1.1. General

Solvents were purified before use by reported methods. Diethyl 1-(isothiocyanato)alkylphosphonates 1a–d were synthesized according to an earlier published procedure [1,2]. All reagents were purchased from Sigma-Aldrich and used without further purification. Column chromatography was carried out on silica gel 60 (0.040–0.063 mm, 230-400 mesh, Fluka). $^1$H and $^{13}$C NMR spectra were recorded in CDCl$_3$ on a Bruker ARX 600 MHz Spectrometer (600 MHz for $^1$H) at room temperature. Chemical shifts were referenced relative to solvent signals ($^1$H and $^{13}$C spectra) and to ext. 85% H$_3$PO$_4$ ($^{31}$P spectra). IR spectra were run on a FTIR Nexus spectrometer in KBr pellets. Elemental analyses were performed in the Laboratory of Microanalysis at The Centre of Molecular and Macromolecular Studies in Łódź, Poland.

1.2 Syntheses of diethyl 1-(pyrene-1-carbothioamido)alkylphosphonates 2a–d

These compounds were prepared in a similar manner as described before [3].

Diethyl 1-(isothiocyanato)alkylphosphonate (1.5 mmol) and TfOH (348 µL, 4 mmol) were added at room temperature to a solution of pyrene (202 mg, 1 mmol) in CH$_2$Cl$_2$ (10 mL). After stirring for 2 h the reaction mixture was poured onto ice-water (50 mL) and extracted several times with CH$_2$Cl$_2$. The combined extracts were dried (Na$_2$SO$_4$) and evaporated to dryness. Flash chromatography (silica gel/ CH$_2$Cl$_2$) afforded pure products.

1.3. Syntheses of diethyl 1-(pyrene-1-carboxamido)alkylphosphonates 3a–d

These compounds were prepared in a similar manner as described before [3]. Oxone® (1.5 mmol in 10 mL of water) was added to the thioamides 2a–d (1 mmol) dissolved in a mixture of acetonitrile (30 mL) and water (20 mL). The resulting solution was stirred at room temperature overnight, poured into water (100 mL) and extracted several times with CH₂Cl₂. The organic phase was dried over anhydrous Na₂SO₄ and concentrated. The products were purified by silica gel column chromatography (CH₂Cl₂/MeOH 100 : 0 /9 : 1).

2. X-ray diffraction analysis of diethyl 1-(pyrene-1-carboxamido)methylphosphonate 3a

Crystals suitable for X-ray analysis were obtained by slow diffusion of pentane into a solution of this compound in dichloromethane at room temperature. The crystals were clear colorless plates.

The data for were collected on Agilent Supernova 4 circle diffractometer system equipped with molybdenum microsource and Eos CCD detector. The data were collected using MoK\(\alpha\) radiation with CrysAlis171 software and integrated with the CrysAlisPRO software. Data were corrected for absorption effects using the numerical methods (SCALE3 ABSPACK).

The structure was solved by direct methods using SXELXS and refined by the full-matrix least squares procedure with SHELXL within the OLEX2 graphical interface. Figures were produced with Ortep3v2 and Mercury_3.3 software.

All H atoms were visible in the residual density map, but were added geometrically and refined in riding approximation. Positions of the H atoms involved in hydrogen bonds were refined with restraint applied to the N–H distance as suggested by SHELXL for 100 K.

The quantitative descriptors of the data processing and structure refinement for all compounds are presented in Table S1.

Electronic absorption spectra were run on a Perkin Elmer Lambda 45 UV–vis spectrometer. Corrected emission spectra were obtained on a Fluorolog FL3-221 spectrofluorometer from Horiba Jobin-Yvon, including an integration sphere accessory which allows recording excitation and emission spectra and determining absolute quantum yield values in the powder state.

Fluorescence decay curves were obtained by the time-correlated single-photon counting (TCSPC) method with femtosecond laser excitation using a Spectra-Physics set-up composed of a Titanium Sapphire laser (Tsunami, Spectra-Physics) pumped by a doubled YAG laser (Millennia, Spectra-Physics), itself pumped by two laser diode arrays. Light pulses at 720 nm were selected by optoacoustic crystals at a repetition rate of 4 MHz, and then doubled to 360 nm by non-linear crystals. Fluorescence photons were detected through a monochromator by
means of a Hamamatsu MCP R3809U photomultiplier connected to a constant-fraction
discriminator. The time-to-amplitude converter was purchased from Tennelec. The
instrumental response function was recorded before each decay measurement. The
fluorescence data were analysed using the Globals software package developed at the
Laboratory for Fluorescence Dynamics at the University of Illinois at Urbana-Champaign,
which includes deconvolution analysis and the global non-linear least-squares minimization
method.
