Abstract
We discuss the solvability of nonlinear Dirichlet problems of the type $-\Delta_{p,w} u = \sigma$ in $\Omega$; $u = 0$ on $\partial \Omega$, where $\Omega$ is a bounded domain in $\mathbb{R}^n$, $\Delta_{p,w}$ is a weighted $(p,w)$-Laplacian and $\sigma$ is a nonnegative locally finite Radon measure on $\Omega$. We do not assume the finiteness of $\sigma(\Omega)$. We revisit this problem from a potential theoretic perspective and provide criteria for the existence of solutions by $L^p(w) - L^q(\sigma)$ trace inequalities or capacitary conditions. Additionally, we apply the method to the singular elliptic problem $-\Delta_{p,w} u = \sigma u^{-\gamma}$ in $\Omega$; $u = 0$ on $\partial \Omega$ and derive connection with the trace inequalities.

1 Introduction

1.1 Main results
Let $\Omega$ be a bounded domain in $\mathbb{R}^n$, and let $1 < p < \infty$. We consider the existence problem of positive solutions to quasilinear elliptic equations of the type

$$
\begin{cases}
-\text{div} A(x, \nabla u) = \sigma & \text{in } \Omega, \\
u = 0 & \text{on } \partial \Omega,
\end{cases}
$$

(1.1)

where $\text{div} A(x, \nabla \cdot)$ is a weighted $(p,w)$-Laplacian type elliptic operator, $w$ is a $p$-admissible weight on $\mathbb{R}^n$ (see Sect. 2 for details) and $\sigma$ is a nonnegative (locally finite) Radon measure on $\Omega$. We do not assume the global finiteness of $\sigma$. The precise assumptions on $A: \Omega \times \mathbb{R}^n \to \mathbb{R}^n$ are as follows: For each $z \in \mathbb{R}^n$, $A(\cdot, z)$ is measurable, for each $x \in \Omega$, $A(x, \cdot)$ is continuous, and there exist $0 < \alpha \leq \beta < \infty$ such that
for all \( x \in \Omega, z, z_1, z_2 \in \mathbb{R}^n, z_1 \neq z_2 \) and \( t \in \mathbb{R} \). For the standard theory of quasilinear Dirichlet problems with finite signed measure data, we refer to [8, 12, 13, 23, 36, 48, 62]. See also [10, 22, 35–37] for the definitions of local solutions (\( \mathcal{A} \)-superharmonic functions or locally renormalized solutions) and their properties.

Most studies of the quasilinear measure data problem (1.1) assume the finiteness of \( \sigma \) to ensure the existence of solutions satisfying the Dirichlet boundary condition. However, the global finiteness of \( \sigma \) is not a necessary condition, and this existence problem has been stated as an open problem in a paper by Bidaut-Véron (see, [9, Problem 2]). If we recall classical potential theory (see, e.g., [6, 41]), the solution \( u \) to the Poisson equation \( -\Delta u = \sigma \) in \( \Omega \); \( u = 0 \) on \( \partial \Omega \) is given by the Green potential

\[
u(x) = \int_{\Omega} G_{\Omega}(x, y) d\sigma(y).
\]

Since the Green function \( G_{\Omega}(\cdot, \cdot) \) vanishes on the boundary of \( \Omega \), the integral may be finite even if \( \sigma \) is not finite. In addition, the pointwise estimate of the Green function yields more concrete existence results if the boundary of \( \Omega \) is \( C^2 \); \( u \neq +\infty \) if and only if \( \int_{\Omega} \text{dist}(x, \partial \Omega) d\sigma(x) < \infty \) (see, e.g., [44]). However, finding the estimate is another problem, and furthermore, the method is completely useless for nonlinear equations. Note that the use of the Green function is one of the methods to solve the problem and that there are rich examples of solutions even for nonlinear equations with infinite measure data.

One natural desire is to apply the theory of finite measure data problems to infinite measures, but it is actually not enough, because the above examples do not necessarily satisfy the Dirichlet boundary condition in the traditional sense. Therefore, we should adopt a two-step strategy; (i) find a local solution that satisfies the equation in a generalized sense, and (ii) confirm the boundary condition.

Variational methods (more generally, the theory of monotone operators) and comparison principles are effective for good measures. Hence, we find the solution \( u \) to (1.1) by

\[
u(x) = \sup \left\{ v(x) \in H^{1,p}_0(\Omega; w) \cap \mathcal{S}\mathcal{H}(\Omega): 0 \leq -\text{div} \mathcal{A}(x, \nabla v) \leq \sigma \right\},
\]

where \( H^{1,p}_0(\Omega; w) \) is a weighted Sobolev space and \( \mathcal{S}\mathcal{H}(\Omega) \) is the set of all \( \mathcal{A} \)-superharmonic functions in \( \Omega \). Perron’s method for \( \mathcal{A} \)-superharmonic functions have been well studied (see, e.g., [29, 34]), and the relation between them and their Riesz measures is also known ([36, 59]). Furthermore, if \( \sigma \) is absolutely continuous with respect to the \( (p, w) \)-capacity (below, we denote this condition by \( \sigma \in \mathcal{M}_0^+(\Omega) \)), then the above set contains sufficiently many \( \mathcal{A} \)-superharmonic functions. As a result, \( u \) is a local solution if it is not identically infinite. In [18], Cao and Verbitsky proved a comparison principle leading to the minimality of \( u \) (see Theorem 3.5 below for a refinement of it). From this, \( u \) can be considered to satisfy the boundary condition in a very weak sense. Therefore, the remaining problem is to present a sufficient condition for \( u \) to not be identically infinite.

In previous work [32], the author provided an existence theorem for equations of the type (1.1). The sufficient condition was given by the \( L^p(w) - L^q(\sigma) \) trace inequality of Sobolev
type
\[ \| f \|_{L^q(\Omega; \sigma)} \leq C_1 \| \nabla f \|_{L^p(\Omega; w)}, \quad \forall f \in C_c^{\infty}(\Omega), \] (1.6)

where \(0 < q < p\). Note that if (1.6) holds, then \(\sigma\) must be absolutely continuous with respect to the \((p, w)\)-capacity. Our first existence theorem is as follows.

**Theorem 1.1** Assume that \(A\) satisfies (1.2)–(1.5). Let \(\sigma \in M^+_0(\Omega)\), and let \(0 < q < p\). Assume that (1.6) holds, and let \(C_1\) be the best constant. Then, there exists a minimal nonnegative \(A\)-superharmonic solution \(u\) to (1.1) satisfying
\[ \frac{(\alpha/\beta)^p}{\alpha} C_1^q \leq \| \nabla u \|_{L^p(\Omega; w)}^{\frac{p-1}{p-q}} \| u \|_{L^p(\Omega; w)}^{\frac{q-p}{p-q}} \leq \frac{1}{q} \left( \frac{p-1}{p-q} \right)^{\frac{p-1}{p}} \frac{1}{\alpha} C_1^q \] (1.7)

and
\[ \frac{(\alpha/\beta)}{\alpha^\frac{1}{p}} C_1 \leq \left( \int_{\Omega} \frac{u^{q(p-1)} d\sigma}{u^q} \right)^{\frac{p-q}{p}} \leq \frac{1}{q} \left( \frac{p-1}{p-q} \right)^{\frac{p-1}{p}} \frac{1}{\alpha^\frac{1}{p}} C_1. \] (1.8)

In particular, \(u\) satisfies the Dirichlet boundary condition in the sense that
\[ u^{\frac{p-1}{p-q}} \in H^{1,p}_0(\Omega; w). \] (1.9)

Conversely, if there exists a nonnegative \(A\)-superharmonic solution \(u\) to (1.1) satisfying (1.9), then (1.6) holds.

Unlike [32], we deal with the variable coefficient Eq. (1.1). This assumption is natural when considering flatification of Lipschitz boundaries. We verify that results in [32] can be extended to (1.1) with small changes and give a direct proof of Theorem 1.1. In addition, we present a more concrete existence result using Hardy-type inequalities (Corollary 4.4). We also discuss what occurs when condition (1.6) is relaxed (Theorem 5.1 and Proposition 5.4).

Condition (1.9) has already appeared in the study of elliptic equations with boundary blow-up type nonlinearity since the work by Boccardo and Orsina [14]. In Sect. 6, we apply our framework to the singular elliptic problem (Corollary 6.5) and prove the following two theorems.

**Theorem 1.2** Let \(0 < q < 1\). Suppose that \(\sigma \in M^+_0(\Omega) \setminus \{0\}\). Then there exists a unique finite energy weak solution \(u \in H^{1,p}_0(\Omega; w)\) to
\[ \begin{cases} -\text{div} \, A(x, \nabla u) = \sigma u^{q-1} & \text{in } \Omega, \\ u > 0 & \text{in } \Omega, \\ u = 0 & \text{on } \partial \Omega. \end{cases} \] (1.10)

if and only if (1.6) holds.

**Theorem 1.3** Let \(\sigma \in M^+_0(\Omega) \setminus \{0\}\). Let \(h : (0, \infty) \rightarrow (0, \infty)\) be a continuously differentiable nonincreasing function. Assume that there exists a continuous weak supersolution \(v \in H^{1,p}_{\text{loc}}(\Omega; w) \cap C(\overline{\Omega})\) to (1.1). Then there exists a unique continuous weak solution \(u \in H^{1,p}_{\text{loc}}(\Omega; w) \cap C(\overline{\Omega})\) to
\[ \begin{cases} -\text{div} \, A(x, \nabla u) = \sigma h(u) & \text{in } \Omega, \\ u > 0 & \text{in } \Omega, \\ u = 0 & \text{on } \partial \Omega. \end{cases} \] (1.11)
Conversely, if there exists a continuous weak supersolution \( u \in H^{1,p}_{\text{loc}}(\Omega; w) \cap C(\overline{\Omega}) \) to (1.11), then there exists a continuous weak solution \( v \in H^{1,p}_{\text{loc}}(\Omega; w) \cap C(\overline{\Omega}) \) to (1.1).

1.2 Related works

We consider weighted equations using a framework in [34]. In particular, we directly connects the solvability of (1.6) with Hardy-type inequalities of the form (4.3) without reduction to ordinary differential equations. All results of the paper seem to be new even if \( w \equiv 1 \).

This work is strongly inspired by prior studies for \( L^p - L^q \) trace inequalities. General theory for (1.6) was started by Adams [1]. The first characterization of (1.6) with \( 0 < q < p \) was given by Maz’ya and Netrusov [46, 47] using a capacitary condition. Cascante, Ortega and Verbitsky [20] and Verbitsky [61] studied non-capacitary characterizations for inequalities of the type (1.6). Claims that are equivalent to Theorem 1.1 were given by Seesanea and Verbitsky [56] for linear uniformly elliptic operators. In [32], their arguments were applied to \((p, w)\)-Laplace operators and Theorem 1.1 was proved for \( 0 < q < p \) with a different formulation. The results were applied to elliptic problems of the form (1.10) for the case \( 1 < q < p \). See [18, 19, 30, 33, 56] and the above references.

When \( q < 1 \), the right hand side of (1.10) have a singularity at \( u = 0 \). General existence results of classical solutions to elliptic equations with singular nonlinearity were established by Crandall, Rabinowitz and Tartar [21]. Boccardo and Orsina [14] established existence results of generalized solutions for \( L^m \)-integrable data. For further information, we refer to [4, 14, 15, 17, 24, 40, 42, 43, 50, 52, 53, 65] and the references therein. Our approach to singular nonlinearity is not much different from the prior studies. New proposal is to consider connection with (1.6) and utilization of analogs of Green potentials.

Theorem 1.2 corresponds to the case \( 0 < q < 1 \) in [32, Theorems 1.2 and 1.3]. Many authors have dealt with the existence problem of finite energy solutions (see, e.g., [7, 24, 52] and the references therein). However, the necessary and sufficient condition via (1.6) was not been discussed for a long time. After the first draft of this paper, the same equivalence was asserted in [26] under the condition \( \sigma \in L^1(\Omega) \). We confirm that this restriction is not necessary.

Theorem 1.3 is a nonlinear version of [43, Theorem 6]. In [43], Mâagli and Zribi proved an existence theorem of continuous solutions for the Laplace operator and \( \sigma \) in the Kato class and presented the bounds (6.1) and (6.6) using the Green potential of \( \sigma \). We use only (1.2)–(1.5) and replace the Green potential with the solution to (1.1). Similar criteria for more specified linear and quasilinear operators can be found in [50, 54, 58, 60, 63].

1.3 Organization of the paper

In Sect. 2, we present auxiliary results from nonlinear potential theory. In Sect. 3 we provide a framework to solve (1.1). In Sect. 4, we prove Theorem 1.1. In Sect. 5, we extend Theorem 1.1 using capacitary conditions. This section is independent of Sect. 6. In Sect. 6, we apply the framework in Sect. 3 to Eq. (1.11) and prove Theorems 1.2 and 1.3 as a consequence.

Note

We use the following notation. Let \( \Omega \) be a domain (connected open subset) in \( \mathbb{R}^n \).

- \( 1_E(x) := \) the indicator function of a set \( E \).
• $C^\infty_c(\Omega) :=$ the set of all infinitely-differentiable functions with compact support in $\Omega$.
• $\mathcal{M}^+(\Omega) :=$ the set of all nonnegative Radon measures on $\Omega$.
• $L^p(\Omega; \mu) :=$ the $L^p$ space with respect to $\mu \in \mathcal{M}^+(\Omega)$.

For simplicity, we often write $L^p(\Omega; \mu)$ as $L^p(\mu)$. For a ball $B = B(x, R)$ and $\lambda > 0$, $\lambda B := B(x, \lambda R)$. For measures $\mu$ and $\nu$, we denote $\nu \leq \mu$ if $\mu - \nu$ is a nonnegative measure.

For a sequence of extended real valued functions $\{f_j\}_{j=1}^\infty$, we denote $f_j \uparrow f$ if $f_{j+1} \geq f_j$ for all $j \geq 1$ and $\lim_{j \to \infty} f_j = f$. The letters $c$ and $C$ denote various constants with and without indices. The notation $A \approx_{\alpha, \beta} B$ means that there is a positive constant $C$ depending only on $\alpha$ and $\beta$ such that $C^{-1}B \leq A \leq CB$.

2 Preliminaries

2.1 Weighted Sobolev spaces

First, we recall basics of nonlinear potential theory from [34]. Let $1 < p < \infty$ be a fixed constant. A Lebesgue measurable function $w$ on $\mathbb{R}^n$ is said to be the weight on $\mathbb{R}^n$ if $w \in L^1_{\text{loc}}(\mathbb{R}^n; dx)$ and $w(x) > 0$ $\lambda$-a.e. We write $w(E) = \int_E w \, dx$ for a Lebesgue measurable set $E \subset \mathbb{R}^n$. We always assume that $w$ is $p$-admissible, that is, positive constants $C_D$, $C_P$ and $\lambda \geq 1$ exist, such that

$$w(2B) \leq C_D w(B)$$

and

$$\int_B |f - f_B| \, dw \leq C_P \text{diam}(B) \left( \int_{\lambda B} |\nabla f|^p \, dw \right)^{\frac{1}{p}}, \quad \forall f \in C^\infty_c(\mathbb{R}^n),$$

where $B$ is an arbitrary ball in $\mathbb{R}^n$, $f_B = w(B)^{-1} \int_B f \, dw$ and $f_B = f_B f \, dw$. For the basic properties of $p$-admissible weights, see [11, Chapter A.2], [34, Chapter 20] and the references therein. Every Muckenhoupt $A_p$-weight is $p$-admissible. One important property of $p$-admissible weights is the Sobolev inequality. In particular, the following form of the Poincaré inequality holds:

$$\int_B |f|^p \, dw \leq C \text{diam}(B)^p \int_B |\nabla f|^p \, dw, \quad \forall f \in C^\infty_c(B),$$

where $C$ is a constant depending only on $p$, $C_D$, $C_P$ and $\lambda$.

Let $\Omega$ be a bounded domain in $\mathbb{R}^n$. The weighted Sobolev space $H^{1,p}(\Omega; w)$ is the closure of $C^\infty(\Omega)$ with respect to the norm

$$\|u\|_{H^{1,p}(\Omega; w)} := \left( \int_{\Omega} |u|^p + |\nabla u|^p \, dw \right)^{\frac{1}{p}}.$$

The corresponding local space $H^{1,p}_{\text{loc}}(\Omega; w)$ is defined in the usual manner. We denote by $H^{1,p}_{\Omega}(\Omega; w)$ the closure of $C^\infty_c(\Omega)$ in $H^{1,p}(\Omega; w)$. Since $\Omega$ is bounded, we can take $\|\nabla \cdot\|_{L^p(\Omega; w)}$ as the norm of $H^{1,p}_{\text{loc}}(\Omega; w)$ by the Poincaré inequality.

Let $\Omega \subset \mathbb{R}^n$ be open and let $K \subset \Omega$ be compact. The (variational) $(p, w)$-capacity $\text{cap}_{p,w}(K, \Omega)$ of the condenser $(K, \Omega)$ is defined by

$$\text{cap}_{p,w}(K, \Omega) := \inf \left\{ \|\nabla u\|^p_{L^p(\Omega; w)} : u \geq 1 \text{ on } K, \ u \in C^\infty_c(\Omega) \right\}.$$
Since \( \Omega \subset \mathbb{R}^n \) is bounded, \( \text{cap}_{p,w}(E, \Omega) = 0 \) if and only if \( C_{p,w}(E) = 0 \), where \( C_{p,w}(\cdot) \) is the (Sobolev) capacity of \( E \). We say that a property holds quasieverywhere (q.e.) if it holds except on a set of \((p, w)\)-capacity zero. An extended real valued function \( u \) on \( \Omega \) is called as quasicontinuous if for every \( \epsilon > 0 \) there exists an open set \( G \) such that \( C_{p,w}(G) < \epsilon \) and \( u|_{\Omega \setminus G} \) is continuous. Every \( u \in H_{loc}^{1,p}(\Omega; w) \) has a quasicontinuous representative \( \tilde{u} \) such that \( u = \tilde{u} \) a.e.

We denote by \( M_0^+(\Omega) \) the set of all Radon measures \( \mu \) that are absolutely continuous with respect to the \((p, w)\)-capacity. If \( \mu \in M_0^+(\Omega) \) is finite, then the integral \( \int_\Omega f \, d\mu \) is well-defined for any \((p, w)\)-quasicontinuous function \( f \) on \( \Omega \).

### 2.2 \( \mathcal{A} \)-superharmonic functions

Assume that \( \mathcal{A} \) satisfies (1.2)–(1.5). For \( u \in H_{loc}^{1,p}(\Omega; w) \), we define the \( \mathcal{A} \)-Laplace operator \( \text{div} \mathcal{A}(x, \nabla \cdot) \) by

\[
(- \text{div} \mathcal{A}(x, \nabla u), \varphi) = \int_\Omega \mathcal{A}(x, \nabla u) \cdot \nabla \varphi \, dx, \quad \forall \varphi \in C_c^\infty(\Omega).
\]

If \( u \in H_{loc}^{1,p}(\Omega; w) \) satisfies

\[
\int_\Omega \mathcal{A}(x, \nabla u) \cdot \nabla \varphi \, dx = (\geq) 0, \quad \forall \varphi \in C_c^\infty(\Omega), \quad \varphi \geq 0,
\]

then it is called a weak solution (supersolution) to \(- \text{div} \mathcal{A}(x, \nabla u) = 0 \) in \( \Omega \).

A function \( u: \Omega \to (-\infty, \infty) \) is called \( \mathcal{A} \)-superharmonic if \( u \) is lower semicontinuous in \( \Omega \), is not identically infinite, and satisfies the comparison principle on each subdomain \( D \subset \subset \Omega \); if \( h \in H_{loc}^{1,p}(D; w) \cap C(\overline{D}) \) is a continuous weak solution to \(- \text{div} \mathcal{A}(x, \nabla u) = 0 \) in \( D \) and if \( u \geq h \) on \( \partial D \), then \( u \geq h \) in \( D \).

If \( u \) is an \( \mathcal{A} \)-superharmonic function in \( \Omega \), then for any \( k > 0 \), \( \min\{u, k\} \) is a weak supersolution to \(- \text{div} \mathcal{A}(x, \nabla u) = 0 \) in \( \Omega \). Conversely, if \( u \) is a weak supersolution to \(- \text{div} \mathcal{A}(x, \nabla u) = 0 \) in \( \Omega \), then its \textit{lsc}-regularization

\[
u^*(x) := \lim_{r \to 0} \inf_{B(x,r)} u
\]

is \( \mathcal{A} \)-superharmonic in \( \Omega \). If \( u \) and \( v \) are \( \mathcal{A} \)-superharmonic in \( \Omega \) and \( u(x) \leq v(x) \) for a.e. \( x \in \Omega \), then \( u \leq v \) in the pointwise sense.

A Radon measure \( \mu = \mu[u] \) is called the Riesz measure of \( u \) if

\[
\lim_{k \to \infty} \int_\Omega \mathcal{A}(x, \nabla \min\{u, k\}) \cdot \nabla \varphi \, dx = \int_\Omega \varphi \, d\mu, \quad \forall \varphi \in C_c^\infty(\Omega).
\]

It is known that every \( \mathcal{A} \)-superharmonic function has a unique Riesz measure.

The following weak continuity result was given by Trudinger and Wang [59].

**Theorem 2.1** ([59, Theorem 3.1]) Suppose that \( \{ u_k \}_{k=1}^\infty \) is a sequence of nonnegative \( \mathcal{A} \)-superharmonic functions in \( \Omega \). Assume that \( u_k \to u \) a.e. in \( \Omega \) and that \( u \) is \( \mathcal{A} \)-superharmonic in \( \Omega \). Let \( \mu[u_k] \) and \( \mu[u] \) be the Riesz measures of \( u_k \) and \( u \), respectively. Then \( \mu[u_k] \) converges to \( \mu[u] \) weakly, that is,

\[
\int_\Omega \varphi \, d\mu[u_k] \to \int_\Omega \varphi \, d\mu[u], \quad \forall \varphi \in C_c^\infty(\Omega).
\]
The Harnack-type convergence theorem follows from combining Theorem 2.1 and [34, Lemma 7.3]: If \( \{u_k\}_{k=1}^{\infty} \) is a nondecreasing sequence of \( \mathcal{A} \)-superharmonic functions in \( \Omega \) and if \( u := \lim_{k \to \infty} u_k \neq \infty \), then \( u \) is \( \mathcal{A} \)-superharmonic in \( \Omega \) and \( \mu[u_k] \) converges to \( \mu[u] \) weakly.

3 Minimal \( \mathcal{A} \)-superharmonic solution to (1.1)

Next, we introduce classes of smooth measures. For detail, see [32] and the references therein.

**Definition 3.1** For \( \mu \in (H_0^{1,p}(\Omega))^* \cap \mathcal{M}^+(\Omega) \), we denote by \( W^0_A \mu \) the lsc-regularization of the weak solution \( u \in H_0^{1,p}(\Omega; w) \) to

\[
\int_\Omega A(x, \nabla u) \cdot \nabla \varphi \, dx = \langle \mu, \varphi \rangle, \quad \forall \varphi \in H_0^{1,p}(\Omega; w).
\]

Furthermore, we define a class of smooth measures \( S_c[\mathcal{A}] (\Omega) \) by

\[
S_c[\mathcal{A}] (\Omega) := \left\{ \mu \in (H_0^{1,p}(\Omega))^* \cap \mathcal{M}^+(\Omega) : \sup_{\Omega} W^0_A \mu < \infty \text{ and } \text{supp } \mu \subseteq \Omega \right\}.
\]

By the two-sided Wolff potential estimate for \( \mathcal{A} \)-superharmonic functions due to Kilpeläinen and Malý (see [37, 48]), if \( u \geq 0 \) is \( \mathcal{A} \)-superharmonic in \( B(x, 2R) \) and if \( \mu \) is the Riesz measure of \( u \), then,

\[
\frac{1}{C} W^{R}_{1,p,w(u)}(x) \leq u(x) \leq C \left( \inf_{B(x,R)} u + W^{2R}_{1,p,w(u)}(x) \right),
\]

where \( C = C(p, C_D, C_P, \lambda) \) and \( W^{R}_{1,p,w(u)} \) is the truncated Wolff potential of \( \mu \), which is defined by

\[
W^{R}_{1,p,w(u)}(x) := \int_0^R \left( r^{-p} \frac{\mu(B(x,r))}{w(B(x,r))} \right)^{\frac{1}{p-1}} \, dr.
\]  

Using this estimate twice, we can prove that \( S_c[\mathcal{A}](\Omega) = S_c[w(x)|\nabla \cdot |^{p-2} \nabla \cdot |](\Omega) \). Below, we write \( S_c[\mathcal{A}](\Omega) \) as \( S_c(\Omega) \) for simplicity.

**Theorem 3.2** ([32]) Let \( \mu \in \mathcal{M}^+(\Omega) \). Then \( \mu \in \mathcal{M}^+_0(\Omega) \) if and only if there exists an increasing sequence of compact sets \( \{F_k\}_{k=1}^{\infty} \) such that \( \mu_k := 1_{F_k} \mu \in S_c(\Omega) \) for all \( k \geq 1 \) and \( \mu(\Omega \setminus \bigcup_{k=1}^{\infty} F_k) = 0 \).

**Definition 3.3** ([18]) Let \( \mu \) be a nonnegative Radon measure on \( \Omega \). We say that a function \( u \) is an \( \mathcal{A} \)-superharmonic solution (supersolution) to \( -\operatorname{div} A(x, \nabla u) = \mu \) in \( \Omega \), if \( u \) is \( \mathcal{A} \)-superharmonic in \( \Omega \) and \( \mu[u] = \mu(\mu[u] \geq u) \), where \( \mu[u] \) is the Riesz measure of \( u \). We say that a nonnegative solution \( u \) is minimal if \( v \geq u \) in \( \Omega \) whenever \( v \) is a nonnegative supersolution to the same equation.

**Definition 3.4** For \( \mu \in \mathcal{M}^+_0(\Omega) \), we define

\[
W_A \mu(x) := \sup \left\{ W^0_A v(x) : v \in S_c(\Omega) \text{ and } v \leq \mu \right\}.
\]

If \( \mu \in (H_0^{1,p}(\Omega))^* \cap \mathcal{M}^+(\Omega) \), then \( W_A \mu = W^0_A \mu \). If \( W_A \mu \neq \infty \), then \( u = W_A \mu \) is the minimal nonnegative \( \mathcal{A} \)-superharmonic solution to \( -\operatorname{div} A(x, \nabla u) = \mu \) in \( \Omega \). From the argument in [32, Theorem 3.1], the following comparison principle holds.
Theorem 3.5 Let $\Omega$ be a bounded domain. Let $v$ be a nonnegative $A$-superharmonic function in $\Omega$ with the Riesz measure $v$. Assume that $\mu \in M_0^1(\Omega)$ and that $\mu \leq v$. Then $\mathcal{W}_A\mu \leq v$ in $\Omega$.

By the minimality, we can regard $u$ as a solution to (1.1). We will discuss sufficient conditions for $\mathcal{W}_A\mu \neq \infty$ below.

4 Strong-type inequality

In [61], the following theorem was proved: If $\Omega = \mathbb{R}^n$, $w = 1$ and $0 < q < p$, then the best constant $C_1$ in (1.6) satisfies

\[
\frac{1}{c} C_1 \leq \left( \int_{\mathbb{R}^n} (W_{1,p}\sigma)^{\frac{a(p-1)}{p-q}} d\sigma \right)^{\frac{p-q}{q'}} \leq c C_1,
\]

where $c = c(n, p, q)$ and $W_{1,p}\sigma = W_{1,p,1}\sigma$ is the Wolff potential of $\sigma$. Following the strategy of the proof, we prove a logarithmic Caccioppoli type estimate. For $(p, w)$-Laplace operators, it follows from the Picone-type inequality (see [3, 16]).

Lemma 4.1 Let $\sigma \in S_c(\Omega)$, and let $u = \mathcal{W}_A\sigma$. Then

\[
\int_{\Omega} |f|^p \frac{d\sigma}{u^{p-1}} \leq \beta^p \alpha^{1-p} \int_{\Omega} |\nabla f|^p d\nu, \quad \forall f \in C_c^\infty(\Omega).
\]

Proof Without loss of generality we may assume that $f \geq 0$. Let $v = u + \epsilon$, where $\epsilon$ is a positive constant. Since $v \geq \epsilon > 0$, we have $f^p u^{1-p} \in H_0^1(\Omega; w)$; hence,

\[
\int_{\Omega} f^p \frac{d\sigma}{v^{p-1}} = \int_{\Omega} A(x, \nabla v) \cdot \nabla (f^p u^{1-p}) dx.
\]

By (1.2) and (1.3), for a.e. $x \in \Omega$,

\[
A(x, \nabla v(x)) \cdot \nabla (f(x)^p v(x)^{1-p}) = pA(x, \nabla v(x)) \cdot \nabla f(x) f(x)^{p-1} v(x)^{1-p} + (1 - p)A(x, \nabla v(x)) \cdot \nabla v(x) f(x)^{p} v(x)^{-p}
\]

\[
\leq p \beta w(x) |\nabla v(x)|^{p-1} |\nabla f(x)| f(x)^{p-1} v(x)^{1-p} + (1 - p)\alpha w(x) |\nabla v(x)| f(x)^{p} v(x)^{-p}.
\]

Then, Young’s inequality $ab \leq \frac{1}{p} a^p + \frac{p-1}{p} b^{\frac{p}{p-1}}$ ($a, b \geq 0$) yields

\[
A(x, \nabla v(x)) \cdot \nabla (f(x)^p v(x)^{1-p}) \leq \beta^p \alpha^{1-p} |\nabla f(x)|^p w(x).
\]

Therefore,

\[
\int_{\Omega} |f|^p \frac{d\sigma}{(u + \epsilon)^{p-1}} \leq \beta^p \alpha^{1-p} \int_{\Omega} |\nabla f|^p d\nu, \quad \forall f \in C_c^\infty(\Omega).
\]

The desired inequality follows from the monotone convergence theorem. \[ \square \]

Proof of Theorem 1.1 We first prove the existence part. Take $\{\sigma_k\}_{k=1}^\infty \subset S_c(\Omega)$ such that $\sigma_k = 1_{F_k} \sigma$ and $1_{F_k} \uparrow 1_\Omega$ $\sigma$-a.e. Set $u_k = \mathcal{W}_A\sigma_k \in H_0^1(\Omega; w) \cap L^\infty(\Omega)$. By (1.5), for
each $\epsilon > 0$, we have
\[
\frac{1}{q} \left( \frac{p-1}{p-q} \right)^{p-1} \int_{\Omega} \left( u_k^{\frac{q(p-1)}{p-q}} - \epsilon \frac{q(p-1)}{p-q} \right) \, d\sigma_k
\]
\[
= \int_{\{x \in \Omega: u_k(x) > \epsilon\}} A(x, \nabla u_k^{\frac{p-1}{p-q}}) \cdot \nabla u_k^{\frac{p-1}{p-q}} \, dx.
\]
Take the limit $\epsilon \to 0$. By the monotone convergence theorem and (1.2),
\[
\alpha \int_{\Omega} |\nabla u_k^{\frac{p-1}{p-q}}| \, |w| \, dw \leq \int_{\Omega} A(x, \nabla u_k^{\frac{p-1}{p-q}}) \cdot \nabla u_k^{\frac{p-1}{p-q}} \, dx
\]
\[
= \frac{1}{q} \left( \frac{p-1}{p-q} \right)^{p-1} \int_{\Omega} u_k^{\frac{q(p-1)}{p-q}} \, d\sigma_k.
\]
The right-hand side is finite, and thus, $u_k^{\frac{p-1}{p-q}} \in H_0^{1,p}(\Omega; w)$. By (1.6) and density,
\[
\int_{\Omega} u_k^{\frac{q(p-1)}{p-q}} \, d\sigma_k \leq C_1 \left( \int_{\Omega} |\nabla u_k^{\frac{p-1}{p-q}}| \, w \right)^{\frac{q}{p}}.
\]
Combining the two inequalities, we obtain
\[
\left( \int_{\Omega} |\nabla u_k^{\frac{p-1}{p-q}}| \, w \right)^{\frac{p-q}{p}} \leq \frac{1}{q} \left( \frac{p-1}{p-q} \right)^{p-1} \frac{1}{\alpha} C_1^q.
\]
By the Poincaré inequality, $u_k \uparrow u \neq \infty$, so $u = \mathcal{W}_A \sigma$ is $A$-superharmonic in $\Omega$ and satisfies (1.1) by Theorem 2.1 and the monotone convergence theorem. By the uniqueness of the limit, $u^{\frac{p-1}{p-q}}$ satisfies the latter inequality in (1.7).

Conversely, assume the existence of $u$. Take $\{\sigma_k\}_{k=1}^{\infty} \subset S_c(\Omega)$ such that $\sigma_k = 1_{F_k} \sigma$ and $1_{F_k} \uparrow 1_{\Omega} \sigma$-a.e. by using Theorem 3.2, and set $u_k = \mathcal{W}_A \sigma_k$. By Lemma 4.1,
\[
\int_{\Omega} |f|^q \, d\sigma_k = \int_{\Omega} |f|^q u_k^{\frac{p-1}{p-q}} \frac{d\sigma_k}{u_k^{\frac{p-1}{p-q}}}
\]
\[
\leq \left( \int_{\Omega} |f|^p \frac{d\sigma_k}{u_k^{\frac{p-1}{p-q}}} \right)^{\frac{q}{p}} \left( \int_{\Omega} u_k^{\frac{q(p-1)}{p-q}} \frac{d\sigma_k}{u_k^{\frac{p-1}{p-q}}} \right)^{\frac{p-q}{p}} \quad (4.1)
\]
\[
\leq \left( \beta^p \alpha^{1-p} \int_{\Omega} |\nabla f|^p \, dw \right)^{\frac{q}{p}} \left( \int_{\Omega} u_k^{\frac{q(p-1)}{p-q}} \, d\sigma_k \right)^{\frac{p-q}{p}}.
\]
Note that $v := u_k^{\frac{p-1}{p-q}} \geq u_k^{\frac{p-1}{p-q}}$ by Theorem 3.5. Since $v \in H_0^{1,p}(\Omega; w)$, by density,
\[
\int_{\Omega} u_k^{\frac{q(p-1)}{p-q}} \, d\sigma_k \leq \int_{\Omega} v^q \, d\sigma_k \leq \left( \beta^p \alpha^{1-p} \int_{\Omega} |\nabla v|^p \, dw \right)^{\frac{q}{p}} \left( \int_{\Omega} u_k^{\frac{q(p-1)}{p-q}} \, d\sigma_k \right)^{\frac{p-q}{p}}.
\]
Using (4.1) again, we obtain
\[
\int_{\Omega} |f|^q \, d\sigma_k \leq \beta^p \alpha^{1-p} \left( \int_{\Omega} |\nabla f|^p \, dw \right)^{\frac{q}{p}} \left( \int_{\Omega} |\nabla v|^p \, dw \right)^{\frac{p-q}{p}}.
\]
The former inequality in (1.7) follows from the monotone convergence theorem. \[\square\]
If $\mathcal{A}$ and $\mathcal{A}'$ satisfy the same structure conditions, then
\[
\left( \int_{\Omega} (\mathcal{W}_{\mathcal{A}} \sigma)^{\frac{q(p-1)}{p-q}} d\sigma \right)^{\frac{p-q}{q}} \approx_{\alpha, \beta} \left( \int_{\Omega} (\mathcal{W}_{\mathcal{A}'} \sigma)^{\frac{q(p-1)}{p-q}} d\sigma \right)^{\frac{p-q}{q}}.
\]
Note that we do not have a global pointwise estimate between solutions. The boundary behavior of two solutions may not be comparable.

Finally, we observe examples of $\sigma$ satisfying (1.6). If $w \equiv 1$, $p < n$ and $\sigma \in L^m(\Omega; dx)$ with
\[
m = \left( \frac{p^*}{q} \right) = \left( \frac{np}{q(n-p)} \right)^{\prime},
\]
then (1.6) follows from Sobolev’s inequality and Hölder’s inequality.

Other type examples can be found from Hardy type inequalities. For one-dimensional cases, we refer to [46, Sect. 1.3.3] and [57]. To present multi-dimensional sufficient conditions, we add an assumption to the boundary of $\Omega$. We say that a bounded domain $\Omega$ is \textit{Lipschitz} if for each $y \in \partial \Omega$, there exist a local Cartesian coordinate system $(x_1, \ldots, x_n) = (x', x_n)$, an open neighborhood $U = U_y$ and a Lipschitz function $h = h_y$ such that $\Omega \cap U = \{ (x', x_n) : x_n > h(x') \} \cap U$. If $\Omega$ is bounded and Lipschitz, then by the Hardy inequality in [51, Theorem 1.6],
\[
\int_{\Omega} |f|^p \delta^t dx \leq C \int_{\Omega} |\nabla f|^p \delta^t dx, \quad \forall f \in C_c^\infty(\Omega),
\]
where $\delta(x) := \text{dist}(x, \partial \Omega)$, $t < p - 1$ and $C$ is a constant independent of $f$.

**Proposition 4.2** Let $\Omega$ be a bounded Lipschitz domain. Set $w = \delta^t$ and $d\sigma = \delta^{-s} dx$, where $-1 < t < p - 1$ and $1 \leq s < p - t$. Then, for any $q \in \left( \frac{p(s-1)}{p-1-t}, p \right)$, the trace inequality (1.6) holds.

**Proof** By the inner cone property of Lipschitz graphs, for each $r > -1$,
\[
\int_{\Omega} \delta^r dx < \infty.
\]
(For further information about the integrability of $\delta$, see [31, Theorem 6] and the references therein.) Thus, by the Hardy inequality (4.3),
\[
\int_{\Omega} |f|^q \delta^{-s} dx = \int_{\Omega} \frac{|f|^q}{\delta^q} \delta^{q-s-t} \delta^t dx \\
\leq \left( \int_{\Omega} \frac{|f|^p}{\delta^p} \delta^t dx \right)^{\frac{q}{p}} \left( \int_{\Omega} \delta^{\frac{p(s-t)}{p-q}} \delta^t dx \right)^{\frac{p-q}{p}} \\
\leq C \left( \int_{\Omega} |\nabla f|^p \delta^t dx \right)^{\frac{q}{p}}, \quad \forall f \in C_c^\infty(\Omega).
\]
This completes the proof. \hfill \Box

**Remark 4.3** The boundary of a bounded Lipschitz domain is $(n-1)$-regular. Thus, by [25, Lemma 3.3] (see also [2] and [11, Chapter A.3]), $w = \delta^t$ is an $A_p$-weight (and hence a $p$-admissible weight) on $\mathbb{R}^n$ for $-1 < t < p - 1$.

**Corollary 4.4** Let $\Omega$ be a bounded Lipschitz domain and let $w = \delta^t$, where $-1 < t < p - 1$. Let $1 \leq s < p - t$. Assume that $\sigma \in L^1_{\text{loc}}(\Omega)$ satisfies $0 \leq \sigma(x) \leq C \delta(x)^{-s}$ for a.e. $x \in \Omega$. Then, there exists a minimal nonnegative $\mathcal{A}$-superharmonic solution $u$ to (1.1).
Trace inequalities of the Sobolev type and nonlinear Dirichlet

216

Proof Combine Proposition 4.2, Remark 4.3 and Theorem 1.1. □

Remark 4.5 Corollary 4.4 is not trivial even if div $A(x, \nabla u) = \Delta u$. In fact, the Green function of a polygon is not comparable to $\delta$ near the corners. This result asserts that the threshold of $s$ still be 2 ($= p$) even if such a case. We refer to an excellent work on barriers by Ancona [5] for further results for linear operators.

Remark 4.6 Note that $L^p(w)-L^p(\sigma)$ trace inequalities do not yield the existence of (bounded) solutions to (1.1). Let $\Omega = B(0, 1)$ and $d\sigma = \delta^{-2} dx$. Then, the $L^2(dx)-L^2(d\sigma)$ trace inequality holds by (4.3), but the Green potential of $\sigma$ does not exist.

5 Weak-type inequality and capacitary condition

In [20], the following form of a weak-type trace inequality was studied:

$$\|f\|_{L^q, \infty(\sigma)} \leq C_2 \|\nabla f\|_{L^p(w)}, \quad \forall f \in C_0^\infty(\Omega).$$

Here, $L^{q, \infty}(\sigma)$ is the Lorentz space with respect to $\sigma$ (see, e.g., [28, Chapter 1]). By a truncation argument, this implies

$$\sigma(K)^\frac{p}{q} \leq C^p_2 \text{cap}_{p, w}(K, \Omega), \quad \forall K \subset \Omega. \quad (5.1)$$

Hence, by Maz’ya’s capacitary inequality (see, e.g., [45], [11, Lemma 6.22]), (5.1) is equivalent to the embedding into $L^{q, p}(\sigma)$. In particular, the condition (5.1) is weaker than (1.6) because $L^q(\sigma) = L^{q, q}(\sigma) \subsetneq L^{q, p}(\sigma)$ for $q < p$.

Theorem 5.1 Assume that $0 < q < p$. Let $\sigma \in \mathcal{M}_0^+(\Omega)$ and let $C_2$ be the best constant of (5.1). Then,

$$\frac{(\alpha/\beta)}{\alpha^p} C_2 \leq \|\mathcal{W}_A\sigma\|_{L^{q(p-1)/(p-q), \infty(\sigma)}} \leq 4 \frac{p-1}{\alpha^p} \frac{1}{C_2}. \quad (5.2)$$

To prove the lower bound in (5.2), we consider the counterparts of Lemma 5.10 and Proposition 6.1 in [55].

Lemma 5.2 Let $0 < q < \infty$. Assume that $\sigma \in \mathcal{M}_0^+(\Omega)$ satisfies the following weighted norm inequality:

$$\|\mathcal{W}_A\sigma\|_{L^{q(p-1)/(p-q), \infty(\sigma)}} \leq C_2^q \Omega(x), \quad \forall \nu \in \mathcal{M}_0^+(\Omega). \quad (5.3)$$

Then, (5.1) holds with $C_2 = (\beta p^p \alpha^{1-p} C_2^q)^{\frac{1}{p}}$.

Proof Let $K$ be any compact subset of $\Omega$. Let $u$ be the $A$-potential of the condenser $(K, \Omega)$, and let $\nu$ be the Riesz measure of $u$. Then, by [48, Corollary 4.8],

$$\nu(\Omega) \leq \beta p \alpha^{1-p} \text{cap}_{p, w}(K, \Omega).$$

Since $u = \mathcal{W}_A\sigma \geq 1$ on $K$,

$$\sigma(K)^\frac{p}{q} \leq \|\mathcal{W}_A\sigma\|_{L^{q(p-1)/(p-q), \infty(\sigma)}} \leq C_2^q \nu(\Omega) \leq \beta p \alpha^{1-p} C_2^q \text{cap}_{p, w}(K, \Omega).$$
Then, \( v = \frac{U_j}{E_j} \) where
\[
\| f \|_{L^p(\sigma)} = \sup_{k \geq 0} k^p \sigma(|f| \geq k) \gtrless \frac{v}{W}.
\]
\[
\leq C_2^p \sup_{k \geq 0} k^p \text{cap}_{p,w}(|f| \geq k, \Omega) \leq C_2^p \| \nabla f \|_{L^p(w)}.
\]
This completes the proof. \(\square\)

**Lemma 5.3** Let \( v, \sigma \in M_0^+ (\Omega) \). Then,
\[
\left\| \frac{\mathcal{W}_A v}{\mathcal{W}_A \sigma} \right\|_{L^{p-1, \infty}(\sigma)} \leq v(\Omega)^{\frac{1}{p-1}}.
\]

**Proof** Without loss of generality, we may assume that \( \sigma, v \in S_c(\Omega) \). Set \( u = \mathcal{W}_A \sigma \) and \( v = \mathcal{W}_A v_t \), where \( v_t = t^{-p} v \). For \( k > 0 \), set \( I_k(v-u) = k^{-1} \min\{v-u, +, k\} \). By (1.4),
\[
\int_{\Omega} I_k(v-u) \, dv_t - \int_{\Omega} I_k(v-u) \, d\sigma = \frac{1}{k} \int_{\{x \in \Omega, 0 < v(x) - u(x) < k\}} (A(x, \nabla v) - A(x, \nabla u)) \cdot (v-u) \, dx \geq 0.
\]
Passing to the limit \( k \to 0 \) yields
\[
v_t(\Omega) \geq \sigma\left(\{x \in \Omega : v(x) > u(x)\}\right).
\]
By (1.5), \( v = t^{-1} \mathcal{W}_A v \), and thus,
\[
t^{p-1} \sigma\left(\left\{x \in \Omega : \frac{\mathcal{W}_A v(x)}{\mathcal{W}_A \sigma(x)} > t\right\}\right) \leq v(\Omega).
\]
Taking the supremum over \( t > 0 \), we obtain the desired inequality. \(\square\)

**Proof of Theorem 5.1** We first prove the latter inequality for \( \sigma \in S_c(\Omega) \). Let \( u = \mathcal{W}_A \sigma \). Then,
\[
\sup_{j \in \mathbb{Z}} 2^{j+1} \left(\frac{q(p-1)}{p-q} \right)^{\frac{q(p-1)}{p-q}} \sigma(E_j) \leq \sup_{j \in \mathbb{Z}} 2^{j+1} \left(\frac{q(p-1)}{p-q} \right)^{\frac{q(p-1)}{p-q}} \sigma(E_j),
\]
where \( E_j = \{x \in \Omega : u(x) > 2^j\} \). By (5.1), we have
\[
\sigma(E_j) \leq C_2^q \text{cap}_{p,w}(E_j, \Omega)^{\frac{q}{p}} \leq C_2^q \text{cap}_{p,w}(E_j, E_{j-1})^{\frac{q}{p}}.
\]
Let \( U_j = \min\{u - 2^{-j+1}, 2^{-j}\} \). Then \( U_j \in H^{1,p}_0(E_{j-1}; w), 0 \leq U_j \leq 2^{-j-1} \) in \( E_{j-1} \) and \( U_j \equiv 2^{-j-1} \) on \( E_j \). By (1.2),
\[
\text{cap}_{p,w}(E_j, E_{j-1}) \leq 2^{(1-j)p} \int_{E_j} |\nabla U_j|^p \, dw \leq \frac{2^{(1-j)p}}{\alpha} \int_{E_j} A(x, \nabla u) \cdot \nabla U_j \, dx = \frac{2^{(1-j)p}}{\alpha} \int_{E_j} U_j \, d\sigma \leq \frac{2^{p-1} 2^{j(1-p)}}{\alpha} \sigma(E_{j-1}).
\]
\(\square\) Springer
Combining these inequalities, we obtain
\[ \Vert u \Vert_{L^\frac{q(p-1)}{p-q}, \infty(\sigma)} \leq 2 \frac{q(p-1)}{p-q} C^2 \frac{2^{p-1}}{\alpha^\frac{q}{p}} \left( 2^{p-1} \sup_{j \in \mathbb{Z}} 2^j \frac{q(p-1)}{p-q} \sigma(E_{j-1}) \right)^{\frac{q}{p}} \]
\[ \leq 4 \frac{q(p-1)}{p-q} C^2 \frac{2^{p-1}}{\alpha^\frac{q}{p}} \left( \Vert u \Vert_{L^\frac{q(p-1)}{p-q}, \infty(\sigma)} \right)^{\frac{q}{p}} \]

Hence the desired inequality holds.

Let us prove the existence. Take \( \{\sigma_k\}_{k=1}^\infty \subset S_c(\Omega) \) such that \( \sigma_k = 1_{F_k} \sigma \) and \( 1_{F_k} \uparrow 1_\Omega \) \( \sigma \)-a.e. By the monotone convergence theorem,
\[ \Vert \mathcal{W}_A \sigma \Vert_{L^\frac{q(p-1)}{p-q}, \infty(\sigma)} \leq \lim_{k \to \infty} \Vert \mathcal{W}_A \sigma_k \Vert_{L^\frac{q(p-1)}{p-q}, \infty(\sigma)} \leq \leq 4 \frac{q(p-1)}{p-q} C^2 \frac{2^{p-1}}{\alpha^\frac{q}{p}} \sqrt{\frac{C}{q}}. \]

Thus \( \mathcal{W}_A \sigma \neq \infty \) and is \( \mathcal{A} \)-superharmonic in \( \Omega \).

Conversely, assume that \( \Vert \mathcal{W}_A \sigma \Vert_{L^\frac{q(p-1)}{p-q}, \infty(\sigma)} \) is finite. By Hölder’s inequality for Lorentz spaces, Lemma 5.3 yields
\[ \Vert \mathcal{W}_A v \Vert_{L^\frac{q(p-1)}{p-q}, \infty(\sigma)} \leq \Vert \mathcal{W}_A \sigma \Vert_{L^\frac{q(p-1)}{p-q}, \infty(\sigma)} \Vert \mathcal{W}_A v \Vert_{L^{p-1, \infty(\sigma)}} \leq \| \mathcal{W}_A \sigma \|_{L^{\frac{q(p-1)}{p-q}, \infty(\sigma)}} v(\Omega)^{\frac{1}{p-1}}, \quad \forall v \in \mathcal{M}_0^+(\Omega). \]

From Lemma 5.2, the desired lower bound follows. \( \square \)

To treat the more general \( \sigma \in \mathcal{M}_0^+(\Omega) \), we consider the following relaxed capacity condition. A typical example of such a measure is the sum of a finite measure in \( \mathcal{M}_0^+(\Omega) \) and a measure satisfying (1.6). Note that it is not clear whether \( \mathcal{W}_A(\sigma_1 + \sigma_2) \neq \infty \) even if \( \mathcal{W}_A \sigma_i \neq \infty \) for \( i = 1, 2 \).

**Proposition 5.4** Let \( \sigma \in \mathcal{M}_0^+(\Omega) \). Assume that there exists a constant \( C_3 > 0 \) such that
\[ \sigma(K) \leq C_3 \left( \text{cap}_{p, w}(K, \Omega)^{\frac{q}{p}} + 1 \right), \quad \forall K \subseteq \Omega, \quad \tag{5.4} \]
where \( 0 < q < p \) and \( C_3 > 0 \) is a constant. Then, there exists a minimal nonnegative \( \mathcal{A} \)-superharmonic solution \( u \) to (1.1).

**Proof** We first claim that if \( \sigma \in S_c(\Omega) \) satisfies (5.4), then
\[ \| (u - 1)_+ \|_{L^{p-1, \infty(\sigma)}} \leq C, \quad (5.5) \]
where \( C = C(p, q, w, \alpha, C_3) \). Let \( E_j = \{ x \in \Omega : u(x) > 2^j \} \). As in the proof of Theorem 5.1,
\[ \sigma(E_j) \leq C \text{cap}_{p, w}(E_j, \Omega)^{\frac{q}{p}} + C \leq C \left( 2^{j(1-p)} \sigma(E_{j-1}) \right)^{\frac{q}{p}} + C. \]

Thus,
\[ 2^j \frac{q(p-1)}{p-q} \sigma(E_j) \leq C \left( 2^{j-1} \frac{q(p-1)}{p-q} \sigma(E_{j-1}) \right)^{\frac{q}{p}} + 2^j \frac{q(p-1)}{p-q} C, \]

Springer
and hence
\[ \max \left\{ \sigma(E_0), \sup_{j \leq -1} 2^{j \frac{q(p-1)}{p-q}} \sigma(E_j) \right\} \leq C \left( \sup_{j \leq -1} 2^{j \frac{q(p-1)}{p-q}} \sigma(E_j) \right)^{\frac{q}{p}} + C. \]

By Young’s inequality, \( \sigma(E_0) \leq C \). Using the test function \( \min\{(u - 1)_+, l\} \) \( l > 0 \), we obtain
\[ \alpha \|\nabla \min\{(u - 1)_+, l\}\|_{L^p(w)} \leq \int_{\Omega} A(x, \nabla u) \cdot \nabla \min\{(u - 1)_+, l\} \, dx \]
\[ = \int_{\Omega} \min\{(u - 1)_+, l\} \, d\sigma \leq l \sigma(E_0). \]

Then, the Poincaré inequality yields
\[ l^p w(\{x \in \Omega : (u - 1)_+(x) \leq l\}) \leq Cl. \]

This result implies (5.5).

Take \( \{\sigma_k\}_{k=1}^{\infty} \subset S_c(\Omega) \) such that \( \sigma_k = 1_{F_k} \sigma \) and \( 1_{F_k} \uparrow 1_{\Omega} \sigma \)-a.e. Then \( \mathcal{W}_A \sigma_k \uparrow \mathcal{W}_A \sigma \neq \infty \) by (5.5). Hence, \( u := \mathcal{W}_A \sigma \) is the desired minimal \( A \)-superharmonic solution. \( \square \)

### 6 Applications to singular elliptic problems

We first prove the following general existence result.

**Theorem 6.1** Let \( \sigma \in \mathcal{M}^+_0(\Omega) \setminus \{0\} \). Assume that there exists a nonnegative \( A \)-superharmonic supersolution \( v \) to (1.1). Let \( h : (0, \infty) \to (0, \infty) \) be a continuously differentiable nonincreasing function. Then there exists a nonnegative \( A \)-superharmonic solution \( u \) to (1.11) satisfying the Dirichlet boundary condition in the sense that
\[ 0 < g(u)(x) \leq v(x), \quad \forall x \in \Omega, \tag{6.1} \]
where
\[ g(u) := \int_0^u \frac{1}{h(t)^{\frac{1}{p-1}}} \, dt. \]

**Remark 6.2** By assumption, \( g \) is a convex increasing function. In particular, \( \lim_{t \to \infty} g(t) = \infty \). Use of this type transformation can be found in [27, 43, 64].

As in prior studies, we use the following approximating problems:
\[ \begin{cases} -\text{div} A(x, \nabla u_k) = \sigma_k h\left( u_k + \frac{1}{k} \right) & \text{in } \Omega, \\ u = 0 & \text{on } \partial \Omega, \end{cases} \tag{6.2} \]

where \( k \in \mathbb{N}, \sigma_k := 1_{F_k} \sigma \) and \( \{F_k\}_{k=1}^{\infty} \) is a sequence of compact sets in Theorem 3.2. We may assume that \( \sigma_1 \neq 0 \) without loss of generality.
If \( \{u_k\}_{k=1}^{\infty} \subset H_0^{1,p}(\Omega; w) \) is a sequence of weak solutions to \((6.2)\), then \( u_{k+1} \geq u_k \) a.e. in \( \Omega \) for all \( k \geq 1 \). In fact, using the test function \((u_k - u_{k+1})_+ \in H_0^{1,p}(\Omega; w)\), we have

\[
\int_{\Omega} (A(x, \nabla u_k) - A(x, \nabla u_{k+1})) \cdot \nabla (u_k - u_{k+1})_+ \, dx \\
= \int_{\Omega} (u_k - u_{k+1})_+ \left( u_k + \frac{1}{k} \right) \, d\sigma_k - \int_{\Omega} (u_k - u_{k+1})_+ \left( u_k + \frac{1}{k + 1} \right) \, d\sigma_{k+1} \\
\leq \int_{\Omega} (u_k - u_{k+1})_+ \left\{ h \left( u_k + \frac{1}{k + 1} \right) - h \left( u_{k+1} + \frac{1}{k + 1} \right) \right\} \, d\sigma_{k+1} \leq 0.
\]

By \((1.4)\), \( \nabla u_k = \nabla u_{k+1} \) a.e. in \( \{ x \in \Omega : u_k(x) > u_{k+1}(x) \} \), and thus, \((u_k - u_{k+1})_+ = 0 \) in \( H_0^{1,p}(\Omega; w) \).

It is well-known that the singular problem has a convex structure (see e.g., [14, 40]), so we use the Minty-Browder theorem (e.g., [38, Corollary III.1.8] and [49]). The same approach can be found in [39].

**Lemma 6.3** There exists a nonnegative weak solution \( u_k \in H_0^{1,p}(\Omega; w) \) to \((6.2)\).

**Proof** Set \( V = H_0^{1,p}(\Omega; w) \). For \( u \in V \), we define

\[
A(u) := - \text{div} \, A(x, \nabla u) - \sigma_k h \left( u_+ + \frac{1}{k} \right).
\]

We apply the Minty-Browder theorem to \( A \). Since \( \sigma_k \in S_c(\Omega) \subset (H_0^{1,p}(\Omega))^* \),

\[
\left| \int_{\Omega} \varphi h \left( u_+ + \frac{1}{k} \right) \, d\sigma_k \right| \leq h \left( \frac{1}{k} \right) \int_{\Omega} |\varphi| \, d\sigma_k \leq h \left( \frac{1}{k} \right) \|\sigma_k\|_{V^*} \|\nabla \varphi\|_{L^p(\Omega)}
\]

for all \( \varphi \in V \). Thus, \( A \) is a bounded operator from \( V \) to the dual \( V^* \) of \( V \). Moreover,

\[
\frac{\langle A(u), u \rangle}{\|u\|_V} \to \infty \quad \text{as} \quad \|u\|_V \to \infty.
\]

Since \( h \) is nonincreasing,

\[
\int_{\Omega} (u - v) \left\{ h \left( u_- + \frac{1}{k} \right) - h \left( v_- + \frac{1}{k} \right) \right\} \, d\sigma_k \leq 0, \quad \forall u, v \in V,
\]

and hence,

\[
\langle A(u) - A(v), u - v \rangle \geq 0, \quad \forall u, v \in V.
\]

Finally, we claim that if \( \{u_i\}_{i=1}^{\infty} \subset V \) and \( u_i \to u \) in \( V \), then for any \( \varphi \in V \),

\[
\int_{\Omega} A(x, \nabla u_i) \cdot \nabla \varphi \, dx \to \int_{\Omega} A(x, \nabla u) \cdot \nabla \varphi \, dx \quad \text{(6.3)}
\]

and

\[
\int_{\Omega} \varphi h \left( u_i + \frac{1}{k} \right) \, d\sigma_k \to \int_{\Omega} \varphi h \left( u_+ + \frac{1}{k} \right) \, d\sigma_k. \quad \text{(6.4)}
\]

The proof of (6.3) is standard (see [34, Proposition 17.2]). Let \( \{u_{ij}\}_{j=1}^{\infty} \) be any subsequence of \( \{u_i\}_{i=1}^{\infty} \). Since \( \sigma_k \in S_c(\Omega) \), the embedding \( V \hookrightarrow L^1(\Omega; \sigma_k) \) is continuous, and hence
Thus, \( u_{i,j} \to u \) in \( L^1(\Omega; \sigma_k) \). We choose a subsequence \( \{u_{i,j'}\}_{j'=1}^\infty \) of \( \{u_{i,j}\}_{j=1}^\infty \) such that \( u_{i,j'} \to u \) \( \sigma_k \)-a.e. Since \( h \) is continuous and nonincreasing, by the dominated convergence theorem,

\[
\int_\Omega \phi h \left( (u_{i,j'})_+ + \frac{1}{k} \right) d\sigma_k \to \int_\Omega \phi h \left( (u)_+ + \frac{1}{k} \right) d\sigma_k.
\]

The right hand side is independent of the choice of \( \{u_{i,j}\}_{j=1}^\infty \), and hence (6.4) holds. Consequently, the map \( A: V \to V^* \) is onto. In particular, there exists a unique \( u \in V \) such that \( A(u) = 0 \). Since \( u \) is a supersolution to \( -\text{div} A(x, \nabla u) = 0 \) in \( \Omega \), \( u \geq 0 \) q.e. in \( \Omega \). Thus, \( u = u_+ \sigma_k \)-a.e. in \( \Omega \) and satisfies (6.2).

\[ \square \]

**Lemma 6.4** Let \( u_k \in H_0^{1,p}(\Omega; w) \) be an lsc-regularized weak solution to (6.2). Then \( 0 < g(u_k) \leq W_A \sigma_k \) in \( \Omega \).

**Proof** By the comparison principle for weak solutions,

\[
0 \leq u_k(x) \leq W_A \left( h \left( \frac{1}{k} \right) \sigma_k \right)(x), \quad \forall x \in \Omega.
\]

Since \( \sigma_k \in S_c(\Omega) \), \( u_k \in H_0^{1,p}(\Omega; w) \cap L^\infty(\Omega) \). Fix a nonnegative function \( \varphi \in C^{\infty}_c(\Omega) \). By assumption, the function \( t \mapsto \left( \frac{1}{h(t)} - \epsilon \right)_+ \) is nondecreasing and locally Lipschitz.

Consider the test function \( \left( \frac{1}{h(u_k)} - \epsilon \right)_+ \varphi \in H_0^{1,p}(\Omega; w) \). Since

\[
\int_\Omega A(x, \nabla u_k) \cdot \nabla \left( \frac{1}{h(u_k)} - \epsilon \right)_+ \varphi \, dx \geq 0,
\]

we have

\[
\int_\Omega A(x, \nabla u_k) \cdot \nabla \varphi \left( \frac{1}{h(u_k)} - \epsilon \right)_+ \, dx \leq \int_\Omega \varphi \, h(u_k + \frac{1}{k}) \, d\sigma_k \leq \int_\Omega \varphi \, d\sigma_k.
\]

By (1.5) and the dominated convergence theorem,

\[
\int_\Omega A(x, \nabla g(u_k)) \cdot \nabla \varphi \, dx = \int_\Omega A(x, \nabla u_k) \cdot \nabla \varphi \left( \frac{1}{h(u_k)} \right) \, dx \leq \int_\Omega \varphi \, d\sigma_k.
\]

By the comparison principle for weak solutions, \( 0 < g(u_k) \leq W_A \sigma_k \) a.e. in \( \Omega \). In other words, \( 0 < u_k \leq g^{-1}(W_A \sigma_k) \) a.e. in \( \Omega \), where \( g^{-1} \) is the inverse function of \( g \). Since \( g^{-1} \) is concave and increasing, \( g^{-1}(W_A \sigma_k) \) is \( A \)-superharmonic in \( \Omega \), and thus, the same inequality holds for all \( x \in \Omega \).

\[ \square \]

**Proof of Theorem 6.1** Let \( \{u_k\}_{k=1}^\infty \) be the sequence of lsc-regularized weak solutions to (6.2). By Lemma 6.4,

\[
0 < g(u_k) \leq W_A \sigma_k \leq W_A \sigma \leq v \quad \text{in} \quad \Omega.
\]

Thus, \( u(x) \coloneqq \lim_{k \to \infty} u_k(x) \) is not identically infinite. By Theorem 2.1, \( \mu[u_k] \) converges to \( \mu[u] \) weakly. Fix \( \varphi \in C^{\infty}_c(\Omega) \). By the weak Harnack inequality, there exists a constant \( c \) such that \( u_k \geq u_1 \geq c > 0 \) on \( \text{supp} \varphi \). By the dominated convergence theorem,

\[
\lim_{k \to \infty} \int_\Omega \varphi \, h \left( u_k + \frac{1}{k} \right) \, d\sigma_k = \int_\Omega \varphi \, h(u) \, d\sigma.
\]

Thus, \( u \) satisfies (1.11) in the sense of \( A \)-superharmonic solutions.

\[ \square \]
The following existence result was established by Boccardo and Orsina [14] for unweighted equations. The necessity part seems to be new.

**Corollary 6.5** Suppose that \( \sigma \in \mathcal{M}^+_t(\Omega) \setminus \{0\} \). Set \( h(u) = u^{-\gamma} \), where \( 0 < \gamma < \infty \). Then there exists an \( A \)-superharmonic solution \( u \) to \((1.11)\) satisfying \( u^\frac{p-1+p\gamma}{p} \in H^{1,p}_0(\Omega; w) \) if and only if \( \sigma \) is finite.

**Proof** Assume that \( \sigma \) is finite. Then \( \mathcal{W}_A \sigma \neq \infty \) by [48, Theorem 6.6]. Thus, the existence of \( u = \mathcal{W}_A(u^{-\gamma}) \) follows from Theorem 6.1. Set \( u = u^{-\gamma} \sigma \). By (1.7) and (1.8),

\[
\int \Omega d\sigma = \int \Omega u^{-\gamma} d\sigma = \int \Omega (\mathcal{W}_A u)^\gamma d\mu \approx_{\alpha, \beta} \int \Omega |\nabla u|^{\frac{p-1+p\gamma}{p}} |\varphi| d\omega.
\]

The necessity part follows from this two-sided estimate directly. \( \square \)

**Remark 6.6** If there exists a finite energy solution \( u \in H^{1,p}_0(\Omega; w) \) to \((1.11)\), then

\[
\int \Omega \varphi h(u) d\sigma = \int \Omega \mathcal{A}(x, \nabla u) \cdot \nabla \varphi dx \\
\leq \beta \left( \int \Omega |\nabla |ux|^p d\omega \right)^{\frac{p-1}{p}} \left( \int \Omega |\nabla \varphi|^p d\omega \right)^{\frac{1}{p}}, \quad \forall \varphi \in C_c^\infty(\Omega).
\]

Thus, the embedding \( H^{1,p}_0(\Omega; w) \hookrightarrow L^1(\Omega; h(u) \sigma) \) is continuous. Furthermore, such a solution is unique in \( H^{1,p}_0(\Omega; w) \). In fact, if \( v \in H^{1,p}_0(\Omega; w) \) is another solution, then

\[
\int \Omega (\mathcal{A}(x, \nabla u) - \mathcal{A}(x, \nabla v)) \cdot \nabla (u - v) dx = \int \Omega (u - v) (h(u) - h(v)) d\sigma \leq 0.
\]

Hence \( \nabla u = \nabla v \) a.e. in \( \Omega \) and \( u = v \) in \( H^{1,p}_0(\Omega; w) \).

**Proof of Theorem 1.2** Assume that \((1.6)\) holds. Let \( h(u) = u^{q-1} \), and let \( \{u_k\}_{k=1}^\infty \) be the sequence of lsc-regularized weak solutions to (6.2). Then

\[
\alpha \int \Omega |\nabla u_k|^p d\omega \leq \int \Omega \mathcal{A}(x, \nabla u_k) \cdot \nabla u_k dx = \int \Omega u_k \left( u_k + \frac{1}{k} \right)^{q-1} d\sigma_k \\
\leq \int \Omega u_k^{q-1} d\sigma \leq C_1 \left( \int \Omega |\nabla u_k|^p d\omega \right)^{\frac{q}{p}}.
\]

Therefore, \( u(x) = \lim_{k \to \infty} u_k(x) \) belongs to \( H^{1,p}_0(\Omega; w) \), and

\[
\|\nabla u\|_{L^p(\Omega; w)} \leq \liminf_{k \to \infty} \|\nabla u_k\|_{L^p(\Omega; w)} \leq \alpha^{\frac{1}{p-q}} C_1^{\frac{q}{p-q}}.
\]

Meanwhile, by the argument in the proof of Theorem 6.1, \( u \) satisfies (1.11) in the sense of weak solutions. The uniqueness follows from Remark 6.6.

Conversely, assume the existence of \( u \). By (6.5) and Hölder’s inequality,

\[
\int \Omega \varphi^q d\sigma = \int \Omega u^{q(1-q)} \varphi^{q-1} d\omega \\
\leq \left( \int \Omega u^q d\omega \right)^{1-q} \left( \int \Omega \varphi^{q-1} d\sigma \right)^q \\
\leq \beta \left( \int \Omega |\nabla u|^p d\omega \right)^{\frac{p-q}{p}} \left( \int \Omega |\nabla \varphi|^p d\omega \right)^{\frac{q}{p}}, \quad \forall \varphi \in C_c^\infty(\Omega), \varphi \geq 0.
\]
Therefore, (1.6) holds with \( C_1 \leq \beta_1^2 \| \nabla u \|_{L^{p/(p-1)}(\Omega;w)}^p \).

**Proof of Theorem 1.3** Assume the existence of \( v \). Then, Theorem 6.1 gives a bounded \((p, w)\)-superharmonic solution \( u \) to (1.11). By [34, Theorem 7.25], \( u \in H^{1,p}_\text{loc}(\Omega; w) \cap L^\infty(\Omega) \). By the weak Harnack inequality, \( h(u) \) is locally bounded in \( \Omega \). Fix \( x_0 \in \Omega \). By [37, Theorem 4.20] (see also [48, Corollary 3.17] for weighted equations), \( u \) is continuous at \( x_0 \) if and only if

\[
\lim_{R \to 0} \sup_{x \in B(x_0, R)} W_{p,w}^R(h(u)\sigma)(x) = 0.
\]

On the other hand, since \( v \) is continuous at \( x_0 \), by the same reason,

\[
\lim_{R \to 0} \sup_{x \in B(x_0, R)} W_{p,w}^R \sigma(x) = 0.
\]

Therefore, \( u \) is continuous in \( \Omega \). The boundary continuity of \( u \) follows from (6.1).

Let \( u, v \in H^{1,p}_\text{loc}(\Omega; w) \cap C(\overline{\Omega}) \) be continuous weak solutions to (1.11). Assume that there exists \( x \in \Omega \) such that \( u(x) > v(x) \). Then the open set \( D = \{ x \in \Omega : u(x) > v(x) + \epsilon \} \) is not empty for \( \epsilon > 0 \) small. Recall that \( u \) vanishes on \( \partial \Omega \) continuously and that \( v \geq 0 \) in \( D \). Thus \( \overline{D} \subseteq \Omega \) and \( u, v \in H^{1,p}(D; w) \). Using the test function \( (u - v - \epsilon) \in H^0_\text{loc}(D; w) \), we get

\[
\int_D (A(x, \nabla u) - A(x, \nabla v)) \cdot (u - v) \, dx = \int_D (A(x, \nabla u) - A(x, \nabla v)) \cdot (u - v - \epsilon) \, dx = \int_D (u - v - \epsilon)(h(u) - h(v)) \, d\sigma \leq 0.
\]

Thus, \( \nabla u = \nabla v \) a.e. in \( D \) and \( u - v - \epsilon = 0 \) in \( D \). This contradicts the assumption.

Conversely, assume the existence of \( u \). By Theorem 3.5,

\[
u(x) \geq W_{A}(h(u)\sigma)(x) \geq W_{A}\left(h(\sup_\Omega u)\sigma\right)(x) = h(\sup_\Omega u)^{1/{p-1}} W_{A}\sigma(x), \quad \forall x \in \Omega.
\]

Therefore, \( v = W_{A}\sigma \) is a bounded weak solution to (1.1), and

\[
v(x) \leq \frac{u(x)}{h(\sup_\Omega u)^{1/{p-1}}}, \quad \forall x \in \Omega.
\]

(6.6)

The interior regularity of \( v \) follows from the same argument as above. \( \square \)
