**Abstract**  
We call rectangles Gell-Mann matrices rectangle matrices which make generalization of the expression of a tensor commutation matrix $n \otimes n$ in terms of tensor products of square Gell-Mann matrices.

**MCS 2000:** Primary 15A69; secondary 15A90

1 Introduction  

For any $n \in \mathbb{N}$, $n \geq 2$, a tensor commutation matrix $n \otimes n$, can be expressed in terms of $n \times n$-Gell-Mann matrices $\Lambda_a^{(n)}$ for the following way [1]

$$U_{n \otimes n} = \frac{1}{n} I_n \otimes I_n + \frac{1}{2} \sum_{a=1}^{n^2-1} \Lambda_a^{(n)} \otimes \Lambda_a^{(n)}$$  

(1.1)

where $I_n$ is the $n \times n$ unit matrix. Particularly, for $n = 2$, $U_{2 \otimes 2}$ can be expressed in terms of the Pauli matrices, namely

$$U_{2 \otimes 2} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} = \frac{1}{2} I_2 \otimes I_2 + \frac{1}{2} \sum_{i=1}^{3} \sigma_i \otimes \sigma_i$$

which is frequently found in quantum information theory [2], [3], [4]. We had tried [1] to express the tensor commutation matrix $U_{2 \otimes 3}$ and $U_{3 \otimes 2}$ as linear combinations of the tensor products of the Pauli matrices with
the $3 \times 3$-Gell-Mann matrices, in expecting to have expressions that lead
to the generalization of (1.1). However, the obtained expressions are not
interesting enough for the wanted generalization. We have noticed that for
generalizing (1.1) to the expression of $U_{n \otimes p}$, $n \neq p$, we should use rectangle
matrices instead of square matrices. We call rectangle Gell-Mann matrices
such rectangle matrices.

At first, we talk about the tensor commutation matrices. After that, we
construct the $n \times p$-Gell-Mann matrices, in starting with some examples.

Let us denote by $I_{n \times p}$ the $n \times p$ matrices obtained in adding into the unit
matrix $I_{n \otimes p} \mid n-p \mid$ rows or $\mid n-p \mid$ columns formed by zeros.

## 2 Tensor commutation matrix

**Definition 2.1.** For $n, p \in \mathbb{N}$, $n \geq 2$, $p \geq 2$, we call tensor commutation
matrix $n \otimes p$ the permutation matrix $U_{n \otimes p} \in \mathcal{M}_{np \times np}(\mathbb{C})$ formed by 0 and 1,
verifying the relation

$$U_{n \otimes p} \cdot (a \otimes b) = b \otimes a$$

for all $a \in \mathcal{M}_{n \times 1}(\mathbb{C})$, $b \in \mathcal{M}_{p \times 1}(\mathbb{C})$.

We can construct $U_{n \otimes p}$ by using the following rule [5].

**Rule 2.2.** Let us start in putting 1, at the first row and first column, after
that let us pass into the second column in going down at the rate of $n$ rows
and put 1 at this place, then pass into the third column in going down at the
rate $n$ rows and put 1, and so on until there is only $n - 1$ rows for going
down (then we have obtained as number of 1: $p$). Then, pass into the next
column which is the $(p+1)$-th column, put 1 at the second row of this column
(second row, because $(n-1) + 1 = n$) and repeat the process until we have
$n - 2$ rows for going down (then we have obtained as number of 1: $2p$).
After that, pass into the next column which is the $(2p+1)$-th column, put 1 at
the third row of this column (third row, because $(n-2) + 2 = n$) and repeat
the process until we have $n - 3$ rows for going down (then we have obtained
as number of 1: $3p$). Continuing in this way we will have that the element
at $n \times p$-th row and $n \times p$-th column is 1. The other elements are 0.

**Proposition 2.3.** For $n, p \in \mathbb{N}$, $n, p \geq 2$,

$$U_{n \otimes p} = \sum_{(i,j)} E_{p \times n}^{(i,j)} \otimes E_{p \times n}^{(i,j)'} = \sum_{(i,j)} E_{p \times n}^{(i,j)} \otimes E_{n \times p}^{(j,i)}$$

where $E_{p \times n}^{(i,j)}$ is the elementary $p \times n$-matrix formed by zero except the element
at $i$-th row, $j$-th column which is equal 1.
Proof. Let \( a = \begin{pmatrix} a_1 \\ a_2 \\ \vdots \\ a_n \end{pmatrix} \in M_{n \times 1}(\mathbb{C}) \), \( b = \begin{pmatrix} b_1 \\ b_2 \\ \vdots \\ b_p \end{pmatrix} \in M_{p \times 1}(\mathbb{C}) \)

\[
U_{n \otimes p} \cdot (a \otimes b) = \sum_{(i,j)} E_{p \times n}^{(i,j)} \otimes E_{n \times p}^{(j,i)} \cdot (a \otimes b)
\]

\[
= \sum_{(i,j)} (E_{p \times n}^{(i,j)} \cdot a) \otimes (E_{n \times p}^{(j,i)} \cdot b)
\]

\[
= \sum_{(i,j)} (\delta_{ik} a_j)_{1 \leq k \leq p} \otimes (\delta_{jl} b_i)_{1 \leq l \leq n}
\]

\[
= \sum_{(i,j)} (\delta_{ik} b_i)_{1 \leq k \leq p} \otimes (\delta_{jl} a_j)_{1 \leq l \leq n}
\]

\[
= \sum_{(i,j)} \begin{pmatrix} 0 \\ \vdots \\ 0 \end{pmatrix} \otimes \begin{pmatrix} 0 \\ \vdots \\ 0 \end{pmatrix}
\]

\[
= b \otimes a
\]

Example 2.4. The application of the rule yields us

\[
U_{2 \otimes 3} = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \end{pmatrix}
\]

\[
U_{2 \otimes 3} = \left( \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \otimes \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} + \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} \otimes \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} + \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} \otimes \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} + \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} \otimes \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix} \right)
\]

3
3 Construction of a system of rectangle Gell-Mann matrices

At first, let us consider some particular cases.

3.1 $U_{2 \otimes 3}$

The $2 \times 2$-Gell-Mann matrices are the Pauli matrices $\sigma_1 = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$,

$\sigma_2 = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}$, $\sigma_3 = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$.

Let $\sigma_0 = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$. Being inspired by a way for constructing the $n \times n$-Gell-Mann matrices from the $(n - 1) \times (n - 1)$-Gell-Mann matrices, where on the diagonal there is not zero between two non zero elements and the first non zero element is the first element (that is, the element at the first row, first column) (Cf. for example[6]), we add into these four matrices third column formed by zeros. Then, we have a system formed by

$I_{2 \times 3} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix}$, $\Lambda_1 = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$, $\Lambda_2 = \begin{pmatrix} 0 & -i & 0 \\ i & 0 & 0 \end{pmatrix}$, $\Lambda_3 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \end{pmatrix}$

And for obtaining a basis of $\mathcal{M}_{2 \times 3}(\mathbb{C})$, we introduce the matrices

$\Lambda_4 = \begin{pmatrix} 0 & 0 & \sqrt{2} \\ 0 & 0 & 0 \end{pmatrix}$, $\Lambda_5 = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & \sqrt{2} \end{pmatrix}$. We can check easily that

$U_{2 \otimes 3} = \frac{1}{2} I_{2 \times 3} \otimes I_{2 \times 3} + \frac{1}{2} \sum_{a=1}^{5} \Lambda_a^+ \otimes \Lambda_a$

where $\Lambda_a^+$ is the hermitian conjugate of $\Lambda_a$.

3.2 $U_{3 \otimes 2}$

Using analogous way, but this time we are adding into the Pauli matrices and $\sigma_0$ a third row formed by zeros, instead of column. Then, we get a system $(\Lambda_a)_{1 \leq a \leq 5}$ of $3 \times 2$ matrices which satisfies

$U_{3 \otimes 2} = \frac{1}{2} I_{3 \times 2} \otimes I_{3 \times 2} + \frac{1}{2} \sum_{a=1}^{5} \Lambda_a^+ \otimes \Lambda_a$

In fact, $U_{n \otimes p} = U^t_{n \otimes p} = U_{n \otimes p}^+$, for all $n, p \in \mathbb{N}$, $n, p \geq 2$. 

\[ \square \]
3.3 \(U_{2\otimes 4}\)

Using yet the analogous way, but in this case we are adding into the Pauli matrices and the \(2 \times 2\) unit matrix third and fourth columns formed by zeros. Then, we have a system formed by four \(2 \times 4\) matrices \(I_{2\times 4}, \Lambda_1, \Lambda_2, \Lambda_3\). And for obtaining a basis of \(\mathcal{M}_{2\times 4}(<\mathbb{C})\), we introduce the matrices

\[
\Lambda_4 = \begin{pmatrix} 0 & 0 & \sqrt{2} & 0 \\ 0 & 0 & 0 & 0 \\ \end{pmatrix}, \quad \Lambda_5 = \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & \sqrt{2} & 0 \\ \end{pmatrix}, \quad \Lambda_6 = \begin{pmatrix} 0 & 0 & 0 & \sqrt{2} \\ 0 & 0 & 0 & 0 \\ \end{pmatrix},
\]

\[
\Lambda_7 = \begin{pmatrix} 0 & 0 & 0 & \sqrt{2} \\ 0 & 0 & 0 & 0 \\ \end{pmatrix}
\]

in the system. The system satisfies the relation

\[
U_{2\otimes 4} = \frac{1}{2} I_{2\times 4}^+ \otimes I_{2\times 4} + \frac{1}{2} \sum_{a=1}^{7} \Lambda_a^+ \otimes \Lambda_a
\]

3.4 \(U_{3\otimes 4}\)

In this case, we start from the \(3 \times 3\)-Gell-Mann matrices. Then, we have a system \((\Lambda_a)_{1 \leq a \leq 11}\) of \(3 \times 4\) matrices which satisfies the relation

\[
U_{3\otimes 4} = \frac{1}{3} I_{3\times 4}^+ \otimes I_{3\times 4} + \frac{1}{2} \sum_{a=1}^{11} \Lambda_a^+ \otimes \Lambda_a
\]

Definition 3.1. Let \(n, p \in \mathbb{N}, p \geq n \geq 2\). We call \(n \times p\)-Gell-Mann matrices the \(n \times p\) matrices \(\Lambda_1, \Lambda_2, ..., \Lambda_{n^2-1}, \Lambda_n, \Lambda_{n^2+1}, ..., \Lambda_{np-1}\) such that:

- \(\Lambda_1, \Lambda_2, ..., \Lambda_{n^2-1}\) are obtained in adding into the \(n \times n\)-Gell-Mann matrices \((n+1)\)-th, \((n+2)\)-th, ..., \(p\)-th columns, formed by zeros;
- \(\Lambda_{n^2} = \sqrt{2} E_{n \times p}^{(1,n+1)}, \Lambda_{n^2+1} = \sqrt{2} E_{n \times p}^{(2,n+1)}, ..., \Lambda_{n^2+n-1} = \sqrt{2} E_{n \times p}^{(n,n+1)}\);
- \(\Lambda_{n^2+n} = \sqrt{2} E_{n \times p}^{(1,n+2)}, \Lambda_{n^2+n+1} = \sqrt{2} E_{n \times p}^{(2,n+2)}, ..., \Lambda_{n^2+2n-1} = \sqrt{2} E_{n \times p}^{(n,n+2)}\);
- \(\Lambda_{n(p-1)} = \sqrt{2} E_{n \times p}^{(1,p)}, \Lambda_{n(p-1)+1} = \sqrt{2} E_{n \times p}^{(2,p)}, ..., \Lambda_{np-1} = \sqrt{2} E_{n \times p}^{(n,p)}\).

Then, we define the \(p \times n\)-Gell-Mann matrices as the matrices obtained in taking the hermitian conjugates of the \(n \times p\)-Gell-Mann matrices.

Proposition 3.2. For \(n, p \in \mathbb{N}, p, n \geq 2\), consider the system of \(n \times p\)-Gell-Mann matrices \(\Lambda_1, \Lambda_2, ..., \Lambda_{np-1}\). Then,

\[
U_{n \otimes p} = \frac{1}{\inf(n,p)} I_{n \times p}^+ \otimes I_{n \times p} + \frac{1}{2} \sum_{a=1}^{np-1} \Lambda_a^+ \otimes \Lambda_a \quad (3.1)
\]

Proof. Let us suppose \(p \geq n\).

\[
\frac{1}{2} \sum_{a=n^2}^{np-1} \Lambda_a^+ \otimes \Lambda_a = \sum_{(j,l)\in(1,n+1)} E_{n \times p}^{(j,l)} \otimes E_{n \times p}^{(j,l)} \quad (3.2)
\]
Using the proposition and the formula (1.1) we have
\[
\sum_{(j,l)=(1,1)}^{(n,n)} E^{(j,l)}_{n\times n} \otimes E^{(j,l)}_{n\times n} = \frac{1}{n} I_n \otimes I_n + \frac{1}{2} \sum \Lambda_a^{(n)} \otimes \Lambda_a^{(n)}
\]  

(3.3)

In adding, in (3.3), into the terms on the left of \( \otimes \)'s \( p - n \) rows, \( (n + 1) \)-th, \( (n + 2) \)-th, ..., \( p \)-th rows, and on the right \( p - n \) columns, \( (n + 1) \)-th, \( (n + 2) \)-th, ..., \( p \)-th columns, formed by zeros, the non zero elements which have same position, same row and same column, will keep same position. So by the definition of tensor product of matrices
\[
\sum_{(j,l)=(1,1)}^{(n,p)} E^{(j,l)}_{n\times p} \otimes E^{(j,l)}_{n\times p} = \frac{1}{n} \Lambda_a^+ \otimes \Lambda_a + \frac{1}{2} \sum_{a=1}^{n^2-1} \Lambda_a^+ \otimes \Lambda_a
\]

Using the proposition and (3.2) we have (3.1).

\[ \square \]

Now, we are giving some properties of the rectangle Gell-Mann matrices.

**Proposition 3.3.** For \( n, p \in \mathbb{N}, p, n \geq 2 \), let \( (\Lambda_a)_{1 \leq a \leq np-1} \) a system of \( n \times p \)-Gell-Mann matrices. Then, \( \text{Tr}(\Lambda_a^+ \Lambda_b) = 2\delta_{ab} \) where \( \delta_{ab} \) is the Kronecker symbol.

**Proposition 3.4.** For \( n, p \in \mathbb{N}, p \geq n \geq 2 \), let \( (\Lambda_a)_{1 \leq a \leq np-1} \) a system of \( n \times p \)-Gell-Mann matrices. Then,
\[
\Lambda_a \Lambda_b^+ - \Lambda_b \Lambda_a^+ = i \sum_{c=1}^{n^2-1} f_{abc} \Lambda_c^{(n)}
\]

where \( f_{abc} \)'s the components of a tensor totally antisymmetric, with \( f_{abc} = 0 \) if at least one of \( a, b, c \) is in \( \{n^2, n^2 + 1, \ldots, np - 1\} \).

**Conclusion**

Being inspired by a way for constructing the \( n \times n \)-Gell-Mann matrices from the \( (n - 1) \times (n - 1) \)-Gell-Mann matrices, where on the diagonal there is not zero between two non zero elements and the first non zero element is the first element (that is, the element at the first row, first column), we can construct a basis of \( \mathcal{M}_{n\times p}(\mathbb{C}) \), whose elements make generalization of the expression of \( U_{n\otimes n} \) in terms of the tensor products of \( n \times n \)-Gell-Mann matrices to the expression of \( U_{n\otimes p} \).
