**INTRODUCTION**

*Ehretia* genus has around 150 species belongs to the family Boraginaceae [1-3]. Many species are mainly distributed in tropical Asia, Africa, Australia, Europe, and Northern America [4-14]. All species of *Ehretia* are trees (*Ehretia acuminate*) and shrubs [15] (*Ehretia rigida*). The leaves, barks, roots, branches, fruits, and heartwoods are used as the traditional medicines in China, Japan, and India. Some species produce small fruits are visited by a broad variety of opportunistic avian frugivores, and some species could be a valuable supplementary feedstuff for ruminant livestock and wild animal due to its fermentation characteristics as well as low fiber [15-19]. In India, genus *Ehretia* is reported for many species such as *Ehretia laevis* Roxb., *E. acuminate* R.Br. [20], and *Ehretia microphylla* [21,22]. These species are used in many herbal and traditional medicines in India and China because of their good response in many biological activities. *Ehretia* genus has reported the presence of phenolic acids, lignans, flavonoids, nitrile glycosides, quinonoids, steroids, triterpenoids, and pyrrolizidine alkaloids [23,24]. Many species of *Ehretia* genus are reported for anti-inflammatory, antidiabetic, and antibacterial activity. Some important species of this genus are *Ehretia longiflora*, *E. laevis*, *E. acuminate*, *E. microphylla*, and *Ehretia obtusifolia*.

In an effort to provide the up-to-date information of the genus *Ehretia*, in previous, some chemical constituents and activities have published up to 2010 [25], and this article represents the results of an extensive investigation of the chemotaxonomy, secondary metabolites, biological activities, and pharmacological applications of this genus up to 2017, which would assist further researches and potential applications of the plants.

**TRADITIONAL AND MEDICINAL IMPORTANCE OF SOME SPECIES OF GENUS EHRETIA**

Different plants of genus *Ehretia* are widely used traditionally in many herbal and Chinese medicines from last few decades in China, India, and Japan [26,27] (Table 1).

**CHEMICAL CONSTITUENT PRESENT IN GENUS EHRETIA**

Species present under the genus *Ehretia* contains many phytocomponents such as - phenolic acids, flavonoids, benzoquinones, cyanogenic glycosides, fatty acids, and some other important compounds.

**Phenolic acids**

Plants are potential sources of natural bioactive compounds such as secondary metabolites and antioxidants. Phenolic acids are the secondary metabolites and therapeutic agent present in medicinal plant. Phenolic compounds confer unique taste and health-promoting properties found in vegetables and fruits. The effect of dietary phenolics is currently of great interest due to their antioxidative and possible anticarcinogenic effect (Table 2).

**Flavonoids**

Flavonoids are the polyphenolic compounds among secondary metabolites in different parts of plants that possess a wide range of biological activities. They are present in fruits, vegetables, nuts, spices, and herbs and derived products such as wine, tea, and chocolate. The flavonoid class includes more than 6000 compounds as found in nature and comprises several subclasses including flavonols (e.g., queretin, kaempferol, myricetin, and rhamnatin), flavones (e.g., apigenin, luteolin, and tangeretin), flavanones (e.g., hesperetin, naringenin, and eriodictyol), flavanols (e.g., catechins and epicatechins), anthocyanidins (e.g., cyanidin, delphinidin, and malvidin), and isoflavones (e.g., genistein, daidzein, and glycitein) (Table 3).

**Alkaloids**

Alkaloids are quite important secondary metabolites of plants. They are internal constituents of plants so-called biomolecules. Uses of alkaloids primarily mean their use in health care. They act as lifesaving drugs in various serious disorders such as heart failure, blood pressure, and cancer. Several alkaloids isolated from natural herbs exhibit antimitastasis and antiproliferation effects on various types of cancers such as vinblastine and camptothecin and have already been successfully developed into anticancer drugs. Lycorine, indoline n-oxide, alstonine, cocaine, quinine, and quinidine are some alkaloids present in plants (Table 4).

**Fatty acids**

Plants synthesize a huge variety of fatty acids although only a few are major and common phytoconstituents. Fatty acids are...
important dietary sources of fuel for animals because, when metabolized, they yield large quantities of ATP (Adenosine triphosphate). Many types of cell can use either fatty acids or glucose for this purpose. Long-chain fatty acids are not capable to cross the blood–brain barrier and so cannot be used as fuel by the cells of the central nervous system (Table 5).

**Benzoquinones**

Quinones, a type of plant-derived secondary metabolites and benzoquinones, are widely distributed in the plant kingdom and mainly exist in higher plants, such as those from the Polygonaceae, Rubiaceae, Leguminosae, Rhamnaceae, Labiatae, and Boraginaceae families, among others. Moreover, a number of benzoquinones show significant biological activities such as anticancer and antibacterial activities (Table 6).

**Glycosides**

In the chemical constituents occur in a glycoside are important, secondary metabolites. However, biological activities of glycosides are, in many cases, susceptible to the nature of sugar moieties. They are an essential resource of natural medicine, health food, cosmetics, and food supplements (Table 7).

### Table 1: Traditional uses of genus Ehretia

| Botanical name | Common name | Part used | Traditional use | References |
|----------------|-------------|-----------|----------------|------------|
| Ehretia acuminata R.Br. | Pudila, Nara, Koda | 1. Leaves 2. Bark 3. Root | 1. The extract of the leaves mixed with water and taken orally once daily for 2–3 days to cure acute dysentery | [28] |
|  |  |  | 2. Bark juice used in sores on tongue and fever | [29] |
| Ehretia laevis Roxb. | Chamror (Punjab), Kuptaa, Datanang (Maharashtra) | 1. Leaves 2. Root 3. Bark 4. Fruit | 1. Leaves juice is applied on ulcer, skin disease, and headache | [30] |
|  |  |  | 2. Root used in venereal diseases | [31] |
|  |  |  | 3. Bark is used internally and as gargle in throat infections, inner bark of E. laevis is used as food | [32] |
|  |  |  | 4. Fruit used in infections of urinary passages, diseases of lungs and spleen | [33] |
| Ehretia microphylla Lam. | Pala. | 1. Leaves 2. Root | 1. Dried leaves used in stomachic, decoction of the leaves is used as cure for coughs and is prescribed for the treatment of cyaniding with bloody discharge and for dysentery | [34] |
|  |  |  | 2. Root in cachexia and syphilis; an antidote to vegetable poisoning | |
| Ehretia obtusifolia, Hochst. ex A.DC |  | 1. Leaves 2. Thin branches | 1. Decoction of leaves and bark in Malaria | [35] |
| Ehretia cymosa |  | 1. Leaves 2. Bark | 1. Different parts of plant are used in diarrheea | [36] |
|  |  |  | 2. The extract of leaves used in Malaria | |
|  |  |  | 3. Bark and leaves used in epilepsy | |
| Ehretia amoena |  | 1. Leaves 2. Bark 3. Root | 1. Plant works against trypanosomiasis | [37] |

### Table 2: Phenolic acids separated from genus Ehretia

### Table 8: Other important constituents extract from genus Ehretia

Many other important constituents are also reported from different parts such as leaves, bark, fruit, and root of plants of *Ehretia* genus (Table 8).
CHEMICAL STRUCTURE OF COMPOUND PRESENT IN EHRETIA GENUS (FIGS. 1-75)
Some species of genus *Ehretia*

Essential oil extracted from leaves of *Ehretia cymosa* by hydrodistillation. Some chemical constituents separated by comparison of their mass spectra with NIST from essential oil which mainly comprised sesquiterpene hydrocarbon compounds. The other classes of compounds identified in these essential oils were monoterpenes, alcohols, phenylpropanoids, esters, and fatty acids. In addition, some of the studied volatile oils have exhibited biological activities such as antimicrobial, phytotoxicity, insecticidal, and cytotoxicity (Table 9).

**SOME SPECIES OF GENUS EHRETIA**
BIological activities of different species of genus Ehretia

Many species of genus Ehretia show different biological activities such as antioxidant, antibacterial, anti-inflammatory, antiarthritic, and anti-snake venom activities.

Antioxidant activity
Many compounds, naturally occurring from plant sources, have been identified as free radical or active oxygen scavengers. Recently, interest has increased substantially in finding naturally occurring antioxidant for use in foods or medicinal materials to replace synthetic antioxidants, which are being restricted due to their side effects such as carcinogenicity. Natural antioxidants can protect the human body from free radicals and retard the progress of many chronic diseases as well as decelerate lipid oxidative naccidity in foods. In Ehretia serrata, 1-butanol and chloroform fractions of leaves and ethyl acetate fraction of fruits showed appreciable results against free radical. 12 compounds including six phenolic acids and six flavonoids, rosmarinic acid, cinnamic acid, icariside E5, ferulic acid, α-hydroxydihydrocaffeic acid, lithospermic acid B, isouqueritin, hyperoside, trifolin, astragalin, kaempferol 3-O-arabinosylgalactoside, and quercitin 3-O-arabinosylgalactoside were first isolated from Ehretia thyrsiflora and have a significant response of antioxidant (Table 10).

Anti-inflammatory activity
The inflammatory process may be outline a sequence of events that occur in response to noxious stimulus, infection, or trauma. The classic signs of inflammation are redness, heat, swelling, pain, and loss of function. The issue of inflammation that underlines these manifestations are induced and regulated by a large number of chemical mediators including eicosanoids, kinins, complement proteins, histamine, and monokines (Table 11).

Anti-allergic activity
Allergic disorders such as rhinitis, sinusitis, atopic dermatitis, asthma, pollenosis, and food allergy are the most common cause of human disease. There are a number of pharmacological agents available for the treatment of allergic conditions such as asthma and allergy rhinitis, and we also focus antiallergic activity as an essential step to the development of effective anti- allergic agent. Some species of Ehretia genus have compounds such as dimeric prenylbenzoquinones, nitrile glucosides, and rosmarinic acid show antiallergic effect (Table 12).

Anti-bacterial activity
All extracts of E. laevis leaves (methanol, chloroform, and aqueous solvent) have revealed excellent antibacterial activity. When compared to methanol, chloroform, and aqueous methanolic extract showed the high antibacterial activity on Gram-positive and Gram-negative bacteria, and aqueous extracts show the high antibacterial activity on Gram-negative than Gram-positive. Some other species also show positive respond against antibacterial activity (Table 13).

Antitubercular activity
In human being, tuberculosis is a contagious infectious disease primarily caused by Mycobacterium tuberculosis. Although regimens exist for treating tuberculosis, they are far from ideal. Development of effective strategies for the treatment of human tuberculosis has posed a challenge, considering the increase in infections associated with the human immunodeficiency virus and immunocompromised patients. Phytoconstituents have been used in traditional treatment of many diseases; however, careful investigation of these constituents has not been undertaken with respect to treatments of tuberculosis. Two compounds ehretiolide and prenylhydroquinone have extracted from root of Ehretia longiflora are responsible for antitubercular activity (Table 14).

Anti-snake venom activity
Snakebite is an important cause of morbidity and mortality and is one of the major health problems in India and other Asian countries. Ehretia buxifolia claimed to be useful in treating snake poison. The present study evaluated the potential antivenom effect Ehretia genus. A compound ehretianone has isolated from MeOH extract from E. buxifolia is responsible for anti-snake venom activity (Table 15).

Antiarthritic activity
Arthritis is an inflammatory disorder involving damage of joints. There are over a hundred different forms of arthritis, of which rheumatoid arthritis, osteoarthritis, and psoriatic arthritis are the most common. The treatment of any systemic disorder with allopathic drugs causes moderate-to-severe adverse effect that could cause death. Hence, alternative systems of medicine are being explored to treat diseases. E. laevis treatment supports antiarthritic activity. Of the three parts such as stem, leaf, and bark and fruit employed, the leaf extract was the most effective. This antiarthritic respond may be due to the presence of active constituents such as hexadecanoic acid (palmitic acid), oleic acid, and other fixed oils (Table 16).
Antitrypanosomal and antiprotozoal activity
Sleeping sickness, leishmaniasis, Chagas disease, and malaria are infectious diseases caused by unicellular eukaryotic parasites "protozoans." The available drugs for the treatment of trypanosomiasis and protozoans are old, expensive, and less effective, associated with severe adverse reactions and face the problem of drug resistance. This situation underlines the urgent need for the development of new safe, cheap, and effective drugs for the treatment of parasitic disease. The search for new antitrypanosomal and antiprotozoal agents in this study is based on ethnomedicine. *E. amoena* show weak antitrypanosomal potential with ethanol extract of leaves, bark, and root. *E. acuminata* show antiprotozoal activity with methanol extract of leaves (Table 17).

Antidiabetic activity
Diabetes mellitus, one of the fastest-growing health problems, is concerned about the use of antihyperglycemic drugs because of undesirable pathological conditions, for example, the adverse effect of metformin is gastrointestinal discomfort, pioglitazone with bladder cancer and heart failure, and sulfonymureas with hypoglycemia and weight gain. There are the ethnomedical studies of medicinal plants used in the treatment of diabetes mellitus in many countries. A lot of genus have already reported for effective respond of antidiabetic potential, but a few species of genus *Ehretia* are reported for antidiabetic activity yet. A species of *E. laevis* shows antidiabetic potential using multiwalled carbon nanotubes paste electrode in electrochemical measurement (Table 18).

Cardiotonic activity
*Carmona retusa* (*E. microphylla*) has a high potential enlighting the growth and multiplication of cancer cells. However, there are no scientific data on the use of this plant on cardiotonic activity. Hence, this study was carried out to evaluate the effect of aqueous extract of various aerial parts of *C. retusa* on isolated frog's heart. The activity of the aqueous extract was found to be effective (Table 19).

### CONCLUSION AND FUTURE PROSPECTS
The genus *Ehretia* contains abundant ingredients displaying extensive biological and pharmacological functions such as anti-snake venom, antiarthritic, antitrypanosomal, and antiprotozoal activity, and antitumor activities. Despite that many *Ehretia* species have been used as the traditional medicines in Australia, North America, and Asian countries for long time, and numerous studies on chemistry and pharmacology have been conducted, the authors propose herein a few opinions with an attempt to shed light on the related investigations on *Ehretia* in future.

Foremost, *Ehretia* is a relatively vast genus, and there are considerable differences in their major secondary metabolites, these molecules were intensively described from *E. longiflora, E. laevis, E. microphylla, E. obtusifolia, E. thyrsiflora, E. buxifolia, E. philippinensis, E. dicksonii,* and *E. ovalifolia,* while no reports were found for other investigated species *E. alba, E. angolensis, E. bakeri, E. coerulea, E. dichotoma, E. dolichandra, E. exsoluta, E. hainanensis, E. javanica, E. latifolia,* and *E. papuana.* There are nine species found in South Africa *E. coerulea, E. amoena, E. obtusifolia, E. namibiensis subsp. kaokoensis, E. namibiensis subsp. namibiensis, E. alba, E. rigida subsp. rigidia, E. rigida subsp. silvatica,* and *E. rigida subsp. nervifolia.* Recently, a new species of *Ehretia retroserata* is reported in China [67].

Second, great efforts were devoted to explore the study of *E. microphylla* which indicate great potential of antibacterial and a recent research has done in India which shows *Ehretia microphylla* helps in treating irregular ovulation disorders and promotes fertility in female [68]. In Bangladesh, *E. microphylla* used in traditional medicinal treatment of various forms of cancer, and it is expected that scientific studies on this plants shall lead to discovery of novel anticancer compounds [66,69,70]. *E. microphylla* used widely in the traditional Philippine medicine and considered most promising for large-scale culture. Advice is given on vegetative propagation culture, harvesting, and storage (where appropriate), based on the results of preliminary trials [71].

*E. laevis* used as masticatories by the ethnic communities in India [72]. Unexplored wound healing property has shown by *E. laevis.* The best part is its leaves are effective, and hence, plenty of material is available without requirement of uprooting of plant [73]. Many researches have done by Indian scientists to improve the germination of multipurpose trees like *E. laevis* [74]. Molecular study has also done on some species to better understand the properties of genus *Ehretia* [75]. Recently, a research has done on *Ehretia tinifolia* which show positive response against diabetic complications, atherosclerosis, and cardiovascular diseases [76].

These properties have created a sense of conservation reservation and cultivation of the plant. The treatment is also very economic as only
