ABSTRACT

The aim of the investigation was to evaluate the feasibility of mixing fly ash in cement to make mortar specimens for getting an agreeable compressive strength of the mortar. Different proportions of cement and fly ash were tried at laboratory-scale, utilizing dry fly ash at 15%, 20%, 25%, 30%, 35%, 40%, 45% and 50% of cement weight. The reference mortar was prepared with 100% of Ordinary Portland Cement (OPC). The blended mortar was utilized to make standard cubes of uniform size, namely, 70.6mm (L), 70.6 mm (W) and 70.6 mm (H). After curing at standard temperature and humidity, being soaked in potable water, tests were carried out, for evaluating the compressive strengths attained by the cube specimens, at the curing ages of 3, 7, 14, 21 and 28 days.

The 28th day’s compressive strength of the cement-fly-ash-mortar containing 70% cement and 30% fly ash was 37.53N/sq.mm, which corresponded to 93.7% of the Compressive strength (40.06N/sq.mm) attained by the reference mortar which contained 100.0% of cement and zero percent.

It was inferred that fly ash can be added at 30% weight of cement in the mortar, on dry weight basis.

1. INTRODUCTION

Portland Cement, generally referred to as Ordinary Portland Cement (OPC) is the popular ingredient in making a mortar, along with sand and water (1). Manufacturing of cement causes the emission of excessive Carbon dioxide (CO2), along with other polluting materials such as dust (Particulate Matter), and other harmful gases. For this reason, alternative material which can substitute cement needs to be tested and evaluated (2,3,4). ‘Fly ash’ obtained from coal-burnt Thermal Power Plants, is one such material which may be used along with cement, in making a mortar or concrete. There could be some advantage from the view point of economic savings, energy savings, without losing technical advantage (4). Fly ash, as a substance possessing cementitious ingredients, can supplement the bonding action in the mortar or concrete (5).

The mixing of fly ash with cement in making a mortar, or use in the concrete has been reported to increase pozzolanic quality (containing silicious and aluminous compounds). Adding water to cement initiates the hydration process, involving an exo-thermic reaction, generating heat in the mix. Calcium Silicate Hydrate, a product of cement hydration, will undergo Pozzolnic reaction with fly-ash, if it is added. As a result, strength development and increase in durability are achieved (6,7,8,9).

1.1. Hydration Process and Its Impact on Binding Products

Hydration generally describes the physical and chemical processes which take place when water is added to cement. As a result of hydration, Silicates and Aluminates are yielded, forming a hardened mass called ‘hydrated cement’. It is achieved by an Exothermic Reaction when cement and fly ash are mixed with water. Subsequently, a pozzolanic activity gets initiated, producing the same kind of cementitious compounds, similar to the cement-hydration process(10). However, the rate of reaction with fly ash is considered as a slow process in so far as the rate at which the strength is gained by the resulting mass. For this reason, perhaps, the re-use of fly ash, in the manufacture of ‘Pozzolanic Portland Cement’ has not increased significantly(11).

It is further learnt that the ‘Free Lime (CaOH)’ liberated during the hydration process of cement and water is going to be beneficial when fly ash is added as a third ingredient, to result in the formation of a ‘durable binder’, namely, called Calcium Silicate Hydrate(8).

In order to curtail environmental pollution caused by other methods of disposing fly-ash, the scheme of producing Pozzolana Portland Cement has been introduced in many cement manufacturing companies around the world (10, 11).

2. ROLE OF RESEARCH

Research findings in the effort of finding alternate materials to replace cement, or substituting cement in its use, at least partially, wherever possible, is considered as a contribution to the society, due to the well-established statistical facts relating to the quantum of cement manufacture, at the global scale, and the seriousness of environmental pollution related to cement production, in view of carbon dioxide-emissions and other green house gases (12). Encouraging results in partial replacement of cement by Fly Ash have been shown, in developing strength and durability in concrete (13). This has formed the basis of interest to take up the present Study.
3. AIM AND OBJECTIVE OF THE STUDY
The aim of the Study was to evaluate the optimum percentage of fly ash which can be reliably used in cement concrete, without sacrificing strength aspects in construction works. The scope of the study is that the results of the study can be successfully put into field-practice.

4. METHODOLOGY
Laboratory Studies were conducted to cast sufficient number of mortar specimens, in pre-determined mix proportions. Relevant IS-codes were followed in carrying out the necessary experiments for each parameter chosen for the study. The ratio of mortar mix was selected as cement : sand = 1:3. The Reference Mortar containing 100% cement. Varying percentages of Fly Ash were added in the mortar, to replace cement, at 15%, 20%, 25%, 30%, 35%, 40%, 45%, and 50% weight of cement. The quantity of fine aggregate (sand) remained the same. The specimens of mortar were cast in the moulds of standard size, to produce specimen prototypes of size 70.6mm (L), 70.6 mm(W), 70.6 mm(H). After removing the specimens from the moulds, they were kept under controlled laboratory conditions, maintaining a constant temperature of 27°C and a relative humidity of 90%, for a period of 24 hours, and then kept in the curing yard under shade. They were subjected to testing for compressive test during the Curing age of 3, 7, 21 and 28 days.

5. RESULTS
Table-1 presents a comparison of Physical and Chemical characteristics of Ordinary Portland Cement (OPC) and Fly Ash.

| Physical Parameters                  | OPC        | Fly Ash     |
|--------------------------------------|------------|-------------|
| (i) Fineness                         | 94.2%      | 98.12%      |
| Passing 0.075 mm Sieve, (%)          |            |             |
| Specific Surface area (sq.m/kg)      | 330        | 380         |
| Specific Gravity                     | 3.12       | --          |
| Chemical ingredients (%)             |            |             |
| CaO (Calcium Oxide)                 | 56.12      | 6.98        |
| SiO2 (Silicon Di-Oxide)              | 19.06      | 53.77       |
| Al2O3 (Aluminium Oxide)              | 5.02       | 20.43       |
| Fe2O3 (Ferric Oxide)                 | 2.73       | 4.98        |
| MgO (Magnesium Oxide)                | 1.98       | .36         |
| SO3 (Sulphur Tri-oxide)              | 0.97       | 0.19        |
| Na2O (Sodium Oxide)                  | --         | 3.13        |
| Ignition Loss                        | 1.04       | --          |
| Residue (Insoluble)                  | 0.57       | --          |
| Lime Reactivity                      | --         | 9.87        |

Note : Portland Cement Association (PCA) has categorized Fly Ash as follows: Type – F, Type-Cl, and Type-CH, based on percentage content of CaO (Calcium Oxide).

Type-F contains less than 8% CaO; Type-Cl contains 8% to 20% CaO; and Type-CH contains greater than 20% CaO. (PCA-Publication, 2015).
Table-2 presents the percentage of grains finer than the respective sieve sizes.

Table 2 Grain size distribution of fine aggregate

| Sieve Size | % finer |
|------------|---------|
| 4750 um    | 99.2    |
| 1700 um    | 98.14   |
| 1180 um    | 97.56   |
| 425 um     | 91.27   |
| 300 um     | 92.11   |
| 212 um     | 80.33   |
| 150 um     | 59.23   |
| 75 um      | 36.75   |

Table-3 presents the compressive strengths attained by the Reference mortar (containing 100% cement in the 1:3 cement-sand mortar), and the 8-other mixes containing 15% of fly-ash substitute for cement, 20%, 25%, 30%, 35%, 40%, 45% and 50% fly-ash contents.

Table 3 Variation of Percentages of Compressive Strength (N/sq.mm) against Fly ash percentages achieved during different Curing Ages

| Sl No | Fly ash % | 3days CS | 7 days CS | 14 days CS | 21 days CS | 28 days CS |
|-------|-----------|----------|-----------|------------|------------|------------|
| 1     | 0.00      | 29.2     | 33.6      | 36.6       | 38.0       | 40.06      |
| 2     | 15.00     | 24.82    | 29.13     | 31.18      | 33.50      | 34.13      |
| 3     | 20.00     | 22.01    | 24.02     | 29.32      | 33.41      | 35.57      |
| 4     | 25.00     | 26.57    | 30.57     | 33.32      | 35.34      | 36.65      |
| 5     | 30.00     | 27.42    | 30.12     | 33.32      | 35.91      | 37.53      |
| 6     | 35.00     | 26.98    | 30.01     | 32.97      | 34.93      | 36.35      |
| 7     | 40.00     | 27.01    | 29.47     | 32.67      | 33.08      | 33.98      |
| 8     | 45.00     | 27.98    | 30.06     | 31.98      | 32.17      | 32.38      |
| 9     | 50.00     | 27.97    | 31.17     | 32.04      | 32.27      | 32.87      |

The Cement mortar with sand and 100.0% cement attains compressive strengths of 29.2 N/sq.mm, 33.6 N/sq.mm, 36.6 N/sq.mm, 38.0 N/sq.mm, and 40.06 N/sq.mm, respectively, on the Curing Ages of 3days, 7days, 14days, 21days and 28days. The Compressive strengths of Mortars containing varying percentages Fly Ash, namely, 15%, 20%, 25%, 30%, 35%, 40%, 45% and 50%, are shown in Table-3, corresponding to the Curing Ages varying from 3days to 28days.

The Compressive Strength of Fly Ash-Cement mortar containing 30% of Fly Ash (and 70% of Cement) attains the maximum value of 37.53 N/sq.mm, on the 28th day of Curing Age, among all the Fly Ash-Cement mortars used in the Study. This means that 30.0% of Cement weight is the Optimum Fly Ash quantum which can be added in the mortar, to give the maximum Compressive Strength. This variation is shown in Table-4 and depicted in Figure-1.
Table 4 Variation of Compressive Strength of Fly-ash mortars as a percentage of Reference Mortar

| S No | Fly ash (%) | 28 days CS |
|------|-------------|------------|
| 1    | 0.00        | 100        |
| 2    | 15.00       | 85.2       |
| 3    | 20.00       | 88.8       |
| 4    | 25.00       | 91.5       |
| 5    | 30.00       | 93.7       |
| 6    | 35.00       | 93.5       |
| 7    | 40.00       | 88.8       |
| 8    | 45.00       | 84.8       |
| 9    | 50.00       | 71.8       |

Figure 1 Variation of Compressive Strength percentages in Mortars containing Fly-Ash in contrast to Reference Mortar

6. CONCLUSIONS

Based on laboratory-scale studies on comparing the compressive strengths developed by cement mortars, using 100% cement in the first case, versus partially substituting cement by adding fly ash, in varying percentages, namely, 15% to 50%, in steps of 5%, the following results were revealed:

(i) The Cement mortar containing 100% cement with sand and water attained a compressive strength of 40.06 N/sq.mm.

(ii) Trials of substituting cement with Fly ash proved that 30% of cement weight is the optimum Fly ash addition at which maximum compressive strength is attained, which was equal to 93.7% of the compressive strength attained by the Reference Mortar.

(iii) Optimum percentage of Fly ash added can be encouraged up to 30% of the weight of cement, in making the mortar, from the view-point of achieving a favourable compressive strength.

(iv) There is evidence in the literature to show that the quality characteristics of Fly Ash, which obtained from Coal-burning Thermal Power Plants, can be different, depending on the nature of combustion processes employed, and the type of fuels used, and hence, it becomes necessary to generate data locally to optimize on the re-use of coal (14,15,16).
