The Power of Place: Tourism Development in Costa Rica

ERIC NOST
Department of Geography, University of Kentucky, Lexington, USA

ABSTRACT In this paper, I question how representations of tourist destinations color and are colored by development. Presenting the results of ethnographic fieldwork conducted on the southern Caribbean coast of Costa Rica, I find that the authenticity of portrayals of place is important not for its veracity, but for the social work it performs. Authenticity is not merely socially constructed but expressive of social relations which value people and places. Tourist perceptions of the caribe sur as genuinely underdeveloped—gauged by an analysis of photos and guidebooks as well as surveys—produce an approach to resource use within the community that is limiting. Because the value of the place is its underdevelopment, development itself constrains the possibility of sustaining further growth. Ultimately, reading development via place can be a guide for critically appreciating contemporary patterns of tourism and sustainable development in the caribe sur and elsewhere.

Key Words: Place, tourism, sustainable development, authenticity, Costa Rica

Bar Brawls and Big Marinas: Tourism Development in Caribe Sur

In this paper, I question how representations of place color and are colored by development on the southern Caribbean coast of Costa Rica (Figure 1). The economic life of that region – the caribe sur – depends upon tourism. To differing extents, the region’s diverse population of English-speaking Afro-Caribbeans, nearly half of Costa Rica’s indigenous population, Hispanic-Costa Ricans, and expatriate North Americans and Europeans participate in the tourism trade all make up . . . Yet in spite of tourism, and the region’s extensive history of community resource management and development (Gump 2001; Frantz 2003), Talamanca (which includes the coastal caribe sur as well as nearby mountainous areas) remains the most impoverished of the Costa Rica’s 81 cantones. Recent events there have brought to the fore the connections between tourism, these development strategies, and representations of the region as a place.

In the early morning hours of April 19, 2008, a resident of Cahuita – a small, relatively dispersed settlement of about 1,000 on the coast – was shot and killed at

Coco’s Bar, a popular hangout for tourists as well as locals. Although the reporting was relatively benign, the town has received critical attention in recent years for gruesome violence in a place that tourists and locals alike typically consider tranquil. This type of negative press coverage is lamented by local business owners for scaring away potential tourists and damaging the local economy (Kelly 2004).

A few days later at the University of Costa Rica (UCR), students draped a large banner that read “Long live Puerto Viejo – Without the Marina” over the campus’s main library. The university newspaper, *Semanario Universitario*, had recently published a front-page story on a proposed marina complex to be sited in Puerto Viejo de Talamanca, a town about 15 kilometers south of Cahuita. The story articulated several of the potential ecological and social effects that the large-scale development might engender, such as damage to nearby coral reef systems and crime (Chacón 2008). In a similar report, a female US tourist explained, “I’m a tourist and if this is constructed I won’t come here anymore. I like the simplicity and naturalness of Puerto Viejo that would be lost with this (Plaza & Carvajal 2008).”

The shooting incident raises some appealing questions. How does the image of a place motivate or daunt tourists and to what end for local economic development? The remark of the U.S. tourist, poses the reverse. It hints at a tension between development and the reasons travelers visit the region, suggesting that states of development inspire travel. She will only continue to travel to Puerto Viejo if the marina project, which would generate substantial revenue but ruin the town’s “simplicity and naturalness,”
is scrapped. But what is the true character of the town? Is such an essential definition even available?

My answer is that in the *caribe sur*, depictions of place in brochures and text produce and sustain a dialectical communication between tourists and promoters about the place, in which its perceived authenticity emerges as the central selling point. Yet what travelers interpret as genuine is a lack of development – indeed, an historic underdevelopment. Such judgments of the place are central to conflicts over regional growth and management of natural resources. At the core of these contests, tourists, locals, and foreign residents all attempt to define the *caribe sur*. While tourism is heralded as a means to achieve development – and indeed, as the only road to development for poor peoples (UNWTO 2005 in Schellhorn 2010) – I argue that the negotiated results of such rhetorical maneuvering reveal a limited promise of sustainable development.

**Authenticity as Social Relation**

Place, authenticity, and development each lay claim to their own literature within tourism studies. Place is conceived of as a locus that defines where tourism activities occur, as in a tourist destination (Crang 2006; Hernández-Lobato *et al.* 2006). But beyond geographical coordinates, the term bears notions of meaning. The representation of places inspires travel (Hernández-Lobato *et al.* 2006; Su 2010) as tourists decide where to visit after reading or hearing about a place (Urry 1990; Young 1999). But here crucial questions spring forth: how are these places imagined and by whom? Should places be understood more in terms of their performance (what is done in place) or their representation (what is portrayed of place)?

Places are best understood as constructed socially. They are the product of dynamic attempts at definition by various actors who operate and express themselves within capitalist, colonial, patriarchal, and other such structures. This meaning of place, moreover, is not static. It is continuously reworked through “agency, struggle, and resistance,” (Tucker 2007, p. 142) be it by tourists (D’Hauteserre 2006; Tucker 2007), development interest groups (Schollmann *et al.* 2001), or locals (Su & Teo 2008). Related, place is not simply “out there”; rather, it is made and remade by specific agents (Crouch 2000).

However, within this constructionist view, the epistemology of place meaning is contested. Some consider place as knowable through its depiction in images, texts, and maps. Places can thus be read semiotically (Knudsen *et al.* 2007; Metro-Roland 2009). This perspective has the advantage of treating language and the “demarcation of social reality” (Schollmann *et al.* 2001) as powerful. However, a reliance upon existing imagery and text runs the risk of obscuring struggles at the heart of the creation of places, as images can be passively read (Crouch 2000). Instead, it is argued, place ought to be known by the ways people perform it (Crouch 2000, 2010;
Hanna et al. 2004; Minca 2007). The meaning of place, then, is linked with what people do on the ground, in place, as part of a process.

The representation and performance of place are not mutually exclusive. In this study, I approach place in a manner similar to Hanna et al. (2004) and Crouch (2010) in considering representation as a sort of performative work that is done by tourists, locals, and others—all those who weigh in on the matter and meaning of place. Images are not final products but contain a social history and a contemporaneous currency.

The performance of place may emphasize how individuals are disciplined and how that discipline is contested (Crouch 2000; Tucker 2007), but such a perspective misses out on important “powers” of place stemming from “wider economic and political relations of power” (Bianchi 2009, p. 490). The display of place is performed by multiple constituents in a matrix of power relations. Del Casino & Hanna (2000) suggest that representations in maps and guides struggle continuously to “fix” identities by delineating what is appropriate for a given bounded space (see also Harvey 1990). The social production of space via this intertextual illustration is not essentializing. Rather, representations permit space for ambiguity, allowing for manifold disputes of meaning and it is this contestation which makes place identity in constant flux (Harvey 1990; Del Casino & Hanna 2000; Schollman et al. 2001; Lacy 2002; Sundberg 2003; Cresswell 2004; Davis 2005; Su 2010). Thus, a critique of representations can, when their creation and what work they perform is kept in mind, illustrate overlooked power in place.

**Authenticity**

Authenticity has a contentious history as a concept in tourism studies (Wang 1999; Reisinger & Steiner 2006; Lau 2010). The questions of how authenticity is made to matter—if at all—and to what end have been dealt with diversely. Authenticity variously refers to verifiable cultural traits (MacCannell 1976), is negotiated (Cohen 1988), is socially constituted (May 1996; DeLyser 1999; West & Carrier 2004), or is simply unimportant (Reisinger & Steiner 2006).

Dydia DeLyser (1999) has written persuasively on authenticity. She suggests that authenticity is constructed at multiple scales; the validity of information about other cultures is filtered at an individual level, yet such filters are in many ways defined by broader trends in society. A tourist at a western U.S. ghost town may express their amusement at the anachronism of an authentic artifact, but such authenticity becomes “a vehicle through which the narratives of the mythic West, of progress, and American virtues, are made tangible and believable to visitors” (DeLyser 1999, p. 624). Authenticity is thus elicited in things, but is not a thing to be measured per se. Authenticity is a “vehicle,” a means to an end. Notions of the authentic perform and the reason they can be valuable to researchers (cf. Wang 1999; Reisinger & Steiner 2006; Lau 2010) is because of the work they do to enroll people in social projects.
In this sense, authenticity is a social relation enacted between people. West and Carrier (2004, p. 485) approach this sort of conceptualization in building the salient claim that what ecotourists consider authentic is not derived from conservationists or any other informed individual or group, but “that it is the framework of Nature and the frontier” through which tourists judge authenticity. Importantly, this authenticity is inseparable from ecotourism, which they brand as a project of promoting markets in social goods. The convention that a particular nature is authentic enables an eco-friendly tourism to function as the neoliberal form of sustainable development.

Davis (2005) elaborates on how landscapes are thus transformed by conceptions of the world. Place representations discursively “legitimize certain uses and prohibits others” and in performing so produce the material landscapes of place (Davis 2005, p. 609). Authenticity as such a vision of place is a social relation reproduced by tourists and locals. West and Carrier (2004) demonstrate this concept in Jamaican ecotourism. Discourse concerning authentic nature becomes, in dialectical fashion, actually existing material reality as tourists successfully make their claim to authorities to have fishing boats removed from areas around a beach. Authenticity becomes a social relation – valuing, ordering, and reorganizing people, places, and resources.

This authenticity cannot be engaged without considering the representation of place. Britton (1991) urged geographers to critique what he deemed “markers of tourism space” – representations like maps, brochure images, guidebooks of travel areas. While Urry (1990) has been important in this regard, others have added valuable contributions to the conversation (Edensor 1998; Del Casino & Hanna 2000; Davis 2005). In particular, Catherine Lutz and Jane Collins’s (1993) deconstruction of image meaning in the National Geographic magazine is useful. Lutz and Collins nullify the idea of the magazine as an unbiased scientific source by presenting how its printed images actually encode messages and value impositions about its subjects. The magazine projects cultures and places as harmoniously associated with nature and essential qualities of human existence, yet this view contrasts with the dynamism of change that cultures and places readily experience. As in National Geographic photography, notions of authenticity are expressed through and embodied in displays of place. Moreover, such notions are more projections of social desires than realities (Wang 1999).

**Development**

If authenticity is indeed a social relation, how does it operate? How do ideas of place actually “find ground” and create social and material reality? In the Bikini Atoll, for instance, the might of U.S. military and media is a transformative power (Davis 2005). Yet the many means by which places are made visible are typically bracketed from questions of economic development.

As social relation, authenticity of place is inseparable from development – the interrelated social (e.g., income and well-being) and material (e.g., physical infrastructure like roads and resorts as well as environmental impact) aspects of economic
growth. The uneven global development that sustainable development seeks to rectify is driven in part by forces of homogenization and differentiation in the capitalist economy (Smith 1990; Sywngedouw 1997). Capitalism tends toward equalizing the rate of profit across space and in place as it achieves greater economies of scale while it simultaneously seeks niches that yield comparatively high rates of profit. It is a commonplace that globalization standardizes places so that they become like everywhere else. However, Harvey (1990) has noted that in a globalized world, capital moves freely but locale remains fixed. In order to attract residents, businesses, or, in this case, visitors, places work to distinguish themselves from other, often homogenized, areas. Capital serves to augment the assembly of place and place-identity (Harvey 1993; O’Hare 1997; Sywngedouw 1997; Kneafsey 1998). As such, tourism may be “destroying” places, but at the same time it is creating others.

Place, authenticity, and development can be analytically united. Sustainable development studies in particular tend to treat place as a mise-en-scène which enframes sets of peoples and resources whose interaction could be made more sustainable (D’Hauteserre 2005; Lu & Nepal 2009; Wearing et al. 2010) Thus, much of the work on tourism development focuses on how to manage destinations for growth (Young 1999; Landorf 2009). Related, such studies chart the trajectory of destinations’ development (Saarinen & Kask 2008), as opposed to the processes that make such development contingent (Young 1999; D’Hauteserre 2005). In this vein, there is scant attention paid to explaining destination success or failure in terms of the way place identity is framed (cf. Hernández-Lobato et al. 2006).

O’Hare (1997), however, posits a dialectical relation between place and tourism development on Australia’s east coast. A “narrative of landscape” that historically depicted the area as relaxing informs development discourses. Decision-makers have codified the village’s low-key atmosphere by enforcing building codes that restrict high-rise projects. Yet the result of tourists’ demand is not always a given; place ideas are often disputed. Saarinen (1998) emphasizes the power relationships between groups offering competing notions of development and place by describing how the transformation of a tourism region, in this case the Finnish Lapland, is dependent upon negotiated notions of development. Who gets to choose how local resources are managed? The answer regularly relies on a complex interaction of power. Bianchi (2003) proposes that, “tourism spaces, therefore, reflect the contest over the meaning and ‘appropriate’ use to which particular places should be devoted” (Bianchi 2003, 27).

Place-meaning is therefore constituted by multiple parties within webs of power. Tourist promoters aim to ascribe an identity to place, as do locals, and authenticity is one key frame in which these identities are articulated. It is socially written at multiple layers from the individual (DeLyser 1999) to the state (Bianchi 2003) to the ideological (May 1996) and its performance is as a social relation amongst people and places. As such, authenticity is inextricable from the material matters of development.
Tourist Motivations for Visiting the Caribe Sur

The style, scale, and materiality of tourism encountered on the Pacific coast of Costa Rica contrasts sharply with that of the Caribbean. The Pacific specializes in providing beach access and mass excursions and is heavily reliant on large-scale investment (national and foreign). Tourism in the caribe sur tends to center around intimate experiences with nature and culture and is undertaken with a smaller degree of investment and physical infrastructure (Anuario de Turismo 2006).

Tourism has replaced banana production as the mainstay of the regional economy there. Increased access to the region, the arrival of electricity in 1976, the failure of the cacao crop in the late 1970s and early 80s, and the establishment of Cahuita National Park in 1978 are both popularly and scholarly deemed additional contributors to the formation of the tourism industry in Cahuita (Leary 1996) and elsewhere in the region (GreenCoast.com). In 1993, after the government proposed an entry fee increase at the national park, locals seized control of the park and started investing entry fees – now voluntary donations – in community projects (Frantz 2003). The period immediately following the takeover of park management, from the early to mid 1990s, is imagined by locals as the pinnacle of tourism in Cahuita (Figure 2). At some point in 1990s, main growth in the sector shifted to Puerto Viejo. The town lacks the immediate vicinity of a national park, but supplies a number of beaches that host excellent surfing conditions. In both places, tours to neighboring protected natural areas are popular.

Methods

Drawing upon original ethnographic study in the field in 2008, I assess text and image content analyses against what tourists themselves describe as motivations for visiting
the *caribe sur*. A set of promoter (online and printed) and tourist photos was gathered for the image analysis. After an initial scan of the set for major themes and reoccurring objects, coding questions were produced as a means of determining frequency in the depiction of: location (Puerto Viejo area, Manzanillo, Cahuita, anywhere else in Talamanca, or indiscernible), environment (town, jungle, beach, inside), people (how many, what kind, and activity), and the presence of wildlife, palm trees, hammocks, empty boats, or mountains (Djafarova & Andersen 2010). One third of all images from each data set were randomly selected to craft a study sample (tourists, \( n = 30 \); online promoters, \( n = 55 \); and print promoters, \( n = 26 \)), which was then coded.

Participant observation can be an effective way of gaining access to tourists and understanding their experiences on their own terms (Cook 1997; Graburn 2002; Pereiro 2010). In Cahuita, I regularly volunteered at the local national park and beach. As part of this strategy, I used short surveys to seek out both tourists’ and locals’ perceptions of the area. One hundred and one surveys were administered to visitors to Cahuita National Park along Playa Blanca and 38 visitors to Playa Cocles, located near Puerto Viejo. Interviewees were allowed to provide more than one answer. They were not asked to supply an overarching reply as to why they decided to visit or what they enjoyed the most. This approach entails methodological complications in that it is not entirely clear which motivations are primary, but provides richer qualitative data to work with and still generates basic quantitative results. Answers were distilled into a few main themes (Parfitt 1997). Forty nine short surveys were also collected from Cahuita residents. A fairly common tactic in tourism research (King et al. 1993; Chris Choi & Murray 2010), participants were asked about their favorite aspects of Cahuita, why tourists came to town, and the benefits and drawbacks of tourism there.

Additionally, several longer semi-structured interviews were conducted with contacts in the community. Interviewees were owners of either restaurants or *cabinas* in Cahuita. Conversations were intended to get a sense of Cahuita’s experience of tourism, particularly how tourism there has developed historically and its effects. Interviews with members and directors of charity, environmental, and developmental organizations in Talamanca were also undertaken to assess tourism in a broader, regional context.

*Images*

Do promoters employ certain images as tools in selling the place and do tourists grasp and reproduce such rhetoric? While the Caribbean coast of Costa Rica is indeed populated by palm trees, for instance, the incidence of images depicting palm tree beaches in promotional material is likely exaggerated. This is interesting given that perhaps the most popular beach in all of Talamanca—Cahuita National Park— is lined with almond trees and relatively few palms. Promoters utilize the palm in a third of all photos, but it is featured significantly less in images grabbed by tourists. Palm trees are nearly 15 times more likely to appear in promoter pictures.
than in tourist pictures. The frequency of images displaying empty fishing boats is also exaggerated. Furthermore, there are only a handful of beaches in the region, yet beaches are heavily featured in both tourist and vendor images. However, online promoters are three times as apt to depict beach images as are tourists. Finally, there is an absence of crowds and other people from images of place. There are not as many people featured in tourist promotions as one would actually encounter in place regardless of the season.

The difference in the imagery produced by promoters and tourists denote a rhetoric that promoters employ and that tourists fail to reproduce. Promoters’ imagery coalesces around a few elements like palm trees and empty boats, whereas tourists’ imagery is less consistent. Standardized images become rhetorical devices through which promoters participate in the discourse of place. Tourists do not typically engage in and reproduce such rhetoric, as their aim is not to sell, but that is not to say that tourists do not internalize the promoter discourse. The meanings sustaining the rhetoric can still matter for tourists. Tim Edensor (1998, 13) explains that representations “are part of a technology of enframing sights which forms the epistemological apparatus through which tourists see and interpret difference.” How do visitors to the caribe sur understand difference there?

Tourists’ shots of a single building emphasize the West Indian architecture typical of the area. Broader takes of the town highlight greenery at the expense of the built environment. Related, there is an evident focus on depopulated spaces; very few images include people. Promoters stress that the caribe sur is a place with relatively few other tourists – a place where one could relax. Tourists agree; the only people within their photos are themselves. The use of palm tree beach imagery unites a larger ideal of the Caribbean as relaxing and natural in place at the scale of the Costa Rican caribe sur. The image of the palm has stereotypically signified a peaceful atmosphere and environment throughout the Caribbean (Daye 2005). Indeed, the gaze of both tourists and promoters is directed toward the (palm tree) beaches of the area. The vast majority of photos are taken either of the beach or on the beach, shunning the mountainous and indigenous interior. The caribe sur, at least in the tourist discourse, is distinctively a “sand and sun” place.

Guidebooks

Brochure images are not the only way travelers discover the area and are not the only way the caribe sur is made to matter for them. The frequent usage of guidebooks entails that information about the area is transmitted to would-be visitors through short, stylistic characterizations. In these texts, the caribe sur is again depicted as a place that is depopulated, natural, and relaxing.

I asked travelers to both Playa Blanca in Cahuita National Park (CNP) and to Playa Cocles, a 10 minutes walk from Puerto Viejo proper, how they first learned about either Cahuita or Puerto Viejo. The most common responses from visitors to
The Power of Place: Tourism Development in Costa Rica

Figure 3. Empty boats are a common trope in guidebook depictions of the area, as in this representation of Puerto Viejo from *Frommer’s Top Destinations 2011 – Puerto Viejo, Costa Rica* (Greenspan 2011).

the CNP were “Word of Mouth” (*n* = 36, 39%) or “Guidebooks” (*n* = 34, 37%). At Playa Cocles, “Word of Mouth” was overwhelmingly the most provided response. From the “Guidebooks” category, the one source that was specifically mentioned was *Lonely Planet* (*n* = 16, 17%). *Lonely Planet* describes Cahuita as having a “very laid-back vibe,” “a decidedly Afro-Caribbean flavor” and as “breathtakingly beautiful” (Vorhees & Firestone 2006, 470). Descriptions of Cahuita encountered in other popular guidebooks like Fodor’s all note an underwhelming physicality and lack of other tourists. Cahuita is “dusty,” “laid-back,” (Kelly 2004, 196) “offbeat,” (Baker 1999, 383) comprised of “just two puddle-dotted, gravel-and-sand streets running parallel to the sea, intersected by a few cross-streets,” (Kelly 2004, 196) and “a village [of] no more than two parallel dirt streets crossed by four rutted streets overgrown with grass, with ramshackle houses spread apart throughout” (Baker 1999, 383). Depictions of Puerto Viejo are analogous (Greenspan 2011), but reveal tensions between the town’s economic growth and the tranquility that a historic lack of development has engendered. Puerto Viejo has a “laid-back attitude” and consists of “little more than one long paved road that follows the road,” though it is also “touristy” (Vorhees & Firestone 2006, 480) (Figure 3). “The development is low density,” but a “boom in tourism has taken place in the last few years, “creating a “plethora” of tourist-related activities in town (Kelly 2004, 199).

Surveys

What guidebooks intimate is that there exists a slight but substantial difference in attitudes toward Puerto Viejo and Cahuita. The reasons images and guidebook text propose tourists travel to the area are reinforced by tourists’ stated purposes. First, results from short surveys of tourists buttress previous findings (Gump 2001) that nature is a primary reason for visiting Cahuita. However, the data do not maintain
the conclusion that nature is the primary reason for visiting Cahuita. More visitors responded, “I came here for the beach” \((n = 27, 27\%)\) than \(\text{“I came here the flora, fauna, vegetation or other similar aspect of nature (other than the beach)”} \ (n = 20, 20\%)\) and just as many answered, “I heard it was a nice/beautiful place” \((n = 20, 20\%)\). Visitors to Cahuita National Park traveled to Cahuita not just because of its natural resources, beauty, or park, but also because it is a tranquil place that is “not over touristy” \((n = 19, 19\%)\). To visitors, Cahuita is “a relaxed town” and a “low-key place.”

Responses from visitors to Playa Cocles near Puerto Viejo differ from those at Cahuita National Park. Recommendations were tourists’ principal motivation for traveling to Puerto Viejo \((n = 9, 24\%)\). Visitors remarked, “I heard it was nice from friends who had been here” or “it was recommended by two friends. They say you must absolutely go to Cahuita and Puerto Viejo.” Many visitors \((n = 6, 16\%)\) answered that they traveled to Puerto Viejo randomly. Unlike Cahuita, natural surroundings are not a persuasive reason for visiting Puerto Viejo. Only a few respondents \((n = 2, 5\%)\) listed nature as a reason for traveling to the town.

The data on tourist motives demonstrate a distinction between the two places, which observation and informal conversations co-sponsor. There are few responses from the Playa Cocles surveys that fit the “Nature” category, unlike Cahuita, where one-fifth of respondents replied that they had visited to encounter nature. Furthermore, though visitors to both places list the atmosphere as a purpose for visiting, many clarified that Puerto Viejo was more “congested” and had more people and nightlife than Cahuita, an argument Lonely Planet puts forth as well. Both Cahuita and Puerto Viejo are tranquil and natural places, but each to its own degree.

**Caribe Sur as Authentically Underdeveloped**

The results of fieldwork narrate a common story. Images from promoters and text from guidebooks market the _caribe sur_ as a relaxing, natural Caribbean getaway. At one level, tourists are merely seeking “sand and sun.” Yet there are beaches elsewhere in the world, including many more on the Pacific coast (Costa Rica Tourism 2011). Why do people elect to travel specifically to the _caribe sur_ and to what end?

The correlation between tourist motivations and the representation of place ought to be viewed as a dialectical process, one that operates at different geographical scales. The manner in which the display of place is manufactured, framed, exported, and acted upon is a continuous give-and-take between tourists and promoters. Silver (1993, p. 316) posits that it is local promoters who “contribute to how ideas of the other are imagined and conceptualized within Western consciousness.” These promoters do indeed depict place and in many ways do so as they wish, without regard to tourists. However, those portraying place are not always local. Tourists regularly act on depictions provided by other travelers or media such as Lonely Planet. Moreover, visitors are rarely agenda-less and businesses have a real, fiscal incentive to appeal to
what inspires travel. Thus, the rhetoric Talamanca promoters employ in images to
gain customers is rooted in their understanding of tourists’ desires. Empty boats and
palm trees are entities encountered in the caribe sur that promoters feature because
they can symbolize the experience promoters presume tourists will prefer. In this way,
tourists’ actions as bearers of place-ideas play a powerful role in fashioning general
notions about – and as we will see, transforming – destinations.

Even more incisive analyses of the dialectic are achievable. Tourist motives and
place-meaning operate at various scales (Vaccaro & Beltran 2007). Generally, tourists
consider Costa Rica an alternative to destinations elsewhere in the Caribbean like
Cancún. Within Costa Rica, tourists deem the Caribbean coast as different from the
mass tourism ventures on the Pacific. Yet visitors formulate one further distinction
that highlights the fickle nature of tourist motivations. Between Puerto Viejo and
Cahuita, they consider the latter to be less “touristy.” In this model of decision-
making, different travelers funnel into the places appropriate to their expectations
of place. Thus, the traveler encountered in Cahuita and in Puerto Viejo may be
regarded as the embodiment of a type of tourist that covets sand and sun, values
local culture, seeks a relaxing atmosphere, and dislikes the presence of other
foreigners.

This kind of tourist seeks the authentic in desiring the “pristine” and the “tranquil,”
traits which take form in space in Talamanca, not North America or Western Europe,
or even the beaches of the Costa Rican Pacific. It is the caribe sur’s beaches, diversity,
and historic underdevelopment that enable promoters in Cahuita and Puerto Viejo to
represent an authenticity of place. That visitors invent distinctions between Cahuita
and Puerto Viejo because of their ostensibly different development environments –
when in fact the places are quite similar (Nost 2008) – stresses the value tourists
discover in discerning genuine landscapes of development.

This claim is significant because notions of the caribe sur as an underdeveloped
place are situated problematically against locals’ desired development of the place.
What is crucial to this authenticity is not its veracity, but what work it achieves. As
May (1996, p. 321) notes, “at issue is not so much which image or meaning is correct,
but it is a question of the material politics articulated by each vision.” The work that
authenticity performs is to develop social relations of a certain political economic
kind; the value of the people and resources in this place is their underdevelopment.
Yet these social relations do not go uncontested. The notion of the caribe sur as unde-
veloped belies struggles for development. The caribe sur is a “space stemming from
a variety of social processes that are often occluded by its symbolic representations”
(Bartling 2006, p. 394).

Recent project proposals underscore tensions between locals and foreigners. In
2008, an international firm presented the town with plans to construct a significantly-
sized marina within the harbor of Puerto Viejo (Plaza & Carvajal 2008) (Figure 4).
Though the plan has since then been withdrawn (Barquero 2008), the firm’s intentions
triggered an acute controversy.
Broadly, the project split both foreigners and locals. Ex-pats opposed the marina out of the fear that it would spoil the atmosphere and natural settings for which they had come to Puerto Viejo. Many actively participated in town hall councils on the issue. Individual tourists, always only an ephemeral presence in the area at any given time, likely did not weigh in very vocally (save the female tourist quoted earlier). But given the purposes for which tourists travel to the area they would have likely objected to the construction. Even other Costa Ricans, like the students who hung a banner at the UCR library, were concerned for the loss of the town’s character. Some residents also adopted this stance, additionally rejecting the argument that such a plan would provide new jobs. However, other locals and foreigners either promoted the project or were indifferent. A few residents of Cahuita, for instance, noted in reference to not only the marina but also tourism writ large, that it was Puerto Viejo’s prerogative to manage its resources as it preferred. Other residents of Cahuita and Puerto Viejo saw the marina as a providential source of capital and employment. Furthermore, many ex-pats viewed adopting any (public) stance on the project as an unwieldy and unethical interference in others’ affairs. These ex-pats believed that as foreigners they had no right to tell locals how to develop when many were so impoverished.

These debates over development strategies were at the same time integral to the creation of place-meaning. Individuals and groups, especially the coalition against the marina, drew upon notions of place to formulate their claim. In some sense, local ideas of place jibe well with the meaning tourists glean from the place. When asked, “what is your favorite part of Cahuita?” locals responded only with the beach ($n = 21, 39\%$), the tranquility ($n = 14, 26\%$), nature ($n = 10, 19\%$), and the people ($n = 9, 17\%$). These answers correlate strongly with tourists’ motivations for travel and expectations of the place as measured through images, guidebooks and surveys. What is principal, however, is the way that these facets of place are manipulated.
They are photographed, written about, or in any other way reduced and characterized so that the rhetoric and meaning that tourists receive is different than what locals experience in place. Images and guidebooks emphasize the beaches of the \textit{caribe sur}, its tranquility, and the natural surroundings, but in a way that adds a certain sense of the place as underdeveloped, a meaning that does not play out in the way locals perceive and discuss place.

Indeed, in the debate over the marina, many of the meanings uncovered in the tourist discourse are subverted. A couple of videos made in opposition are emblematic. The author of one short video positions themself as outside of the community but aims to rally around the “danger” Puerto Viejo confronted (Salvemos Puerto Viejo Costa Rica 2008). Projected in front of images that could have been taken straight out of a brochure, the threat is made clear: “Goodbye to the surf, the tranquility, the local culture, the natural charm.” The audience is encouraged to aid people who have “chosen to live at the rhythm of the Caribbean.” The point here is straightforward: images can be put to different uses by different actors. The same authenticity is mobilized to sell tourism as it is to stop a marina. And yet a similar video from locals used typical imagery while making the argument that what it meant for residents to live in the \textit{caribe sur} was not authenticity but a sense of pride in the community and the beneficial management of natural and cultural resources (¡No a la Marina! 2008).

Thus, even though the creators of these film shorts and most foreigners both opposed the marina, they did so for deviating purposes. The tourist rhetoric’s depiction of the \textit{caribe sur} as authentic is situated problematically against the locals’ portrayal because it characterizes the place as unpopulated and underdeveloped. The fact that such a tension exists between two parties critical of the project strengthens the proposition that meanings of place are manifold.

\textbf{Aporia of Tourism Development}

The marina controversy was, on the surface, a referendum on development. In another sense it was centered on the meaning of place. It reveals how the portrayal of place in terms of authenticity creates social relations that are contested and reworked. The association between development and place meaning, then, is dialectical. The landscape enables tourism promoters to depict place as a function of development (Davis 2005). In the context of the \textit{caribe sur}, the resulting discourse fixes an identity of “authentically underdeveloped” to the space that is the \textit{caribe sur}, setting the stage for how further development will take form. Will development be led by substantial foreign investment or with local capital, input, and ownership?

The answers are negotiated within a framework of power and privilege. The restriction of certain kinds and numbers of tourists aids the interests of foreigners who, like the female tourist from the U.S. quoted earlier, travel or move to the area explicitly for the relaxing vibe. When questioned, “why would you live there? There is nothing down there,” one ex-pat responded, “personally I like it the way it is as it has kept
the development down to a minimum and the ‘Disney set’ out and tends to cater to a more ‘down to earth traveler.’ I think the rumors and myths have served many of us who have chosen to live here very well” (Puerto Viejo Satellite 2011). Foreigners deploy their influence in an endeavor to maintain the status quo.

Thus place is paramount to understanding development. Not because development takes place somewhere but because place encapsulates crucial social relations. A critical view of the discursive representation of place points to these relations. Notions of the caribe sur as authentic express a way of relating and ordering people, places, and resources (Crang 2006). Yet the goal is not to leave the analysis in the realm of representation, forgetting its “material” aspects (Bartling 2006; Bianchi 2009). Indeed, the illustration here of authenticity as social relation demonstrates how economic homogenization and differentiation find ground in place. Because the appropriate use value of this place has come to be its authentic underdevelopment, additional development erodes the possibility of further, sustainable growth.

But the tension between the need for further development, sustainable or not, and the tourist desire to visit an “undeveloped” space is real (see also Wainwright 2008). The traveler’s desire for authentic difference does inherently constrict avenues for development; growth does not occur in a vacuum. Even relatively small-scale ventures like indigenous village visits bring in wealth and the resulting infrastructural changes turn-off many kinds of travelers, for whom the meaning of place no longer corresponds with their expectations (Young 1999).

So, how to work through this aporia (Wainwright 2008)? There is no easy answer, but at the very least advocates of sustainable development must explore place as the intersection of social relations, instead of attempting to managerially revalue people and resources while ignoring or leaving in intact the very relations which may well undermine such revaluing. As Cresswell (2004, p. 11) asserts, “place is a way of seeing, knowing, and understanding the world.” Reading development in the caribe sur via place is a guide for critically appreciating contemporary patterns of tourism and development in both the caribe sur and elsewhere.
