An unusual cause of acute carpal tunnel syndrome: An undetected foreign body

Hakan Tekin, Ömer Faruk Koçak, Şafak Aktar

ABSTRACT

Introduction: Carpal tunnel syndrome (CTS) is a trap neuropathy in which the median nerve is entrapped and compressed. Various factors have been implicated in its etiology and to date no single cause has been identified. In literature, foreign bodies following trauma have been rarely reported to compress the median nerve, resulting in CTS.

Case Report: A 19-year-old male patient presented to our outpatient clinics due to symptoms of CTS. The patient had a history of hand injury with window glass. The patient was examined both in emergency department and then in family health center. In examination with palpation and X-ray graphics an undetected foreign body was found.

Conclusion: The current report presents a case of an undetected foreign body that resulted in acute carpal tunnel syndrome, and which could be the subject of a medical malpractice lawsuit.

ABSTRACT

Introduction: Carpal tunnel syndrome (CTS) is a trap neuropathy in which the median nerve is entrapped and compressed. Various factors have been implicated in its etiology and to date no single cause has been identified. In literature, foreign bodies following trauma have been rarely reported to compress the median nerve, resulting in CTS. Case Report: A 19-year-old male patient presented to our outpatient clinics due to symptoms of CTS. The patient had a history of hand injury with window glass. The patient was examined both in emergency department and then in family health center. In examination with palpation and X-ray graphics an undetected foreign body was found. Conclusion: The current report presents a case of an undetected foreign body that resulted in acute carpal tunnel syndrome, and which could be the subject of a medical malpractice lawsuit.

Keywords: Carpal tunnel syndrome, Foreign body, Malpractice, Median nerve

INTRODUCTION

Carpal tunnel syndrome (CTS) is a trap neuropathy in which the median nerve is compressed as it travels through the carpal tunnel. Sir James Paget first described the condition in 1865 [1]. Clinically, the condition presents as pain, numbness, burning, tingling and stinging pain in the thumb and index finger as well as the radial aspect of the middle and ring fingers [2]. Obesity, rheumatoid arthritis, steroid use, pregnancy, female gender, diabetes mellitus, acromegaly, hyperparathyroidism, patent median artery have been reported as risk factors in its etiology [3–5]. Uncommon causes, such as benign and malignant tumors, anatomic variations, vascular insufficiency, trauma, and foreign body have also been reported in literature [6–8]. However, the condition is most frequently idiopathic [6]. In addition to high treatment costs and loss of labor, CTS can also cause permanent disability [9]. Acute carpal tunnel syndrome (ACTS) is different from classic CTS. ACTS is more rare entity according to CTS and mostly occurs after upper extremity traumas [10]. In literature, very rare cases of ACTS have been reported in association with unnoticed foreign body that remained in the median nerve following hand trauma [6, 7]. The current report presents a case of a penetrating foreign body that caused ACTS without causing median nerve injury.
CASE REPORT

A 19-year-old male patient presented to our outpatient clinics due to pain, burning, numbness, and tingling in the right thumb and index finger and a feeling of solid mass in the palms for the previous three weeks. During an argument with friends and the illicit use of drugs, the patient had hit a window with his hand.

Following the incident, the patient was taken to the emergency room where his hand movements had been examined. All finger movements were found to be normal and the patient denied any numbness in his fingers. A small skin incision on his wrist sutured, antibiotics and analgesics were prescribed and the patient was discharged from the hospital. The patient’s complaint started 6–7 days after the injury and he presented to the family physician. After obtaining the patient’s history, the family physician has referred the patient to our outpatient clinics with the pre-diagnosis of CTS. The patient did not undergo a radiological evaluation either in the emergency room or the family health center. On physical examination, there was a 1.5-cm long immature scar on the proximal crease on the volar aspect of the wrist. There was tenderness and pain on palpation of the palm. A hard, mobile object on the palm surface at the level of the proximal crease was palpated (Figure 1). An X-ray examination disclosed a semi-opaque foreign body (Figure 2). The patient was operated under regional nerve block. A glass fragment measuring 6.5 x 1.5 cm was located beneath the flexor retinaculum and passing over the median nerve, which had compressed and flattened (Figures 3 and 4) the median nerve. The fragment was removed without any damage to the median nerve. No complications occurred in post-operation period. The patient’s complaint diminished over a two weeks period. After three weeks, the patient dropped out from follow-up.

DISCUSSION

Carpal tunne syndrome is a progressive neuropathy often characterized by a chronic course with the gradual loss of hand functions [11]. In the case of acute ACTS occurring within a short period of time, as little as a couple of days, mass lesions, foreign body or hematoma, which mechanically compresses the median nerve, should be suspected [12]. In particular, a history of trauma and previous surgery should be questioned. Although classic CTS develops in weeks or months the ACTS develops more rapidly and symptoms occur within days [13]. In ACTS, pressure in the carpal tunnel elevates due to mass effect, but in CTS there is a chronic inflammatory process rather than acute mass effect [14]. Classic CTS is not-common in young patient [11]. In this case, the patient’s complaints were started 6–7 days after injury. The young patient who is a drug abuser, waited for spontaneous resolution of symptoms. For diagnosis of post-traumatic
ACTS, examination with palpation and radiological investigation are needed. This case was considered as ACTS due to history of hand trauma, patient's age and rapid onset of symptoms. ACTS must be treated rapidly to avoid any motor dysfunction [10].

Hand injuries comprise the most frequent cases presenting to the emergency rooms and most are associated with foreign body penetration [15]. Even though finger movement, circulation, and sensation are found normal on physical examination, manual examination (palpation) and a radiological evaluation must definitely be performed. Standard physical examination may miss up to 38% of foreign bodies [16]. Thus, the appropriate radiological imaging method must be made if any suspicion of an impaled foreign body persists. A simple X-ray examination is the first option for radiopaque objects [17]. However, ultrasonography may be the first choice for investigating non-radiolucent objects and computed tomography scan may be the first choice for complex injuries [18]. It should be kept in mind that foreign bodies left in the hand and the resulting complications are one of the major causes of malpractice lawsuits [19, 20]. This foreign body that remained undetected in the carpal tunnel and resulted in CTS is the largest foreign body reported to date in literature.

CONCLUSION

The aim of this case report is to highlight the fact that foreign bodies penetrating the hand may be missed on a classical physical examination, particularly in substance abusers, and these objects may result in permanent consequences in the long-term. We suggest that performing a thorough manual examination, as well as obtaining an X-ray, would prevent such an undesired malpractice, and one that could be the subject of lawsuits for physicians in the emergency room.

**About Edorium Journals**
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

**Invitation for article submission**
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

**But why should you publish with Edorium Journals?**
In less than 10 words - we give you what no one does.

**Vision of being the best**
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

**Exceptional services**
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

**Editorial Review**
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

**Peer Review**
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

**Early View version**
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

**Manuscript status**
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

---

**Our Commitment**

**Six weeks**
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.

**Four weeks**
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.

**Most Favored Author program**
Join this program and publish any number of articles free of charge for one to five years.

**Favored Author program**
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

**Institutional Membership program**
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

**Our presence**
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

**Something more...**
We request you to have a look at our website to know more about us and our services.
