In this article, we use some fixed point theorems to discuss the existence and uniqueness of solutions to a coupled system of a nonlinear Langevin differential equation which involves Caputo fractional derivatives of different orders and is governed by new type of nonlocal and nonseparated boundary conditions consisting of fractional integrals and derivatives. The considered boundary conditions are totally dissimilar than the ones already handled in the literature. Additionally, we modify the Adams-type predictor-corrector method by implicitly implementing the Gauss–Seidel method in order to solve some specific particular cases of the system.

1. Introduction

The fractional calculus is the ramification of mathematics concerning the integrals and derivatives of functions with arbitrary orders. It has a long history that goes back to more than three hundred years. Nonetheless, researchers discovered the importance and effectiveness of this calculus just a mere in the last few decades. It turned out that the fractional integrals and derivatives are very good tools in modeling some phenomena. This was concluded simply because of the amazing results obtained when some of the researchers used the implements in the fractional calculus for the sake of understanding real world problems happening in the environment surrounding. Recently, differential equations of fractional order have been applied in various fields like physical, biology, chemistry, control theory, electrical circuits, blood flow phenomena, and signal and image processing; for more details, see [1–3] and references cited therein.

In 1908, Langevin [4] formulated his famous equation containing derivative of integer order. This equation describes the evolution of certain physical phenomena in fluctuating environments [5]. The Langevin equation was used in large part to describe some phenomena such as anomalous transport [6]. The Langevin equation has been recently extended to the fractional order by Lim et al. [7]. They acquainted a new form of Langevin equations involving two different fractional order for the sake of describing the viscoelastic anomalous diffusion in the complex liquids. We refer the reader to Subsection 2.1 in [3] and the references cited therein for further details. Uranagase and Munakata [8] discussed the generalized Langevin equation with emphasis on a mechanical random force whose time evolution is not natural due to the presence of a projection operator in a propagator. Lozinski et al. [9] discussed the applications of Langevin and Fokker–Planck equations in polymer rheology and stochastic simulation techniques for solving this equation. Laadjal et al. [10] presented the
exist and uniqueness of solutions for the multiterm fractional Langevin equation with boundary conditions.

Using the tools in mathematical analysis and the theory of fixed points, discussing the qualitative specification encapsulating the behaviors of solutions of differential equations in fractional derivatives settings has attracted the attention of many scientists. To get an update about the works in the literature, we ask the readers to investigate [11] and the references cited there. On the top of this, classes of systems of fractional differential equations with separated (or non-separated) boundary conditions have been studied intensively in literatures [12–14].

Motivated by what are mentioned above and the recent development on Langevin equations, in this paper, we discuss the existence and the uniqueness of solutions to a coupled system of fractional Langevin equations in the form as follows:

\[
\begin{align*}
\frac{d^\alpha}{dt^\alpha} \left( \frac{d^\beta}{dt^\beta} + \lambda \right) \psi_1 (t) &= f(t, \psi_1 (t), \psi_2 (t)), \quad t \in J, 0 < \alpha_1 \leq 1 < \beta_1 \leq 2, \\
\frac{d^\alpha}{dt^\alpha} \left( \frac{d^\beta}{dt^\beta} + k \right) \psi_2 (t) &= g(t, \psi_1 (t), \psi_2 (t)), \quad t \in J, 0 < \alpha_2 \leq 1 < \beta_2 \leq 2,
\end{align*}
\]

subject to a new type of nonlocal nonseparated boundary conditions as follows:

\[
\begin{align*}
\psi_1 (0) &= a_0, \psi_2 (0) = b_0, \psi_1' (0) = \psi_2' (0) = 0, \\
\psi_1 (\xi) &= a(c D^\alpha (t) f(t), \xi) \in (0,1), \mu_1 \in J, 0 < p < \beta_2, \\
\psi_2 (\eta) &= b(c D^\alpha (t) f(t), \eta) \in (0,1), \mu_2 \in J, q \geq 0,
\end{align*}
\]

where \( J = [0,1], \lambda, k, a_0, b_0, a, b \) are real constants, \( c D^i \) where \( i = \alpha_1, \beta_1, \alpha_2, \beta_2, p \) are the Caputo fractional derivatives of order \( \alpha_1, \beta_1, \alpha_2, \beta_2 \), and \( p \), respectively. \( f, g: J \times \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R} \) are given functions, and \( c D^i \) is the Riemann–Liouville fractional integral of order \( q \). By using the Banach contraction principle and Leray–Schauder alternative fixed point theorem, we investigate the existence of solutions for problems (1) and (2). We remark that the boundary value problem discussed here is distinctive of the ones discussed in literatures [12–14].

This article is organized as follows. In Section 2, we present some definitions, theorems, and related lemmas used in next sections. Section 3 discusses the existence and uniqueness of the system under consideration. In Section 4, we furnish some numerical examples. Section 5 is devoted to our concluding remarks.

2. Preliminaries

Definition 1. (see [1, 2]). Let \( a, b \in \mathbb{R} (-\infty < a < b < \infty) \). The Riemann–Liouville fractional integral of order \( \alpha \in \mathbb{R}^+ \) for a function \( f \in L^1 [a, b] \) is defined by

\[
\frac{d^\alpha}{dt^\alpha} f(t) = \frac{1}{\Gamma (\alpha)} \int_a^t (t-s)^{\alpha-1} f(s) ds, \quad \text{for } a > 0, \text{ and } \frac{d^0}{dt^0} f(t) = f(t),
\]

where \( \Gamma \) is the Euler Gamma function.

Definition 2 (see [1, 2]). The Caputo fractional derivative of order \( \alpha \in \mathbb{R}^+ \) for a function \( f \in C^\omega [a, b] \) is defined by

\[
\frac{d^\alpha}{dt^\alpha} f(t) = I_{a+}^{\omega - \alpha} D^\omega f(t), \quad \text{for } a > 0, \text{ and } \frac{d^0}{dt^0} f(t) = f(t),
\]

where \( -1 < \alpha \leq n, n \in \mathbb{N} \), and \( D^\omega = \frac{d^\omega}{dt^\omega} \).

Proposition 3 (see [2]). For \( \beta > 0 \) and \( \alpha > 0 \) and \( f \in L^1 [a, b] \), we have the following properties:

\[
\begin{align*}
I_{a+}^{\alpha} \frac{d^\beta}{dt^\beta} f(t) &= \frac{d^{\beta + \alpha}}{dt^{\beta + \alpha}} f(t), \\
I_{a+}^{\alpha} (f(t) - a)^\beta &= \frac{\Gamma (\mu + 1)}{\Gamma (\alpha + \mu + 1)} (t - a)^{\alpha + \mu}, \mu > -1.
\end{align*}
\]

Proposition 4 (see [2]). Let \( \alpha > 0 \) with \( -1 < \alpha \leq n \) and \( f \in C^\omega [a, b] \). Then,

\[
I_{a+}^{\alpha} \frac{d^\alpha}{dt^\alpha} f(t) = f(t) - \sum_{k=0}^{n-1} c_k (t - a)^k,
\]

where \( c_k = f^{(k)}(a)/k! \). In particular, when \( 0 < \alpha \leq 1 \), we have

\[
I_{a+}^{\alpha} \frac{d^0}{dt^0} f(t) = f(t) - f(0).
\]

Proposition 5 (see [2]). Let \( \mu > 0 \) and \( \alpha > 0 \) with \( -1 < \alpha \leq n \). Then,

\[
\frac{d^\alpha}{dt^\alpha} (t - a)^{\mu - 1} = \frac{\Gamma (\mu)}{\Gamma (\mu - \alpha)} (t - a)^{\mu - \alpha - 1}, \mu > n,
\]

\[
\frac{d^\alpha}{dt^\alpha} (t - a)^k = 0, k = 0, 1, \ldots, n - 1.
\]

Theorem 6 (Leray–Schauder alternative [15]). Let \( T: X \rightarrow X \) be a completely continuous operator (i.e., a map that is restricted to any bounded set in \( X \) is compact). Let \( M(T) = \{ u \in X: u = mT(u) \text{ for some } 0 < m < 1 \} \). Then, either the set \( M(T) \) is unbounded or \( T \) has at least one fixed point.

For the sake of simplicity, henceforward we will write \( I^\alpha \) and \( c D^\alpha \) instead of \( I_{a+}^{\alpha} \) and \( c D^\alpha \), respectively.
3. Main Results

In this section, we will discuss the existence and uniqueness of the solution to systems (1)-(2).

Lemma 7. Let \( v, w \in C([0, 1], \mathbb{R}), 0 < \alpha_1, \alpha_2 \leq 1, 1 < \beta_1, \beta_2 \leq 2, q \geq 0, 0 < p < \beta_2, (\overline{\alpha}_1 := \alpha_1 + q, \overline{\alpha}_2 := \alpha_2 + \beta_2 - p), \) and

\[
\Delta = \frac{\eta^{\beta_1} \eta^{\beta_2}}{\Gamma(\beta_1 + 1) \Gamma(\beta_2 + 1)} - \frac{abu_1^{\beta_1-p}u_2^{\beta_2+q}}{\Gamma(\beta_1 + q + 1) \Gamma(\beta_2 - p + 1)} \neq 0.
\]

(9)

The solution of the following coupled system of fractional Langevin equations is as follows:

\[
cD^{\alpha_1}(cD^{\beta_1} + \lambda) \psi_1(t) = v(t),
\]

(10)

\[
cD^{\alpha_2}(cD^{\beta_2} + k) \psi_2(t) = w(t),
\]

(11)

equipped with the boundary condition (2) which is equivalent to the coupled system of the following integral equations:

(12)

\[
\psi_1(t) = I^{\alpha_1, \beta_1}v(t) - \lambda I^{\beta_1, \psi_1}(t) + \mu^2 \left[ A_1 \left[ aI^{\alpha_2, \overline{\alpha}_1}w(\mu_1) - akI^{\beta_2, \overline{\alpha}_1}\psi_1(\mu_1) - I^{\alpha_1, \beta_1}v(\xi) + \lambda I^{\beta_1, \psi_1}(\xi) \right] \\
+ A_2 \left[ bI^{\alpha_2, \overline{\alpha}_2}v(\mu_2) - b\lambda I^{\beta_2, \overline{\alpha}_2}w(\eta) + kI^{\beta_2, \psi_2}(\eta) \right] + A_3 \right] + a_0,
\]

\[
\psi_2(t) = I^{\alpha_2, \beta_2}w(t) - kI^{\beta_2, \psi_2}(t) + \mu^2 \left[ B_1 \left[ bI^{\alpha_2, \overline{\alpha}_1}v(\mu_1) - b\lambda I^{\beta_2, \overline{\alpha}_1}\psi_1(\mu_1) - I^{\alpha_1, \beta_1}v(\xi) + \lambda I^{\beta_1, \psi_1}(\xi) \right] + B_3 \right] + b_0,
\]

(13)

where

\[
A_1 = \frac{1}{\Delta \Gamma(\beta_1 + 1) \Gamma(\beta_2 + 1)},
\]

\[
A_2 = \frac{1}{\Delta \Gamma(\beta_1 + 1) \Gamma(\beta_2 - p + 1)}a_0 \eta^{\beta_1},
\]

\[
A_3 = \frac{1}{\Delta \Gamma(\beta_1 + 1)} \left[ \frac{a_0 \eta^{\beta_2}}{\Gamma(\beta_2 + 1)} + \frac{a_0 \eta^{\beta_1}}{\Gamma(\beta_2 - p + 1)} \left( \frac{ba_0 \mu_2^{\beta_1}}{\Gamma(q + 1)} - b_0 \right) \right],
\]

\[
B_1 = \frac{1}{\Delta \Gamma(\beta_2 + 1) \Gamma(\beta_1 + 1)} \eta^{\beta_1},
\]

\[
B_2 = \frac{1}{\Delta \Gamma(\beta_2 + 1) \Gamma(\beta_1 + 1)} \left( \frac{ba_0 \mu_2^{\beta_1}}{\Gamma(q + 1)} + \frac{ba_0 \mu_2^{\beta_2}}{\Gamma(q + 1)} - b_0 \right),
\]

\[
B_3 = \frac{1}{\Delta \Gamma(\beta_2 + 1) \Gamma(\beta_1 + 1)} \left( \frac{ba_0 \mu_2^{\beta_1}}{\Gamma(q + 1)} + \frac{ba_0 \mu_2^{\beta_2}}{\Gamma(q + 1)} - b_0 \right).
\]

Proof. Applying the operator \( I^{\alpha_1, \beta_1} \) and \( I^{\alpha_2, \beta_2} \) on (10) and (11), respectively, we get
\[
\psi_1(t) = I^{\alpha_1 + \beta_1} v(t) - \lambda I^{\beta_1} \psi_1(t) + \frac{c_2 x_2^{\beta_1}}{\Gamma(\beta_1 + 1)} + c_1 t + c_0, \\
\psi_2(t) = I^{\alpha_2 + \beta_2} w(t) - k f^{\beta_2} \psi_2(t) + \frac{c_1 x_1^{\beta_2}}{\Gamma(\beta_2 + 1)} + c_1 t + c_0,
\]
(15)

where \(c_i, \tau_i \in \mathbb{R} \ (i = 0, 1, 2)\). From the boundary conditions \(\psi_1(0) = a_0, \psi_2(0) = b_0\), and \(\psi_1'(0) = \psi_2'(0) = 0\), we get \(c_0 = a_0, \tau_0 = b_0\), and \(c_1 = \tau_1 = 0\), respectively. Next, using the nonlocal integral conditions \(\psi_1(\xi) = a (I D^\beta \psi_2)(\mu_1)\) and \(\psi_2(\eta) = b (I D^\beta \psi_1)(\mu_2)\), we obtain that

\[
I^{\alpha_1 + \beta_1} v(\xi) - \lambda I^{\beta_1} \psi_1(\xi) + \frac{c_2 x_2^{\beta_1}}{\Gamma(\beta_1 + 1)} + a_0 = a I^{\tau_1} w(\mu_1)
\]

\[
- a k I^{\beta_2} \psi_2(\mu_1) + \frac{a c_2 \mu_1^{\beta_2 - p}}{\Gamma(\beta_2 - p + 1)},
\]
(17)

\[
I^{\alpha_2 + \beta_2} w(\eta) - k f^{\beta_2} \psi_2(\eta) + \frac{c_2 x_2^{\beta_2}}{\Gamma(\beta_2 + 1)} + b_0 = b I^{\tau_2} v(\mu_2)
\]

\[
- b \lambda I^{\beta_1} \psi_1(\mu_2) + \frac{c_2 b \mu_2^{\beta_1 - q}}{\Gamma(\beta_1 + q + 1)} + \frac{ba_0 \mu_2^q}{\Gamma(q + 1)}.
\]
(18)

Solving the above system, we find that

\[
c_2 = \frac{1}{\Delta} \left[ \frac{\eta_2^{\beta_1}}{\Gamma(\beta_1 + 1)} I^{\tau_1} w(\mu_1) - a k I^{\beta_1} \psi_2(\mu_1) - I^{\alpha_1 + \beta_1} v(\xi) + \lambda I^{\beta_1} \psi_1(\xi) \right]
\]

\[
+ \frac{a \mu_1^{\beta_1 - p}}{\Gamma(\beta_2 + 1)} \left[ I^{\tau_1} v(\mu_2) - b I^{\beta_1} \psi_1(\mu_2) - I^{\alpha_2 + \beta_2} w(\eta) + k f^{\beta_2} \psi_2(\eta) \right]
\]

\[
- \frac{a_0 \eta_2^{\beta_2}}{\Gamma(\beta_2 + 1)} + \frac{a \mu_1^{\beta_1 - p}}{\Gamma(\beta_2 - p + 1)} \left( \frac{ba_0 \mu_2^q}{\Gamma(q + 1)} - b_0 \right)
\]

\[
\tau_2 = \frac{1}{\Delta} \left[ \frac{\xi_2^{\beta_2}}{\Gamma(\beta_1 + 1)} I^{\tau_1} w(\mu_1) - b I^{\beta_1} \psi_1(\mu_2) - I^{\alpha_2 + \beta_2} w(\eta) - k f^{\beta_2} \psi_2(\eta) \right]
\]

\[
+ \frac{b \mu_2^{\beta_1 - p}}{\Gamma(\beta_1 + q + 1)} \left[ I^{\tau_1} w(\mu_1) - a k I^{\beta_2} \psi_2(\mu_1) - I^{\alpha_1 + \beta_1} v(\xi) + \lambda I^{\beta_1} \psi_1(\xi) \right]
\]

\[
- \frac{a_0 \beta_3 \mu_2^q}{\Gamma(\beta_1 + q + 1)} + \frac{b \mu_2^{\beta_1 - p}}{\Gamma(\beta_1 + q + 1)} \left( \frac{ba_0 \mu_2^q}{\Gamma(q + 1)} - b_0 \right).
\]
(19)

where \(\Delta\) is the determinant of the matrix associated with systems (17)-(18) in the two variables \(c_2\) and \(\tau_2\), and it is given by (9).

Substituting the values of \(c_0, \tau_0, c_1, \tau_1, c_2\), and \(\tau_2\) in (15) and (16), we obtain the system of the integral equations (12) and (13). The proof is completed. \(\square\)

The Banach space \(E = C([0, 1], \mathbb{R})\) is defined with the norm \(\| \psi_1 \|_E = \sup_{t \in [0, 1]} | \psi_1(t) |\).

So, the space \(E \times E = \{ (\psi_1, \psi_2), s.t (\psi_1, \psi_2) \in E \times E \}\) with the norm \(\|(\psi_1, \psi_2)\|_{E \times E} = \| \psi_1 \|_E + \| \psi_2 \|_E\) is Banach space.

Now, let us define the operator \(\mathcal{N}: E \times E \rightarrow E \times E\), by \(\mathcal{N}(\psi_1, \psi_2)(t) = (\mathcal{N}_1(\psi_1, \psi_2)(t), \mathcal{N}_2(\psi_1, \psi_2)(t))\), where
Note that the couple $(\psi_1, \psi_2)$ is a fixed point of the operator $\mathfrak{R}$ if only if $(\psi_1, \psi_2)$ is a solution of systems (1)-(2). Consider the following hypotheses:

(H1). $f, g: J \times \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R}$ are continuous functions, and there exist real positive constants $\sigma_i, \tau_i$ $(i = 0, 1, 2)$ such that
\[
|f(t, \zeta, \kappa)| \leq \sigma_0 + \sigma_1 |\zeta| + \sigma_2 |\kappa|,
\]
\[
|g(t, \zeta, \kappa)| \leq \tau_0 + \tau_1 |\zeta| + \tau_2 |\kappa|,
\]
for all $(t, \zeta, \kappa) \in J \times \mathbb{R} \times \mathbb{R}$.

(H2). There exist constants $K, L > 0$ such that
\[
|f(t, \zeta, \kappa) − f(t, \tilde{\zeta}, \tilde{\kappa})| \leq K(|\zeta − \tilde{\zeta}| + |\kappa − \tilde{\kappa}|),
\]
\[
|g(t, \zeta, \kappa) − g(t, \tilde{\zeta}, \tilde{\kappa})| \leq L(|\zeta − \tilde{\zeta}| + |\kappa − \tilde{\kappa}|),
\]
for all $(t, \zeta, \kappa), (t, \tilde{\zeta}, \tilde{\kappa}) \in J \times \mathbb{R} \times \mathbb{R}$.

(H3). There exist $F_0, G_0 > 0$ such that
\[
F_0 = \sup_{t \in J} |f(t, 0, 0)| \quad \text{and} \quad G_0 = \sup_{t \in J} |g(t, 0, 0)|.
\]

Remark 8. From conditions (H1) and (H2) for all $(\psi_1, \psi_2) \in E \times E$, we get
\[
|f(t, \psi_1(t), \psi_2(t))| \leq K\|\psi_1, \psi_2\|_{E \times E} + F_0,
\]
\[
|g(t, \psi_1(t), \psi_2(t))| \leq L\|\psi_1, \psi_2\|_{E \times E} + G_0.
\]

For computation convenience, we set the following constants:

\[
Q_1 = \frac{1 + |A_1| \mu_{\alpha, \beta}^{\alpha, \beta} + |A_2| \mu_{\alpha, \beta}^{\gamma, \beta}}{\Gamma(\alpha + \beta + 1) + \Gamma(\alpha_2 + 1)}
\]
\[
Q_2 = \frac{|aA_1| \mu_{\alpha, \beta}^{\alpha, \beta} + |A_2| \mu_{\alpha, \beta}^{\gamma, \beta}}{\Gamma(\alpha + \beta + 1) + \Gamma(\alpha_2 + 1)}
\]
\[
Q_3 = \frac{|bB_1| \mu_{\alpha, \beta}^{\alpha, \beta} + |B_2| \mu_{\alpha, \beta}^{\gamma, \beta}}{\Gamma(\alpha + \beta + 1) + \Gamma(\alpha_2 + 1)}
\]
\[
Q_4 = \frac{1 + |B_1| \mu_{\alpha, \beta}^{\alpha, \beta} + |B_2| \mu_{\alpha, \beta}^{\gamma, \beta}}{\Gamma(\alpha + \beta + 1) + \Gamma(\alpha_2 + 1)}
\]
\[ Q_5 = \frac{(1 + A_1 |g^{\xi_1}| |\lambda|)}{\Gamma(\beta_1 + q)} + \frac{|A_2| |b\lambda| |g^{\xi_3}|}{\Gamma(\beta_1 + q + 1)} \]  
\[ Q_6 = \frac{|A_1| |ak| |\mu^{\beta_3}|}{\Gamma(\beta_2 - p + 1)} + \frac{|A_2| |k| |\mu^{\beta_3}|}{\Gamma(\beta_2 + 1)} \]  
\[ Q_7 = \frac{|B_1 | |g^{\xi_1}|}{\Gamma(\beta_1 + 1)} + \frac{|b| |B_1 | |g^{\xi_3}|}{\Gamma(\beta_1 + q + 1)} \]  
\[ Q_8 = \frac{|B_1 | |ak| |\mu^{\beta_3}|}{\Gamma(\beta_2 - p + 1)} + \frac{(1 + |B_1 | |g^{\xi_3}|) |k|}{\Gamma(\beta_2 + 1)} \]  
\[ \rho_1 = \max \{Q_5, Q_6\} \]  
\[ \rho_2 = \max \{Q_7, Q_8\} \]  
In the following step, we present the following result about the uniqueness of solutions for problems (1)-(2) by applying the Banach contraction principle.

**Theorem 9.** Assume that (H2) and (H3) hold. If
\[ \|(Q_1 + Q_3) K + (Q_3 + Q_4) L + \rho_1 + \rho_2 \| < 1, \]  
then the boundary value problems (1)-(2) have a unique solution.

**Proof.** Choose a positive real constant \( R \)
\[ R \geq \frac{(Q_1 + Q_3) F_0 + (Q_2 + Q_4) G_0 + |A_3| + |B_3| + |a_0| + |b_0|}{1 - \|(Q_1 + Q_3) K + (Q_2 + Q_4) L + \rho_1 + \rho_2\|} \]  
Let \( B_R = \{(\psi_1, \psi_2) \in E \times E : \|(\psi_1, \psi_2)\|_{E \times E} \leq R\} \). First, we prove that \( \mathcal{N}(B_R) \subseteq B_R \). For all \( (\psi_1, \psi_2) \in B_R \), we have
\[ \|(\mathcal{N}(\psi_1, \psi_2))(t)\| \leq \frac{K R + F_0}{\Gamma(\alpha_1 + \beta_1)} \int_0^t (t-s)^{\alpha_1-1} ds + \|\lambda\| \|\psi_2\|_E \int_0^t (t-s)^{\beta_1-1} ds \]

\[ + t^{\beta_1} \left\{ |A_1| \left( \frac{\|a\| (LR + G_0)}{\Gamma(\alpha_2)} \right) \int_0^{\mu_1} (\mu_1 - s)^{\alpha_2-1} ds + \|a| \|\psi_2\|_E \right\} \int_0^{\mu_1} (\mu_1 - s)^{\beta_1-1} ds \]

\[ + \frac{K R + F_0}{\Gamma(\alpha_1 + \beta_1)} \int_0^t (\xi - s)^{\alpha_1-1} ds + \|\lambda\| \|\psi_2\|_E \int_0^t (\xi - s)^{\beta_1-1} ds \]

\[ + |A_3| \left( \frac{|b| (K R + F_0)}{\Gamma(\alpha_1)} \right) \int_0^{\mu_2} (\mu_2 - s)^{\alpha_2-1} ds + \|b| \|\psi_2\|_E \right\} \int_0^{\mu_2} (\mu_2 - s)^{\beta_2-1} ds \]

\[ + \frac{LR + G_0}{\Gamma(\alpha_1 + \beta_2)} \int_0^t (\eta - s)^{\alpha_2-1} ds + \|k| \|\psi_2\|_E \right\} \int_0^t (\eta - s)^{\beta_2-1} ds \]

\[ + |A_3| + |a_0| + \left( |\lambda| (1 + |A_3| |g^{\xi_1}|) \right) \|\psi_1\|_E \]

\[ + \left( \frac{|k A_3| |g^{\xi_2}|}{\Gamma(\beta_2 + 1)} + \frac{|a A_2| |\mu^{\beta_3}|}{\Gamma(\beta_2 - p + 1)} \right) \|\psi_2\|_E \]

\[ \leq \left( K \left( 1 + |A_1| |g^{\xi_1}| \right) \right) \|\psi_1\|_E \]

On the other hand, we have...
\[
\begin{align*}
\mathcal{N}(\psi_1, \psi_2)(t) & \leq \frac{LR + G_0}{\Gamma(\alpha + \beta + 1)} + \frac{|bB_1|\mu_1^\gamma (K \psi + F_0)}{\Gamma(\alpha_1 + 1)} + \frac{|B_1|(LR + G_0)\eta^{\alpha + \beta_1}}{\Gamma(\alpha_2 + \beta_2 + 1)} \\
& \quad + \frac{|aB_2| (LR + G_0)\mu_2^{\beta_1}}{\Gamma(\alpha_2 + 1)} + |B_2| (K \psi + F_0)\lambda^{\alpha + \beta_1} + |B_2| + |b_0| + \left(\frac{|\lambda B_1| \eta_2^{\beta_1}}{\Gamma(\beta_1 + q + 1)} + \frac{|\lambda B_2| \eta_2^{\beta_1}}{\Gamma(\beta_1 + 1)}\right)\left\|\psi_1\right\|_E \\
& \quad + \left(\frac{|k|}{\Gamma(\beta_2 + 1)} + \frac{|kB_1| \eta_2^{\beta_1}}{\Gamma(\beta_2 + 1)} + \frac{|akB_2| \eta_2^{\beta_1-p}}{\Gamma(\beta_2 - p + 1)}\right)\left\|\psi_2\right\|_E \\
& \leq Q_4G_0 + Q_3F_0 + |B_2| + |b_0| + (Q_4L + Q_3K)R + \rho_1\left(\left\|\psi_1\right\|_E + \left\|\psi_2\right\|_E\right) \\
& \leq Q_4G_0 + Q_3F_0 + |B_2| + |b_0| + (Q_4L + Q_3K + \rho_2)R.
\end{align*}
\] (32)

Consequently,
\[
\begin{align*}
\left\|\mathcal{N}(\psi_1, \psi_2)\right\| & \leq (Q_1 + Q_3)F_0 + (Q_2 + Q_4)G_0 + |A_3| + |\psi_1| + |\psi_2| + |A_0| + |b_0| + [(Q_1 + Q_3)K + (Q_2 + Q_4)L + \rho_1 + \rho_2]R, \\
& \leq R.
\end{align*}
\] (33)

Therefore, \(\mathcal{N}(B_R) \subseteq B_R\). Next, we prove that \(\mathcal{N}\) is a contraction. Let \((\psi_1, \psi_2), (\bar{\psi}_1, \bar{\psi}_2) \in E \times E\). For all \(t \in J\), we have

\[
\begin{align*}
\mathcal{N}_1(\psi_1, \psi_2) - \mathcal{N}_1\left(\bar{\psi}_1, \bar{\psi}_2\right)(t) & \leq \frac{K\left(\left\|\psi_1 - \bar{\psi}_1\right\|_E + \left\|\psi_2 - \bar{\psi}_2\right\|_E\right)}{\Gamma(\alpha_1 + \beta_1 + 1)} + \frac{|\lambda|\left\|\psi_1 - \bar{\psi}_1\right\|_E\theta_1^{\alpha + \beta_1}}{\Gamma(\beta_1 + 1)} \\
& \quad + t^{\beta_1} \left[|A_1|\left(\frac{aL\left(\left\|\psi_1 - \bar{\psi}_1\right\|_E + \left\|\psi_2 - \bar{\psi}_2\right\|_E\right)}{\Gamma(\alpha_1 + 1)} + \frac{|ak|\left\|\psi_2 - \bar{\psi}_2\right\|_E\theta_2^{\beta_1-p}}{\Gamma(\beta_1 + 1)}\right) + |A_2|\left(\frac{bK\left(\left\|\psi_1 - \bar{\psi}_1\right\|_E + \left\|\psi_2 - \bar{\psi}_2\right\|_E\right)}{\Gamma(\alpha_2 + \beta_2 + 1)} + \frac{|k|\left\|\psi_2 - \bar{\psi}_2\right\|_E\theta_2^{\beta_1}}{\Gamma(\beta_2 + 1)}\right) + |A_3|\right]
\end{align*}
\] (34)
In the other respect, we have

\[ \mathcal{N}_2(\psi_1, \psi_2)(t) - \mathcal{N}_2(\overline{\psi}_1, \overline{\psi}_2)(t) \leq \frac{L(\|\psi_1 - \overline{\psi}_1\|_E + \|\psi_2 - \overline{\psi}_2\|_E)}{\Gamma(\alpha + \beta_2 + 1)} + \frac{k\|\psi_2 - \overline{\psi}_2\|_E}{\Gamma(\beta_2 + 1)} + \frac{|B_1|K(\|\psi_1 - \overline{\psi}_1\|_E + \|\psi_2 - \overline{\psi}_2\|_E)}{\Gamma(\alpha + \beta_1 + 1)\|\lambda\|_{\mu_1}^{\beta_1}} + \frac{|B_1|L(\|\psi_1 - \overline{\psi}_1\|_E + \|\psi_2 - \overline{\psi}_2\|_E)}{\Gamma(\alpha + \beta_2 + 1)} + \frac{|B_2|\|\psi_2 - \overline{\psi}_2\|_E}{\Gamma(\beta_2 + 1)} \] 

Consequently,

\[ \|\mathcal{N}(\psi_1, \psi_2) - \mathcal{N}(\overline{\psi}_1, \overline{\psi}_2)\| \leq (Q_1L + Q_2K + \rho_2)\|\psi_1 - \psi_2\|_E
\]

Therefore, the operator \( \mathcal{N} \) has a unique fixed point. Thus, we conclude that problems (1)-(2) have a unique solution on \([0, 1]\). The proof is complete.

Now, we apply the Leray-Schauder alternative theorem to obtain the following result about the existence of solutions for problems (1)-(2).

**Theorem 10.** Assume that (H1) holds. If

\[ S < 1, \text{ and } \overline{S} < 1, \]

where

\[ S = Q_1\sigma_1 + Q_2\tau_1 + Q_3\sigma_1 + Q_4\tau_1 + Q_5 + Q_6, \]

\[ \overline{S} = Q_1\sigma_2 + Q_2\tau_2 + Q_3\sigma_2 + Q_4\tau_2 + Q_6 + Q_7, \]

then the boundary value problems (1)-(2) have at least one solution on \([0, 1]\).

Proof. First, we show that the operator \( \mathcal{N} \) is completely continuous.

Because \( f \) and \( g \) are continuous functions, \( \mathcal{N} \) is continuous operator as well. Let \( \Lambda \) be any nonempty bounded subset of \( E \times E \). Then, there exists \( r > 0 \) such that for any \( (\psi_1, \psi_2) \in \Lambda \), \( \|\psi_1, \psi_2\|_{E \times E} \leq r \). Notice that from the condition (H1) for all \( (\psi_1, \psi_2) \in \Lambda \), we have

\[ |f(t, \psi_1(t), \psi_2(t))| \leq \sigma_0 + \sigma_1|\psi_1(t)| + \sigma_2|\psi_2(t)|, \]

\[ \leq \sigma_0 + \max\{\sigma_1, \sigma_2\}\|\psi_1, \psi_2\|_{E \times E} \]

\[ \leq \sigma_0 + r \max\{\sigma_1, \sigma_2\} \Psi_1 \Psi_2. \]

Next, we prove that \( \mathcal{N}(\Lambda) \) is uniformly bounded. Let \( (\psi_1, \psi_2) \in \Lambda \). Indeed, for any \( t \in [0, 1] \), we have

\[ |g(t, \psi_1(t), \psi_2(t))| \leq \tau_0 + r \max\{\tau_1, \tau_2\} \]

\[ \leq \tau_0 + \tau_2 \max\{\tau_1, \tau_2\}. \]
\begin{equation}
\begin{align*}
|Y_1(\psi_1, \psi_2)(t)| & \leq \frac{\sigma_0 + r \max \{|\sigma_1, \sigma_2|\}}{\Gamma (\alpha_1 + \beta_1)} \int_0^t (t - s)^{\alpha_1 - 1} ds + \frac{|A_1|}{\Gamma (\beta_1)} \int_0^t (t - s)^{\beta_1 - 1} ds \\
& \quad + \frac{\sigma_0 + r \max \{|\sigma_1, \sigma_2|\}}{\Gamma (\alpha_1 + \beta_1)} \int_0^\xi (\xi - s)^{\alpha_1 - 1} ds + \frac{|\lambda_1\psi_1|_E}{\Gamma (\beta_1)} \int_0^\xi (\xi - s)^{\beta_1 - 1} ds \\
& \quad + \frac{\sigma_0 + r \max \{|\sigma_1, \sigma_2|\}}{\Gamma (\alpha_1 + \beta_1)} \int_0^{\xi} (\xi - s)^{\alpha_1 - 1} ds + \frac{|\lambda_1\psi_1|_E}{\Gamma (\beta_1)} \int_0^{\xi} (\xi - s)^{\beta_1 - 1} ds \\
& \quad + |A_2| \left( \frac{|b|(\sigma_0 + r \max \{|\sigma_1, \sigma_2|\})}{\Gamma (\alpha_1)} \int_0^{\mu_1} (\mu_2 - s)^{\alpha_2 - 1} ds + \frac{|b\lambda_1\psi_1|_E}{\Gamma (\beta_2)} \int_0^{\mu_1} (\mu_2 - s)^{\beta_2 - 1} ds \right) \\
& \quad + \left( \frac{|1 + |A_1|\xi^{\alpha_1 + \beta_1}}{\Gamma (\alpha_1 + \beta_1 + 1)} + \frac{|bA_2| (\sigma_0 + r \max \{|\sigma_1, \sigma_2|\})}{\Gamma (\alpha_2 + \beta_2 + 1)} \right) (\tau_0 + r \max \{\tau_1, \tau_2\}) + |A_3| + |a_0| \\
& \quad + \left( \frac{|1 + |A_1|\xi^{\alpha_1 + \beta_1}}{\Gamma (\alpha_1 + \beta_1 + 1)} + \frac{|bA_2| (\sigma_0 + r \max \{|\sigma_1, \sigma_2|\})}{\Gamma (\alpha_2 + \beta_2 + 1)} \right) (\tau_0 + r \max \{\tau_1, \tau_2\}) + |A_3| + |a_0| + \rho_1 r \\
& \leq + \infty.
\end{align*}
\end{equation}

Similarly,

\begin{equation}
\begin{align*}
|Y_2(\psi_1, \psi_2)(t)| &= \frac{(1 + |B_1|\eta^{\alpha_1 + \beta_1}) (\tau_0 + r \max \{\tau_1, \tau_2\})}{\Gamma (\alpha_2 + \beta_2 + 1)} + \frac{|bB_1|\mu^{\alpha_1}_{2} (\sigma_0 + r \max \{|\sigma_1, \sigma_2|\})}{\Gamma (\alpha_1 + \beta_1 + 1)} \\
& \quad + \frac{|aB_2| (\tau_0 + r \max \{\tau_1, \tau_2\})\mu^{\alpha_1}_{2}}{\Gamma (\alpha_2 + \beta_2 + 1)} + \frac{|B_2| (\sigma_0 + r \max \{|\sigma_1, \sigma_2|\})\xi^{\alpha_1 + \beta_1}}{\Gamma (\alpha_1 + \beta_1 + 1)} + |B_3| + |b_0| \\
& \quad + \left( \frac{|b\lambda B_1|\mu^{\alpha_1 + \beta_1}}{\Gamma (\beta_1 + q + 1)} + \frac{|\lambda B_2|\xi^{\alpha_1 + \beta_1}}{\Gamma (\beta_1 + 1)} \right) \|\psi_1\|_E + \left( \frac{|k| + |kB_1|\eta^{\alpha_1 + \beta_1}}{\Gamma (\beta_2 + 1)} + \frac{|kB_2|\xi^{\alpha_1 + \beta_1}}{\Gamma (\beta_2 + 1)} \right) \|\psi_2\|_E \\
& \leq \left( \frac{|bB_1|\mu^{\alpha_1}_{2}}{\Gamma (\alpha_1 + \beta_1 + 1)} + \frac{|B_2|\eta^{\alpha_1 + \beta_1}}{\Gamma (\alpha_1 + \beta_1 + 1)} \right) (\sigma_0 + r \max \{|\sigma_1, \sigma_2|\}) \\
& \quad + \left( \frac{|aB_2|\mu^{\alpha_1}_{2}}{\Gamma (\alpha_1 + \beta_1 + 1)} + \frac{(1 + |B_1|\eta^{\alpha_1 + \beta_1})}{\Gamma (\alpha_2 + \beta_2 + 1)} \right) (\tau_0 + r \max \{\tau_1, \tau_2\}) + |B_3| + |b_0| + \rho_2 r \\
& < + \infty.
\end{align*}
\end{equation}
Consequently, $\|\psi_1, \psi_2\|_{E^E} < +\infty$ for any $(\psi_1, \psi_2) \in A$. Therefore, $\mathcal{R}(A)$ is uniformly bounded.

Now, we show that $\mathcal{R}$ is equicontinuous on $A$. Let $(\psi_1, \psi_2) \in A$. For any $t_2, t_1 \in I$, where $t_2 > t_1$, we have

$$\left|\mathcal{R}_1(\psi_1, \psi_2)(t_2) - \mathcal{R}_1(\psi_1, \psi_2)(t_1)\right| \leq \frac{\sigma_0 + \max\{\sigma_1, \sigma_2\}}{\Gamma(\alpha_1 + \beta_1)} \left(\int_{t_1}^{t_2} (t_2 - s)^{\alpha_1 + \beta_1 - 1} (t_1 - s)^{\alpha_1 + \beta_1 - 1} \,ds + \int_{t_1}^{t_2} (t_2 - s)^{\alpha_1 + \beta_1 - 1} \,ds\right)$$

$$+ \frac{\|\psi_1\|_E \|\psi_2\|_E}{\Gamma(\beta_1)} \left(\int_{t_1}^{t_2} (t_2 - s)^{\beta_1 - 1} (t_1 - s)^{\beta_1 - 1} \,ds + \int_{t_1}^{t_2} (t_2 - s)^{\beta_1 - 1} \,ds\right)$$

$$+ (t_2^\beta_1 - t_1^\beta_1) \left\{\left|A_1\right| \frac{|a| \mu_1^{\alpha_1}}{\Gamma(\alpha_1 + 1)} + \left|A_2\right| \frac{\eta^{\alpha_1 + \beta_1}}{\Gamma(\alpha_2 + \beta_1 + 1)}\right\} (\tau_0 + \max\{\tau_1, \tau_2\})$$

$$+ \frac{|A_1| \frac{|a| \mu_1^{\alpha_1 + \beta_1}}{\Gamma(\alpha_1 + \beta_1 + 1)} + \frac{|A_2| \frac{|\xi_1^{\alpha_1 + \beta_1}}{\Gamma(\beta_2 + 1)}}{\Gamma(\alpha_2 + \beta_2 + 1)}}{\Gamma(\beta_1 + p + 1)} \|\psi_1\|_E + \left(\left|A_1\right| \frac{|\lambda| \xi_1^{\beta_1}}{\Gamma(\beta_1 + 1)} + \left|A_2\right| \frac{|\lambda| \xi_1^{\beta_1 + q}}{\Gamma(\beta_1 + q + 1)}\right) \psi_1$$

$$+ \frac{|A_2| \frac{|b| \mu_2^{\alpha_2 + \beta_2}}{\Gamma(\alpha_1 + \beta_2 + 1)} + \left|A_1\right| \frac{|\xi_2^{\alpha_1 + \beta_1}}{\Gamma(\alpha_1 + 1)}}{\Gamma(\beta_1 + 1)} (\tau_0 + \max\{\tau_1, \tau_2\})$$

$$+ (t_2^\beta_2 - t_1^\beta_2) \left\{\left|A_1\right| \frac{|a| \mu_1^{\alpha_1 + \beta_1}}{\Gamma(\alpha_1 + 1)} + \left|A_2\right| \frac{\eta^{\alpha_1 + \beta_1}}{\Gamma(\alpha_2 + \beta_1 + 1)}\right\} (\tau_0 + \max\{\tau_1, \tau_2\})$$

$$\leq \frac{\sigma_0 + \max\{\sigma_1, \sigma_2\}}{\Gamma(\alpha_1 + \beta_1 + 1)} \left(t_2^\beta_1 - t_1^\beta_1\right)$$

$$+ (t_2^\beta_1 - t_1^\beta_1) \left\{\left|A_1\right| \frac{|a| \mu_1^{\alpha_1 + \beta_1}}{\Gamma(\alpha_1 + \beta_1 + 1)} + \left|A_2\right| \frac{\eta^{\alpha_1 + \beta_1}}{\Gamma(\alpha_2 + \beta_2 + 1)}\right\} (\tau_0 + \max\{\tau_1, \tau_2\})$$

$$+ \frac{|A_1| \frac{|a| \mu_1^{\alpha_1 + \beta_1}}{\Gamma(\alpha_1 + \beta_1 + 1)} + \frac{|A_2| \frac{|\xi_1^{\alpha_1 + \beta_1}}{\Gamma(\beta_2 + 1)}}{\Gamma(\alpha_2 + \beta_2 + 1)}}{\Gamma(\beta_1 + p + 1)} \|\psi_1\|_E + \left(\left|A_1\right| \frac{|\lambda| \xi_1^{\beta_1}}{\Gamma(\beta_1 + 1)} + \left|A_2\right| \frac{|\lambda| \xi_1^{\beta_1 + q}}{\Gamma(\beta_1 + q + 1)}\right) \psi_1$$

$$+ \frac{|A_2| \frac{|b| \mu_2^{\alpha_2 + \beta_2}}{\Gamma(\alpha_1 + \beta_2 + 1)} + \left|A_1\right| \frac{|\xi_2^{\alpha_1 + \beta_1}}{\Gamma(\alpha_1 + 1)}}{\Gamma(\beta_1 + 1)} (\tau_0 + \max\{\tau_1, \tau_2\})$$

$$+ (t_2^\beta_2 - t_1^\beta_2) \left\{\left|A_1\right| \frac{|a| \mu_1^{\alpha_1 + \beta_1}}{\Gamma(\alpha_1 + 1)} + \left|A_2\right| \frac{\eta^{\alpha_1 + \beta_1}}{\Gamma(\alpha_2 + \beta_1 + 1)}\right\} (\tau_0 + \max\{\tau_1, \tau_2\})$$

$$\rightarrow 0, \text{ as } t_2 \rightarrow t_1.$$

Analogously,
\[ |\mathcal{N}_2(\psi_1, \psi_2)(t_2) - \mathcal{N}_2(\psi_1, \psi_2)(t_1)| \leq \frac{r_0 + r \max\{r_1, r_2\}}{\Gamma(2 \alpha + 2 \beta + 1)} \left( t_2^{\alpha+\beta} - t_1^{\alpha+\beta} \right) + \frac{|k|r}{\Gamma(2 \beta + 1)} \left( t_2^{\beta} - t_1^{\beta} \right) \]

\[ \quad \quad \quad + \left( t_2^{\beta} - t_1^{\beta} \right) \left\{ \left( \frac{|bB|}{\Gamma(2 \alpha + 1)} + \frac{B_2}{\Gamma(\alpha + 1)} \right) \left( t_2^{\alpha+\beta} - t_1^{\alpha+\beta} \right) + \max\{\sigma_0, r \max\{\sigma_1, \sigma_2\}\} \right\} \]

\[ \quad \quad \quad + \frac{r \max\left\{ \left( \frac{|B_2|}{\Gamma(\alpha + q + 1)} + \frac{B_2}{\Gamma(\beta + q + 1)} \right), \left( \frac{|B_2|}{\Gamma(\beta + q + 1)} + \frac{B_2}{\Gamma(\alpha + q + 1)} \right) \right\}}{\Gamma(\alpha + \beta + 1)} \left( r_0 + r \max\{r_1, r_2\} + |B_2| \right) \]

\[ \longrightarrow 0, \quad \text{as } t_2 \longrightarrow t_1. \]

which imply that \( |\mathcal{N}(\psi_1, \psi_2)(t_2) - \mathcal{N}(\psi_1, \psi_2)(t_1)| \longrightarrow 0 \) as \( t_2 \longrightarrow t_1 \). Thus, the operator \( \mathcal{N} \) is equicontinuous. Hence, by Arzela–Ascoli theorem, we deduce that the operator \( \mathcal{N} \) is completely continuous.

Finally, we will verify that the set \( M(\mathcal{N}) \)

\[ \{ (\psi_1, \psi_2) \in E \times E : (\psi_1, \psi_2) = m \mathcal{N}(\psi_1, \psi_2) \text{ for some } 0 < m < 1 \} \]

is bounded. For all \( (\psi_1, \psi_2) \in M(\mathcal{N}) \) and for any \( t \in J \), we have \( m \mathcal{N}(\psi_1, \psi_2) = (m \mathcal{N}_1(\psi_1, \psi_2), m \mathcal{N}_2(\psi_1, \psi_2)) \). Then,

\[ |\psi_1(t)| = m|\mathcal{N}_1(\psi_1, \psi_2)(t)| \leq \frac{\sigma_0 + \sigma_1}{\Gamma(\alpha + \beta + 1)} + \frac{|A_1|}{\Gamma(\alpha + \beta + 1)} \left( \frac{|a|}{\Gamma(\alpha + \beta + 1)} + \frac{|A_2|}{\Gamma(\alpha + \beta + 1)} \right) \]

\[ \times \left( r_0 + r_1 \|\psi_1\|_E + r_2 \|\psi_2\|_E \right) + \frac{|A_1|}{\Gamma(\beta + 1)} \left( \frac{|ak|}{\Gamma(\beta + q + 1)} + \frac{|A_2|}{\Gamma(\beta + q + 1)} \right) \|\psi_2\|_E \]

\[ + \frac{|A_2|}{\Gamma(\beta + 1)} \left( \frac{|b\lambda|}{\Gamma(\alpha + 1)} + \frac{|A_1|}{\Gamma(\alpha + 1)} \right) \|\psi_1\|_E \]

\[ + \frac{|A_2|}{\Gamma(\alpha + 1)} \left( \frac{|b\lambda|}{\Gamma(\alpha + 1)} + \frac{|A_1|}{\Gamma(\alpha + 1)} \right) \|\psi_1\|_E \]

\[ \leq Q_1(\sigma_0 + \sigma_1) + Q_2(\sigma_0 + \sigma_1) + Q_3(\sigma_0 + \sigma_1) + Q_4(\sigma_0 + \sigma_1) + Q_5(\sigma_0 + \sigma_1) + Q_6(\sigma_0 + \sigma_1) + Q_7(\sigma_0 + \sigma_1) + Q_8(\sigma_0 + \sigma_1) + |A_3| + |a_0|. \]

This yields that

\[ \|\psi_1\|_E = m\|\mathcal{N}_1(\psi_1, \psi_2)\| \leq Q_1(\sigma_0 + \sigma_1) + Q_2(\sigma_0 + \sigma_1) + Q_3(\sigma_0 + \sigma_1) + Q_4(\sigma_0 + \sigma_1) + Q_5(\sigma_0 + \sigma_1) + Q_6(\sigma_0 + \sigma_1) + Q_7(\sigma_0 + \sigma_1) + Q_8(\sigma_0 + \sigma_1) + |A_3| + |a_0|. \]

In the same way, we deduce that

\[ \|\psi_2\|_E = m\|\mathcal{N}_2(\psi_1, \psi_2)\| \leq Q_1(\sigma_0 + \sigma_1) + Q_2(\sigma_0 + \sigma_1) + Q_3(\sigma_0 + \sigma_1) + Q_4(\sigma_0 + \sigma_1) + Q_5(\sigma_0 + \sigma_1) + Q_6(\sigma_0 + \sigma_1) + Q_7(\sigma_0 + \sigma_1) + Q_8(\sigma_0 + \sigma_1) + |B_3| + |b_0|. \]

Hence, we have
\[
\|\psi_1 - \psi_2\|_{E^{x,E}} \leq Q_1 |\sigma_0 + \sigma_1 \psi_1 + \sigma_2 \psi_2| + Q_2 (\tau_0 + \tau_1 |\psi_1 + \tau_2 |\psi_2|) + Q_3 (\sigma_0 + \sigma_1 |\psi_1 + \sigma_2 |\psi_2|) + Q_4 (\tau_0 + \tau_1 |\psi_1 + \tau_2 |\psi_2|) + Q_5 (\sigma_0 + \sigma_1 |\psi_1 + \sigma_2 |\psi_2|)
\]

which yields

\[
\|\psi_1 - \psi_2\|_{E^{x,E}} \leq \frac{Q_1 |\sigma_0 + \sigma_1 \psi_1 + \sigma_2 \psi_2|}{1 - \max\{S, \tilde{S}\}}
\]

where \(S\) and \(\tilde{S}\) are given by (36) and (38), respectively, which proves that \(M(\mathcal{R})\) is bounded. Thus, as a consequence of Leray–Schauder alternative theorem, \(\mathcal{R}\) has more than one fixed point. Hence, the boundary value problems (1)-(2) have one solution at the very least on \([0, 1]\).

### 4. Applications and Numerical Examples

In this section, we solve the integral equations (12) and (13) using the Adams-type predictor-corrector method with step size \(h = 0.01\) (for details, see [16–18] and the references therein). Briefly, we aim to approximate the solution of the following fractional initial value problem:

\[
D^\alpha y(t) = f(t, y(t)), \quad y(t_0) = y_0, \quad t \in [t_0, T], \quad \alpha \in (0, 1),
\]

at the grid points \(t_m = t_0 + mh, m \geq 0\), with \(h\) is a uniform step size. It is found that

\[
\begin{align*}
R(t_m) &= \frac{1}{\Gamma(1 - \alpha)} \int_{t_0}^{t_m} (t_m - r)^{-\alpha} \frac{y'(r) dr}{(1 + t_m - r)^{\frac{\alpha}{2}}} - f(t_m, Y(t_m)), \\
&= \frac{1}{\Gamma(1 - \alpha)} \frac{h}{2} \sum_{j=0}^{m-1} (m - j - 1)^{-\alpha} \frac{y'(t_{j+1}) - y'(t_j)}{2} - f(t_m, Y(t_m)), \\
&= \frac{h^{-\alpha}}{2\Gamma(1 - \alpha)} \sum_{j=0}^{m-1} \left( (m - j - 1)^{-\alpha} Y'(t_{j+1}) - (m - j)^{-\alpha} Y'(t_j) \right) - f(t_m, Y(t_m)),
\end{align*}
\]

after using the trapezoidal rule.

Consider the following coupled system of fractional Langevin equations:

\[
\begin{align*}
&\frac{\cD^{\alpha}}{\cD^{\alpha}} \left( \frac{\cD^{\alpha}}{\cD^{\alpha}} + \frac{1}{8} \right) \psi_1(t) = \frac{|\psi_2(t)|}{7(1 + t^2)} \left( 1 + |\psi_2(t)| \right) - \frac{|\psi_1(t)|}{5} + \sin(1 + t), \quad t \in [0, 1], \\
&\frac{\cD^{\alpha}}{\cD^{\alpha}} \left( \frac{\cD^{\alpha}}{\cD^{\alpha}} + \frac{1}{7} \right) \psi_2(t) = \frac{|\psi_1(t)|}{14\sqrt{1 - t + \psi_1^2(t)}} - \frac{3 \sin \psi_1(t)}{5 + t} - 1 - t^2.
\end{align*}
\]
Equipped with the nonlocal nonseparated fractional integral and fractional derivative boundary conditions,
\[
\begin{align*}
\psi_1(0) &= 1, \psi_2(0) = 3, \psi_1'(0) = \psi_2'(0) = 0, \\
\psi_1(\frac{9}{10}) &= \frac{1}{4} \left( cD^{1/4}_t \psi_2 \right) \left( \frac{1}{5} \right), \\
\psi_2(1) &= 2 \left( f^{1/4}_t \psi_1 \right) \left( \frac{1}{5} \right).
\end{align*}
\]  
(56)

Here, \( \lambda = 1/8, k = 1/7, a = 1/4, b = 2, \alpha_0 = 1, \beta_0 = 3, p = 1/4, q = 5/4, \xi = 9/10, \eta = 1, \mu_1 = 1/5, \mu_2 = 1/8, \) and
\[
f(t, \psi_1, \psi_2) = \frac{\left| \psi_2 \right|}{7 \left( 1 + t^2 \right)} \left( 1 + \left| \psi_2 \right| \right) - \frac{\psi_1}{5} + \ln(1 + t),
\]
\[
g(t, \psi_1, \psi_2) = \frac{\left| \psi_1 \right|}{14 \sqrt{1 - t + \psi_1^2}} - \frac{3 \sin \psi_2}{5 + t} - 1 - t^2.
\]  
(57)

On the other part, for \((t, \zeta, \kappa), (t, \bar{\zeta}, \bar{\kappa}) \in [0, 1] \times \mathbb{R} \times \mathbb{R}, \) we get
\[
\left| f(t, \zeta, \kappa) - f(t, \bar{\zeta}, \bar{\kappa}) \right| \leq \frac{1}{5} \left( |\zeta - \bar{\zeta}| + |\kappa - \bar{\kappa}| \right),
\]
\[
\left| g(t, \zeta, \kappa) - g(t, \bar{\zeta}, \bar{\kappa}) \right| \leq \frac{3}{5} \left( |\zeta - \bar{\zeta}| + |\kappa - \bar{\kappa}| \right),
\]
\[
\left| f(t, \zeta, \kappa) \right| \leq \sigma_0 + \frac{1}{5} |\kappa| + \frac{1}{7} |\kappa|,
\]
\[
\left| g(t, \zeta, \kappa) \right| \leq \tau_0 + \frac{1}{14} |\zeta| + \frac{3}{5} |\zeta|,
\]  
(58)

so \( \sigma_1 = 1/5, \sigma_2 = 1/7, \tau_1 = 1/14, \tau_2 = 3/5, K = 1/5, \) and \( L = 3/5. \)

Case i. In order to illustrate Theorem 9, we take \( \alpha_1 = 1/4, \beta_1 = 5/4, \alpha_2 = 1/2, \) and \( \beta_2 = 2. \)
Thus, \( \bar{\alpha}_1 = 11/4 \) and \( \bar{\alpha}_2 = 5/4. \)
By using the Matlab program, we found that
\[
\Delta = \frac{3.8678768558080}{1.171331813010056},
\]
\[
A_1 = \frac{1.4049906832007}{0.031689241829108},
\]
\[
A_2 = -1.262241885268691,
\]
\[
B_2 = 1.000159825315441,
\]
\[
B_3 = 0.004297601923856,
\]
\[
Q_1 = 1.485098417429794,
\]
\[
Q_2 = 0.56422691832900,
\]
\[
Q_3 = 0.004245829991826,
\]
\[
Q_4 = 0.601861587859298,
\]
\[
Q_5 = 0.220678979659357,
\]
\[
Q_6 = 0.00303082369281,
\]
\[
Q_7 = 8.31262586410917 \times 10^{-4},
\]
\[
Q_8 = 0.142874266998083,
\]
\[
Q_9 = 0.202678979659357,
\]
\[
Q_{10} = 0.142874266998083,
\]
\[
S = 0.708442401834063 < 1,
\]
\[
\bar{\delta} = 0.6115960688384 < 1.
\]  
(59)

Thus, all the conditions of Theorem 10 are satisfied.
Then, problems (55)-(56) have one solution at the least \( [0, 1]. \) In addition, both solutions \( \psi_1(t) \) and \( \psi_2(t) \) for Case ii are sketched in Figure 2.
implementing the Gauss–Seidel method.

Adams-type predictorcorrector method by implicitly from the theoretical point and solved numerically using the forced to use computer programs in order to find examples different parameters. Because of the complexity, we were suzerainty of nonlocal and nonseparated boundary condi-
tions. jT_he boundary value problem we studied contained 6
suzerainty of nonlocal and nonseparated boundary condi-
tions. jT_he most important features of differentialequations subject
to either initial or boundary conditions are the existence and
uniqueness of their solutions. In this paper, we discussed the
existence and uniqueness of solutions of specific type of the
couple system of the Langevin differential equation in the
framework of Caputo fractional derivatives and under the
suzerainty of nonlocal and nonseparated boundary condi-
tions. The boundary value problem we studied contained 6
different parameters. Because of the complexity, we were
forced to use computer programs in order to find examples
that would support our results. We discussed these examples
from the theoretical point and solved numerically using the
Adams-type predictorcorrector method by implicitly
implementing the Gauss–Seidel method.

It is recommended to consider the same problem in the frame of other fractional derivatives especially the ones with

no singular kernels and compare their results to the ones discussed in this paper.

Data Availability

The data used to support the findings of this study are included within the article in the references.

Conflicts of Interest

The authors declare that they have no conflicts of interest.

Acknowledgments

The authors would like to acknowledge and express their
gratitude to the United Arab Emirates University, Al Ain,
UAE, for providing the financial support with Grant No.
31S363-UPAR (4) 2018.
