smbA DNA (left panel) or pED208 smbA DNA (right panel), monitored by electrophoretic mobility shift
assay.
Supplementary Movies

Movie S1, related to Figure 5. Morph of B-DNA conformation \textit{sbmA} to the conformation observed in the crystal structure, illustrating unwinding and kinking of DNA. Morph was created with CNS (12) using the script from the Morph Server (13). Movie was created with Pymol (http://www.pymol.org).

Movie S2, related to Figure 5. Morph of B-DNA conformation \textit{sbmA} to the conformation observed in the crystal structure, orthogonal view to better illustrate DNA kinking. Morph was created with CNS (12) using the script from the Morph Server (13). Movie was created with Pymol (http://www.pymol.org).
**Supplementary Experimental Procedures**

**Growth media and bacterial strains**

Cells were grown in LB (Luria-Bertani) broth or on LB solid medium containing appropriate antibiotics or other supplements. Antibiotics were used at the following final concentrations: ampicillin (Amp), 50 µg/mL; kanamycin (Km), 25 µg/mL; spectinomycin (Spc), 100 µg/mL; nalidixic acid (Nal), 40 µg/mL, and tetracycline (Tet), 10 µg/ml. IPTG (isopropylthio-β-D-galactoside) was used at a final concentration of 1 mM. The following *Escherichia coli* strains were used: XK1200 [F ΔlacU124 Δ(nadA gal attλ bio) gyrA (Nal')] (14), ED24 (F Lac Spc') (15), DH5α [ΔlacU169 (φ80 lacZΔM15) supE44 hsdR17 recA1 endA1 gyrA96 (Nal') thi-1 relA1] (16) and BL21-DE3 [F ompT hsdS (rB− mB−) galI(DE3)] (Stratagene).

**Plasmids and plasmid construction**

Plasmids pJLM400 and pJLM403 (6), pOX38-MK3 (8), pRF105 (10), pRF911 (11), pED208 (4), pRFM200 (9), pACYC184 (1), pOX38-DM (7), pJMtraD (7), pBluescript KS (+) (3), pBAD 24 (2), and pT7-5 (5) have been described previously. Plasmids and primers used in this work are described in Table S2. The 0.5-kb *EcoRI-BamHI* fragment of the PCR products amplified from pED208 using primer pair JLU91 was cloned into the *EcoRI-BamHI* sites of pT7-5 or pBluescript KS (+), resulting in pJLEM200 or pJLM404, respectively. The 0.5-kb *EcoRI-BamHI* fragment of the PCR products amplified from pRF105 using primer pair JLU601 and JLU602, or JLU603 and JLU602, was cloned into the *EcoRI-BamHI* sites of pJLM400, resulting in pJLM401 or pJLM402, respectively.

Overlap extension (Ho et al., 1989) was used to construct pJLM407 expressing a hybrid TraM (F TraM<sup>1−55</sup>:pED208 TraM<sup>56−127</sup>). PCR primer pair JLU3 and JLU612 were used to amplify a fragment containing F traM<sup>1−55</sup> from pRFM200. Primer pair JLU611 and JLU608 were used to amplify a fragment containing pED208 traM<sup>56−127</sup> from pJLEM200. Primer pair JLU3 and JLU608 were used to amplify the full-length hybrid traM (F TraM<sup>1−55</sup>:pED208 TraM<sup>56−127</sup>) fragment, which was further digested by *EcoRI* and *BamHI* and cloned into the *EcoRI-BamHI* sites of pBluescript KS (+), resulting pJLM407.
The 1.5-kb \textit{EcoRI-ScaI} fragment from pJLM400 or pJLM407 was cloned into the \textit{EcoRI-ScaI} sites of pACYC184, resulting in pACM400 or pACM407, respectively. The 1.1-kb \textit{PstI-HindIII} fragment of PCR products amplified from pJMtraD using primer pair JLU262 and JLU263, or JLU262 and JLU264, was cloned into the \textit{PstI-HindIII} sites of pJMtraD, resulting in pJLD263 or pJLD264, respectively.

**Overexpression and purification of F TraM, R100 TraM, and R100 R3K:I5N TraM**

DH5\textsubscript{α} cells containing pJLM400, pJLM401 or pJLM402, were grown in 100 mL of LB broth containing ampicillin and 0.4% glucose at 37°C. After 12 hours, the 100 mL culture was added into 1 L of LB with ampicillin and grown under the same conditions for 3 hours. IPTG was added to a final concentration of 1 mM and the culture was grown for another 3 hours before harvesting. All the following steps were performed at 4°C or on ice. The cell pellet was suspended in 75 mL of buffer containing 50mM Tris-HCl, pH7.5 and one tablet of Complete protease inhibitor cocktail (Roche), and sonicated for 30 seconds, 6 times. Cell debris was removed by centrifugation at 39,000 x g for 1 hour. Ammonium sulfate (20 grams) was dissolved in the extracted supernatant. After centrifugation at 39,000 x g for 1 hour, the supernatant was loaded onto a 25 mL HIC column (Phenyl Sepharose\textsuperscript{TM} 6 Fast Flow, GE healthcare Life Sciences), eluted with Tris-HCl (50 mM, pH 7.5) and a 1 to 0 M ammonium sulfate gradient. The fractions containing TraM (~40 mL) was brought to 135 mL with malonic acid (50 mM, pH 5.5), loaded onto a 25 mL cation-exchange column (SP Sepharose\textsuperscript{TM} Fast Flow, GE healthcare Life Sciences), and was eluted with malonic acid (50 mM, pH 5.5) and a 0 to 1 M NaCl gradient. The pooled TraM fractions were concentrated to 5 mL using an Amicon\textsuperscript{®} ultracentrifuge filter (Millipore), loaded onto a size exclusion column (Hiload\textsuperscript{®} 26/60 Superdex 75 prep grade, GE Healthcare Life Sciences), and was eluted with 50mM sodium phosphate, 150 mM NaCl, pH 7.5. Fractions containing purified TraM were concentrated and the buffer was exchanged for 0.5 M ammonium acetate using an Amicon\textsuperscript{®} ultracentrifuge filter (Millipore) to a final volume of 1 mL. Protein concentration was determined using BCA protein assays (Pierce) following the manufacturer's instructions.

**Expression and purification of pED208 TraM**
BL21-DE3 cells containing pJLEM200 were grown in LB media containing 100ug/ml ampicillin at 37°C until the OD 600 reached ~0.7, followed by induction with 0.5 mM IPTG for 5 hours at 27°C. Harvested cells from 1 L of media were suspended in 100 ml of 50 mM Tris pH 7.5, 150 mM NaCl, 1 mM DTT containing 1 Complete, EDTA-free protease inhibitor tablet (Roche). The cells were lysed by sonication for 20 seconds 6 times, followed by centrifugation at 39,000 x g for 45 minutes to remove cell debris. 35 grams of ammonium sulfate was added to the clarified cell lysate, and dissolved by stirring for 15 minutes on ice. Precipitated proteins were removed by centrifugation at 39,000 x g for 30 minutes. 10 grams of ammonium sulfate was dissolved in the resulting supernatant, followed by centrifugation as in the previous step. The resulting pellet containing TraM was dissolved in 100 ml of 50 mM Tris, pH 7.5, 1 M ammonium sulfate. The dissolved pellet was loaded onto a 25 ml HIC column (Phenyl Sepharose 6 Fast Flow™, GE Healthcare Life Sciences) and eluted by a decreasing gradient of 50 mM Tris pH 7.5, 1 M ammonium sulfate. Ammonium sulfate was added to fractions containing TraM to 45 grams per 100 ml and dissolved by stirring on ice for 15 minutes, followed by centrifugation at 39,000 x g for 30 minutes to precipitate TraM. The resulting pellet was dissolved in 100 ml of 50 mM L-Histidine, pH 5.5, and loaded onto a 25 ml anion exchange column (Q Sepharose Fast Flow™, GE Healthcare Life Sciences) and eluted by increasing gradient of 50 mM L-Histidine, pH 5.5, 1 M NaCl. TraM-containing fractions were concentrated and exchanged into 50 mM MES pH 6.8, 300 mM NaCl by centrifugation at 2,400 x g in 15 ml concentrators (Amicon Ultracel 10K, Millipore). The concentrated fraction was loaded onto a 300 ml size exclusion column (HiLoad 26/60 Superdex75™ prep grade, GE Healthcare Life Sciences) and eluted with the same buffer. TraM-containing fractions were concentrated in 15 ml concentrators (Amicon Ultracel 10K, Millipore) and exchanged into 0.5 M ammonium acetate. Protein concentration was determined using BCA protein assays (Pierce) following the manufacturer's instructions.

**Oligonucleotide DNA purification and annealing for crystallization, titration analysis, and MALLS**

Synthetic DNA oligonucleotides were purified on a 7 mL anion exchange column (Source 15Q) under denaturing conditions (10 mM NaOH) and eluted by increasing gradient of 10mM NaOH, 1M NaCl. DNA-containing fractions were desalted with a Sep-PAK® (C18) cartridge in a volatile buffer (30%
acetonitrile in 0.1 M triethylammonium bicarbonate), lyophilized and resuspended in water. Oligonucleotide DNA solutions were quantified by absorbance at 260 nm. The 30-base pair F sbmA DNA was generated by annealing of 30BTA and 30BTB, and F sbmAB by annealing F sbmAB–F and F sbmAB–R. The 24-base pair pED208 sbmA DNA was generated by annealing the perfectly palindromic sequence pED 4site. Mixed oligos were heated in a water bath to 100°C and slow cooled to room temperature in 10 mM Tris pH 7.5 and 100 mM NaCl at a final concentration of 0.5 mM double stranded DNA.

**Titration analysis of pED208 TraM binding to sbmA**

Each binding mixture contained 1.5 µM of 24 base-pair sbmA, the indicated molar ratio of TraM, 50mM Tris-HCl (pH 7.5), and 10% glycerol in a 15 µl volume. Samples were incubated for 10 minutes at room temperature. Mixtures were run on TBE-buffered 12% polyacrylamide gel in 1X TBE at 4°C and 200 Volts for 45 minutes. DNA and DNA-protein complexes were visualized by ethidium bromide staining.

**Competition of Wild-type pED208 sbmA by pED208 sbmA mutants**

0.1 nM of P³²-labelled pED208 24 bp wild-type sbmA was mixed with 50 nM of TraM (enough to effectively bind all unbound DNA) in 50 mM Tris pH 7.5, 10% glycerol, and 30 ng/µl bovine serum albumin (Pierce). TraM-sbmA complexes were incubated for 10 minutes, followed by addition of unlabelled competitor sbmA oligos in the amount of times the concentration of labeled oligo indicated. Mixtures with competitor DNA were incubated for 48 hours. All incubations were done at room temperature. Mixtures were run at 200 V on a 1x TBE-buffered 12% acrylamide gel for 45 minutes at 4°C. Gel bands were visualized by phosphor screen. Proportion of bound radioligand was fitted to a 3-parameter logistic curve for obtaining the IC₅₀.

**Multi-angle laser light scattering**

All following steps were performed at 25 °C. Purified TraM (200 µg) or purified TraM (120 µg) plus 200 µg of 30-base pair sbmA DNA was applied to a Superose™ 12 HR 10/30 column eluted with the same buffer. The effluent from this column was run directly through in-line DAWN EOS™ multi-angle laser
light scattering (MALLS) and Optilab rEX™ differential refractive index detectors (Wyatt Technologies, Santa Barbara, CA). ASTRA v.4.90 software was used to process the data.

**Titration analysis of F TraM-sbmA binding**

Each binding mixture contained 1 µM of 30 bp sbmA, 50 mM Tris-HCl (pH 7.5), and 10% glycerol. Increasing amount of purified F plasmid TraM was added with different molar ratios to the 30 bp sbmA. The final volume of each sample is 10 µl. The resulting mixture was loaded onto a TBE-buffered 12% polyacrylamide gel and was run in 1x TBE (90 mM Tris-borate, 1 mM EDTA) at 4°C and 40 Volts for 4 hours. DNA and DNA-protein complexes were visualized by ethidium bromide staining.
