Effects of *Balanites aegyptiaca* (Del) seed cake on growth and carcass performance of growing rabbit

**Abstract**

A study on growth and carcass performance was conducted to evaluate the effect of *Balanites aegyptiaca* seed cake meal (BASCM) as a substitute for groundnut cake in the diet of growing rabbit. Five experimental diets were formulated representing the following treatments: T₁, T₂, T₃, T₄ and T₅ respectively. T₁ (0% BASCM) was served as the control diet, while T₂, T₃, T₄ and T₅ contained 25%, 50%, 75% and 100% BASCM respectively. A total of 100 weaner rabbits of mixed breeds were purchased from the National Animal Production Research Institute (NAPRI), Zaria, Nigeria. The rabbits were fed the control diet from the end of one week of adjustment period. They were given vitalyte as anti-stress and were dewormed using ivermectin, at the end of one week of adjustment; the rabbits were housed in different hutches and fed their respective experimental diet for one month. Each treatment contained 20 rabbits and these treatments' (T₁-T₅) each was replicated in four portions and each portion had five rabbits each. Results showed that all the parameters were significantly different (P<0.05) among the treatment groups. *Balanites aegyptiaca* seed cake meal can replace groundnut cake at 25% level inclusion without adverse effect on the rabbit physiology.

**Keywords:** rabbit, growth, carcass, *Balanites aegyptiaca* seed cake, groundnut cake, evaluation

**Introduction**

Rabbit production in developing countries as a means of alleviating world’s animal protein shortage is on the rise. This is attributed to several advantages of rabbit over other livestock in the tropics. It has been reported by Ayinde et al., that feed accounted for 65.75% of the total cost of rabbit production and therefore recommended research into alternative and cheaper feeds for rabbits in Nigeria. *Balanites aegyptiaca* is widely grown in Nigeria. Early studies, showed that *Balanites* offers the most rapid and lowest means of providing alternative and cheaper feed for rabbits in Nigeria. *Balanites aegyptiaca* has been reported to have anti-inflammatory and analgesic, antihelminthic, antioxidant, anti diabetic, anticoagulant, hepatoprotective, antibacterial and larvicidal activities in animals (Dubey et al.), the presence of the phytotoxins in *Balanites* may limit its intensive utilization in diets for man or livestock. Research on process treatments of *Balanites* seed cake have been reported to have less of this deleterious material. When roasting soaking pretreatment is employed. *Balanites aegyptiaca* being a browse plant has been reported to improve the feeding potential of ruminant animals in the semi-arid. Therefore, the objectives of this Research is to evaluate Growth and Carcass Performance of Growing Rabbit using *Balanites aegyptiaca* roasted seed cake as a replacement for ground nut cake.

**Material and methods**

**Experimental design**

The rabbits were allocated to four lots with five rabbits each. Each treatment contained 20 rabbits and these treatments (T₁-T₅) each were replicated in four portions and each portion had five rabbit. Each treatment (T₁-T₅) were replicated four times in a completely randomized design (CRD).

**Experimental diets**

Four experimental diets were formulated and designated as T₁, T₂, T₃, and T₅ respectively. T₁ (control) contain Groundnut cake as its protein source while T₂, T₃, T₄ and T₅ contain 25%, 50%, 75% and 100% *Balanites* seed cake replacing GNC in the diets. The gross composition of the experimental diets is shown in the Table 1 below.

**Growth performance study**

Rabbits were weighed individually at the beginning of the experiment and, thereafter, weekly for one month duration of the experiment using weighing scale. Weighing was done before the morning feeding. The parameters determined for the evaluation of growth performance were initial weight (g), average weekly feed intake (g), average weekly weight gain (g) and feed conversion ratio. Weight gain for each animal was calculated by subtracting the initial weight (g) from the final weight (g), while the feed conversion ratio was calculated by dividing the average feed intake (g) by the average weight gain (g) per week.

**Carcass evaluation**

At the end of the feeding trial, two rabbits per treatment were randomly selected for carcass evaluation. The rabbits were fasted overnight but allowed access to water thus emptying the gut and allow excretion of the undigested feed residue. They were weighed, slaughtered, defurred using flame (singing) and then eviscerated. Individual internal organ (heart, liver, kidneys, lungs, viscera and spleen) were weighed and expressed as percentage of the carcass weight. The dressed carcasses were weighed and dressing percentage was calculated as a percentage of the live weight using the formula.

\[
\text{Dressing percentage (\%) = } \frac{\text{Carcass weight} \times 100}{\text{Live weight}}
\]

The carcass was subsequently cut into different portions viz: head, tail, feet, shoulder, rack/ribs, loin and hind legs, weighed on sensitive weighing scale and expressed as percentage of the carcass following the standard procedures described by Njidda et al.
Table 1: Proximate composition of raw and roasted Balanites aegyptiaca seed cake

| Nutrients, % | Raw  | Roasted |
|--------------|------|---------|
| Dry matter   | 93   | 92.83   |
| Crude Protein| 17.7 | 19.26   |
| Crude fiber  | 5.95 | 5.2     |
| Ether extract| 11.02| 10.55   |
| Ash          | 9.1  | 10.25   |
| Nitrogen free extract | 49.71 | 49.57   |
| Gross energy (Cal/100g) | 4.31 | 4.12    |

Results and discussion

Table 2 revealed photochemical in cake from raw (A1) and roasted Balanites seed cakes (A). Alkaloid from roasted (4.20%), raw cake (29%) samples shows reduced value however revealing reduce anti-microbial potency for feed use. The saponins content in the A1 and A samples showed a drastic reduction in saponins values. This revealed that in feed formulation, bitter associated compound from Balanites aegyptiaca may be reduced in roasted cake seeds formulated meals. Cake from roasted Balanites aegyptiaca seed cake may not cause hemolytic problem, precipitating and coagulation of red blood cells in animal when use as feed ration. The flavonoid values were low for roasted cake (2.03%) compared with the raw or control sample (13.4%). This confirms that cake from Balanites aegyptiaca seed oil may be natural anti-oxidants and also keep feed products longer. Phenol values were low for roasted (10.4%) than the raw sample (108.05) phenol content. Roasting drastically reduced phenol contents of Balanites seed cake hence reducing its anti-nutritional efficacy. The ability of this cake to inhibit microbial growths or activities may be due to alkaloids content in the cake which has traceable microbial and toxicological inhibition on feed.

The result of the Growth performance of rabbits fed with roasted Balanites seed cake replaced with groundnut cake is presented in Table 3. The results showed that all parameters measured were not significantly (P>0.05) different at level of inclusions except feed conversion ration.

Weight is gained as percentage substitution increased significantly. Treatment T₁ (25%) is significantly higher (p>0.05) compared to the control and the other treated samples. However T₅ (100%) was significantly similar with other treatments and treatment T₃ (0%). The observed increase in weight with increased of inclusion of seed cake may be due to high matabolizable energy in the cake compared to the control sample treatment (T₅).

Treatment (T₂, 25%) Balanites inclusion gave significant value at p<0.05 for daily weight gain. Treatment (T₃, 100%) showed a greater value in weight gain on a daily basis which is significantly higher than the treatment T₁, T₂ and T₅ respectively. The low value observed in Treatments T₄ and T₅ revealed fiber interaction with the meal formulation.

The total and daily Feed intake of treatment (T₃, 50%) had the highest value and this was followed significantly by treatment (T₁, 25%). Treatment T₅ showed the lowest total feed intake and daily feed intake ratios respectively. This variation may be due to traces of saponins content or other anti-nutritional factors in the cake.

The feed conversion ration depict that treatment (T₅, 75%) is significantly (P<0.05) greater than treatment T₁. This increase was followed by treatment T₃ and T₅ percentage treatment respectively. The energy conversion in Treatment T₅ is higher than the other treatments. This conversion and utilization of bio-meal from Balanites may be due to low ant-nutritional factor from process approach on the cake as well as inability to obtain enough energy from the percentage inclusion.

There was no mortality during the growth evaluations period, this maybe because of the bioactive and anti-microbial ingredient inherent in the cake at the process stage.
The result of the carcass characteristics of rabbit fed with *Balanites aegyptiaca* cake as a replacement with groundnut cake is presented in Table 4. There were no significant (P>0.05) differences in the parameters measured except treatment T1, T2. Rabbit live weight showed a significant increase in (T1 100%) BASM inclusion. This significant increase was followed by treatment T3m and T3. Treatment T4 revealed low live weight. The low live weight observed may be due to inclusion level and conversion synergy at inclusion and inherent fiber blend utilization.\(^6\) After slaughtering, the carcass weight on treatment T2, T4, and T5 revealed a significant slaughter weight (p>0.05) compared to treatment T1 and T3. The dressed weight revealed that there were no significant difference for treatment T1, T2 and T3 carcass treatments respectively. This trend was also revealed in carcass weight at (p>0.05) significant level. The dressing percentage further revealed that T3, T2 were not significant at (p>0.05) compared to treatments T0, T1, T3 and T4 respectively. The chest percentage carcass dressed, thigh, lion and hind leg were significantly different (P>0.05) from T1 treatment. This was followed by treatment T2, T3 and T5 percentage inclusion treatments. The organ weight from carcass evaluation showed that rabbit fed with treatment T0 inclusion as well as treatment T2 and T1 were significantly different.

The kidney weight of carcass further revealed that there were no significant difference in kidney weight between T1 and T2. The treatments T2, T4 were significantly different from treatment T0, T1 and T3 *Balanites* included samples. This observation may be because of the absorbable nature of protein moieties from the ration treatment compare to treatment T1.

### Table 4 Carcass characteristics of growing rabbits fed diets containing BASM as substitute for groundnut cake

| Parameters       | T1 0% | T2 (25%) | T3 50% | T4 (75%) | T5 (100%) | SEM | P-value |
|------------------|-------|----------|--------|----------|-----------|-----|---------|
| Live weight(g)   | 1450.00 | 1733.33  | 1625.98 | 1726.67  | 1832.3   | 128.67 | 0.001   |
| Slaughter weight(g) | 1400.00 | 1648.34  | 1535.00 | 1607.01  | 1748.9   | 135.33 | 0.001   |
| Dressed weight(g) | 1255.65 | 1542.41  | 1483.34 | 1590.90  | 1654.4   | 137.88 | 0.003   |
| Carcass weight(g) | 1010.00 | 1381.67  | 1358.07 | 1356.60  | 1504.6   | 131.27 | 0.002   |
| Dressing percentage% | 69.66   | 79.71    | 72.25   | 69.83    | 80.57    | 2.51  | 0.001   |
| Chest,(%)        | 14.94  | 15.49    | 14.98   | 12       | 15.67    | 1.8   | 0.072   |
| Thigh,(%)        | 7.57   | 7.64     | 6.51    | 5.79     | 7.98     | 0.93  | 0.061   |
| Loin,(%)         | 18.75  | 20.62    | 20.63   | 13.05    | 19.45    | 1.89  | 0.002   |
| Hindleg,(%)      | 3.81   | 6.24     | 5.19    | 2.90     | 5.98     | 0.84  | 0.091   |
| Foreleg,(%)      | 3.80   | 3.82     | 3.81    | 2.89     | 3.83     | 0.47  | 0.12    |
| Organs weight    |        |          |        |          |          |      |         |
| Lungs,(%)        | 0.54   | 0.63     | 0.50    | 0.40     | 0.57     | 0.12  | 0.067   |
| Kidney,(%)       | 0.62   | 0.71     | 0.66    | 0.52     | 0.77     | 0.11  | 0.071   |
| Liver,(%)        | 2.17   | 2.55     | 2.31    | 1.54     | 2.56     | 0.52  | 0.062   |
| Spleen,(%)       | 0.03   | 0.04     | 0.04    | 0.02     | 0.07     | 0.01  | 0.051   |
| Heart,(%)        | 0.23   | 0.28     | 0.23    | 0.16     | 0.32     | 0.07  | 0.091   |
| Intestine weight,(%) | 16.26  | 18.75    | 17.26   | 11.58    | 18.67    | 1.79  | 0.0001  |

The liver weight showed a high value in treatment T2 and T3. The treatment on T1 and T2 are significantly different from other samples. The spleen and heart similar trend also revealed significant weight except on treatment T1 and T2 which revealed no significant difference. There exist significant difference in spleen and heart for treatment T1, T2, and T3 spleen and heart carcass weight compared to T3 and T2 and T1 respectively. This may be due to traces of saponins and alkaloid that may not have been deactivated during *Balanites* cake roasting, improper roasting.

### Conclusion

From the study, *Balanites Aegyptiaca*, seed cake showed potentials to replace ground nut cake at 25% inclusion with no negative implication or effect on rabbit growth and carcass performance for growing Rabbit.
