Screening of bactericidal activity of selected Plumbago species against bacterial pathogens

Abstract
The present study was undertaken to determine the antibacterial potential of Plumbago species viz., Plumbago zeylanica Linn., Plumbago auriculata Lam. and Plumbago rosea Linn. collected from various localities of South India. For the bio-efficacy studies six different extracts of Plumbago species with various concentrations viz., 20, 40, 60, 80 and 100µg/ml against gram positive and gram negative bacterial pathogens viz., Staphylococcus aureus (MTCC 737), Streptococcus pyogenes (MTCC 1928), Bacillus subtilis (MTCC 441), Klebsiella pneumoniae (MTCC 109), Morganella morganii (MTCC 662) and Pseudomonas aeruginosa (MTCC 1688) using well diffusion method. Among the eighteen different extracts of three different Plumbago species, highest frequency of antibacterial activity (54%) was recorded in P. rosea. The antibacterial activity of various extracts in different concentration of the selected Plumbago species are as follows: P. rosea (54%) > P. zeylanica (49%) > P. auriculata (40%). The ethanolic extract of all the Plumbago species revealed superior bactericidal activity compared to other tested extracts. The ethanolic extracts of P. zeylanica, P. auriculata and P. rosea showed 91%, 50% and 99% of activity against Gram positive pathogens and 66%, 26% and 89% of activity against Gram negative pathogens. The bioactive compound plumbagin and extract of aerial parts of Plumbago species show a wide spectrum of antibacterial activity. The compound shows promise as a new drug for various bacterial infectious diseases. Hence, this study offers a base of using Plumbago species as herbal alternative for the synthesis of antimicrobial agents.

Keywords: bactericidal, Plumbago species, antibacterial, extracts

Introduction
Plants and plant derived metabolites are believed as rich sources of antimicrobial agents. A wide range of plants and their parts are used for their medicinal properties by local communities and folklore healers. Plants possess varieties of secondary metabolites with antimicrobial properties. The studies on plant derived polyphenolic compounds confirmed the antimicrobial, antioxidant, anticancer and apoptosis inducing properties of the plants and supplemented effective usage of medicinal herbs against microorganisms. With the impact and less side effects, the herbal medicine is practiced as complementary and alternative medicine day by day in developing countries. Plants and plant derived products are the cheapest, easily available and safer alternative sources of antimicrobials. The phytochemical and pharmacological studies on the roots of P. zeylanica confirmed antiplasmodial, anti microbial, anti inflammatory and anticancer, anti hypertensive, hypolipidaemic and anti atherosclerotic properties of the plant.

The ethnobotanical knowledge and biological studies on the aerial parts or roots of P. auriculata suggested that root and aerial parts of P. auriculata are employed to control black water fever, plant are used as anti febrile and antifungal agents to control spore germination of Macrophomina phaseolina. The ethanolic leaf extract of P. rosea is active against herpbus simplex virus type I. The root of P. rosea was used to treat digestive problems, dyspepsia, colic cough and bronchitis. Ibrahim et al., studied the antibacterial potentials of P. indica. Devi et al., screened the antibacterial efficacies of P. zeylanica leaf extracts. Vishnukanta & Rama studied the anti convulsant activity Plumbago zeylanica, Jeyachandran et al., evaluated the antibacterial activity of plumbagin and root extracts of Plumbago zeylanica, Rahman & Anwar screened the antimicrobial activity of Plumbago zeylanica root crude extract. Parekh & Chanda studied the antibacterial potentials of P. zeylanica. Tharmaraj & Antonysamy screened the antibacterial efficacy of P. rosea from Chankanachari, Kerala. Most of the studies were focused on the antimicrobial potentials of P. zeylanica roots only; very few reports are available on aerial parts of the selected Plumbago species of Tamil Nadu. There is no report on the antimicrobial activities of Plumbago auriculata. There is no report on the antimicrobial activities of Plumbago auriculata. To supplement the previous observations, an attempt has been made to reveal the bactericidal activity of three selected Plumbago species viz., Plumbago zeylanica Linn., Plumbago auriculata Lam. and Plumbago rosea Linn. aerial parts.

Materials and methods
Preparation of extracts
For bioefficacy studies, the aerial parts of Plumbago zeylanica Linn., Plumbago auriculata Lam. and Plumbago rosea Linn. were collected from Papanasam (Tamil Nadu), Tenkasi (Tamil Nadu) and Dana (Tamil Nadu) respectively. The collected Plumbago species were washed thoroughly with tap water followed by distilled water. The washed Plumbago species were blotted on the blotting paper and spread out at room temperature in shade to remove the excess water contents. The shade dried plant samples were ground to fine powder using mechanical grinder. The powdered samples were stored at 4°C for further use.

The dried and powdered aerial parts of Plumbago species were extracted successively with 30g of plant powder and 180ml of petroleum ether, chloroform, acetone, ethyl acetate, ethanol and...
water using soxhlet extractor for 8 hr at a temperature not exceeding the boiling point of the solvent. The extracts were filtered using Whatman filter paper (No.1) and then concentrated in vacuum at 40°C using rotary evaporator. The residues obtained were stored in a freezer until further tests. One gram of plant extracts were diluted with 1 ml of the respective solvents. They were used as stock solutions for the antibacterial assay.

Preparation of the test organisms

Staphylococcus aureus (MTCC 737), Streptococcus pyogenes (MTCC 1928), Bacillus subtilis (MTCC 441), Klebsiella pneumoniae (MTCC 109), Morganella morgani (MTCC 662) and Pseudomonas aeruginosa (MTCC 1688) were commercially purchased from Institute of Microbial Technology, Chandigarh, India. Stock cultures of different bacteria were grown in nutrient broth at 30 °C and were sub-cultured and maintained in nutrient broth at 4°C. Before swabbing, each culture was diluted (1:10) with fresh sterile nutrient broth.

Antibacterial assay

The antibacterial activity was determined by the agar well diffusion method Parekh & Chanda. A suspension of the culture organism was swabbed above the solidified Muller Hinton agar medium. Wells were made using sterile cork borer under aseptic condition. One milligram of plant extracts were diluted with 1 ml of the respective solvents. They were used as stock solutions for the antibacterial assay. From the stock the plant extracts (1mg/ml) various concentrations viz., 20, 40, 60, 80 and 100µg/ml were prepared and inoculated in the wells. The antibiotic amikacin (30µg /disc) was used as a standard to compare its effect on test organisms with the plant extracts. The plates were kept at room temperature for 2 h to allow diffusion of the test solution into the agar then they were incubated for 24h at 37°C. After the incubation period, the plates were observed and zone of inhibition was measured (mm) and the activities were recorded.

Results

Among the three species studied, highest frequency of antibacterial activity (54%) was recorded in P. rosea. The range of antibacterial activity of various extracts of Plumbago species are as follows: P. rosea (54%)>P. zeylanica (49%)>P. auriculata (40%). Major antibacterial activities were observed predominantly in ethanolic extracts (85%) of P. zeylanica. However the range of the inhibition zone varied with test organisms based on different concentration of extracts. Highest antibacterial activity was observed in ethanolic extract at 100µg/ml followed by petroleum ether and chloroform extract. There was minor difference on the size of the inhibition zone between ethanolic and other extracts of P. zeylanica. The range of inhibitory activity was less at lower concentration of extracts (Table 1). Ethanolic extracts of P. zeylanica was active against all the selected bacterial pathogens except B. subtilis which represents no zone of inhibition at 20-40µg/ml concentration. Compared to standard amikacin (30µg), 100µg/ml of ethanolic extract showed more antibacterial (90% and 5%) activity against S. pyogenes and K. pneumonia respectively (Table 1). The ethanolic extracts of P. zeylanica showed higher antibacterial activity against pathogens K. pneumonia and S. pyogenes. The petroleum ether extract of P. zeylanica also expressed maximum zone of inhibition (20±0.5 mm) against S. pyogenes. The acetone and aqueous extracts of P. zeylanica failed to show the antibacterial activity against S. aureus. Similar to that, the petroleum ether, acetone and aqueous extracts of P. zeylanica were also unsuccessful against B. subtilis. The antibacterial activity of P. zeylanica extracts at different concentrations are arranged as follows: ethanolic extracts (85%)>petroleum ether (69%)>chloroform (62%)>acetone (53%)>ethyl acetate (34%)>aqueous extract (31%). Ethanolic extracts of P. zeylanica showed 91% percentage of activity against Gram positive pathogens and 66% of activity against Gram negative pathogens.
Screening of bactericidal activity of selected Plumbago species against bacterial pathogens

Note: P, Petroleum ether; C, Chloroform; A, Acetone; EA, Ethylacetate; E, Ethanol; AQ, Water

Similar to *P. zeylanica*, highest activity was observed in ethanolic extracts (70%) of *P. auriculata* followed by petroleum ether and chloroform extracts. There was distinguished difference on the size of the inhibition zone between ethanolic and other extracts of *P. auriculata*. The range of inhibition was directly coincided with the concentrations of extracts tested, less inhibition was observed at lower concentration of extracts and maximum inhibition was obtained in higher concentrations (Table 2).

Table continued
The ethanolic extracts of *P. auriculata* demonstrated maximum zone of inhibition (23±0.3 mm) against *M. morganii* (Table 2). *P. auriculata* ethanolic extracts was active against all the examined pathogens except *S. aureus*. Compared to all the tested pathogens, *K. pneumoniae* was highly sensitive to all the screened extracts of *P. auriculata*. The 40-100µg/ml of ethyl acetate extracts represented more percentage of activity (18, 27, 45 and 63%) against *S. pyogenes* than the standard amikacin. 100µg/ml ethanolic extracts represented 18% and 9% of more antibacterial activity against *S. pyogenes* and *K. pneumoniae* than the standard amikacin. Similar to ethyl acetate and ethaonic extracts, acetone extracts also showed more activity against *S. pyogenes* than the standard amikacin.

The significant antibacterial activity was observed in ethanolic extracts compared to other tested extracts of *P. auriculata*. The activity of *P. auriculata* extracts as follows: ethanolic extracts 70%>petroleum ether 54%>ethyl acetate 53%>acetone 48%>chloroform 34%>water extract 31%. The ethanolic extracts of *P. auriculata* showed above 50% activity against Gram positive pathogens and 26% activity against Gram negative pathogens.

In *P. rosea*, highest activity was observed in ethanolic extracts (91%) followed by acetone (64%) and chloroform extracts (59%). The ethanolic extracts 100µg/ml showed 45% higher antibacterial activity against *S. pyogenes* and 10% more activity against *M. morganii* than the standard amikacin. There was prominent difference on the size of the inhibition zone between ethanolic and other extracts of *P. rosea*. All the screened extracts of *P. rosea* demonstrated the inhibition against *K. pneumoniae* (Table 3). Highest antibacterial activity was observed in ethanolic extracts against *B. subtilis* and *M. morganii* with 22±0.3 and 22±0.7 mm zone of inhibition. Except 20µg/ml of water extracts, all other extracts of *P. rosea* with various concentrations (20-100µg/ml) showed activity against *K. pneumoniae* and maximum zone of inhibition (20±0.3 mm) was observed in ethanolic extracts of *P. rosea*. The 100µg/ml of *P. rosea* ethanolic extracts displayed higher activity against *M. morganii* with 22±0.5 mm zone of inhibition.

**Table 3** Antibacterial activity of *Plumbago rosea*.

| Pathogens | Zone of inhibition in mm |

Note: P, Petroleum ether; C, Chloroform; A, Acetone; EA, Ethylacetate; E, Ethanol; AQ, Water

Similar to other two studied plants, the highest zone of inhibition was observed in ethanolic extracts compared to other tested extracts of *Prosoea*. The activity of *P. rosea* extracts as follows: ethanolic extracts 91% > acetone; 64% > chloroform; 56% > ethyl acetate; 52% > petroleum ether; 50% > water extract. Ethanolic extract of *P. rosea* showed Gram 99% activity against positive pathogens and 89% activity against Gram negative pathogens.

**Discussion**

Due to the failure of synthetic drugs, adverse side effects of antibiotics and antibiotic resistance of the microorganisms led to the development of new plant derived antibiotic without any side effects. Simonsen et al., documented the use of natural products as new antibacterial drugs. In the present study also we screened the antibacterial potentials of *P. rosea*, *P. zeylanica* and *P. auriculata* against various bacterial pathogens. The ethanolic extract of *P. zeylanica* and *P. rosea* showed high frequency of activity against Gram positive pathogens and Gram negative pathogens. The ethanolic extracts of *P. auriculata* showed least activity against the tested pathogens. The antibacterial potentials of the *P. rosea*, *P. zeylanica* and *P. auriculata* against the tested pathogens may be due to the existence of alkaloids, phenolic substances.

Antimicrobial activities of *Plumbago* species have been reported by many workers, Ibrahim et al., evaluated the antibiotic activity using the methanolic extracts of *P. indica* against *S. aureus*, *S. typhi*, *S. dysenteriae*, *B. cereus*, *P. aeruginosa*, *S. sonnei*, *V. cholera* and *E. coli*. The highest inhibition was observed against *S. aureus*, *E. coli* and *S. typhi* compared to other pathogens ranged from 15-27 mm. Devi et al., studied the antibacterial activity of *P. zeylanica* methanolic leaf, root and stem extract of against *Bacillus subtilis*. Antibacterial activities of *Plumbago* species have been reported by many workers, Ibrahim et al., evaluated the antibiotic activity using the methanolic extracts of *P. indica* against *S. aureus*, *S. typhi*, *S. dysenteriae*, *B. cereus*, *P. aeruginosa*, *S. sonnei*, *V. cholera* and *E. coli*. The highest inhibition was observed against *S. aureus*, *E. coli* and *S. typhi* compared to other pathogens ranged from 15-27 mm. Devi et al., studied the antibacterial activity of *P. zeylanica* methanolic leaf, root and stem extract of against *Bacillus subtilis*. Antibacterial activities of *Plumbago* species have been reported by many workers, Ibrahim et al., evaluated the antibiotic activity using the methanolic extracts of *P. indica* against *S. aureus*, *S. typhi*, *S. dysenteriae*, *B. cereus*, *P. aeruginosa*, *S. sonnei*, *V. cholera* and *E. coli*. The highest inhibition was observed against *S. aureus*, *E. coli* and *S. typhi* compared to other pathogens ranged from 15-27 mm. activity of methanolic and chloroform extracts of \textit{P. zeylanica} against five different organisms viz., \textit{S. pyogenes}, \textit{S. aureus}, \textit{Bacillus sp.}, \textit{P. aeruginosa} and \textit{E. coli} were studied using disc diffusion method. The methanolic extracts were more active against all the tested organisms.\textsuperscript{18} VishnuKanta & Rana\textsuperscript{20} studied the antibacterial activity of \textit{P. zeylanica} against \textit{S. gallinariaium}, \textit{E. coli}, \textit{P. vulgaris}, \textit{S. typhimurium}, \textit{P. aeruginosa} and \textit{S. aureus}. Among the tested extracts methanolic extract exhibited higher antibacterial activity against all the pathogenic bacteria.

Jetty et al.,\textsuperscript{26} evaluated the antimicrobial properties of compounds such as neoishinanolone and 1-epineo-isoishinanolone isolated from the roots of \textit{P. zeylanica}. Among these 1-epineo-isoishinanolone is more active with a MIC of 12.5-25µg/mL whereas neoishinanolone has recorded a MIC of 50-100µg/mL. The activities are compared more active with a MIC of 12.5-25µg/mL whereas neoisoshinanolone and 1-epineo-isoshinanolone isolated from the roots of \textit{P. rosea} were moderate and lower against \textit{Proteus vulgaris} and \textit{Pseudomonas aeruginosa}. The methanolic extract exhibited moderate activity and the aqueous extract weak activity against bacterial strains as assessed by disc diffusion assays.

Rahman & Anwar\textsuperscript{21} studied the antimicrobial activities of ethanolic extracts of \textit{P. zeylanica} root against 11 human pathogenic bacteria and 6 phytopathogenic fungi using disc diffusion method. \textit{V. cholerae} was found to be the most sensitive. Parekh et al.,\textsuperscript{24} studied the antibacterial potential of \textit{P. zeylanica} using agar disc diffusion method and agar well diffusion method against five bacterial strains viz., \textit{B. cereus}, \textit{S. aureus}, \textit{K. pneumoniae}, \textit{E. coli} and \textit{P. pseudoalcaligenes}. Preliminary screening revealed that methanolic extracts were more potent than the aqueous extracts. Wang & Huang\textsuperscript{27} revealed the anti-\textit{H. pylori} activity of ethanolic, ethyl acetate, acetone and aqueous extracts of \textit{P. zeylanica}.

Paiva et al.,\textsuperscript{14} evaluated the antimicrobial activity in the plumbagin isolated from the chloroform extract of \textit{P. scandens} against \textit{S. aureus}, \textit{P. aeruginosa}, \textit{B. subtilis}, \textit{P. vulgaris} and against the yeast \textit{C. albicans}. Plumbagin exhibited relatively specific antimicrobial activity. The growth of \textit{S. aureus} and \textit{C. albicans} was completely inhibited. Antibacterial activity of \textit{P. zeylanica} alcoholic root extracts was studied against multidrug-resistant clinical isolates of bacteria (\textit{S. paratyphi}, \textit{S. aureus}, \textit{E. coli}, \textit{S. dysenteriae}). The extracts exhibited strong antibacterial activity against all test bacteria irrespective of their antibiotic resistance behaviour.\textsuperscript{9} Except Wang & Hang et al.,\textsuperscript{30} observation, all others were recorded the highest frequency of antibacterial activity in the methanolic extracts of \textit{Plumbago} species. Tharmaraj & Antonyasamy\textsuperscript{25} observed the antibacterial activity of \textit{P. rosea} against \textit{K. pneumoniae}, \textit{B. subtilis}, \textit{S. aureus}, \textit{P. aeruginosa} and \textit{P. vulgaris} with maximum zone inhibition 20, 19, 17, 16 and 16 mm respectively. In the present study we observed better results then the previous observations. 100µg of ethanolic extracts of \textit{P. rosea} showed maximum zone of inhibition against \textit{B. subtilis} and \textit{K. pneumoniae} with 22 and 20 mm respectively. 100µg of acetone extracts of \textit{P. rosea} demonstrated maximum zone (18 mm) of inhibition against \textit{P. aeruginosa} earlier 16 mm of inhibition was observed with 250µg of methanolic extracts. In addition, the ethanolic and acetone extracts of \textit{P. rosea} illustrated the inhibition against \textit{M. morganii} (22 mm) and \textit{S. pyogenes} (16 mm) respectively.

Similar to that in the present study also we observed the high frequency of antibacterial activity in the ethanolic extracts of three \textit{Plumbago} species. The antibacterial action of various aerial parts extracts of \textit{Plumbago} species may indicate their potential as antibacterial herbal remedies. Further work is needed to locate the active principle from the various extracts and their phyto pharmaceutical studies. Research into the effects of local medicinal plants is expected to boost the use of these plants in the therapy against disease caused by the test bacterial species and other microorganisms.
