INTRODUCTION

Traumatic brain injury (TBI) is a significant cause of death and disability around the world.¹,³ Elevated intracranial pressure (ICP) is an important cause of secondary brain injury and is consistently associated with worse outcome.⁴ The brain trauma foundation (BTF) guidelines are supposed to be strictly adhered to for the management of TBI. The BTF recommends continuous ICP monitoring in all salvageable severe TBI patients (Glasgow Coma Score [GCS] ≤8) with a computed tomography (CT) scan revealing intracranial pathology. They are also to be utilized for severe TBI patients with a normal CT scan,
but who exhibit two or more of the following risk factors: age over 40 years, unilateral or bilateral motor posturing, or a systolic blood pressure of <90 mm Hg.[2,4]

It has been suggested that implementation and adherence to BTF guidelines correlate with improvement in neurological outcome and reduction in mortality following severe TBI. However, there is significant variability in the use of ICP monitors and inconsistency in adherence to BTF guidelines across neurosurgical centers.[1,5,10,11]

Here, we evaluated the extent to which BTF guidelines for continuous ICP monitoring in severe TBI patients were being performed, and how it impacted outcomes.

MATERIALS AND METHODS

We obtained IRB approval for this population-based retrospective cohort study of TBI patients. From 2000 to 2013, 5449 patients with TBI from three trauma centers were evaluated [Table 1]. Multiple demographic and clinical variables were collected from the trauma registry database [Table 2].

The study population was stratified into two-study arms based on the adherence to BTF guidelines for insertion of ICP monitoring; (1) patients with severe TBI (GCS ≤8) and an abnormal CT scan, (2) patients with severe TBI without CT abnormalities, but with at least two of the following: age >40 years old, unilateral or bilateral motor posturing (GCS motor score ≤3), and/or a systolic blood pressure <90 mm Hg.

Evaluation of outcomes

Primary outcomes included assessment of adherence to BTF guidelines, and in-hospital mortality. Secondary outcomes assessed morbidity including ICU and hospital length of stay (LOS), discharge disposition, and others.

Statistical methods and bias

Univariate and multivariate logistic and linear regression were used to assess outcome. A purposeful selection method was deployed using variables after univariate analysis to identify the predictors of adherence and confounders effect on outcome.

All statistical analyses were performed using Stata 13.1. \( P < 0.05 \) was considered statistically significant.

RESULTS

Adherence rates to BTF criteria

There were 1848 patients who met the BTF guidelines for ICP monitoring; of these, 1606 had abnormal CT scans. The adherence rate to BTF guidelines for the insertion of an ICP monitor in TBI patients was highest among those with abnormal CT studies (1606 patients; 33.31%) versus normal CT’s (8.68% of 242 patients). Notably, just 556 (30.09%) patients received ICP monitors [Figure 1].

Predicting ICP monitoring adherence

Baseline demographics, injury characteristics, and the model of care systems for ICP adherence and nonadherence groups were analyzed [Table 3]. Significant predictors for guideline adherence included: younger patient age, higher injury severity scores (ISS), lower GCS, the absence of alcohol intoxication, a CT scan abnormality, requiring craniotomy, and the absence of a cardiac arrest [Table 4].

Strict adherence to BTF criteria for ICP monitoring in TBI patients was lowest in the specialized neurological program within a general ICU model (center). Further, the general ICU model (center) had a lower adherence rate versus the neurocritical model (center) [Table 4].

---

**Table 1: Study inclusion and exclusion criteria.**

| Inclusion criteria | Exclusion criteria |
|--------------------|-------------------|
| Age≥18 | Penetrating brain injury |
| ISS≥12 | Nonalberta resident |
| AIS of head and neck>3 | Patients who died in the emergency department |
| GCS ≤8 or ICP monitoring was inserted |

**Table 2: Variables/quantitative variables and data sources/measurement.**

- Age
- Mechanism of injury
- Extraction and it’s time
- Sex
- GCS
- Systolic blood pressure
- Trauma severity score including: ISS and AIS for (head, chest, abdomen, and extremity)
- Alcohol level
- Coagulopathy
- CT head abnormality
- Cardiac arrest
- Craniotomy and other surgical procedures
- ICU model (neurocritical care, general intensive care unit (ICU), and specialized neurological program within a general ICU)
- ICU length of stay
- Hospital length of stay
- Discharge disposition
- Over-all in hospital mortality

*Purposeful selection method was used for selecting variables in the model. Overall fit of the model was assessed using Hosmer-Lemeshow statistic which not statistically significant (Chi-square statistics=14.98, df=8, P=0.06) indicating that the model provided a good-fit for the data.
Summary of morbidity and mortality rates
In-hospital, the mortality was 42% in the adherent group and 32% in the nonadherent group [Table 5], (crude OR: 1.54 \( P = 0.0001 \)) (adjusted OR: 2.01 \( P = 0.0001 \)). Increased age, higher ISS score, lower GCS, and cardiac arrest all increased mortality rates; CT abnormality and performing craniotomies did not [Table 6].

Table 5: Percentage of in hospital death, discharge disposition, hospital and ICU length of stay and ventilation days in adhere and not adhere group.

| In-hospital mortality | Adhere | Not-adhere | P-value |
|-----------------------|--------|------------|---------|
| Survive               | 57.73% | 67.8%      | 0.0001  |
| Died                  | 42.27% | 32.2%      |         |

| Discharge disposition | Home | P-value |
|-----------------------|------|---------|
|                       | 5.58 | 18.67%  | 0.0001  |

| Acute care facility | 14.21% | 17.82% | 0.0001 |
| Chronic care facility | 42.27% | 32.22% | 0.0001 |

| Hospital LOS | Mean (SE) (days) | 34.32 (1.76) | 24.41 (1.30) | 0.0001 |
| ICU LOS      | Mean (SE) (days) | 13.40 (0.46) | 8.06 (0.33)  | 0.0001 |
| Ventilation days | Mean (SE) (days) | 11.24 (0.42) | 5.83 (0.25) | 0.0001 |

Adherence to ICP monitoring following BTF guidelines was associated with an average higher LOS in the ICU (>7 days), and hospital (>14 days). Other variables were associated with longer ventilation times, ICU and length of hospital stays are listed in [Tables 7 and 8].

In the sensitivity analysis from excluding patients who died within 48 h of admission, the association between adherence to BTF of ICP monitoring and mortality was greater (OR: 4.59 \( P = 0.0001 \)).

DISCUSSION
Our study showed that ICP monitoring was performed in a minority of patients with severe traumatic brain injuries who meet the current BTF criteria (30.1%). Adherence rates were significantly different across different critical care units; this rate is even lower than those reported in UK (43% and 46%), Austria (56%),[1,6,9] and systematic review studies (46.4%).[17]

Adherence was lower in patients with a normal CT scan and two or more risk factors; age, BP , and motor GCS (9%) versus patients with abnormal intracranial finding (33%). This suggests that clinicians are likely not convinced that ICP monitoring in this subgroup of severe TBI patients is necessary.

*Purposeful selection method was used for selecting variables in the model. Overall fit of the model was assessed using Hosmer-Lemeshow statistic which not statistically significant (Chi-square statistics=11.56, df=8, \( P=0.17 \)) indicating that the model provided a good-fit for the data. OR: Odd ratio

In this study, ICP monitoring was associated with the higher mortality and morbidity despite controlling multiple confounders.

**CONCLUSION**

In a large sample of Canadian TBI patients, adherence to BTF guidelines for ICP monitoring was low and varied across centers, especially if CT studies were normal. Further, ICP monitoring was associated with the higher mortality rates and ICU/hospital lengths of stay.

**Declaration of patient consent**

Institutional Review Board permission obtained for the study.

**Financial support and sponsorship**

Nil.

**Conflicts of interest**

There are no conflicts of interest.
