MATERIALS AND METHODS

Bioinformatics analysis and modification of ASFV CD2V protein

According to the sequence of ASFV China/2018/ AnhuixCGQ isolates (Genebank No. MK128995.1), the sequence of ASFV CD2V (Protein ID: EP402R AYW34030.1) gene was analyzed by TMHMM Server V.2.0 online software (http://www.cbs.dtu.dk/services/TMHMM/) to identify the extracellular region. The extracellular sequence of CD2V protein was linked with itself by a flexible linker (GGGGSGGGGSGGGGS) to form CD2V recombination protein.

The codon optimization of CD2V recombinant protein

The sequence of ASFV CD2V recombinant protein was optimized codons by NovoPro online software (https://www.novopro.cn/tools/codon-optimization). Then modified gene of CD2V recombinant protein synthesized as pUC57-CD2V in Shanghai Sangon Bioengineering Co., Ltd. (Shanghai, China).

Construction of a recombinant vector pFastBac™1-CD2V and development of Bacmids

The gene of ASFV CD2V recombination protein was amplified by PCR using specific the upstream and downstream primers in Table S1. Then the target gene was cloned into the vector pFastBac™1 (Invitrogen, US) of the Bac-to-Bac baculovirus expression system (Invitrogen, US) by double digestion and ligation. The gp67 signal peptide was added to C terminus of the protein for secretory expression. Meanwhile, a 6×His tag was added to N terminus of the protein to facilitate further detection and purification. After double digestion, DNA ligation and transformation experiments, the PCR reaction was carried on using universal primers M13 (M13-For: 5’-CCCAGTCACGACGTTGTAAAACG-3’, M13-Back: 5’-AGCGGATAACAATTTCACACAGG-3’). Two positive clones was selected and sequenced. Sequencing results were aligned with target gene using the Meglin software (DNAstar, US). Plasmids sequenced correctly are used to prepare Bacmids.
Analysis of immunogenicity for CD2V recombinant protein
Healthy female BALB/c mice, which were about 20g and 6-8 weeks old, were selected as immune experimental animals. The experimental group and the control group were set with five mice in each group. 5 µg/mouse CD2V recombinant protein was as immunogen in the experimental group, and the immunogen of the control group was sterilized PBS. Freund's complete adjuvant was used for the first immunization, and incomplete Freund's adjuvant was used for following two immunizations. Three immunizations were carried out in total. And the interval of immunization was 3 weeks (21 days). Serum was got by cutting tail at 63 days. The titer of antibody to CD2V recombinant protein in serum was detected using indirect ELISA method.

Amplifying variable regions of heavy chain and light chain of monoclonal antibodies
RNA of cells producing the five monoclonal antibodies was extracted with TRIzol (Invitrogen, Thermofisher,US) and reverse-transcribed into cDNA by PrimeScript™ RT Master Mix (Takara, Dalian, China). Nucleic acids of the heavy and light chains of CD2V mAbs were amplified by PCR using the primers in Table S2, and the results were observed by 2% agarose gel electrophoresis.

Prediction of CD2V B cell epitopes
Continuous B cell epitope regions of ASFV CD2V proteins were predicted using four bioinformatics softwares--ABCPred, BCPR ED S, BepiPred and SVMTriP. Continuous B cell epitope regions of ASFV CD2V proteins were determined by comparison of the predicted results of each software.

RESULTS
Bioinformatics analysis and modification of ASFV CD2V protein
As was shown in Fig. S1 A and B, 1-206 amino acids (aa) was extracellular area including 1-16 aa CD2V signal peptide sequence. 207-229 aa was across the membrane area, and 230-360 aa was intracellular area. This result was consistent with the topology of ASFV CD2V in the Uniprot protein database (Fig. S1C). According to
ProtParam online prediction software, the isoelectric point (PI) of CD2V full-length sequence was 6.21 and the molecular weight was 41.008kDa, while the PI of CD2V extracellular region (1-206aa) was 4.65 and the molecular weight was 23.68kDa. CD2V recombinant protein was designed using a flexible linker (GGGGSGGGGSGGGGS) coupling with two homologous CD2V extracellular sequences in figure S1D. The PI of CD2V recombinant protein was 5.36 and the molecular weight was 45.62kDa by ProtParam tool of Expasy.

The codon optimization of CD2V-dimer sequence

The result of codon optimization for the original amino acid sequence of CD2V was shown in Figure S2. The codon optimization increased the CAI value to 0.94 (Fig. S2B) and the average GC content to 49.34% (Fig. S2C) in order that CD2V could be expressed well in eukaryotic baculovirus expression system.

Construction of a recombinant vector pFastBac™1-CD2V and development of Bacmids

As was shown in Figure S3A, 1% agarose gel electrophoresis showed that sequence of the CD2V recombinant protein was 1362 bp. As was shown in Figure S3B, two positive clones, pFastBac™1-CD2V-1 and pFastBac™1-CD2V-6, were located on correct size (3662 bp). The sequences of pFastBac™1-CD2V-1 and pFastBac™1-CD2V-6 were consistent with the CD2V target gene sequence. PCR results of 14 clones from blue-white selection were all positive clones. pFastBac™1-CD2V(DH10Bac)-1 was selected to prepare Bacmid.

Immunogenicity analysis of ASFV CD2V recombinant protein

As was shown in Figure S4, the antibody titer of CD2V recombinant protein as immunogen was 1:12,800 after third immunization. The OD450 values of negative control were lower than 0.5.

Amplification of variable region of heavy and light chain in monoclonal antibodies
As was shown in Figure S5, the sizes of the heavy and light chain were approximately 300 bp. And the heavy chain was slightly larger than the light chain. The CDR regions of mAbs were verified by IMGT. These analyses of IMGT were shown in Figure S6.

Bioinformatics prediction of ASFV CD2V protein B cell epitopes

As was shown in Figure S7A, ABCPred predicted continuous B cell epitopes on the extracellular region of the CD2V protein as the score from high to low:

152NESILEYNWNNNSINN166, 69YSTSIYNITNNCSLTI84, 57CGKAGNFCECSNYSTS72, 25TIILDSNITNDNNDIN40, 13VLSIDYWVSFNKTIIL16, 175NNTISTSNETTLINCT19, 0109NQIINYTIKLTPAT115, 38DINGVSWNFFNSFNT53, 79NCSLTIFPHNDVDFTT94, 109LLPATPPNITYNCTN124, 138NIYLNIDTFVKYTNE153, 115PPNITYNCTNFLITCK130, 123TNFLITCKKNNGTNTN138, 90VFDTTYQVVWNQIINY105, 162NSNNFNTA TCIINNT177, 129CKKNNGTNNTNIYLNIN134, 185TLINCTYLTLSSNYFY200, 31NITNDN NDINGVSWNF46.

As was shown in Figure S7B, continuous B cell epitopes on the extracellular region of the CD2V protein were predicted by BC Pred Predictions software. B cell epitopes were shown as the scores from high to low:

171TCIINNTISTSNETTLINCT190, score: 0.999, 110LTPATPPNITYNCTNFLITC129, score: 0.996, 22FNKTIILDSNITNDNNDING42, score: 0.985, 150YTNE SILEYNW NNSNNINNFT169, score: 0.958, 43SWNNFNSFNTLATICGKAGN62, score: 0.824, 65ECSYSTSIYNITNNCSLTI84, score: 0.819.

The results of BepiPred software prediction were shown in Figure S7C. And B cell epitopes on the extracellular region of the CD2V protein were as follows:

12LDSNITNDNNDINGVSWNFFNSF35, 40TCGKAGNFCECSNYSTSIYNI60, 71HN DVFDTTYQV81, 116NNGTN120, 131FVKYTNE137, 145NNSNNINF152, 176TLNSSN181.

As was shown in Figure S6D, the B cell epitopes predicted by the SVMTriP softwares were as follows:

96QVVWNQIINYTIKLTPAT115.

The results predicted by four softwares was compared with each other to find that 145NNSNNINF152 was predicted as B cell epitope in three softwares. Hence, 145NNSNNINF152 was the most possible B cells epitope on CD2V protein.
**Table S1** Primers for amplifying target genes of CD2V recombinant protein

| Primers    | Sequences (5’-3’)                          |
|------------|--------------------------------------------|
