**S1 General**

All reagent grade solvents were used as purchased without further purification. Members of the Ant-Cn series were synthesized according to our previous report.[1] Photochemical reactions were performed using a Kessil® PR160–427 nm light source from DiCon FiberOptics Inc. Flash chromatography (FC) was performed using CombiFlash EZ-Prep, using SiO2 columns. The gradual photochemical reaction profile over time was followed by irradiating the twistacenes in a Spectroline® fluorescence analysis cabinet (model CM-10A) from Spectronics Corporation, USA.

For photo/thermal switching studies of twistacenes/endoperoxides, absorbance was measured at the longest wavelength vibronic shoulder, because these species exhibit maximal optical contrast at that wavelength. 1H-NMR and 13C-NMR spectra were recorded on Bruker AV 400 and Bruker AV 500 spectrometers in chloroform-d (CDCl3) and kinetic measurements were performed in 1,1,2,2-tetrachloroethane-d2 (C2D2Cl4). Residual solvent peaks were used as internal references.

The actual sample temperatures were accurately measured using an external standard (78.96 wt% ethylene glycol in dimethyl sulfoxide-d6 (DMSO-d6)). UV-vis absorption spectra were recorded using an Agilent Cary-5000 spectrophotometer. The spectra were measured using a quartz cuvette (1 cm) at 25 °C. The absorption wavelengths are reported in nm with the extinction coefficient ε (M⁻¹cm⁻¹) in brackets. The kinetics of photo-oxidation were measured under ambient conditions using the previously mentioned Kessil PR160–427 nm light source at 10% intensity. High resolution mass spectra were analyzed on an Agilent HR Q-TOF-MS mass spectrometer using the dual-ESI technique operating in the positive mode.
**S2 Synthesis**

**Scheme S1. Synthetic route to the peroxides**

General procedure for the photochemical synthesis of Ant-$Cn$-O$_2$

Quantitative photosynthesis was achieved by exposing the anthracenes at 100% intensity to the Kessil PR160–427 nm light source. Ant-$Cn$ (10$^{-3}$ M) in chloroform (1 mL), kept at -5 °C in a screw-capped glass vial, was irradiated at 427 nm for 3 min. The reaction was monitored by the disappearance of the blue emission from the reaction mixture. Chloroform was distilled off the reaction mixture by rotavapor, kept at 35 °C and the resulting mass was washed with 2 × 0.5 mL hexane to afford a pure white solid.
S2.1 Synthesis of Ant-open-O$_2$

Ant-Open-O$_2$ was synthesized using an identical procedure to that used for the Ant-Cn-O$_2$ series, with the exception that an extended irradiation time (5 min) was used for Ant-Open (8 mg, 9.82 $\times 10^{-6}$ mol). A purification procedure similar to that used for the Ant-Cn-O$_2$ series afforded Ant-Open-O$_2$ as a white solid (7.5 mg, 90%), which consisted of three isomers in solution:

$^1$H NMR (400 MHz, Chloroform-d) $\delta$ 7.58 (s, 2H), 7.26 – 6.95 (m, 9H), 6.90 (t, $J = 7.4$ Hz, 2H), 6.81 – 6.73 (m, 2H), 6.68 (ddd, $J = 11.9, 7.5, 1.6$ Hz, 2H), 6.38 – 6.30 (m, 2H), 6.13 (d, $J = 8.3$ Hz, 2H), 3.79 (d, $J = 3.1$ Hz, 2H), 3.43 (s, 4H).

$^{13}$C NMR (126 MHz, Chloroform-d) $\delta$ 154.75, 154.63, 154.60, 142.21, 141.78, 141.63, 141.17, 136.63, 135.76, 135.21, 135.18, 135.01, 134.64, 134.47, 134.16, 134.03, 133.62, 133.52, 133.26, 132.62, 132.59, 129.79, 129.46, 129.43, 129.37, 128.55, 128.11, 128.08, 127.48, 127.41, 126.67, 126.60, 123.29, 123.13, 122.98, 122.84, 122.21, 122.02, 120.87, 119.78, 110.68, 108.80, 84.61, 84.39, 84.16, 54.90, 54.06.

HRMS (ESI) m/z: [M]$^+$ Calcd for C$_{44}$H$_{26}$F$_{12}$O$_4$ 846.1639; found 846.1636.
UV-vis (H2C2Cl4): $\lambda_{\text{max}} (\varepsilon) = 292$ nm (7807 M$^{-1}$ cm$^{-1}$).

**S2.2 Synthesis of Ant-C6-O2**

Prepared according to the general procedure, using Ant-C6 (6 mg, 7.14× $10^{-6}$ mol). Obtained a white solid (5.7 mg, 93%).

$^1$H NMR (500 MHz, Chloroform-\textit{d}) $\delta$ 8.09 (s, 4H, H-C(18)), 7.60 (s, 2H, H-C(20)), 7.43 (dd, $J$ = 7.9, 1.3 Hz, 2H, H-C(4)), 7.30 (t, $J$ = 7.8 Hz, 2H, H-C(3)), 7.03 (ddd, $J$ = 8.2, 7.4, 1.7 Hz, 2H, H-C(15)), 6.89 (dd, $J$ = 7.7, 1.3 Hz, 2H, H-C(2)), 6.66 (d, $J$ = 8.2 Hz, 2H, H-C(16)), 6.46 (td, $J$ = 7.4, 1.0 Hz, 2H, H-C(14)), 6.38 (dd, $J$ = 7.4, 1.7 Hz, 2H, H-C(13)), 3.97 (ddd, $J$ = 8.9, 5.2, 3.8 Hz, 2H, H-C(22), diastereotopic), 3.64 (td, $J$ = 9.1, 2.9 Hz, 2H, H-C(22), diastereotopic), 1.48 (m, 2H, H-C(23), diastereotopic), 1.07 (m, 2H, H-C(23), diastereotopic), 0.85 (m 3H, H-C(24), diastereotopic), 0.77 – 0.67 (m, 2H, H-C(24), diastereotopic).

$^{13}$C NMR (125 MHz, Chloroform-\textit{d}) $\delta$ 154.8 (C11), 139.0(C9a), 135.7(C4a), 135.5(C1), 135.2(C17), 133.4(C2), 130.3(C12), 130.0 (C19), 129.3(C13), 128.4(C15), 128.3(C18), 127.2(C3), 126.4-119.9 (q, $J$ = 275 Hz, C21), 122.7(C20), 122.6(C4), 120.2(C14), 111.3 (C16), 83.8(C10), 66.8(C22), 29.4(C23), 25.7(C24).

HRMS (ESI) m/z: [M]$^+$ Calcd for C$_{48}$H$_{32}$F$_{12}$O$_4$ 900.2109; found 900.2166.

UV-vis (H$_2$C$_2$Cl$_4$): $\lambda_{\text{max}} (\varepsilon) = 271$ (3267), 292 nm (2955 M$^{-1}$ cm$^{-1}$).
S2.3 Synthesis of Ant-C5-O$_2$

Prepared according to the general procedure, using **Ant-C5** (5 mg, $5.85 \times 10^{-6}$ mol). Obtained white solid (5.0 mg, 96%).

$^1$H NMR (400 MHz, Chloroform-$d$) $\delta$ 8.04 (S, 4H, H-C(18)), 7.61 (s, 2H, H-C(20)), 7.50 (dd, $J = 7.9, 1.3$ Hz, 2H, H-C(4)), 7.33 (t, $J = 7.8$ Hz, 2H, H-C(3)), 7.08 (td, $J = 7.8, 1.8$ Hz, 2H, H-C(15)), 6.93 (dd, $J = 7.6, 1.3$ Hz, 2H, H-C(2)), 6.76 (d, $J = 8.2$ Hz, 2H, H-C(16)), 6.53 (td, $J = 7.5, 1.1$ Hz, 2H, H-C(14)), 6.40 (dd, $J = 7.5, 1.8$ Hz, 2H), 3.82-3.67 (m, 2H, H-C(22), diastereotopic), 3.58 (td, $J = 8.3, 3.4$ Hz, 2H, H-C(22), diastereotopic), 1.33 (m, 2H, H-C(23), diastereotopic), 1.17 (d, $J = 8.5$ Hz, 2H, H-C(23), diastereotopic), 0.58 (p, $J = 8.1$ Hz, 2H, H-C(24)).

$^{13}$C NMR (100 MHz, Chloroform-$d$) $\delta$ 155.5 (C11), 141.0 (C9a), 135.3(C4a), 134.6 (C17), 132.6 (C2), 132.0(C12), 130.3-130.0 (C19), 128.6 (C13), 128.6 (C15), 128.4 (C18), 126.4-119.9 (q, $J = 275$ Hz, C21), 122.7(C4), 122.6 (C20), 121.5(C14), 114.7(C16), 83.8(C9), 69.6(C22), 30.3(C23), 22.4 (C24).

HRMS (ESI) m/z: [M]$^+$ Calcd for C$_{47}$H$_{30}$F$_{12}$O$_4$ 886.1952; found 886.1964.

UV-vis (H$_2$C$_2$Cl$_4$): $\lambda_{\text{max}}$ ($\varepsilon$) = 272 nm (3276 M$^{-1}$ cm$^{-1}$).
S2.4 Synthesis of Ant-C4-O2

Prepared according to the general procedure, using Ant-C4 (4 mg, $4.76 \times 10^{-6}$ mol). Obtained a white solid (4.0 mg, 96%).

$^1$H NMR (500 MHz, Chloroform-$d$) $\delta$ 8.02 (s, 4H, H-C(18)), 7.63 (s, 2H, H-C(20)), 7.61 (dd, $J = 7.7, 1.2$ Hz, 4H, H-C(4)), 7.35 (t, $J = 7.7$ Hz, 2H, H-C(3)), 7.09 (td, $J = 7.9, 1.7$ Hz, 2H, H-C(15)), 6.90 (dd, $J = 7.5, 1.2$ Hz, 2H, H-C(2)), 6.59-6.59 (m, 4H, H-C(14) and H-C(16)), 6.46 (dd, $J = 7.4, 1.7$ Hz, 2H, H-C(13)), 3.94 (d, $J = 8.3$ Hz, 2H, H-C(22), diastereotopic), 3.25 (dd, $J = 12.1, 8.5$ Hz, 2H, H-C(22), diastereotopic), 1.06 (m, 2H, H-C(23), diastereotopic), 0.78 (m, 2H, H-C(23), diastereotopic).

$^{13}$C NMR (125 MHz, Chloroform-$d$) $\delta$ 155.1 (C11), 144.6 (C9a), 135.4 (C17), 133.9 (C1), 133.2 (C4a), 131.9 (C2), 130.9 (C12), 130.6-129.8 (q, $J = 33.8$ Hz, C19), 128.9 (C15), 128.4 (C18), 127.2 (C3), 127.1 (C13), 126.4-119.9 (q, $J = 275$ Hz, C21), 122.5 (C20), 121.9 (C4), 120.7 (C16), 110.6 (C14), 83.6 (C10), 66.7 (C22), 25.7 (C23).

HRMS (ESI) m/z: [M]$^+$ Calcd for C$_{46}$H$_{28}$F$_{12}$O$_4$ 872.1796; found 872.1753.

UV-vis (H$_2$C$_2$Cl$_4$): $\lambda_{\text{max}}$ ($\varepsilon$) = 285 nm (4695 M$^{-1}$ cm$^{-1}$).
S2.5 Synthesis of Ant-C3-O₂

Prepared according to the general procedure, using Ant-C3 (4 mg, $4.84 \times 10^{-6}$ mol). Obtained a white solid (4.0 mg, 96%).

$^1$H NMR (500 MHz, Chloroform-d) $\delta$ 8.00 (s, 4H, H-C(18)), 7.72 (dd, $J = 7.7, 1.2$ Hz, 2H, H-C(4)), 7.66 (s, 2H, H-C(20)), 7.42 (t, $J = 7.7$ Hz, 2H, H-C(3)), 7.10 (td, $J = 7.8, 1.7$ Hz, 2H, H-C(15)), 7.01 (dd, $J = 7.6, 1.2$ Hz, 2H, H-C(2)), 6.77 (dd, $J = 8.1, 1.3$ Hz, 2H, H-C(16)), 6.69 (td, $J = 7.5, 1.2$ Hz, 2H, H-C(14)), 6.48 (dd, $J = 7.4, 1.7$ Hz, 2H, H-C(13)), 3.10 (dt, $J = 9.3, 5.7$ Hz, 2H, H-C(22)), 2.73 (dt, $J = 9.2, 5.9$ Hz, 2H, H-C(22)), 1.21 (p, $J = 5.8$ Hz, 2H, H-C(23)).

$^{13}$C NMR (125 MHz, Chloroform-d) $\delta$ 156.7 (C11), 146.2 (C9a), 135.5 (C4a), 134.0 (C12), 133.21 (C1), 133.18 (C17), 132.0 (C2), 130.8-130.0 (q, $J = 37.5$ Hz, C19), 129.5 (C15), 128.34-128.31 (C18), 127.4 (C3), 127.2(C13), 126.3-119.8 (q, $J = 275$ Hz, C21), 123.6(C14), 122.4 (C20), 122.0(C4), 120.2(C16), 83.5 (C10), 68.4 (C22), 31.3 (C23).

HRMS (ESI) m/z: [M]$^+$ Calcd for C₄₅H₂₆F₁₂O₄ 858.1639; found 858.1639.

UV-vis (H₂C₂Cl₄): $\lambda_{\text{max}} (\varepsilon) = 286$ (4745 M$^{-1}$ cm$^{-1}$).

S4 Time-dependent photo-oxidation of anthracenes

S4.1 Photo-oxidation studied at different wavelengths

The photochemical reaction was followed over time, where at least 90% conversion of the parent twistacenes was considered. The twistacenes were exposed to a 365 nm lamp as the molar absorptivities (ε) of all the twistacenes at this wavelength are almost identical. Moreover, the dependence of wavelength was also observed when the photo-oxidation was studied at 427 nm.
Figure S43. Gradual photo-oxidation of (a) Ant-Open, (b) Ant-C6, (c) Ant-C5, (d) Ant-C4 and (e) Ant-C3 in chloroform at room temperature under a 365 nm lamp.
Figure S44. Gradual photo-oxidation of (a) Ant-Open, (b) Ant-C6, (c) Ant-C5, (d) Ant-C4 and (e) Ant-C3 in chloroform at room temperature under a 427 nm lamp.
S4.2 Photo-oxidation kinetics
The electronic transition in the photo products centers on the $^1B_h$ band of the parent molecules. However, photobleaching could be studied unambiguously from the bleaching of the $^1L_a$ transitions of the parent twistacenes because of the absence of any absorbance from the anthracene peroxides in that spectral region. Consequently, photo-oxidation kinetics was monitored from the change in the absorbance of the lowest energy vibronic shoulder of the $^1L_a$ transition against time. The kinetic data could be established from the change in absorbance because twistacene concentration was kept constant and because oxygen concentration could be assumed to be constant as solvent conditions (solvent and amount) were identical in all experiments.

**Figure S45.** Gradual photo-oxidation of the twistacenes at 365 nm (top) 427 nm (bottom).
S4.2.1 Photo-oxidation in the presence of methylene blue

Anthracenes are excellent singlet quenchers because of their ability to act as both photosensitizer and singlet state reagent to singlet oxygen (${}^1$O$_2$). To gain further insight into the mechanism of the photo-oxidation reaction of the twistacenes and $^1$O$_2$, methylene blue (MB) was used as an external sensitizer. The photooxidation was performed by irradiation of the twistacene ($2.96 \times 10^{-5}$ M) and MB ($2.96 \times 10^{-6}$ M, 0.1 equivalent) at 617 nm using a Mightex LED lamp. This allowed us to monitor the photo-oxidation reaction of the singlet states of both twistacene and atmospheric oxygen under conditions in which twistacenes were not expect to perform a sensitizer role. We performed the experiment at constant concentrations of Ant-C6 and Ant-C3 and we assumed that the oxygen concentrations were identical in both cases under atmospheric pressure. The presence of MB resulted in Ant-C3 photo-oxidizing more quickly than Ant-C6 (Figures S47c).

| Ant-C5    | 2743    | 5664    |
| Ant-C4    | 2893    | 7666    |
| Ant-C3    | 2863    | 7811    |

S6 Kinetics of the thermal retro Diels-Alder reaction of the twistacene peroxides

Ant-Open-O2 was found to be completely robust under ambient conditions and to convert to the parent twistacene only at temperatures >100 °C. However, the tethered peroxides started to convert to twistacenes via thermal retro Diels-Alder reaction at ambient conditions, although the conversion rate was very slow. Raising the temperature to ≥60 °C raised the reaction rate. Thermochemical analyses of the cycloreversion reactions of endoperoxides were accomplished using $^1$H NMR at variable temperatures. The conversion of the endoperoxides to the parent twistacenes was examined by plotting the number of moles (n) of the corresponding peroxides against time at four different temperatures (Figure S53). The activation parameters (enthalpy, entropy, and Gibbs free energy) of the retro Diels-Alder reactions were obtained using Eyring’s equation by correlating between these rate constants and the corresponding temperatures (Figure S54).
Figure 50. Cycloreversion reaction profile of Ant-C4-O$_2$ to Ant-C4 monitored by $^1$H NMR spectra in C$_2$D$_2$Cl$_4$ at 338 K. These spectra are representative of all the variable temperature photo-oxidation rate measurements that were used in this work to extract the kinetic parameters for the cycloreversion reaction of the Ant-Cn-O$_2$ series.
Table S2. Rate constants for the retro Diels-Alder reaction of the endoperoxides.

S7 Single crystal X-ray diffraction crystallography (SCXRD)

Single crystals of Ant-C5-O2 and Ant-Open-O2 were grown in a mixture of chloroform/hexane by the slow evaporation method. A single crystal of the peroxide was mounted onto a 400/50 MicroMesh™ with NVH Oil, and transferred to a Bruker SMART APEX CCD X-ray diffractometer equipped with a graphite-monochromator. The diffractogram for Ant-C5-O2 was recorded at 150 K using a Bruker KRYOFLEX nitrogen cryostat, whereas Ant-Open-O2 was recorded at room temperature. The system was controlled by a Pentium-based PC running the SMART software package. Data were collected using Mo-Kα radiation (λ=0.71073 Å). The recorded raw data frames were subjected to integration and reduction by the SAINT program package. The structure was solved and refined by the SHELXTL software package.

Table S3. Crystal data and structure refinement for Ant-C5-O2 and Ant-Open-O2.

**S8 Computational analysis of the twistacene peroxides**

All calculations were carried out using the Gaussian 16 program applying density functional theory (DFT). All molecules were optimized using a hybrid density functional \[^9\] and Becke’s three-parameter exchange functional combined with the LYP correlation functional (B3LYP) \[^10\] and with the 6-31G(d) basis set (B3LYP/6-31G(d)). Frequency calculations were performed at the same level of theory as geometry optimization for all stationary points to differentiate them as minima or saddle points. The UV spectra were simulated from time-dependent density functional theory (TDDFT) using the CAM-B3LYP functional and the 6-31G(d) basis set.

**Table S4.** Optimized structures of the peroxides.

Effect of tether on strain in the tethered anthracene-peroxide core
To analyze the isolated effect of tether length on dihedral angle in the anthracene peroxide core, the Ant-Cn-O$_2$ series was optimized by retaining geometric constraints identical to those on the most reactive part of the corresponding optimized Ant-Cn-O$_2$ series members. All other substituents in their parent molecules, the Ant-C-nO$_2$ series, were replaced with hydrogen atoms. The variation in strain (Figure S56) arising from variation in tether length could thus be isolated from other steric factors in the actual reactions involving the Ant-Cn-O$_2$ series.
