ABSTRACT

The experiment was conducted in the Horticultural Farm of Sher-e-Bangla Agricultural University, Dhaka, Bangladesh to investigate the effect of nitrobenzene concentrations with application methods on growth and yield of cucumber. The experiment consisted of two factors viz. i) concentration of nitrobenzene (F0= control, F1= Nitrobenzene @ 500ppm, F2= Nitrobenzene @ 600ppm, F3= Nitrobenzene @ 700ppm), ii) application method (T1= Foliar Application, T2= Soil Application, T3= Combined Application). In case of, different concentrations of nitrobenzene the maximum vine length (175.65 cm) at harvest was found in F2 treatment and minimum (124.44 cm) were found in F0 treatment. Nitrobenzene concentration of 600ppm showed better vine growth than concentration of 500ppm and 700ppm. However, the maximum number branches (12.02), female flower (25.61), fruit per plant (18.22), fruit weight (169.09 gm.) and yield (34.43 t/ha) were recorded from F2 and F3 treatment. The minimum values of the same parameters were observed in F0 treatment or control. The minimum yield (14.71 kg/plot) was found in T2 and maximum yield (16.16 kg/plot) was found in T3 treatment. In the combination of nitrobenzene concentration and application method, the maximum yield (36.90 t/ha) was found in F2T3 treatment and minimum yield (19.90 t/ha) was recorded in F0T3 treatment. The second highest (35.49 t/ha) yield was obtained from F3T3 treatment. The highest benefit cost ratio (2.632) was attained from the treatment combination of F2T3 (nitrobenzene @ 600ppm with combined application) treated plants.

1. INTRODUCTION

Cucumber (Cucumis sativus L.) belongs to the family of cucurbitaceae, is a major vegetable crop worldwide and develops rapidly, with a shorter time from planting to harvest [1]. It is a sub-tropical vegetable crop that grows successfully under conditions of high light, high humidity and soil moisture, temperature with fertilizers in green-houses [2]. Cucumber is grown widely in different parts of the world. The crop is the second most important vegetable crop after tomato in Western Europe and is the fourth most cultivated vegetable in the world after tomatoes, brassicas and onions [3]. In Bangladesh, vegetable production is far below actual requirements. In 2019-20, total vegetable (summer and winter season) production area was 10.72 lac hectares of land with total production of 43.36 million tons. The total production of cucumber in Bangladesh was about 78,845 metric ton in 25,303 acres of land with an average yield of 7.69971 ton/ha [4]. It is good for people suffering from indigestion and biliousness [4].

Sex expression and sex ratio in cucurbits are important factors for governing the yield. All the cultivars of cucurbits differ in production of pistillate flowers. It is a tendency of all the cucurbits to produce more numbers of male flowers and less numbers of pistillate and hermaphrodite flowers. Plant growth regulators play a key role in controlling internal mechanisms of plant growth by interacting with key metabolic processes such as nucleic acid metabolism and protein synthesis [5]. Different plant growth regulators are auxins, gibberellins, nitrobenzene, cytokinin, abscisic acid (ABA) and ethylene, etc. Among them, nitrobenzene (20% w/w) plays an important role for higher growth and yield of vegetables [6]. Nitrobenzene is a combination of nitrogen and plant growth regulators, extracted from seaweeds that act as plant energizer, flowering stimulant and yield booster. “Flora” is a commercially available plant growth substance containing 20% (w/w) nitrobenzene. Nitrobenzene 20% used to repair the hormonal function of a plant thus promotes the flowering activity and growth of roots [7].

The application of nitrobenzene produces the highest number of fruits and flowers per plant. It is quickly absorbed into the plants and influences the biochemical pathway of the plants to uptake more nutrients from the soil [8]. It also increases the nutrient use efficiency thus improves the vegetative growth. Induces profuse flowering and helps in the retention of the flowers and fruits [9]. Unfortunately, very limited researches have been carried out regarding the use of nitrobenzene, the effect of various concentrations and application method on plants of cucurbitaceae family for higher growth and yield. A detailed and systematic study is needed to find out the suitable concentration, appropriate application method and suitable combination concentration of nitrobenzene and application method for maximum growth, yield and economic benefit of cucumber in Bangladesh.

2. MATERIALS AND METHODS

2.1 Experimental Site and Experimental Framework

The research work was conducted at the Horticultural Farm of Sher-e-Bangla Agricultural University (SAU), Sher-e-Bangla Nagar, Dhaka-1207, Bangladesh, in robi season during the period of October 2019 to March 2020. The experimental site is situated between 23°74” N latitude and 90°35” E longitude and at an elevation of 8.2 m from sea level. The experimental site was a medium high land and pH of the soil was 5.4 to 5.6. The morphological characters of the soil are given below: AEZ No. 28, Soil series- Tejgaon, General soil - Non-calcareous dark gray. The experiment consists of two factors- Factor A: Concentration of Nitrobenzene as F₁= Control, F₂= Nitrobenzene @ 500ppm, F₃= Nitrobenzene @ 600ppm, F₄= Nitrobenzene @ 700ppm and Factor B: Application Method as T₁= Foliar Application, T₂= Soil Application, T₃= Combined Application. It was a factorial experiment. The experiment was laid out in a two factorial Randomized Complete Block Design (RCBD) with three replications. Total land was divided into three equal blocks. Each block was divided into twelve plots. Every replication had twelve plots where 12 treatments were allotted at random. The size of each plot was 1.8m x 1.8m. The distance between two blocks and two of the plots both were 1m.

2.2 Planting Materials and Nitrobenzene (20% w/w)

Seed of “Baromashi” local variety of cucumber were obtained from BADC, Dhaka. Flora was
used as the source of nitrobenzene (20% w/w), Flora is a product of ACI Formulations Ltd. which contain nitrobenzene (Nitrobenzene 20% w/w). About 2.5ml/L flora contains 500ppm nitrobenzene, 3.0ml/L flora contains 600ppm nitrobenzene and 3.5ml/L flora contains 700ppm nitrobenzene.

2.3 Application of Nitrobenzene

Flora was applied in 4 different concentrations: control, 500ppm, 600ppm and 700ppm. Total four sprays were done, first nitrobenzene dose was applied at 25 days after sowing, and rest three doses were applied at 15 days interval.

2.4 Economic Analysis

The cost of production was calculated to find out the most economic combination of the concentration of nitrobenzene and application method. All input cost like the cost for land lease and interest in running capital was computing in the calculation. The benefit-cost ratio (BCR) was calculated as follows:

$$\text{BCR} = \frac{\text{Gross return per hectare (Tk)}}{\text{Total cost of production per hectare (Tk)}} \times 100$$

2.5 Statistical Analysis

The recorded data on different parameters were statistically analyzed using Statistix-10 software. The significance of the difference among the treatment combinations of means was estimated by Duncan’s Multiple Range Test (DMRT) at 5% level of probability [10].

3. RESULTS AND DISCUSSION

3.1 Vine Length (cm)

A statistically significant variation was found in vine length due to different levels of nitrobenzene concentration at 30 DAS, 45 DAS and harvesting stage. At harvest the maximum vine length (175.65 cm) was recorded from F₂ (nitrobenzene @ 600ppm) treatment and the minimum vine length (124.44 cm) was recorded from F₀ (control) treatment [Fig.1]. The result indicated that nitrobenzene application increased plant height comparing with the control, which might be due to increases the nutrient use efficiency thus improves the vegetative growth [9]. Observed similar trend of results.

In terms of vine length in relation with nitrobenzene application method at 30 DAS, 45 DAS and harvest a statistically significant difference were recorded under the trial. At harvest, the maximum vine length (158.05 cm) was recorded from T₃ (foliar + basal application) treatment and the minimum vine length (153.88 cm) was recorded from T₂ (basal application) treatment [Fig.2].

Combined effects of different nitrobenzene doses and application methods showed statistically significant variation in terms of plant height of cucumber 30 DAS, 45 DAS and harvest. At harvest, the highest vine length (178.41 cm) was recorded from the treatment combination F₂T₃ and the minimum vine length (122.98 cm) was recorded from the treatment combination of F₀T₁ treatment [Table 1]. The results indicated that plant growth regulator application ensures the maximum growth and development of cucumber plant and ultimate result is the maximum plant height.

3.2 Number of Branches

Number of branches per plant of cucumber showed statistically significant differences due to different levels of nitrobenzene concentration at 30DAS, 45 DAS and harvesting. At harvesting, the maximum number of branches per plant (12.02) was found from F₂ (nitrobenzene @ 600ppm) treatment, whereas the minimum number of branches per plant (7.80) was recorded from F₀ (control) treatment [Fig.3]. The result also indicated that the increasing concentration of nitrobenzene significantly increased the number of branches of cucumber. This result is in agreement with the finding of [6].

In terms of the number of branches in relation to the nitrobenzene application method, a statistically significant difference was recorded. The maximum number of branches (10.91) were recorded from T₃ (combined application) and the minimum number of branches (10.33) were produced by the T₂ (soil application) treatment [Fig. 4].

Means in a column followed by same letter do not differ significantly at 5% level. Here, \( F_0 \): Control, \( F_1 \): Nitrobenzene @ 500ppm, \( F_2 \): Nitrobenzene @ 600ppm, \( F_3 \): Nitrobenzene @ 700ppm and \( T_1 \): Foliar application, \( T_2 \): Soil application, \( T_3 \): Combined application.
Combined effect of different nitrobenzene doses and application methods showed statistically significant variation in terms of number of branches per plant of cucumber at 30 DAS, 45 DAS and harvest. At harvest, the maximum number of branches per plant (12.50) was observed from $F_2T_3$ treatment combination and the minimum number of branches per plant (7.66) was recorded from $F_0T_3$ treatment combination [Table 2]. This might be due to the fact that application of nitrobenzene maintained balanced absorption of nutrients improve physiological activities resulted the maximum number of branches per plant of cucumber. [11-12] found almost same result in his earlier experiment.

### 3.3 Number of Male Flowers per Plant

Number of male flowers per plant showed statistically significant variation due to different nitrobenzene concentration. The maximum number of male flowers per plant (26.63) was recorded from $F_2$ treatment, whereas the minimum number of male flowers per plant (23.41) was found from $F_1$ treatment [Table 3]. The result indicates that minimum male flower was produced from low concentration of nitrobenzene applied plant comparing with others [13], found almost same result in his earlier experiment.

Number of male flowers per plant of cucumber varied significantly in terms of nitrobenzene application method. The maximum number of male flowers per plant (26.00) was found from $T_3$ treatment while the minimum number of male flowers per plant (25.37) was found from $T_1$ treatment which was statistically identical (25.27) with $T_2$ treatment [Table 4].

Combined effects of different nitrobenzene doses and application method showed statistically significant variation in terms of number of male flowers per plant of cucumber. The maximum number of male flowers per plant (27.08) was observed from $F_2T_3$ treatment combination and the minimum number of male flowers per plant (22.66) was recorded from $F_1T_1$ treatment combination, which was statistically identical (22.91) to $F_1T_2$ treatment combination [Table 5].

### 3.4 Number of Female Flowers per Plant

Different nitrobenzene concentrations varied significantly in terms of number of female flowers per plant of cucumber. The maximum number of female flowers per plant (25.61) was recorded from $F_2$ treatment whereas the minimum number of female flowers per plant (18.38) was found from $F_0$ treatment [Table 3]. The results indicated that maximum female flower was produced by the application of plant growth regulator compared to control. [13] reported similar trends from their experiment.

In terms of the number of female flowers per plant, the nitrobenzene application method varied significantly in cucumber. The maximum number of female flowers per plant (23.27) was found from $T_3$, while the minimum number of female flowers (22.56) was found from $T_2$ treatment [Table 4].

Combined effects of different nitrobenzene doses and application method showed statistically significant variation in terms of number of female flowers per plant of cucumber. The maximum number of female flowers per plant (26.33) was observed from $F_2T_3$ treatment combination and the minimum number of female flowers per plant (18.16) was recorded from $F_0T_2$ treatment combination [Table 5]. The result indicated that combination of nitrobenzene with their application method produces the maximum number of female flower per plant. [8] reported that application of nitrobenzene results quickly absorbed into the plants and influences the biochemical pathway of the plants to uptake more nutrient use efficiency thus improve vegetative and reproductive growth of plants.

### 3.5 Ratio of Male and Female Flowers

Statistically significant variation was recorded in terms of ratio of male and female flowers of cucumber due to different nitrobenzene concentration. The highest ratio of male and female flowers (1.43) was recorded from $F_2$ treatment, whereas the lowest ratio of male and female flowers (1.03) was found from $F_3$ treatment which was statistically identical (1.04) to $F_1$ and $F_2$ treatment [Table 3]. The result indicated that minimum ratio of male and female flower were produced by application of nitrobenzene compared to control.

Ratio of male and female flowers of cucumber varied insignificantly in terms of nitrobenzene application method. The ratio of male and female flowers (1.13) was found from all the $T_1$, $T_2$ and $T_3$ treatments [Table 4].
Combined effect of different nitrobenzene doses and application methods showed statistically significant variation in terms of ratio of male and female flowers of cucumber. The highest ratio of male and female flowers (1.45) was observed from F_0T_2 treatment combination and the lowest ratio of male and female flowers (1.01) was recorded from F_1T_1 treatment combination which was statistically identical with F_3T_2 treatment combination [Table 5].

### 3.6 Number of Fruits per Plant

Significant variation was recorded due to different nitrobenzene concentration in terms of number of fruits per plant of cucumber. The maximum number of fruits per plant (18.22) was recorded from F_2 treatment which was statistically identical (18.16) to F_3 treatment, whereas the minimum number of fruits per plant (13.30) was found from F_0 treatment [Table 6].

Number of fruits per plant of cucumber varied significantly in terms of the nitrobenzene application method. The maximum number of fruits per plant (16.70) was found from T_3 treatment while the minimum number of fruits per plant (15.66) was found from T_2 treatment [Table 7].

Means in a column followed by same letter do not differ significantly at 5% level. Here, F₀: Control, F₁: Nitrobenzene @ 500ppm, F₂: Nitrobenzene @ 600ppm, F₃: Nitrobenzene @ 700ppm and T₁: Foliar application, T₂: Soil application, T₃: Combined application.

Combined effect of different nitrobenzene doses and application methods showed statistically influence in terms of number of fruits per plant of cucumber. The maximum number of fruits per plant (19.16) was observed from F₂T₃ treatment combination and the minimum number of fruits per plant (13.16) was recorded from F₀T₃ treatment combination which was statistically identical to F₀T₂ treatment combination [Table 8].

3.7 Individual Fruit Weight (g)

Statistically significant variation was recorded in individual fruit weight of cucumber due to different nitrobenzene concentration. The maximum individual fruit weight (169.09 g) was recorded from F₂ treatment, whereas the minimum individual fruit weight (135.35 g) was found from F₀ treatment [Table 6].

Individual fruit weight of cucumber varied significantly in terms of nitrobenzene application method. The maximum individual fruit weight (158.47 g) was found from T₃ treatment, while the minimum individual fruit weight (154.78 g) was found from T₂ treatment [Table 7].
Combined effect of different nitrobenzene doses and application methods showed statistically significant variation in terms of individual fruit weight of cucumber. The maximum weight of individual fruits (172.27 g) was observed from F_2T_3 treatment combination, while the minimum individual fruit weight (134.75 g) was recorded from F_0T_2 treatment combination [Table 8]. It was observed that the individual fruit weight was gradually increased with the higher level of nitrobenzene concentration up to a limit. This might be due to that nitrobenzene improve physiological activity like photosynthesis and translocation of food materials to the fruits. This result is also in agreement with the findings of [8].

### 3.8 Fruit Yield (Kg) Per Plant

Different nitrobenzene concentration showed statistically significant variation in terms of fruit yield per plant of cucumber. The maximum fruit yield per plant (3.10 kg) was recorded from F_2 treatment, whereas the minimum fruit yield per plant (1.80 kg) was found from F_0 treatment [Table 9].

Fruit yield per plant of cucumber varied significantly in terms of nitrobenzene application method. The maximum fruit yield per plant (2.69 kg) was found from T_3 treatment, while the minimum fruit yield per plant (2.45 kg) was found from T_1 treatment [Table 10].

| Treatment | Yield/plant (kg) | Yield/ha (ton) |
|-----------|-----------------|----------------|
| F_0       | 1.80 d          | 20.01 d        |
| F_1       | 2.40 c          | 26.69 c        |
| F_2       | 3.10 a          | 34.43 a        |
| F_3       | 3.02 b          | 33.57 b        |
| CV%       | 12.87           | 11.42          |
| LSD_{0.05} | 0.058           | 0.74           |

Here, F_0: Control, F_1: Nitrobenzene @ 500ppm, F_2: Nitrobenzene @ 600ppm, F_3: Nitrobenzene @ 700ppm.

### 3.9 Fruit Yield (ton) Per Hectare

Different nitrobenzene concentration showed significant variation in terms of fruit yield per hectare of cucumber. The maximum fruit yield per hectare (34.43 ton) was recorded from F_2 treatment, whereas the minimum fruit yield per hectare (20.01 ton) was from F_0 treatment [Table 9].

Fruit yield per hectare of cucumber varied significantly in terms of nitrobenzene application method. The maximum fruit yield per hectare (29.93 ton) was found from T_3 treatment, while the minimum fruit yield per hectare (27.25 ton) was found from T_2 treatment [Table 10].

| Treatment | Yield/plant (kg) | Yield/ha (ton) |
|-----------|-----------------|----------------|
| T_1       | 2.59 b          | 28.84 b        |
| T_2       | 2.45 c          | 27.25 c        |
| T_3       | 2.69 a          | 29.93 a        |
| CV%       | 12.87           | 11.42          |
| LSD_{0.05} | 0.051           | 0.29           |

Table 12. Cost and returns of cucumber cultivation as influenced by different treatments

| Treatments | Total cost of production | Yield/ha (ton) | Gross Return (taka) | Net Return (taka) | Benefit cost Ratio |
|------------|--------------------------|----------------|--------------------|-------------------|-------------------|
| F₀T₁       | 339987                    | 20.18          | 504500             | 164513            | 1.484             |
| F₀T₂       | 334422                    | 19.94          | 498500             | 164078            | 1.491             |
| F₀T₃       | 345552                    | 19.90          | 497500             | 164078            | 1.491             |
| F₁T₁       | 343882                    | 26.64          | 668000             | 322118            | 1.937             |
| F₁T₂       | 338332                    | 25.98          | 649500             | 311168            | 1.919             |
| F₁T₃       | 349447                    | 27.45          | 686250             | 336803            | 1.964             |
| F₂T₁       | 344995                    | 34.97          | 874250             | 529255            | 2.456             |
| F₂T₂       | 339430                    | 31.42          | 785500             | 446070            | 2.317             |
| F₂T₃       | 350560                    | 36.90          | 922500             | 571940            | 2.632             |
| F₃T₁       | 346108                    | 33.56          | 839000             | 492892            | 2.424             |
| F₃T₂       | 340543                    | 31.66          | 791500             | 450957            | 2.324             |
| F₃T₃       | 351673                    | 35.49          | 887250             | 535577            | 2.523             |

Here, F₀: Control, F₁: Nitrobenzene @ 500ppm, F₂: Nitrobenzene @ 600ppm, F₃: Nitrobenzene @ 700ppm and T₁: Foliar application, T₂: Soil application, T₃: Combined application.

Combined effect of different nitrobenzene doses and application methods showed statistically significant variation in terms of fruit yield per hectare of cucumber. The maximum fruit yield per hectare (36.90 ton) was observed from F₂T₃ treatment combination and the minimum fruit yield per hectare (19.90 ton) from F₀T₃ treatment combination which was statistically identical (20.18 ton and 19.94 ton) to F₀T₁ and F₀T₂ treatment combinations respectively [Table 11].

3.10 Economic Analysis

Input costs for land preparation, seed cost, fertilizers, nitrobenzene, pesticides, irrigation and manpower required for all the operations from planting to harvesting of cucumber were recorded for unit plot and converted into cost per hectare. Price of cucumber was considered as per market rate. The economic analysis presented under the following headings-

Gross return:

The combination of sowing time and phosphorus showed different gross returns. The highest gross return (922500 Tk./ha) was obtained from F₂T₃ treatment combination and the second highest gross return (887250 Tk./ha) was found in F₃T₃. The lowest gross return (497500 Tk./ha) was obtained from F₀T₃ treatment combination [Table 12].
Net return:

In case of net return different treatment combinations showed different net return. The highest net return (571940 Tk./ha) was found from the F₂T₃ treatment combination and the second highest net return (535577 Tk./ha) was obtained from the F₃T₃ treatment combination. The lowest (151948 Tk./ha) net return was obtained F₀T₀ treatment combination [Table 12].

Benefit cost ratio:

The combination of sowing time and phosphorus highest benefit cost ratio (2.632) was noted from F₂T₃ treatment combination and the second highest benefit cost ratio (2.523) was estimated from F₃T₃ treatment combination. The lowest benefit cost ratio (1.439) was obtained from F₀T₀ treatment combination [Table 12]. From an economic point of view, it was apparent from the above results that the F₂T₃ treatment combination was more profitable than the rest of the combination.

4. CONCLUSION

From the results of the study, following conclusions and recommendations may be followed:

i. Treatment F₂ (nitrobenzene @ 600ppm) was superior to others; this nitrobenzene concentration may be used to get desirable yield of cucumber.

ii. The treatment T₃ (foliar + soil application method), showed better performance on growth and yield of cucumber.

iii. The treatment combination F₂T₃ (nitrobenzene @ 600ppm with foliar + soil application) may be used to get more fruits per plant and total yield of cucumber. It may provide best substantial benefit to the farmers. So it may be recommended to the farmer level for cucumber cultivation in winter season.

DISCLAIMER

The products used for this research are commonly and predominantly use products in our area of research and country. There is absolutely no conflict of interest between the authors and producers of the products because we do not intend to use these products as an avenue for any litigation but for the advancement of knowledge. Also, the research was not funded by the producing company rather it was funded by personal efforts of the authors.

COMPETING INTERESTS

Authors have declared that no competing interests exist.
