Perceptions about the implementation of physiotherapist prescribing in Australia: a national survey of Australian physiotherapists

Timothy David Noblet,1,2 John F Marriott,1 Taryn Jones,3 Catherine Dean,4 Alison B Rushton5

ABSTRACT

Objectives To explore: (1) the views of Australian physiotherapists regarding potential implementation of non-medical prescribing in Australia, (2) how the geographical location and health sector in which a clinician works may influence their perceptions and (3) the perceptions of Australian physiotherapists about how physiotherapist prescribing might impact the care that the profession can provide.

Design A cross-sectional descriptive survey using open and closed questions.

Setting Participants completed an online questionnaire.

Participants 883 Australian Health Professionals Registration Authority (AHPRA)-registered physiotherapists, working across all states and territories.

Outcome measures An online questionnaire was developed by a panel of subject experts and pretested (n=10) for internal consistency. A hyperlink to the questionnaire was emailed to all members of the Australian Physiotherapy Association. A reminder email was sent 4 weeks later. Quantitative data were analysed descriptively, with use of absolute risk reductions (ARRs) and 95% CIs to determine the likelihood that health sector or geographical location were associated with specific views. Thematic analysis enabled synthesis of the qualitative data.

Results 79.0% participants felt that physiotherapist prescribing should be introduced in Australia, with 71.2% wanting to train as prescribers. Clinical governance, risk management, regulation of clinicians and the development of an education framework were identified as priorities for implementation. Participants working in the private sector were significantly more likely to train as prescribers than those in the public sector (ARR 9.9%; 95% CI 3.5 to 16.4) or educational/research institutions (ARR 23.3%; 95% CI 12.8 to 33.8), with city dwellers significantly more likely to train compared with physiotherapists in remote regions (ARR 19.8%; 95% CI 0.8 to 39.2). Physiotherapist prescribing was predicted to improve efficiency of healthcare delivery, access to medicines and reductions in healthcare costs.

Conclusions AHPRA-registered physiotherapists perceive that the introduction of autonomous physiotherapist prescribing would be beneficial for the Australian population and should be introduced. Decision makers should consider the results of this survey in conjunction with cost–benefit and risk analysis when planning the introduction of physiotherapist prescribing.

BACKGROUND AND RATIONALE

Non-medical prescribing (NMP) has been used in clinical practice by a variety of professions for over 20 years.1 However, it was not until 2012 that in the UK, physiotherapists were first granted independent prescribing responsibilities. In July 2015, the Australian Physiotherapy Association (APA) in collaboration with the Australia Physiotherapy Council and Council of Physiotherapy Deans Australia and New Zealand submitted a proposal for the endorsement of registered physiotherapists for autonomous prescribing to the Physiotherapy Board of Australia.2 To prescribe medicines autonomously, a practitioner must be responsible for the assessment and diagnosis of the patient, prescribing drugs from a specified formulary within their individual scope of practice. The clinician manages ongoing therapy without the requirement of protocols or supervision.3 Difficulties in accessing medicines for Australians living in...
rural and remote areas alongside recognised health inequities between minority groups such as Aboriginal and Torres Strait Islander peoples were cited as key drivers for reform. Benefits of the implementation of prescribing by physiotherapists in Australia, such as the potential to increase access to medicines for health service users across all communities, are therefore anticipated.

The clinical and cost-effectiveness of NMP remains unclear, with a recent systematic review finding only minimal empirical evidence with unknown risk of bias; nonetheless, its popularity in clinical practice continues to grow. A contemporary and robust mixed-methods systematic review of 50 moderate to good quality studies, investigating the barriers to and facilitators of independent NMP, identified conflict within a profession as a key barrier to successful implementation. A united professional position regarding the adoption of innovative clinical practice was highlighted as essential to ensure the development of safe and high-quality practice. Divided opinion between individual clinicians, academics and professional managers/leaders may lead to confusion across the healthcare community, resulting in unwarranted negative thoughts and perceptions about NMP roles and responsibilities. Diverse perceptions regarding the implementation of physiotherapist prescribing and current physiotherapeutic pharmacological knowledge and practices have been reported in national evaluations in Nigeria, South Africa and the UK. Data from these evaluations have been used to influence national policy and the political drive towards or against the adoption of NMP within the physiotherapy profession in these countries. Acceptance and support for prescribing by the Australian physiotherapy profession will be required for successful implementation into local and national health systems. It is therefore important that the views of Australian physiotherapists are understood in order to inform key stakeholders and decision makers about redefining the scope of physiotherapy to include NMP in Australia. To date, no evidence exists evaluating the Australian physiotherapy professions’ views and perceptions about the potential use of NMP by physiotherapists in Australia.

OBJECTIVES
1. To explore the views of Australian physiotherapists about the potential implementation and use of NMP by physiotherapists in Australia.
2. To explore how the geographical location and health sector in which a clinician’s works may influence the perceptions of Australian physiotherapists about the potential implementation and application of NMP by physiotherapists in Australia.
3. To explore the perceptions of Australian physiotherapists about how physiotherapist prescribing might impact the care that the physiotherapy profession can provide.

METHODS
A detailed study protocol was published to ensure transparency and reproducibility. The study is reported in line with an adapted version of the Standard Protocol Items: Recommendations for Interventional Trials statement, recommended by the SUrvey Reporting GuidelinE. This article reports the data collected from registered physiotherapists from a larger study evaluating both registered and student physiotherapists in Australia. The data collected evaluating the views and perceptions of student physiotherapists about the implementation of physiotherapist prescribing in Australia are presented in the related article published independently.

Survey design
A cross-sectional online descriptive survey design enabled the collection of empirical data across Australia. An online questionnaire was developed using Qualtrics (Qualtrics, Provo, Utah, USA), thus enabling Australian-wide participation with no geographical or time zone constraints.

Participants
Participant inclusion criteria are described in box 1. According to data published by the Physiotherapy Board of Australia, 30 004 physiotherapists were registered with the Australian Health Professionals Registration Authority (AHPRA) at the time of the survey.

Procedure
AHPRA privacy policy prohibits approaching AHPRA-registered physiotherapists directly. Therefore, an advertisement containing a link to the online survey was emailed to all members of the APA, including all clinical and professional networks. A reminder advertisement was sent via email 4 weeks after the initial email to promote participation in the survey. IP addresses were not saved to ensure participant anonymity. The APA membership was selected as the recruitment platform as it is representative of all physiotherapy specialties and levels of experience (qualified and student physiotherapists) across Australia, with 23 153 members at the time of survey. Word-of-mouth referrals to the survey through professional networks were promoted in the email to facilitate capturing the views of non-APA members.

Data collection took place 1 March–30 April 2017. Participants accessed the questionnaire via the online link. Completion of the survey was anonymous and entirely voluntary. Participant consent was gained using an online information and consent form. Researcher contact details were supplied to enable any questions or
concerns to be answered prior to completing the online questionnaire.17–19

Questionnaire development
Data from a mixed methods systematic review examining the barriers to and facilitators of NMP internationally informed the questionnaire design and specific question inclusion.5 Questions were optimised through consultation with experts in the fields of physiotherapy, NMP and Australian state/federal law and health policy.17–19

The questionnaire consisted of four sections:
1. Demographic information including participants’ age/gender/number of years qualified/specialty/location.
2. Participants’ perceptions of the positive and/or negative aspects of physiotherapist prescribing to the profession as a whole.
3. Participants’ perceptions of the impact of physiotherapist prescribing to them as an individual.
4. Participants’ perceptions regarding the potential wider impacts of physiotherapist prescribing.

Sections 1–3 used closed questions to collect quantitative data. Section 4 contained two open-ended questions to allow the participants to answer without limitation.17–19

In-built survey logic ensured that participants were shown questions that were pertinent to them based on their previous answers. Before completion, participants were encouraged to share any additional information that they deemed relevant, capturing useful insights not addressed elsewhere in the questionnaire.17–19

The questionnaire was piloted to test for internal consistency and optimise user experience.18 Ten participants (n=7 registered physiotherapists, n=3 student physiotherapists) were purposely sampled to represent the physiotherapy profession in Australia.17–19

Following the pilot, Anglo-Australian terminology was clarified, and small changes were made to the linguistics and survey logic. Pilot participants were not excluded from completing the final questionnaire. The final questionnaire can be found in online supplementary file 1.

Data storage
All electronic data were stored in password-protected computer files only accessible by study investigators. Participants who disclosed personal details were additionally protected via coding on data files.17–19

The password-protected files will be retained for 10 years, satisfying ethical and university policies.

Data analysis
Demographic data (section 1) were tabulated, and primary descriptive analysis of the data was completed using IBM SPSS Statistics for Macintosh, V.22.0. Comparisons of proportions from questions in sections 2 and 3, addressing objectives 1 and 2, were conducted using the PEDro CI calculator (http://www.pedro.org.au).24–25

Calculations of absolute risk reductions (ARRs) with 95% CIs were used to determine the likelihood that health sector or geographical location were associated with specific views.23 Thematic analysis was used to ensure the transparent synthesis of data addressing objective 3, collected in section 4 of the online questionnaire. This analysis enabled the identification of key themes within a structured analytical framework.26 Answers were coded line-by-line using NVivo 11 software (QSR International, Melbourne, Australia) by one researcher (TDN) and were verified by a second researcher (TJ). Independently generated themes/subthemes were then examined by a panel of experts for confirmation and agreement.26

Patient and public involvement
The development of this study was informed by the experiences of patients and the general public acknowledged in the literature. Due to the study’s objectives, patients and the general public were not used in design of the study or in participant recruitment. The results will be disseminated to all interested parties through publication and presentation at professional conferences.

RESULTS

Demographics
A total of 883 participants (3% of all AHPRA-registered physiotherapists) completed the questionnaire. Demographic data are presented in table 1. Fifty-eight per cent of participants had been qualified for more than 10 years, with the majority of participants (88.4%) gaining their primary professional qualification in Australia. The largest proportion of participants (n=536, 61%) identified musculoskeletal physiotherapy as their specialty area of practice. Of those working clinically, 52% of participants worked in the private health sector. There were participants from every state and territory, with the majority practising in New South Wales (n=299, 34%), Victoria (n=234, 27%), Western Australia (n=130, 15%) or Queensland (n=115, 13%). Seventy-eight per cent of participants worked in a major city.

Participants’ perceptions about the impact of physiotherapist prescribing on the physiotherapy profession
Six hundred and eighty participants (79%) reported that they strongly agreed or agreed that autonomous prescribing responsibilities should be introduced for physiotherapists in Australia, with 144 participants (12%) against the introduction (figure 1). Potential benefits and concerns were identified.

The participants reported that physiotherapist prescribing could have a range of benefits in the Australian healthcare system (figure 1). The most commonly identified benefit was an improvement in the delivery of health services (80.1%; n=707). Reduced costs of healthcare delivery to the consumer, as well as a reduction in the overall cost of healthcare and an improved consumer experience were also identified as potential benefits of NMP in Australia. Participants’ concerns about the prescription of medicines by physiotherapists centred on quality and safety

Noblet TD, et al. BMJ Open 2019;9:e024991. doi:10.1136/bmjopen-2018-024991

3
issues. In particular, concerns about whether physiotherapists have the knowledge required to train as a prescriber (34.8%) and a potential increased safety risk to consumers (34.1%) were raised. One-third of participants (33.1%) were concerned that the expected remuneration for this service would not reflect the increased professional risk.

Figure 2 illustrates participants’ opinions about the number of years of experience a physiotherapist should have prior to being permitted to train as a prescriber. The majority of participants felt that physiotherapists should have 3 years or more of experience (68.4%), with 34.6% believing this should be at least 6 years.

Participants’ perceptions about the impact of physiotherapist prescribing to them as an individual

Six hundred and eight participants (71.2%) would be extremely likely (n=397, 47%) or somewhat likely (n=211,
“I believe that autonomous prescribing responsibilities should be introduced for physiotherapists in Australia”.

Potential benefits of physiotherapist prescribing in Australia

- Improved efficiency of service delivery: 80.1%
- Reduced costs of healthcare delivery to the consumer: 69.4%
- Reduction in the overall costs of healthcare: 64%
- Improved consumer experience: 61.9%
- Improved access for consumers to prescription: 43.3%
- Future proofing the Australian healthcare workforce: 42.4%
- Improved retention of clinicians: 26.7%
- Potential for enhanced remuneration: 15.1%
- Reduced safety risks to consumers: 12.9%
- No benefits: 8.2%
- Other: 6.6%

% Percentage of all study participants

Participants' Concerns about the prescription of medicines by physiotherapists

- No need for prescribing: 7.9%
- Not a physiotherapists' role: 12.6%
- Other e.g. Clinical Governance: 12.7%
- Creation of a two tier profession: 21.3%
- Remuneration does not match the responsibility: 33.1%
- Increase safety risks to consumers: 34.1%
- Pre-requisite knowledge missing: 34.8%

% Percentage of participants identifying concern

25%) to train as a prescriber if this were permitted, while
174 participants (20.5%) would not. Figure 3 outlines the
key motivators and deterrents among participants to train
as a prescriber.

Key motivators cited included the ability to provide
improved quality of care (n=646, 96.0%) and the
improved professional reputation associated with NMP
(n=416, 61.8%). Some participants included increased
job satisfaction (n=303, 45.0%) and remuneration
(n=125, 18.6%) as motivating factors. Additionally, some
participants (n=72, 10.7%) reported being motivated by
potential clinical and cost efficiencies for both for the
consumer and healthcare provider through enhanced
clinical pathways, improved access to medicines and opti-
misation of clinical knowledge.

The most common deterrent for training to be a
prescriber was the belief that this will not change the care
that the individual physiotherapist would provide to their
patients (n=152, 61.8%). Concerns around an increased
level of clinical responsibility were also highlighted as
potential deterrents (n=108, 43.9%). Some participants
felt that they did not have sufficient background knowl-
gedge to undertake the prescribing course (n=76, 30.9%).
Additionally, participants reported that the cost of training
or distance to travel to universities would be too great
or that they were nearing retirement and did not want
the additional stress of training to become a prescriber.
Furthermore, it is noted that a small number of partici-
pants reported that they would not train as prescribers
as they are employed in non-clinical roles (n=35, 14.2%).

Influence of health sector and geographical location
The percentage of participants from different health
sectors and geographical locations, who agreed or
strongly agreed with autonomous prescribing responsibil-
ities being introduced for Australian physiotherapists and
those who stated that they were extremely likely or some-
what likely to want to train as a prescriber are summarised
in table 2.

Participants working in the private sector were signifi-
cantly more likely to agree that autonomous prescribing
responsibilities should be introduced for physiotherapist
in Australia than those who work in education, not-for-
profit organisations and the military (ARR 9.8%, 95% CI
0.8 to 20.2). No significant difference (ARR 1.7%; 95% CI
−4.0 to 7.6) was seen between participants who worked
in the private or public healthcare sectors. Participants
working in the private sector were significantly more
likely to train as prescribers than those working in the
public sector (ARR 9.9%; 95% CI 3.5 to 16.4) or other
areas, such as within educational or research institutions
(ARR 23.3%; 95% CI 12.8 to 33.8). A significantly higher
proportion of participants in city regions expressed a wish
to train as a prescriber compared with those in remote
regions (ARR 19.8%; 95% CI 0.8 to 39.2). Those practising
in cities (ARR 24.0%, 95% CI 5.8 to 43.9) and regional
areas (ARR 19.5%, 95% CI 0.4 to 40.1) were significantly
more likely to agree with the introduction of physio-
therapist prescribing than those from remote regions.
However, there was no significant difference (ARR 4.4%,
95% CI −2.2 to 12.0) between participants who practise in
major cities compared with regional areas.

Wider impacts of physiotherapist prescribing
Participants were asked to provide additional comments
about how NMP may impact the overall level of care that
the profession is able to provide. In total, 230 participants
provided comments.
Four major themes were identified:
1. Clinical and cost-efficiency.
2. Access to prescription medicines.
3. Optimal therapeutics and clinical effectiveness.
4. Time management.

Table 3 lists the number of participants that reported or discussed each theme and provides illustrative quotations.

**Clinical and cost-efficiency**
One hundred and eighteen participants commented that the introduction of autonomous physiotherapist prescribing would have positive effects on both clinical and cost-efficiencies for patients, clinicians and the health economy. Participants identified the positive impact on the overall patient journey as a potential benefit of NMP.
Table 2

| Survey item                                      | Location | RRMA | % (95% CI) | Subgroup comparisons | ARR % (95% CI) |
|-------------------------------------------------|----------|------|------------|----------------------|----------------|
| Agreed or strongly agreed with autonomous prescribing | City     | 79.5 | (75.5 to 83.2) | -                    | -              |
| Likely to train as prescriber                    | Regional | 70.0 | (62.4 to 77.1) | +                    | -              |
| Likely to train as prescriber                    | Remote   | 55.8 | (46.4 to 46.6) | +                    | +              |
| Health sector % (95% CI)                         | Private  | 77.4 | (73.3 to 81.1) | -                    | -              |
| Public                                          | 67.5     | (62.2 to 72.9) | +                    | -              |
| Other                                           | 54.2     | (44.2 to 63.8) | +                    | -              |
| Subgroup comparisons ARR % (95% CI)              | City: public | 1.0 | (-0.3 to 0.3) | +                    | -              |
| City: regional                                  | 24.0     | (8.2 to 44.3) | +                    | -              |
| City: remote                                    | 19.9     | (8.2 to 31.0) | +                    | -              |
| Regional                                        | 14.1     | (5.4 to 23.4) | +                    | -              |
| Remote                                          | 11.7     | (-1.8 to 35.2) | +                    | -              |

Table 3  Comments that reported or discussed each theme and illustrative quotations from participants (quotations have been copied verbatim)

| Theme                                      | Number of comments (n) | Illustrative quotations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Clinical and cost efficiency              | 118                    | ‘… [W]ould benefit people financially if they do not have to go back to their GP for medication’ (participant 41). ‘Time and cost savings for busy workers, that is, not having to go to 2 appointments’ (participant 127). ‘…[I]mprove patient flow and decrease reliance on medical staff’ (participant 490). ‘Working in an Emergency Dept where access and flow is critical, enabling advanced musc [musculoskeletal] physios to prescribe would improve efficiency in the workplace and the patient experience’ (participant 7). ‘The ability to prescribe would enable more efficient service delivery to patients. A lot of time is wasted back and forth trying to get appropriate pain medication, antibiotics etc in a timely fashion’ (participant 32). |
| Access to prescription medicines          | 71                     | ‘Working in a rural area where it is difficult for a patient to be able to make a GP appointment (typical 2–3 week wait) I can see the benefit of streamlining the system by giving prescribing rights to physios who are also primary care professionals’ (participant 630). ‘Will reduce burden on overbooked GP’s and ED’s for people with pain problems, that is, Severe Acute Low back (pain) or those with inflammatory injuries’ (participant 873). ‘Physiotherapists working in public health help people from different minority groups every day - indigenous, recent immigrants, people relying on disability pensions, etc. Greater access to simple medications would improve our quality of life and reduce unnecessary attendances at over- worked GP clinics’ (participant 12). ‘I work in a country setting where travel times are significant and it can be difficult to get a doctor’s appointment and, when injured or without a licence, patients rely on friends, relatives or public transport to reach appointments. This means that a physiotherapy appointment with prescription would become a more efficient use of time and people are more likely to comply’ (participant 654). |
| Optimal therapeutics and clinical effectiveness | 15                     | ‘Will allow physiotherapist to adjust medications particularly in management of chronic pain and LBP…’ (participant 333). ‘There is considerable potential for this to significantly improve adherence to medication regimes and to problem solve in a time appropriate manner’ (participant 45). ‘Physios tend to spend more time with patients and often are better skilled to recommend medications than even the registrars, especially in my urogynae advanced practice clinics, being able to prescribe anticholinergics and vaginal oestrogens would significantly increase the efficiency of the clinics as currently [patients] need two appointment times for this’ (participant 276). ‘[D]e-prescribing’ could potentially be a very important role for Physios’ (participant 790). |
| Time management                           | 9                      | ‘The time required to keep up to date with medications and well as physiotherapy skills to be safe and effective I feel would impact the time available to treat patients…’ (participant 246). ‘Puts extra pressure on appointment time when we already have to deal with full assessment and treatment of the patient’s physical and psycho-social needs’ (participant 693). |
statement highlighting the appropriate use of anticholinergics and vaginal oestrogens necessary to holistically treat many of their patients.

Participants agreed that the close working relationships between physiotherapists and their patients, due to the comprehensive time spent completing physiotherapeutic interventions may be used to promote patients’ compliance to their prescribed medicines. Physiotherapist prescribers with the appropriate knowledge and skills could legally reinforce the appropriate use of medicines, better recognising poor adherence, dependency, abuse or adverse side effects masquerading as conditions treated by physiotherapists.

Time management
Nine participants suggested that the time requirements needed to train as a physiotherapist prescriber and ongoing time required for continuous professional development (CPD) may be prohibitive to introducing NMP in Australia.

Likely, time away from clinical work for education and development and NMP duties were seen to potentially interfere with tasks currently performed by clinicians. Furthermore, participants felt that although greater efficiency and access to medicines may benefit health consumers, time presently spent treating patients in the current scope of practice would be lost to procedures related to prescribing medicines. In other words, although NMP may decrease medical practitioners’ workload, this would instead increase pressures on already understaffed physiotherapy departments and possibly even threaten clinical outcomes.

Further insights
The final question allowed participants to express any additional thoughts and views about physiotherapist prescribing that they deemed important and had not already been captured. Two hundred and sixty-six participants provided comments. Three major themes were identified:
1. Quality and safety: clinical governance, policies and procedures and education.
2. Professional issues.
3. Physiotherapy professional priorities.

Table 4 lists the number of comments that discussed each theme and subtheme, providing Illustrative quotations from participants.

Quality and safety
Two hundred and seventeen comments were received regarding quality and safety concerns around NMP. These focused on clinical governance, policies and procedures and educational requirements for prescribers.

One hundred and forty-four participants proposed that adequate clinical governance, policies and procedures should be in place for physiotherapist NMP to be successful. Participants identified the need for a clear scope of practice linked to a physiotherapy-centric formulary that is endorsed and regulated promoting transparency and safety. Participants raised concerns that statutory processes and procedures defining a limited formulary could quickly become outdated due to medical advances. Meanwhile, other participants identified that a limited formulary based around the profession’s specialist areas of practice would be safest, protecting clinicians from pressures to prescribe out of scope. Participants were concerned that unless communication channels were maintained between physiotherapist prescribers and GPs, there is a risk that patients could shop around for prescriptions, potentially aiding the abuse of prescription medication and causing clinical incidents. Participants were also concerned that the increase in professional risk due to physiotherapist prescribing would lead to an increase in indemnity insurance premiums.

Seventy-three comments were received with regards to education. Participants recognised that the scope of practice must be absolutely clear, endorsed and underpinned by a robust clinical education framework. They felt that thought must be given to the process of assessment and selection of appropriately qualified assessors from outside the profession including medical doctors and pharmacists to ensure quality and safe practice among prescribers.

Access to prescribing courses for physiotherapists living in regional and remote areas was highlighted as a potential issue due to the distance to the nearest university. Participants recommended that the regulatory body should dictate compulsory annual CPD hours, and periodic reassessment of competency should be mandatory. Participants had varying opinions with regards to when physiotherapists should be able to train and qualify as prescribers; however, the participants agreed that current preregistration physiotherapy programmes should be updated to include pharmacology and therapeutics on their syllabi in preparation for the future.

Professional issues
Thirty-nine participants provided comments on important professional issues. Participants noted that the introduction of physiotherapist prescribing could change the ‘physiotherapy brand’, weakening the public’s perception of physiotherapists as experts in manual therapy and exercise, leading to potential loss of patients to other emerging healthcare professions. It was suggested that a marketing campaign may be necessary to manage public expectation and minimise consumer confusion.

Interprofessional relationships between physiotherapists, medical practitioners and pharmacists were highlighted as being fragile. Participants warned that members of the Australian Medical Association would not support the introduction of physiotherapist prescribing, alluding to the possibility that medical doctors might see the introduction as a direct challenge to their authority and private businesses, leading them to reduce referrals to physiotherapy. Participants specifically identified the impact this may have on practice revenues in the musculoskeletal and sport specialties. That said, other participants
**Table 4 Additional comments reported or discussed by participants and illustrative quotations from participants**

| Quality and safety                     | 217                    | ‘Prescribing medicines is a risk to the physiotherapy profession as there can be a lot of risks to the patient with medications. Prescribing and its scope needs to be carefully planned and managed with introduction to the physiotherapy profession’ (participant 379). ‘The physio who is going be a prescriber needs to undergo a certain number of hours of training... going through an examination process. Continuous on-going training is also important as medications change fairly rapidly’ (participant 14). ‘...[P]rofessional indemnity is required to protect them in case of errors or mishaps’ (participant 89). ‘Risks of ‘doctor shopping’ of physiotherapists for opioid based drugs without centralised control’ (participant 651). ‘The challenge in prescribing is ensuring consumer safety through adequate training of the physiotherapists involved and improved communication across health professions’ (participant 56). |
| Professional issues                    | 39                     | I believe that it would create confusion for the public if some physiotherapists could prescribe, while others could not’ (participant 227). ‘A cultural change is needed, namely adjusting the public’s perception of what allied health professionals can do, in order to effectively use non-medical prescribing rights’ (participant 380). ‘... the medical doctors may have their issues with this as it may be seen as a direct challenge to their authority and therefore reduce their use of referral pathways already established’ (participant 4). ‘I would be concerned that there may be a conflict that forms between doctors and physiotherapists if physios were given prescribing authority. I think there would have to be some very strict guidelines about managing a patient who may be seeking prescriptions from both a doctor and physiotherapist at the same time’ (participant 879). ‘I think the medical and pharmaceutical professions would have a negative view of physios prescribing and be less willing to work with us/refer patients to us’ (participant 447). |
| Physiotherapy professional priorities  | 40                     | ‘Physio profession needs to become more progressive with enhanced scope roles, career pathways are currently limited’ (participant 412). ‘I think that the physiotherapy profession should spend their resources and energies trying to improve the ability for Physiotherapists to order radiological investigations (scans etc) and referrals to specialists which would be far more beneficial in a cost and time saving way then being able to prescribe medications’ (participant 78). ‘Potential for increased reliance on pharmaceutical treatments of MSK conditions over traditional physiotherapy management strategies (i.e. manual therapy, exercise prescription)’ (participant 701). ‘May potentially de-value other interventions in the management plan (i.e, committing to taking medication as prescribed, but not to exercises prescribed in same session)’ (participant 219). |
reported great support from medical colleagues and the greater multidisciplinary team, citing the streamlining of current clinical services and patient pathways, alongside improved access medicines as key reasons for positive interprofessional support. Participants warned that although these efficiencies would reduce service costs, establishing physiotherapist prescribing would require an initial coordinated investment to ensure appropriate governance, clinical education and safe/quality implementation across Australia.

**Physiotherapy professional priorities**

Forty participants commented on the profession’s professional priorities. Participants described the risks of junior physiotherapists underdeveloping their traditional physiotherapy skills used to treat impairments and instead depending on medicines. To mitigate these risks, a robust career progression framework would need to be introduced to ensure ongoing high-level professional development across all specialties. To safeguard the good reputation of the profession, participants focused on maintenance of quality and safety for patients and clinicians. Physiotherapist prescribing should be introduced in a structured and organised manner with all physiotherapists supporting each other, even if they do not wish to prescribe themselves. Furthermore, participants also commented that the ability for physiotherapists to directly refer to specialist medical or surgical practitioners and ensuring appropriate patient rebates for imaging would have a positive clinical impact.

**DISCUSSION**

This is the first study to explore the perceptions of Australian physiotherapists regarding NMP by physiotherapists in Australia. The majority of physiotherapists agreed that autonomous prescribing responsibilities should be introduced for physiotherapists in Australia. Improvements in the efficiency of healthcare delivery, access to medicines and reductions in costs across the health economy were suggested as potential benefits. These findings concur with those reported by student physiotherapists in Australia as detailed in a related article, as well as reflecting an evaluation of physiotherapist and podiatrist independent prescribers in the UK, strengthening the external validity and transferability of the results. Concerns regarding clinical safety and management of clinical risk were clearly identified throughout the quantitative and qualitative sections of the survey, supporting the results of an international multiprofession mixed-methods systematic review investigating the barriers and facilitators of the implementation and utilisation of NMP. The systematic review identified the need to address governance, safety, educational and financial factors prior to training prescribers to protect both patients and clinicians from poor practice, process and clinical pathways. To safely and effectively introduce physiotherapist prescribing, politicians, regulatory bodies, healthcare managers, clinicians and the APA, in consultation with experts and health consumers, must develop robust legislation, regulation, clinical governance and safety policies as well as well-defined education and career frameworks.

To ensure that physiotherapists are equipped to prescribe safely within a multimodal physiotherapeutic context, participants perceived that a contemporary, innovative and robust educational framework should be developed prior to the introduction of physiotherapist prescribing. This perception reflects contemporary educational literature that urges educators to carefully consider the ever-evolving healthcare system when designing curricula for physiotherapists. Transforming healthcare needs will require the next generation of physiotherapists to be ready to adapt to changes in consumer complexity and expectation, working within new models of care that are organised, funded and delivered in innovative ways. It has been postulated in the literature that a more flexible, broader and deeper clinical expertise will be required by physiotherapists if the Australian physiotherapy profession wishes to succeed as evidence-based and viable health providers in the integrated, value-driven health industry of the future.

To guarantee quality development of physiotherapists across the profession, participants called for the creation of a contemporary career development framework into which prescribing would be integrated to safeguard mastery of traditional skills, govern quality practice and maintain the ‘physiotherapy brand’. This appeal concurs with literature reporting that career frameworks within healthcare help the public understand different clinicians’ knowledge, skills and roles within one profession, as well as providing purpose and direction for professionals, promoting engagement and job satisfaction. Further, academic qualifications and increased clinical responsibility should lead to enhanced remuneration if physiotherapists are to adopt prescribing into their clinical practice, as a lack of remuneration has been recognised as a barrier to NMP across other professions. Improvements in recruitment and retention within the profession were anticipated due to improvements in job satisfaction for clinicians and greater recognition and professional reputation, echoing the findings of other NMP professions reported in the literature.

Physiotherapists working in cities and regional areas were consistent in observing that physiotherapist prescribing would improve access to medicines across all regions but would be specifically helpful in rural/remote areas where access to medical prescribers may be limited. However, physiotherapists from rural/remote areas, although positive about the introduction of physiotherapist prescribing, were less likely to wish to train as prescribers, identifying potential increased risks when working in geographical isolation owing to a lack of clinical support. Due to a perceived lack of need in the present healthcare environment, participants felt that not all physiotherapists would benefit from undertaking a NMP course. Those working in close multidisciplinary

teams with collocated prescribers, or those employed in non-clinical roles such as healthcare managers or academic physiotherapists were found to be less likely to wish to become prescribers than clinicians working in the public and private sectors. There was debate as to when and who should undertake the training, with no consistency as to whether education should be included in foundation level courses or become a postregistration qualification for those with a specified clinical experience. Furthermore, rural physiotherapists identified that the distance to universities may act as a barrier to training as a prescriber, highlighting the need for educators to consider flexible learning methods such as online education and video teleconferencing to fulfil the academic requirements of a NMP course. It is therefore imperative that a robust, fit for purpose, transparent and future proof education framework is developed to ensure unity within the Australian physiotherapy profession and assurance for all stakeholders that physiotherapists prescribers would be adequately prepared for practice.

Participants’ perceptions that physiotherapist prescribing in Australia would reduce costs to their patients, healthcare services and to the health economy as a whole is supported by an economic review commissioned by the APA. The report predicts savings to the Australian health economy of over $9.22 million per year if physiotherapist prescribing was implemented\(^{37}\); however, this is not currently reflected in the health economics literature. A robust low risk of bias systematic review investigating the clinical and cost-effectiveness of NMP found only one inadequately powered pilot randomised controlled trial investigating clinical effectiveness to date, concluding that the benefit of NMP to the health economy remains unclear.\(^\text{4}\) This gap in the literature highlights the need for robust, adequately powered economic evaluation to investigate the cost–benefits perceived by physiotherapists across Australia.

**Strengths and limitations**

This is the first study investigating the perceptions of AHPRA-registered physiotherapists about the potential introduction of NMP among physiotherapists in Australia, and so, alongside the data from student physiotherapists presented in the related article, provides an important overview of the current associated professional landscape. The data should be used to guide the APA, health departments and political leaders towards successful implementation of physiotherapist prescribing in Australia. As with all survey-based research, limitations are inherent due to selection and response bias. The survey was anonymous, so participants may have biased the results by completing the online questionnaire multiple times. Furthermore, physiotherapists with strong views or vested interests may be more likely to complete the questionnaire, meaning that their answers may not reflect the views of the wider profession.

A representative survey response rate (as per prescriptive power calculations) was achieved.\(^\text{13}\) Although only 3% of AHPRA responded, this reflected the response rate of a previous national evaluation of physiotherapists,\(^\text{37}\) where similarly, it was not possible to contact all registered physiotherapists directly due to the AHPRA privacy policy. Physiotherapists who were not APA members at the time of the survey would have been unaware of the questionnaire unless they were provided with a link to the questionnaire through professional networks. It is impossible to determine why 97% of AHPRA registered physiotherapists did not participate; therefore, the risk of bias remains unknown and should be considered when interpreting the results. In line with recent Australian regulatory data,\(^\text{38}\) the sample was representative of all registered physiotherapists in Australia in terms of age, gender and state in which they practise. Unfortunately, no national demographic data exist demonstrating the geographic location or health sector of registered physiotherapists’ employment. It is therefore likely that the comparable demographic profile of the study’s sample to contemporary national evaluations enhances generalisability of the data to the greater physiotherapist population in Australia and reduces risk of bias.

**CONCLUSION**

AHPRA-registered physiotherapists perceive that the introduction of autonomous physiotherapist prescribing would be beneficial for the Australian population and should be introduced. Acceptance of physiotherapist prescribing and the likelihood of physiotherapists to train as prescribers vary depending on location and the health sector in which a physiotherapist works. Legislation, regulation and governance around the use of physiotherapist prescribing all require careful consideration and consultation with experts and health consumers to ensure the safety and quality demanded by physiotherapy profession. Rigorous national educational frameworks should be developed within a transparent career development structure to ensure prescribing is used within a multimodal physiotherapeutic context, safeguarding the professional reputation of physiotherapy.

It is recommended that the APA, health departments and political leaders use the results of this study in conjunction with cost–benefit analyses, risk analysis as well as assessment of the health requirements and consultation with key stakeholders to redefine the scope of Australian physiotherapy to include NMP. Future research is required to investigate the concerns raised by participants. It would be valuable to interview current physiotherapist prescribers to interrogate the perceived benefits and concerns about physiotherapy prescribing identified by the Australian physiotherapists. Lessons learnt in the UK could thus be used to inform implementation internationally.
