ABSTRACT

The internet in business is used for information exchange, product catalogs, promotional media, e-mails, bulletin boards, electronic questionnaires, and mailing lists. The internet can also be used to dialogue, discuss, and consult with consumers online, so that consumers can be involved proactively and interactively in the design, development, marketing, and sale of products. By using the internet, we can run an electronic business or commonly called e-business as a means of expanding employment opportunities. Given the smaller quota to find employment, that e-business is the right solution for college graduates.

I. INTRODUCTION

Labor market opportunities in Indonesia are now increasingly narrow [1]. Many graduates from famous universities cannot work in elite companies due to increasingly fierce competition and not a few graduate students who still do not have permanent jobs [2]. The registration data for East Java civil service in 2012, totaled 17,014 people, whereas the quota needed was only 148. This means that a percentage of the number of graduates who do not have permanent employment can only be taken and this is expected to increase in subsequent years. The number of companies in Indonesia is already much, but the growth in the human population is not accompanied by growth in existing jobs [3]. In many cases in Indonesia, many person seek to profit when registering prospective workers to an instance or industry. Some of them offer assistance to be accepted to work in an instance or industry with the condition of paying bribes.

II. METHOD

The study using qualitative methods to understand about what is experienced by research subjects such as behavior, perception, motivation, action, and so on on [4], [5]. Holistically and with the description of words, and language in a particular natural context and by utilizing various natural methods.

The technique in the qualitative method used is by distributing questionnaires. This questionnaire contains a list of questions for respondents to look an answers from case study. In the questionnaire there are questions and answers that must be answered by the respondent. The respondents consists of 30 students majoring in Information Engineering UIN Maulana Malik Ibrahim Malang at 5th and 7th semester.

There are several advantages when using questionnaire technique such as [6]: (1) Questionnaires are good for large and scattered data sources. (2) Respondents do not feel disturbed, because they can fill out the questionnaire by choosing their own free time. (3) Questionnaires are relatively more efficient for large data sources. (4) Because the questionnaire does not include the identity of the respondent, the results can be more objective.

There are two types of questionnaire formats, namely Free Format and Fixed Format [7]. Free format questionnaire contains questions that must be filled out by respondents in the places that have been provided. While fixed format questionnaire has several forms of questions such as (1) Check-off Questions that are made so that the respondent can check-off the appropriate answers. (2) Yes/No questions that allow respondents to answer "Yes" or "No". (3) Opinion/choice questions that allow respondents to give their opinions.

III. RESULT AND DISCUSSION

Table 1 shows the results of the questionnaire used to find answers from this study. The results shows that some data
which states that many IT students in semester 5 and semester 7 have experience in the field of E-Business, from data with a sample of 30 students, 19 people said they had done E-Business activities.

Some cases state that many graduates from higher education do not have jobs for one reason is the limited number of employee quotas both government employees, teachers, and also company employees. From the data available of IT students in semester 5 and semester 7 it was found that more than 50% wanted to work as entrepreneurs. In expanding its entrepreneurship from survey data it was found that more than 50% of all answered “Yes” to doing E-Business.

| No | Question Lists                                      | Result | Total |
