[
e_{a,b,p,v}^\kappa(z_1) = \prod_{n=0}^\infty \frac{\Gamma(qn+b)\Gamma(b)}{\Gamma(b)\Gamma(qn+b)} \frac{z_1^n}{(q)_{n+1} B(n+1, b+1/q)} \pmb{F}_q \left[ \begin{array}{c} b, b+1, \ldots, b+k-1 \\ q \end{array} ; z_1 \right]
\]

Interchanging the order of summation and integration, we get

\[
\mathcal{M} \left\{ e_{a,b,p,v}^\kappa(z_1); v \rightarrow s \right\} = \int_0^\delta v^{s-1} e_{a,b,p,v}^\kappa(z_1) dv = \prod_{n=0}^\infty \frac{\Gamma(qn+b)\Gamma(b)}{\Gamma(b)\Gamma(qn+b)} \frac{z_1^n}{(q)_{n+1} B(n+1, b+1/q)} \pmb{F}_q \left[ \begin{array}{c} b, b+1, \ldots, b+k-1 \\ q \end{array} ; z_1 \right]
\]
(30)

5. Integral Transformation of \(e_{a,b,p,v}^\kappa(z_1)\)

Here, we present various integral representations of the function \(e_{a,b,p,v}^\kappa(z_1)\) in (14) such as the Mellin, the Euler-beta, and the Laplace transformations.

5.1. Mellin Transform. The well-known Mellin transform [26] of integrable function \(f(z_1)\) with index \(s\) is defined by

\[
\mathcal{M} \left\{ f(z_1); z_1 \rightarrow s \right\} = \int_0^\infty z_1^{s-1} f(z_1) dz_1,
\]
(31)

if the improper integral in (31) exists.

**Theorem 5.** For the function \(e_{a,b,p,v}^\kappa(z_1)\) in (14), the following Mellin transform exists:

\[
\mathcal{M} \left\{ e_{a,b,p,v}^\kappa(z_1); v \rightarrow s \right\} = \frac{z_1^{s-1}}{\sqrt{\pi}} \prod_{n=0}^\infty \frac{\Gamma(qn+b)\Gamma(b)}{\Gamma(b)\Gamma(qn+b)} \frac{z_1^n}{(q)_{n+1} B(n+1, b+1/q)} \pmb{F}_q \left[ \begin{array}{c} b, b+1, \ldots, b+k-1 \\ q \end{array} ; z_1 \right].
\]
(32)

**Proof.** By (32), we get from (14)

\[
\mathcal{M} \left\{ e_{a,b,p,v}^\kappa(z_1); v \rightarrow s \right\} = \int_0^\infty v^{s-1} e_{a,b,p,v}^\kappa(z_1) dv = \prod_{n=0}^\infty \frac{\Gamma(qn+b)\Gamma(b)}{\Gamma(b)\Gamma(qn+b)} \frac{z_1^n}{(q)_{n+1} B(n+1, b+1/q)} \pmb{F}_q \left[ \begin{array}{c} b, b+1, \ldots, b+k-1 \\ q \end{array} ; z_1 \right]
\]
(33)

Now, by utilizing the well-known result [11, Equation 4.105],

\[
\int_0^\infty v^{s-1} \Gamma_n(\kappa+1;p) dv = \frac{z_1^{s-1}}{\sqrt{\pi}} \prod_{n=0}^\infty \frac{\Gamma(qn+b)\Gamma(b)}{\Gamma(b)\Gamma(qn+b)} \frac{z_1^n}{(q)_{n+1} B(n+1, b+1/q)} \pmb{F}_q \left[ \begin{array}{c} b, b+1, \ldots, b+k-1 \\ q \end{array} ; z_1 \right]
\]
(34)
Therefore, we have
\[
\mathcal{M}\left\{ e_{a,b,p,v}(z_1): v \to s \right\} = \left(2^{s-1}/\sqrt{\pi}\right) \Gamma((s-v)/2) \Gamma((s+v+1)/2) \sum_{l=0}^{\infty} \frac{\Gamma(k+s+1)}{\Gamma(a+l+b) \, l!} \left(\frac{s-v}{2}\right)^l (k+s+1) z_1^l.
\]

Corollary 6. The below integral transform exists:
\[
\mathcal{M}\left\{ e_{a,b,p,v}(z_1): v \to s \right\} = \left(2^{s-1}/\sqrt{\pi}\right) \Gamma((s-v)/2) \Gamma((s+v+1)/2) \sum_{l=0}^{\infty} \frac{\Gamma(k+s+1)}{\Gamma(a+l+b) \, l!} \left(\frac{s-v}{2}\right)^l (k+s+1) z_1^l.
\] (37)

where \( p^\Psi_q \) is the Wright hypergeometric function (see [27, 28]).

5.2. Euler-Beta Transform. In [26], the well-known Euler-beta transform of the function \( f(z_1) \) is defined by
\[
\mathcal{B}\{f(z_1); a_1, b_1]\} = \int_0^1 z_1^{a_1-1} (1-z_1)^{b_1-1} f(z_1)dz_1.
\] (39)

Theorem 7. For the function \( e_{a,b,p,v}(z_1) \) in (14), the following Euler-beta transform holds:
\[
\mathcal{B}\{ e_{a,b,p,v}(z_1); a_1, b_1 \} = \frac{\Gamma(b_1) \Gamma(a_1) \Gamma((a_1+b_1) \, x_1)}{\Gamma(b_1) \Gamma(a_1) \, F_{a_1}[(a, p, v), \Delta(a+b), \Delta(a_1+b_1); \frac{x}{a_1}]} \cdot (a, \sigma \in \mathbb{N}; \mathcal{R}(p) > 0, \mathcal{R}(a_1) > 0, \mathcal{R}(b) > 0, \mathcal{R}(\sigma) > 0, p \geq 0, v \geq 0).
\] (40)

Proof. By using (40) and (14), we obtain
\[
\mathcal{B}\{ e_{a,b,p,v}(z_1); a_1, b_1 \} = \int_0^1 z_1^{a_1-1} (1-z_1)^{b_1-1} e_{a,b,p,v}(z_1)dz_1
\]
\[
= \int_0^1 z_1^{a_1-1} (1-z_1)^{b_1-1} \sum_{l=0}^{\infty} \frac{\Gamma(k+s+1)}{\Gamma(a+l+b) \, l!} \left(\frac{s-v}{2}\right)^l (k+s+1) z_1^l dz_1
\]
\[
= \sum_{l=0}^{\infty} \frac{\Gamma(k+s+1)}{\Gamma(a+l+b) \, l!} \frac{\Gamma((a_1+b_1) \, x_1)}{\Gamma((a_1+b_1) \, x_1)}
\]
\[
= \sum_{l=0}^{\infty} \frac{\Gamma(k+s+1)}{\Gamma(a+l+b) \, l!} \frac{\Gamma((a_1+b_1) \, x_1)}{\Gamma((a_1+b_1) \, x_1)}
\]
\[
\mathcal{B}\{ e_{a,b,p,v}(z_1); a_1, b_1 \} = \frac{\Gamma(b_1) \Gamma(a_1) \Gamma((a_1+b_1) \, x_1)}{\Gamma(b_1) \Gamma(a_1) \, F_{a_1}[(a, p, v), \Delta(a+b), \Delta(a_1+b_1); \frac{x_1}{a_1}]} \cdot (a, \sigma \in \mathbb{N}; \mathcal{R}(p) > 0, \mathcal{R}(a_1) > 0, \mathcal{R}(b) > 0, \mathcal{R}(\sigma) > 0, p \geq 0, v \geq 0).
\] (40)

Corollary 8. By putting \( a_1 = b = b \) and \( \sigma = a \in \mathbb{C} \) in (33) and then using (14), we have
\[
\int_0^1 (1-z_1)^{b_1-1} e_{a,b,p,v}(zx_1)dz_1 = \Gamma(b_1) e_{a,b,p,v}(x).
\] (42)

Similarly, we have
\[
\int_0^1 (1-z_1)^{b_1-1} e_{a,b,p,v}(zx_1)dz_1 = \Gamma(a_1) e_{a,b,p,v}(x).
\] (43)

In general, we get
\[
\int_0^1 (x-z_1)^{a_1-1} (z_1-t)^{b_1-1} e_{a,b,p,v}(w(z_1-t)^a)dz_1 = \Gamma(a_1) (x-t)^{a_1-1} e_{a,b,p,v}(w(z_1-t)^a).
\] (44)

5.3. Laplace Transform. The well-known Laplace transform [26] of \( f(z_1) \) is defined by
\[
\mathcal{L}\{f(z_1)\} = \int_0^\infty e^{-z_1} f(z_1)dz_1.
\] (45)

Theorem 9. For the function \( e_{a,b,p,v}(z_1) \) in (14), the following Laplace transform holds:
\[
\mathcal{L}\left\{ e_{a,b,p,v}(z_1) \right\} = \Gamma(b_1) \frac{\Gamma(a_1)}{\Gamma(b_1) \, \Gamma(a_1)} \frac{\Gamma((a_1+b_1) \, x_1)}{\Gamma((a_1+b_1) \, x_1)} \cdot (a, \sigma \in \mathbb{N}; \mathcal{R}(p) > 0, \mathcal{R}(a_1) > 0, \mathcal{R}(b) > 0, \mathcal{R}(\sigma) > 0, p \geq 0, v \geq 0).
\] (46)
Proof. By using (45) and from (14), we have

\[ L \left\{ z_1^{a-1} e^{x_2 z_1} \mathcal{E}_{a,b,p,v}(x_2 a) \right\} = \int_0^\infty z_1^{a-1} e^{-z_1} \mathcal{E}_{a,b,p,v}(x_2 a) dz_1 \]

\[ = \int_0^\infty z_1^{a-1} e^{-z_1} \sum_{l=0}^{\infty} (\kappa ; p, v)_l \Gamma(a_l + b)_l \frac{l!}{l!} \frac{s^{a_l}}{l!} \frac{s^a}{s^a} d\omega \]

\[ = \sum_{l=0}^{\infty} (\kappa ; p, v)_l \Gamma(a_l + b)_l \frac{s^{a_l}}{l!} \frac{s^a}{s^a} \frac{d\omega}{d\omega} \]

\[ = \Gamma(a) \sum_{l=0}^{\infty} (\kappa ; p, v)_{a_l} \left( \frac{X^{a_l}}{l!} \right) \frac{d\omega}{d\omega} \]

Corollary 10. By setting \( a_1 = b \) and \( \sigma = a \) in (46), we obtain

\[ \int_0^\infty z_1^{a-1} e^{x_2 z_1} \mathcal{E}_{a,b,p,v}(x_2 a) \frac{d\omega}{d\omega} \]

\[ = \frac{1}{s^{2a}} F \left[ (\kappa, p, v)_l \frac{1}{s^{a_l}} \right]. \] (48)

5.4. Whittaker Transformation. To determine the Whittaker transforms, we use the following formula:

\[ \int_0^\infty t^{(1/2)\omega} W_{\eta,\lambda}(t) dt = \frac{\Gamma((1/2) + \xi + \nu)}{\Gamma((1-\eta + \nu)} \left( \Re \left( \nu + \xi > -\frac{1}{2} \right) \right). \] (49)

Theorem 11. For the function \( \mathcal{E}_{a,b,p,v}(z_1) \) in (14), the following Whittaker transform holds:

\[ \int_0^\infty t^{(1/2)\omega} W_{\eta,\lambda}(t) dt = \frac{\Gamma((1/2) + \xi + \nu)}{\Gamma((1-\eta + \nu)} \left( \Re \left( \nu + \xi > -\frac{1}{2} \right) \right). \] (50)

Proof. By the definition of Whittaker transform, we have from (14)

\[ \int_0^\infty t^{(1/2)\omega} W_{\eta,\lambda}(t) dt = \frac{\Gamma((1/2) + \xi + \nu)}{\Gamma((1-\eta + \nu)} \left( \Re \left( \nu + \xi > -\frac{1}{2} \right) \right). \] (51)

By putting \( v = st \) and then using the definition of Whittaker transforms, we get

\[ \int_0^\infty t^{(1/2)\omega} W_{\eta,\lambda}(t) dt = \frac{\Gamma((1/2) + \xi + \nu)}{\Gamma((1-\eta + \nu)} \left( \Re \left( \nu + \xi > -\frac{1}{2} \right) \right). \] (52)

6. Conclusion

In our current investigation, we presented an extension of the generalized ML function \( \mathcal{E}_{a,b,p,v}(z_1) \) in (14) by utilizing an extension of Pochhammer symbol \( (\mu ; \omega, a)_l \) defined in (9). Further, we have investigated several basic properties of the newly defined function \( \mathcal{E}_{a,b,p,v}(z_1) \). The special cases of the main result for \( v = 0 \) can be found in the work of [12]. Thus, the results introduced in this present article are new and an extension of the relating outcomes in the existing literature (see, e.g., [29–31]). The newly defined ML function \( \mathcal{E}_{a,b,p,v}(z_1) \) presented in this article will be applicable in different fields of applied sciences.
