1 Experimental section

General procedures and materials

Unless otherwise mentioned, all experiments were performed under exclusion of moisture and oxygen using standard Schlenk techniques. Solids were handled in a MBRAUN UNIlab plus glovebox under an argon atmosphere (O₂ < 0.5 ppm, H₂O < 0.5 ppm). All experiments involving anhydrous HF (aHF) were performed in self-built PFA (perfluoroalkoxy alkanes) tubes connected to stainless steel metal valves and with a stainless steel vacuum line. Solvents were dried using a MBraun SPS-800 solvent system (CH₂Cl₂, MeCN, n-pentane), or with CaH₂ (o-DFB, Et₂O, CD₃CN, CD₂Cl₂) before use and stored over 3 or 4 Å molecular sieves. PhTeF₅ and Te(C₆F₅)₂ were prepared according to literature procedures.¹² All other reagents were purchased from standard commercial suppliers and used as received. NMR spectra were recorded on a JEOL 400 MHz ECS or JEOL 400 MHz ECZ spectrometer. All reported chemical shifts (δ in ppm) are referenced to the Ξ values given in IUPAC recommendations of 2008 using the ²H signal of the deuterated solvent as internal reference.³ Multiplicity is indicated as follows: s = singlet, t = triplet, quint = quintet, dd = doublet of doublets, dt = doublet of triplets, dquint = doublet of quintets, tquint = triplet of quintets, m = multiplet. IR spectra were measured at room temperature on a Bruker ALPHA FTIR spectrometer with a diamond ATR inside a glovebox under an argon atmosphere, or on a Nicoleti S50 Advance FTIR by Thermo Fisher Scientific equipped with an ATR unit, with a Ge on KBr beam splitter and a DLaTGS-KBr detector for MIR and a solid-substrate beam splitter with a DLaTGS-PE detector for FIR. The ESI-TOF-Mass spectrometry measurements were performed on an Agilent 6210 ESI-TOF, Agilent Technologies, Santa Clara, CA, USA. Solvent flow rate was adjusted to 4 µL/min, spray voltage set to 4 kV. Drying gas flow rate was set to 15 psi (1 bar). Elemental analyses (CHNS) were carried out using a VARIO EL elemental analyzer. Crystal data were collected with MoKα radiation on a Bruker D8 Venture diffractometer with a CMOS area detector. Single crystals were picked −40 °C under nitrogen atmosphere and mounted on a 0.15 mm Mitegen micromount using perfluoroether oil. The structures were solved with the ShelXT⁴ structure solution program using intrinsic phasing and refined with the ShelXL⁵ refinement package using least squares minimizations by using OLEX2.⁶ For visualization the program Diamond V4.6.4 was used.⁷ CCDC 2184677, 2184678, 2184711, 2184734 and 2184735 contain the supplementary crystallographic data for this paper. These data are provided free of
charge by The Cambridge Crystallographic Data Centre. Crystal data and other details of the structure analyses are summarized in Tables S1–S5. Suitable crystals for X-ray diffraction studies were obtained as indicated in the corresponding experimental entry (*vide infra*).

5 Attempted hydrolysis of trans-\((C_6F_5)_2\)TeF_4 (5)

trans-\((C_6F_5)_2\)TeF_4 (20 mg, 38 μmol) was dissolved in a MeCN/H_2O mixture (9:1 V/V, 1 mL) and heated to 50 °C for 4 h. The reaction mixture was extracted with CH_2Cl_2 (3×3 mL). The combined organic phases were dried with MgSO_4, filtered, and the solvent was removed under reduced pressure. A colorless solid was obtained (15 mg) and identified as a mixture containing the two isomers of the doubly hydrolysed \((C_6F_5)_2\)TeF_2(OH)_2.

Single crystals of trans-\((C_6F_5)_2\)TeF_2(OH)_2 suitable for X-ray diffraction were obtained by cooling a saturated solution of the obtained colorless solid in n-hexane to –40 °C.

![Figure S16. Molecular structure of trans-\((C_6F_5)_2\)TeF_2(OH)_2 in the solid state. Displacement ellipsoids set at 50% probability. The summary of crystal data and structure refinement appears in Table S5. Selected bond lengths [pm] and angles [°]: Te1–F1 188.9(1), Te1–C1 213.6(2), Te1–O1 188.2(1) C1–Te1–F1 90.3(1), C1–Te1–O1 87.7(1), O1–Te1–F1 88.9(1).](image)
6 Quantum-chemical calculations

The *Turbomole* program\(^8\) was used to perform calculations at the unrestricted Kohn-Sham DFT level, using the BP86 or B3LYP hybrid functional\(^9–11\) (with RI\(^12\)) in conjunction with basis sets def-SV(P) and def2-TZVP.\(^13\) Minima on potential energy surfaces were characterized by normal mode analysis. Thermochemical data is provided without counterpoise correction but including zero-point energy correction as obtained from harmonic vibrational frequencies.
