GLOBAL EXISTENCE AND ENERGY DECAY OF SOLUTIONS TO THE CAUCHY PROBLEM FOR A WAVE EQUATION WITH A WEAKLY NONLINEAR DISSIPATION

ABBÈS BENAÏSSA AND SOUFIANE MOKEDDEM

Received 21 November 2003

We prove the global existence and study decay properties of the solutions to the wave equation with a weak nonlinear dissipative term by constructing a stable set in $H^1(\mathbb{R}^n)$.

1. Introduction

We consider the Cauchy problem for the nonlinear wave equation with a weak nonlinear dissipation and source terms of the type

$$u'' - \Delta_x u + \lambda^2(x)u + \sigma(t)g(u') = |u|^{p-1}u \quad \text{in } \mathbb{R}^n \times [0, +\infty[,\tag{1.1}$$

$$u(x,0) = u_0(x), \quad u'(x,0) = u_1(x) \quad \text{in } \mathbb{R}^n,$$

where $g: \mathbb{R} \to \mathbb{R}$ is a continuous nondecreasing function and $\lambda$ and $\sigma$ are positive functions.

When we have a bounded domain instead of $\mathbb{R}^n$, and for the case $g(x) = \delta x$ ($\delta > 0$) (without the term $\lambda^2(x)u$), Ikehata and Suzuki [8] investigated the dynamics, they have shown that for sufficiently small initial data $(u_0, u_1)$, the trajectory $(u(t), u'(t))$ tends to $(0, 0)$ in $H_0^1(\Omega) \times L^2(\Omega)$ as $t \to +\infty$. When $g(x) = \delta |x|^{m-1}x$ ($m \geq 1, \delta \equiv 0, \sigma \equiv 1$), Georgiev and Todorova [4] introduced a new method and determined suitable relations between $m$ and $p$, for which there is global existence or alternatively finite-time blow up. Precisely they showed that the solutions continue to exist globally in time if $m \geq p$ and blow up in finite time if $m < p$ and the initial energy is sufficiently negative. This result was later generalized to an abstract setting by Levine and Serrin [12] and Levine et al. [11]. In these papers, the authors showed that no solution with negative initial energy can be extended on $[0, \infty[,$ if the source term dominates over the damping term ($p > m$). This generalization allowed them also to apply their result to quasilinear wave equations (see [1, 17]). Quite recently, Ikehata [7] proved that a global solution exists with no relation between $p$ and $m$ by the use of a stable set method due to Sattinger [18].

For the Cauchy problem (1.1) with $\lambda \equiv 1$ and $\sigma \equiv 1$, when $g(x) = \delta |x|^{m-1}x$ ($m \geq 1$) Todorova [21] (see [16]) proved that the energy decay rate is $E(t) \leq (1 + t)^{(2 - n(m - 1))/(m - 1)}$.
for \( t \geq 0 \). She used a general method introduced by Nakao \[14\] on condition that the data have compact support. Unfortunately, this method does not seem to be applicable in the case of more general functions \( \lambda \) and \( \sigma \).

Our purpose in this paper is to give a global solvability in the class \( H^1 \) and energy decay estimates of the solutions to the Cauchy problem (1.1) for a weak linear perturbation and a weak nonlinear dissipation.

We use a new method recently introduced by Martinez \[13\] (see also \[2\]) to study the decay rate of solutions to the wave equation \( u'' - \Delta_x u + g(u') = 0 \) in \( \Omega \times \mathbb{R}^+ \), where \( \Omega \) is a bounded domain of \( \mathbb{R}^n \). This method is based on a new integral inequality that generalizes a result of Haraux \[6\]. So we proceed with the argument combining the method in \[13\] with the concept of modified stable set on \( H^1(\mathbb{R}^n) \). Here the modified stable set is the extended \( \mathbb{R}^n \) version of Sattinger’s stable set.

### 2. Preliminaries and main results

\( \lambda(x), \sigma(t), \) and \( g \) satisfy the following hypotheses.

(i) \( \lambda(x) \) is a locally bounded measurable function defined on \( \mathbb{R}^n \) and satisfies

\[
\lambda(x) \geq d(|x|),
\]

where \( d \) is a decreasing function such that \( \lim_{y \to -\infty} d(y) = 0 \).

(ii) \( \sigma : \mathbb{R}^+ \to \mathbb{R}^+ \) is a nonincreasing function of class \( C^1 \) on \( \mathbb{R}^+ \).

Consider \( g : \mathbb{R} \to \mathbb{R} \) a nondecreasing \( C^0 \) function and suppose that there exist \( C_i > 0, i = 1,2,3,4 \), such that

\[
\begin{align*}
c'_1 |v|^m & \leq |g(v)| \leq c'_4 |v|^{1/m} \quad \text{if } |v| \leq 1, \\
c_1 |v| & \leq |g(v)| \leq c_2 |v|^r \quad \forall |v| \geq 1,
\end{align*}
\]

where \( m \geq 1 \) and \( 1 \leq r \leq (n+2)/(n-2)^+ \).

We first state two well-known lemmas, and then we state and prove two other lemmas that will be needed later.

**Lemma 2.1.** Let \( q \) be a number with \( 2 \leq q < +\infty \) (\( n = 1,2 \)) or \( 2 \leq q \leq 2n/(n-2)(n \geq 3) \). Then there is a constant \( c_* = c(q) \) such that

\[
\|u\|_q \leq c_* \|u\|_{H^1(\mathbb{R}^n)} \quad \text{for } u \in H^1(\mathbb{R}^n).
\]

**Lemma 2.2 (Gagliardo-Nirenberg).** Let \( 1 \leq r < q \leq +\infty \) and \( p \geq 2 \). Then, the inequality

\[
\|u\|_p \leq C \|\nabla_x^m u\|_{L^2}^{\theta} \|u\|_{L^r}^{1-\theta} \quad \text{for } u \in \mathcal{D}((-\Delta)^{m/2})L^r
\]

holds with some constant \( C > 0 \) and

\[
\theta = \left( \frac{1}{r} - \frac{1}{p} \right) \left( \frac{m}{n} + \frac{1}{r} - \frac{1}{2} \right)^{-1}
\]

provided that \( 0 < \theta \leq 1 \) (assuming that \( 0 < \theta < 1 \) if \( m - n/2 \) is a nonnegative integer).
Lemma 2.3 [10]. Let $E : \mathbb{R}_+ \to \mathbb{R}_+$ be a nonincreasing function and assume that there are two constants $p \geq 1$ and $A > 0$ such that

\[ \int_S^{+\infty} E^{(p+1)/2}(t) \, dt \leq AE(S), \quad 0 \leq S < +\infty, \]  

(2.7)

then

\[ E(t) \leq cE(0)(1 + t)^{-2/(p-1)} \quad \forall \, t \geq 0, \text{ if } p > 1, \]

\[ E(t) \leq cE(0)e^{-\omega t} \quad \forall \, t \geq 0, \text{ if } p = 1, \]  

(2.8)

where $c$ and $\omega$ are positive constants independent of the initial energy $E(0)$.

Lemma 2.4 [13]. Let $E : \mathbb{R}_+ \to \mathbb{R}_+$ be a nonincreasing function and $\phi : \mathbb{R}_+ \to \mathbb{R}_+$ an increasing $C^2$ function such that

\[ \phi(0) = 0, \quad \phi(t) \to +\infty \quad \text{as } t \to +\infty. \]  

(2.9)

Assume that there exist $p \geq 1$ and $A > 0$ such that

\[ \int S^{+\infty} E(t)^{(p+1)/2}(t)\phi'(t) \, dt \leq AE(S), \quad 0 \leq S < +\infty, \]  

(2.10)

then

\[ E(t) \leq cE(0)(1 + \phi(t))^{-2/(p-1)} \quad \forall \, t \geq 0, \text{ if } p > 1, \]

\[ E(t) \leq cE(0)e^{-\omega\phi(t)} \quad \forall \, t \geq 0, \text{ if } p = 1, \]  

(2.11)

where $c$ and $\omega$ are positive constants independent of the initial energy $E(0)$.

Proof of Lemma 2.4. Let $f : \mathbb{R}_+ \to \mathbb{R}_+$ be defined by $f(x) := E(\phi^{-1}(x))$, (we remark that $\phi^{-1}$ has a sense by the hypotheses assumed on $\phi$), $f$ is nonincreasing, $f(0) = E(0)$, and if we set $x := \phi(t)$, we obtain

\[ \int_{\phi(S)}^{\phi(T)} f(x)^{(p+1)/2} \, dx = \int_{\phi(S)}^{\phi(T)} E(\phi^{-1}(x))^{(p+1)/2} \, dx = \int_S^T E(t)^{(p+1)/2}\phi'(t) \, dt \]

(2.12)

\[ \leq AE(S) = Af(\phi(S)), \quad 0 \leq S < T < +\infty. \]

Setting $s := \phi(S)$ and letting $T \to +\infty$, we deduce that

\[ \int_S^{+\infty} f(x)^{(p+1)/2} \, dx \leq Af(s), \quad 0 \leq s < +\infty. \]  

(2.13)

Thanks to Lemma 2.3, we deduce the desired results. \qed

Before stating the global existence theorem and decay property of problem (1.1), we will introduce the notion of the modified stable set. Let

\[ K(u) = ||\nabla_x u||_2^2 + ||u||_2^2 - ||u||_{p+1}^{p+1} \quad \text{if } \lambda \equiv 1, \]

\[ I(u) = ||\nabla_x u||_2^2 - ||u||_{p+1}^{p+1} \quad \text{if } \lambda \neq \text{const}, \]  

(2.14)
for \( u \in H^1(\mathbb{R}^n) \). Then we define the modified stable set \( \tilde{\mathcal{W}}^* \) and \( \tilde{\mathcal{W}}^{**} \) by
\[
\tilde{\mathcal{W}}^* \equiv \{ u \in H^1(\mathbb{R}^n) \setminus K(u) > 0 \} \cup \{ 0 \} \quad \text{if } \lambda \equiv 1, \\
\tilde{\mathcal{W}}^{**} \equiv \{ u \in H^1(\mathbb{R}^n) \setminus I(u) > 0 \} \cup \{ 0 \} \quad \text{if } \lambda \neq \text{const}.
\]

Next, let \( J(u) \) and \( E(t) \) be the potential and energy associated with problem (1.1), respectively:
\[
J(u) = \frac{1}{2} \| \nabla x u \|_2^2 + \frac{1}{2} \| \lambda(x) u \|_2^2 - \frac{1}{p+1} \| u \|_{p+1}^{p+1} \quad \text{for } u \in H^1(\mathbb{R}^n),
\]
\[
E(t) = \frac{1}{2} \| u' \|_2^2 + J(u).
\]

We get the local existence solution.

**Theorem 2.5.** Let \( 1 < p \leq (n + 2)/(n - 2) \) \((1 < p < \infty \text{ if } n = 1, 2)\) and assume that \((u_0, u_1) \in H^1(\mathbb{R}^n) \times L^2(\mathbb{R}^n)\) and \(u_0\) belong to the modified stable set \( \tilde{\mathcal{W}}^* \). Then there exists \( T > 0 \) such that the Cauchy problem (1.1) has a unique solution \( u(t) \) on \( \mathbb{R}^n \times [0, T) \) in the class
\[
u(t, x) \in C([0, T); H^1(\mathbb{R}^n)) \cap C^1([0, T); L^2(\mathbb{R}^n)),
\]
satisfying
\[
u(t) \in \tilde{\mathcal{W}}^*,
\]
and this solution can be continued in time as long as \( u(t) \in \tilde{\mathcal{W}}^* \).

When \( \lambda \neq \text{const} \), we use the following theorem of local existence in the space \( H^2 \times H^1 \), and the decay property of the energy \( E(t) \) is necessarily required for the local solution to remain in \( \tilde{\mathcal{W}}^{**} \) as \( t \to \infty \); this fact of course guarantees the global existence in \( H^2 \times H^1 \) and by approximation, we obtain global existence in \( H^1 \times L^1 \).

**Theorem 2.6 [15].** Let \((u_0, u_1) \in H^2 \times H^1 \). Suppose that
\[
1 \leq p \leq \frac{n}{n-4} \quad (1 \leq \infty \text{ if } N \leq 4).
\]

Then under the hypotheses (2.1), (2.2), and (2.3), problem (1.1) admits a unique local solution \( u(t) \) on some interval \([0, T[\), \( T \equiv T(u_0, u_1) > 0 \), in the class \( W^{2,\infty}([0, T]; L^2) \cap W^{1,\infty}([0, T]; H^1) \cap L^{\infty}([0, T]; H^2) \), satisfying the finite propagation property.

**Proof of Theorem 2.5 (see [15, 18]).** Since the argument is standard, we only sketch the main idea of the proof. Let \((u_0, u_1) \in H^1 \times L^2\) and \(u_0 \in \tilde{\mathcal{W}}^*\). Then we have a unique local solution \( u(t) \) for some \( T > 0 \). Indeed, taking suitable approximate functions \( f_j \) such that (see [20])
\[
f_j(u) = f(u) \quad \text{if } |u| \leq j, \quad |f_j(u)| \leq |f(u)|, \quad |f_j(u)| \leq c_j |u|,
\]
problem (1.1) with \( f(u) \equiv |u|^{p-1}u \) replaced by \( f_j(u) \) admits a unique solution \( u_j(t) \in C([0, T); H^1(\mathbb{R}^n)) \cap C^1([0, T); L^2(\mathbb{R}^n)) \). Further, we can prove that \( u_j(t) \in \tilde{\mathcal{W}}^*, 0 < t < T,\)
for sufficiently large \( j \), and there exists a subsequence of \( \{ u_j(t) \} \) which converges to a function \( \tilde{u}(t) \) in certain senses. \( \tilde{u}(t) \) is, in fact, a weak solution in \( C([0, T]; H^1(\mathbb{R}^n)) \cap C^1([0, T]; L^2(\mathbb{R}^n)) \) (see \([19, 20]\)) and such a solution is unique by Ginibre and Velo \([5]\) and Brenner \([3]\). We can also construct such a solution which meets moreover the finite propagation property, if we assume that the initial data \( u_0(x) \) and \( u_1(x) \) are of compact support:

\[
supp u_0 \cup supp u_1 \subset \{ x \in \mathbb{R}^n, |x| < L \}, \quad \text{for some } L > 0. \tag{2.21}
\]

Applying \([9, Appendix 1]\) of John, then the solution is also of compact support:

\[
supp u_j(t) \subset \{ x \in \mathbb{R}^n, |x| < L + t \}. \tag{2.22}
\]

We denote the life span of the solution \( u(t, x) \) of the Cauchy problem (1.1) by \( T_{\text{max}} \). First we consider the case \( \lambda(x) \equiv \text{const} (\lambda(x) \equiv 1 \text{ without loss of generality}) \). And construct a stable set in \( H^1(\mathbb{R}^n) \).

Setting

\[
C_0 \equiv K \left\{ \frac{2(p + 1)}{(p - 1)} \right\}^{(p - 1)/2} \tag{2.22}
\]

\[
\int_0^{\infty} \sigma(\tau) \, d\tau = +\infty \quad \text{if } m = 1, \tag{2.23}
\]

\[
\int_0^{\infty} (1 + \tau)^{-m(m-1)/2} \sigma(\tau) \, d\tau = +\infty \quad \text{if } m > 1. \tag{2.24}
\]

**Theorem 2.7.** Let \( u(t, x) \) be a local solution of problem (1.1) on \([0, T_{\text{max}}]\) with initial data \( u_0 \in \widetilde{W}^*, u_1 \in L^2(\mathbb{R}^n) \) with sufficiently small initial energy \( E(0) \) so that

\[
C_0 E(0)^{(p - 1)/2} < 1. \tag{2.25}
\]

Then \( T_{\text{max}} = \infty \). Furthermore, the global solution of the Cauchy problem (1.1) has the following energy decay property. Under (2.22), (2.3), and (2.23),

\[
E(t) \leq E(0) \exp \left( 1 - \omega \int_0^t \sigma(\tau) \, d\tau \right) \quad \forall \, t > 0. \tag{2.26}
\]

Under (2.2), (2.3), and (2.24),

\[
E(t) \leq \left( \frac{C(E(0))}{\int_0^t (1 + \tau)^{-m(m-1)/2} \sigma(\tau) \, d\tau} \right)^{2/(m-1)} \quad \forall \, t > 0. \tag{2.27}
\]

Secondly, we consider the case \( \lambda(x) \neq \text{const} \) and we assume that

\[
\frac{n + 4}{n} \leq p \leq \frac{n}{n - 2}. \tag{2.28}
\]

(1) If \( \sigma(t) = \mathcal{O}(\tilde{d}(t)) \), where \( \tilde{d}(t) = d(L + t) \).
If $m = 1$, we suppose that
\[ \int_0^\infty \sigma(\tau) \, d\tau = +\infty \] (2.29)

with
\[
(d(t))^{-\frac{4-(n-2)(p-1)/2}{p-1}} \exp \left( 1 - \omega \int_0^t \sigma(\tau) \, d\tau \right)^{\frac{(p-1)/2}{(p-1)}} < \infty, \]
\[
(d(t))^{-1} \exp \left( \frac{1}{2} - \frac{\omega}{2} \int_0^t \sigma(\tau) \, d\tau \right) < \infty. \] (2.30)

If $m > 1$, we suppose that
\[ \int_0^\infty (1 + \tau)^{-n(m-1)/2} \sigma(\tau) \, d\tau = \infty \] (2.31)

with
\[
\frac{(d(t))^{-\frac{4-(n-2)(p-1)/2}{p-1}}}{\left( \int_0^t (1 + \tau)^{-n(m-1)/2} \sigma(\tau) \, d\tau \right)^{\frac{(p-1)/(m-1)}{2}}} < \infty, \]
\[
\frac{(d(t))^{-1}}{\left( \int_0^t (1 + \tau)^{-n(m-1)/2} \sigma(\tau) \, d\tau \right)^{1/(m-1)}} < \infty. \] (2.32)

If $m = 1$, we suppose that for some $0 \leq \alpha < 1$,
\[ \int_0^\infty \frac{\tilde{d}^2(\tau)}{\sigma^\alpha(\tau)} \, d\tau = +\infty \] (2.33)

with
\[
(d(t))^{-\frac{4-(n-2)(p-1)/2}{p-1}} \exp \left( 1 - \omega \int_0^t \frac{\tilde{d}^2(\tau)}{\sigma^\alpha(\tau)} \, d\tau \right)^{\frac{(p-1)/2}{(p-1)}} < \infty, \]
\[
(d(t))^{-1} \exp \left( \frac{1}{2} - \frac{\omega}{2} \int_0^t \frac{\tilde{d}^2(\tau)}{\sigma^\alpha(\tau)} \, d\tau \right) < \infty. \] (2.34)

If $m > 1$, we suppose that for some $0 \leq \alpha < 1$,
\[ \int_0^\infty (1 + \tau)^{-n(m-1)/2} \sigma^{-(m+1)(1+\alpha)(1+m)-2/2} d^{m+1}(\tau) \, d\tau = \infty \] (2.35)
with
\[
\left(\frac{\tilde{d}(t)}{d(t)}\right)^{-\frac{1}{2(m-1)}} \left(\int_0^t (1 + \tau)^{-\frac{m-1}{2}} \sigma^{-(1+\alpha)(1+m)-2/2}(\tau) \tilde{d}^{m+1}(\tau) d\tau\right)^{\frac{1}{2(m-1)}} < \infty,
\]
(2.36)

We have the following theorem.

**Theorem 2.8.** Let \((u_0, u_1) \in H^1 \times L^2, u_0 \in \tilde{W}^{**}, and let the initial energy \(E(0)\) be sufficiently small. The following cases are considered.

(i) \(\sigma(t) = c(\tilde{d}(t))\).

Suppose (2.2), (2.3), (2.29), and (2.30) or (2.2), (2.3), (2.31), and (2.32). Then problem (1.1) admits a unique solution \(u(t) \in C([0, \infty); H^1) \cap C^1([0, \infty); L^2)\) and has the same decay property as Theorem 2.7.

(ii) \(\tilde{d}(t) = c(\sigma(t))\).

Suppose (2.2), (2.3), (2.33), and (2.34) or (2.2), (2.3), (2.35), and (2.36). Then problem (1.1) admits a unique solution \(u(t) \in C([0, \infty); H^1) \cap C^1([0, \infty); L^2)\). Furthermore, the global solution of the Cauchy problem (1.1) has the following energy decay property:

\[
E(t) \leq E(0) \exp\left(1 - \omega \int_0^t \frac{d^2(\tau)}{\sigma^2(\tau)} d\tau\right) \quad \forall t > 0 \text{ if } m = 1,
\]
(2.37)

\[
E(t) \leq \left(\frac{C(E(0))}{\int_0^t (1 + \tau)^{-\frac{m-1}{2}} \sigma^{-(1+\alpha)(1+m)-2/2}(\tau) \tilde{d}^{m+1}(\tau) d\tau}\right)^{2/(m-1)} \quad \forall t > 0 \text{ if } m > 1.
\]
(2.38)

**Remark 2.9.** In Theorem 2.7, the global existence and energy decay are independent, but in Theorem 2.8, we need the estimation of the energy decay for a local solution to prove global existence.

**Examples 2.10.** (1) If \(\sigma(t) = 1/t^\theta\), by applying Theorem 2.7 we obtain

\[
E(t) \leq E(0)e^{1-\omega t^{1-\theta}} \quad \text{if } m = 1,
\]

\[
E(t) \leq C(E(0))(1 + t)^{-\left(2 - \frac{(m-1) - 2(\theta)/m - 1}{m-1}\right)} \quad \text{if } 1 < m < 1 + \frac{2 - 2\theta}{n}, 0 < \theta < 1,
\]
(2.39)

\[
E(t) \leq C(E(0))(\ln t)^{-2/(m-1)} \quad \text{if } m = 1 + \frac{2 - 2\theta}{n}, 0 < \theta < 1.
\]
(2.39)

(2) If \(\sigma(t) = 1/t^\theta \ln t \ln_2 t \cdots \ln_p t\), by applying Theorem 2.7, we obtain

\[
E(t) \leq E(0)(\ln_p t)^{-\omega} \quad \text{if } m = 1, \theta = 1.
\]
(2.40)

For example, if \(n(m-1)/2 + \theta = 1\), that is, \(1 < m < 1 + 2/n\),

\[
E(t) \leq C(E(0))(\ln_p t)^{-2/(m-1)}.
\]
(2.41)
(3) If \( \sigma(t) = 1/t^\theta \) and \( d(r) = 1/r^\gamma \) with \( \theta \geq \gamma \) by applying Theorem 2.8, we obtain

\[
E(t) \leq C(E(0))(1 + t)^{-(2 - 2m - 2\theta)/(m - 1)} \quad \text{if } 1 < m < 1 + \frac{2 - 2\theta}{2\gamma + n}, \quad 0 < \theta < 1,
\]

\[
E(t) \leq C(E(0))(\ln t)^{-2/(m - 1)} \quad \text{if } m = 1 + \frac{2 - 2\theta}{2\gamma + n}, \quad 0 < \theta < 1.
\]

(2.42)

In order to show the global existence, it suffices to obtain the a priori estimates for \( E(t) \) and \( \|u(t)\|_2 \) in the interval of existence.

To prove Theorem 2.7 we first have the following energy identity to problem (1.1).

**Lemma 2.11 (energy identity).** Let \( u(t,x) \) be a local solution to problem (1.1) on \([0, T_{\text{max}})\) as in Theorem 2.5. Then

\[
E(t) + \int_{\mathbb{R}^n} \int_0^t \sigma(s)u'(s)g(u'(s)) \, ds \, dx = E(0)
\]

for all \( t \in [0, T_{\text{max}}) \).

Next we state several facts about the modified stable set \( \tilde{W}^* \).

**Lemma 2.12.** Suppose that

\[
1 < p \leq \frac{n + 2}{n - 2}.
\]

Then

(i) \( \tilde{W}^* \) is a neighborhood of 0 in \( H^1(\mathbb{R}^n) \),

(ii) for \( u \in \tilde{W}^* \),

\[
J(u) = \frac{p - 1}{2(p + 1)} \left( \|\nabla_x u\|_2^2 + \|u\|_2^2 \right).
\]

(2.45)

**Proof of Lemma 2.12.** (i) From Lemma 2.1 we have

\[
\|u\|_{\frac{p+1}{p+1}} \leq K \|u\|_{H_1}^{p+1} \leq K \|u\|_{H_1}^{p-1} (\|u\|_2^2 + \|\nabla_x u\|_2^2).
\]

(2.46)

Let

\[
U(0) = \left\{ u \in H^1(\mathbb{R}^N) \setminus \{0\} \mid \|u\|_{H_1}^{p-1} < \frac{1}{K} \right\}.
\]

(2.47)

Then, for any \( u \in U(0) \setminus \{0\} \), we deduce from (2.46) that

\[
\|u\|_{\frac{p+1}{p+1}} < \|u\|_2^2 + \|\nabla_x u\|_2^2,
\]

(2.48)

that is, \( K(u) > 0 \). This implies \( U(0) \subset \tilde{W}^* \).

(ii) By the definition of \( K(u) \) and \( J(u) \), we have the identity

\[
(p + 1)J(u) = K(u) + \frac{(p - 1)}{2} (\|\nabla_x u\|_2^2 + \|u\|_2^2).
\]

(2.49)
Since $u \in \widetilde{W}^*$, we have $K(u) \geq 0$. Therefore from (2.44) we get the desired in-equality (2.45).

**Lemma 2.13.** Let $u(t)$ be a solution to problem (1.1) on $[0, T_{\text{max}}]$. Suppose (2.44) holds. If $u_0 \in \widetilde{W}^*$ and $u_1 \in L^2(\mathbb{R}^n)$ satisfy

$$C_0 E(0)^{(p-1)/2} < 1, \quad (2.50)$$

then

(i) $u(t) \in \widetilde{W}^*$ on $[0, T_{\text{max}}]$,  
(ii) $\|u(t)\|_2 \leq I_0$ on $[0, T_{\text{max}}]$.

**Proof of Lemma 2.13.** Suppose that there exists a number $t^* \in [0, T_{\text{max}}]$ such that $u(t) \in \widetilde{W}^*$ on $[0, t^*]$ and $u(t^*) \notin \widetilde{W}^*$. Then we have

$$K(u(t^*)) = 0, \quad u(t^*) \neq 0. \quad (2.51)$$

Since $u(t) \in \widetilde{W}^*$ on $[0, t^*]$, it holds that

$$\frac{p-1}{2(p+1)} (\|\nabla u\|_2^2 + \|u\|_2^2) \leq J(u) \leq E(t); \quad (2.52)$$

it follows from the nonincreasing of the energy that

$$\|\nabla u\|_2^2 + \|u\|_2^2 \leq \frac{2(p+1)}{p-1} E(0) \equiv I_0^2. \quad (2.53)$$

Hence, we obtain

$$\|u\|_2^2 \leq \frac{2(p+1)}{p-1} E(0) \equiv I_0^2 \quad \text{on } [0, t^*]. \quad (2.54)$$

Next, from Lemma 2.1 and (2.54) we have

$$\|u\|_{p+1}^{p+1} \leq K \|u(t)\|_{H^1(\mathbb{R}^n)}^{p+1} \leq K \|u(t)\|_{H^1(\mathbb{R}^n)}^{p-1} (\|\nabla u\|_2^2 + \|u\|_2^2) \leq K I_0^{p-1} (\|\nabla u\|_2^2 + \|u\|_2^2) \leq C_0 E(0)^{(p-1)/2} (\|u(t)\|_2^2 + \|\nabla u(t)\|_2^2) \quad (2.55)$$

for all $t \in [0, t^*]$, where $C_0$ is the constant defined by (2.22). Note that from (2.55) and our hypothesis

$$\eta_0 \equiv C_0 E(0)^{(p-1)/2} < 1, \quad (2.56)$$

it follows that

$$\|u(t)\|_{p+1}^{p+1} \leq (1 - \eta_0) (\|u(t)\|_2^2 + \|\nabla u(t)\|_2^2). \quad (2.57)$$
Therefore, we obtain
\[
K(u(t^*)) \geq \eta_0 (\|u(t^*)\|_2^2 + \|\nabla_x u(t^*)\|_2^2)
\] (2.58)
which contradicts (2.51). Thus, we conclude that \(u(t) \in \widetilde{W}^*\) on \([0, T_{\text{max}}]\). The assertion (ii) can be obtained by the same argument as for (2.54). This completes the proof of Lemma 2.13.

**Lemma 2.14.** Under the same assumptions as in Lemma 2.13, there exists a constant \(M_2\) depending on \(\|u_0\|_{H^1}\) and \(\|u_1\|_{2}\) such that
\[
\|u(t)\|_1^2 + \|u'(t)\|_2^2 \leq M_2^2
\] (2.59)
for all \(t \in [0, T_{\text{max}}]\).

**Proof of Lemma 2.14.** It follows from Lemma 2.13 that \(u(t) \in \widetilde{W}^*\) on \([0, T_{\text{max}}]\). So Lemma 2.12(ii) implies that
\[
J(u) \geq \frac{p - 1}{2(p + 1)} (\|u(t)\|_2^2 + \|\nabla_x u(t)\|_2^2) \quad \text{on } [0, T_{\text{max}}].
\] (2.60)
Hence, from Lemma 2.11 and (2.60) we get
\[
\frac{1}{2} \|u'(t)\|_2^2 + \frac{p - 1}{2(p + 1)} (\|u\|_2^2 + \|\nabla_x u(t)\|_2^2) \leq E(t) \leq E(0).
\] (2.61)
So we get
\[
\|u(t)\|_1^2 + \|u'(t)\|_2^2 \leq M_2^2,
\] (2.62)
for some \(M_2 > 0\).

The above inequality and the continuation principle lead to the global existence of the solution, that is, \(T_{\text{max}} = \infty\). \(\square\)

**Proof of the energy decay.** From now on, we denote by \(c\) various positive constants which may be different at different occurrences. We multiply the first equation of (1.1) by \(E^q \phi' u\), where \(\phi\) is a function satisfying all the hypotheses of Lemma 2.4. We obtain
\[
0 = \int_S^T E^q \phi' \int_{\mathbb{R}^n} u(u'' - \Delta u + u + \sigma(t) g(u') - |u|^{p-1} u) \, dx \, dt
\]
\[
= \left[ E^q \phi' \int_{\mathbb{R}^n} uu' \, dx \right]_S^T - \int_S^T (qE^{q-1} \phi' + E^q \phi'') \int_{\mathbb{R}^n} uu' \, dx \, dt - 2 \int_S^T E^q \phi' \int_{\mathbb{R}^n} |u|^2 \, dx \, dt
\]
\[
+ \int_S^T E^q \phi' \int_{\mathbb{R}^n} \left( u'^2 + |u|^2 + |\nabla u|^2 - \frac{2}{p + 1} |u|^{p+1} \right) \, dx \, dt + \int_S^T E^q \phi' \int_{\mathbb{R}^n} \sigma(t) u g(u') \, dx \, dt
\]
\[
\int_S^T E^q \phi' \int_{\mathbb{R}^n} \left( \frac{2}{p + 1} - 1 \right) |u|^{p+1} \, dx \, dt.
\] (2.63)
Since

\[
(1 - \frac{2}{p+1}) \int_{\mathbb{R}^n} |u|^{p+1} dx \leq (1 - \eta_0) \frac{p-1}{p+1} ||u(t)||_{H^1(\mathbb{R}^n)}^2 dx \\
\leq (1 - \eta_0) \frac{p-1}{p+1} \frac{2(p+1)}{p-1} E(t) \\
= 2(1 - \eta_0) E(t),
\]

we deduce that

\[
2\eta_0 \int_S^{T} E^{q+1} \phi' \ dt \leq - \left[ E^q \phi' \int_{\mathbb{R}^n} uu' \ dx \right]_{S}^{T} + \int_{S}^{T} (qE E^{q-1} \phi' + E^q \phi') \int_{\mathbb{R}^n} uu' \ dx \ dt \\
+ 2 \int_{S}^{T} E^q \phi' \int_{\mathbb{R}^n} u'^2 \ dx \ dt - \int_{S}^{T} E^q \phi' \int_{\mathbb{R}^n} \sigma(t) u g(u') \ dx \ dt \\
\leq - \left[ E^q \phi' \int_{\mathbb{R}^n} uu' \ dx \right]_{S}^{T} + \int_{S}^{T} (qE E^{q-1} \phi' + E^q \phi') \int_{\mathbb{R}^n} uu' \ dx \ dt \\
+ 2 \int_{S}^{T} E^q \phi' \int_{\mathbb{R}^n} u'^2 \ dx \ dt + c(\varepsilon) \int_{S}^{T} E^q \phi' \int_{\mathbb{R}^n} g(u')^2 \ dx \ dt \\
+ \varepsilon \int_{S}^{T} E^q \phi' \int_{\mathbb{R}^n} u'^2 \ dx \ dt + \int_{S}^{T} E^q \phi' \int_{\mathbb{R}^n} \sigma(t) u g(u') \ dx \ dt
\]

for every \( \varepsilon > 0 \). Also, applying Hölder’s and Young’s inequalities, we have

\[
\int_{S}^{T} E^q \phi' \int_{|u'| \geq 1} \sigma(t) u g(u') \ dx \ dt \\
\leq \int_{S}^{T} E^q \phi' \sigma(t) \left( \int_{\Omega} |u|^{r+1} \ dx \right)^{1/(r+1)} \left( \int_{|u'| \geq 1} g(u') \left( \frac{r}{r+1} \right)^{r/(r+1)} \ dx \right)^{r/(r+1)} \ dt \\
\leq c \int_{S}^{T} E^{(2q+1)/2} \phi' \sigma^{1/(r+1)}(t) \left( \int_{|u'| \geq 1} \sigma(t) u' g(u') \ dx \right)^{r/(r+1)} \ dt \\
\leq \int_{S}^{T} \phi' \sigma^{1/(r+1)}(t) E^{(2q+1)/2}(-E')^{r/(r+1)} \ dt \\
\leq c \int_{S}^{T} \phi' \left( \sigma^{1/(r+1)}(t) E^{(2q+1)/2-r/(r+1)} \right) \left( (-E')^{r/(r+1)} E^{r/(r+1)} \right) \ dt \\
\leq c(\varepsilon') \int_{S}^{T} \phi' (-E') \ dt + \varepsilon' \int_{S}^{T} \phi' \sigma(t) E^{r/(r+1)}((2q+1)/2-r/(r+1)) \ dt \\
\leq c(\varepsilon') E(S)^2 + \varepsilon' \sigma(0) E(0)^{(2r-1)/2} \int_{S}^{T} \phi' E^{q+1} \ dt
\]
for every \( \varepsilon' > 0 \). Choosing \( \varepsilon \) and \( \varepsilon' \) small enough, we obtain

\[
\int_{S}^{T} E^{q} \phi' \, dt \leq - \left[ E^{q} \int_{\mathbb{R}^{n}} uu' \, dx \right]_{S}^{T} + \int_{S}^{T} (qE^{q-1} \phi' + E^{q} \phi'') \int_{\mathbb{R}^{n}} uu' \, dx dt \\
+ \int_{|u'| \geq 1} \sigma(t)u g(u') \, dx dt + c \int_{S}^{T} E \phi' \int_{\mathbb{R}^{n}} u'^{2} \, dx dt
\]

(2.67)

Since \( xg(x) \geq 0 \) for all \( x \in \mathbb{R} \), it follows that the energy is nonincreasing, locally absolutely continuous and \( E'(t) = - \int_{\mathbb{R}^{n}} \sigma(t)u' g(u') \, dx \) a.c. in \( \mathbb{R}_{+} \).

\[
\square
\]

**Proof of (2.26).** We consider the case \( m = 1 \), that is,

\[
c_{3}|v| \leq |g(v)| \leq c_{4}|v| \quad \text{for all } |v| \leq 1.
\]

(2.68)

Then we have

\[
u'^{2} \leq \frac{c_{13}}{\sigma(t)} u' \rho(t,u') \quad \forall t \in \mathbb{R}, \, \forall x \in \mathbb{R}^{n},
\]

(2.69)

where \( \rho(t,s) = \sigma(t)g(s) \) for all \( s \in \mathbb{R} \). Therefore we deduce from (2.67) (applied with \( q = 0 \)) that

\[
\int_{S}^{T} E(t) \phi'(t) \, dt \leq CE(S) + 2C \int_{S}^{T} \phi'(t) \int_{\mathbb{R}^{n}} \frac{1}{\sigma(t)} u' \rho(t,u') \, dx dt.
\]

(2.70)

Define

\[
\phi(t) = \int_{0}^{t} \sigma(\tau) \, d\tau.
\]

(2.71)

It is clear that \( \phi \) is a nondecreasing function of class \( C^{2} \) on \( \mathbb{R}_{+} \). The hypothesis (2.23) ensures that

\[
\phi(t) \rightarrow +\infty \quad \text{as } t \rightarrow +\infty.
\]

(2.72)

Then we deduce from (2.70) that

\[
\int_{S}^{T} E(t) \phi'(t) \, dt \leq CE(S) + 2C \int_{S}^{T} \int_{\mathbb{R}^{n}} u' \rho(t,u') \, dx dt \leq 3CE(S),
\]

(2.73)

and thanks to Lemma 2.4 we obtain

\[
E(t) \leq E(0) e^{(1-\phi(t))/3C}.
\]

(2.74)

\[
\square
\]

**Proof of (2.27).** Now we assume that \( m > 1 \) in (2.2). Define \( \phi \) by (2.71). We apply Lemma 2.4 with \( q = (m - 1)/2 \).
We need to estimate
\[ \int_{S}^{T} E\phi' \int_{\mathbb{R}^{n}} u'^{2} \, dx \, dt. \] (2.75)

For \( t \geq 0 \), consider
\[ \Omega_{1} = \{ x \in \mathbb{R}^{n}, |u'| \leq 1 \}, \quad \Omega_{2} = \{ x \in \mathbb{R}^{n}, |u'| > 1 \}. \] (2.76)

First we note that for every \( t \geq 0 \),
\[ \Omega_{1} \cup \Omega_{2} = \mathbb{R}^{n}. \] (2.77)

Next we deduce from (2.2) and (2.3) that for every \( t \geq 0 \),
(i) if \( x \in \Omega_{1} \), then \( u'^{2} \leq ((1/\sigma(t))u' \rho(t,u'))^{2/(m+1)} \),
(ii) if \( x \in \Omega_{2} \), then \( u'^{2} \leq (1/\sigma(t))u' \rho(t,u') \).

Hence, using Hölder’s inequality, we get that
\[
\int_{S}^{T} E\phi' \int_{\mathbb{R}^{n}} u'^{2} \, dx \, dt \\
\leq 2 \int_{S}^{T} E\phi' \int_{\mathbb{R}^{n}} \frac{1}{\sigma(t)} u' \rho(t,u') \, dx \, dt \\
+ 2 \int_{S}^{T} E\phi' \int_{\{|x| \leq (L+t)|\}} \left( \int_{\mathbb{R}^{n}} u' g(u') \, dx \right)^{2/(m+1)} \, dt \\
\leq cE(S)^{1+q} + c' \int_{S}^{T} E\phi' (1 + t)^{n(m-1)/(m+1)} \left( \int_{\mathbb{R}^{n}} u' g(u') \, dx \right)^{2/(m+1)} \, dt \\
\leq cE(S)^{1+q} + c' \int_{S}^{T} E\phi' (1 + t)^{n(m-1)/(m+1)} \sigma^{-2/(m+1)}(t)(-E')^{2/(m+1)} \, dt. \] (2.78)

Set \( \varepsilon > 0 \); thanks to Young’s inequality and to our definitions of \( p \) and \( \phi \), we obtain
\[
\int_{S}^{T} E\phi' \int_{\mathbb{R}^{n}} u'^{2} \, dx \, dt \\
\leq cE(S)^{1+q} + 2 \frac{m-1}{m+1} \varepsilon^{(m+1)/(m-1)} \int_{S}^{T} E^{1+q}(\phi')^{(m+1)/(m-1)}(1 + t)^{n} \sigma^{-2/(m-1)} \, dt \\
+ 4 \frac{1}{m+1} \varepsilon^{(m+1)/2} E(S). \] (2.79)

We choose \( \phi' \) such that
\[ \phi'^{2/(m-1)} (1 + t)^{n} \sigma^{-2/(m-1)} = 1, \] (2.80)
Cauchy problem for nonlinear wave equation

so

\[
\phi(t) = \int_0^t (1 + s)^{-n(m-1)/2} \sigma(s) ds.
\]  

(2.81)

Then we deduce from (2.79) that

\[
\int_S^T E^{1+q} \phi' \, dt \leq 2CE(S),
\]  

(2.82)

and thanks to Lemma 2.4 (applied with \(c = 0\)) we obtain

\[
E(t) \leq \frac{C}{\phi(t)^{2/(m-1)}}.
\]  

(2.83)

□

Proof of Theorem 2.8. First, we see that if \(u \in \tilde{W}^{*,*}\), then

\[
\|\nabla_x u\|^2 + 2 \int_{\mathbb{R}^n} F(u(t)) \, dx \geq \|\nabla_x u\|^2 + \frac{2}{p+1} \|u(t)\|_{p+1}^{p+1} \geq \frac{p-1}{p+1} \|\nabla_x u\|^2.
\]  

(2.84)

In the proof, we often use the following inequality:

\[
\|u(t)\|_2 \leq \frac{1}{d(t)} \|\lambda(x) u(t)\|_2.
\]  

(2.85)

Now, we assume that \(I(u_0) > (1/2) \|\nabla_x u_0\|^2\). Then

\[
I(u(t)) \geq \frac{1}{2} \|\nabla_x u(t)\|^2
\]  

(2.86)

for some interval near \(t = 0\). As long as (2.86) holds, we have \(J(t) \equiv I(u(t))\). Thus

\[
2\eta_0 \int_S^T E^{q+1} \phi' \, dt \leq - \left[ E^q \phi' \int_{\mathbb{R}^n} uu' \, dx \right]_S^T + \int_S^T (qE^{q-1} \phi' + E^q \phi') \int_{\mathbb{R}^n} uu' \, dx \, dt + 2 \int_S^T E^q \phi' \int_{\mathbb{R}^n} u^2 \, dx \, dt - \int_S^T E^q \phi' \int_{\mathbb{R}^n} \sigma(t) u u' \, dx \, dt
\]

\[
\leq - \left[ E^q \phi' \int_{\mathbb{R}^n} uu' \, dx \right]_S^T + \int_S^T (qE^{q-1} \phi' + E^q \phi''') \int_{\mathbb{R}^n} uu' \, dx \, dt + 2 \int_S^T E^q \phi' \int_{\mathbb{R}^n} u^2 \, dx \, dt + c(\varepsilon) \int_S^T E^q \phi' \int_{|u'| \leq 1} \left( \frac{\sigma(t)}{\lambda(x)} \right)^2 g(u') \, dx \, dt + \varepsilon \int_S^T E^q \phi' \int_{|u'| \geq 1} \sigma(t) u u' \, dx \, dt.
\]  

(2.87)

If \(\sigma(t) = \mathcal{O}(\tilde{d}(t))\), that is, \(\sigma(t) \to 0\) as \(t \to \infty\) more rapidly than \(\tilde{d}(t)\), we find the same results of asymptotic behaviour as in Theorem 2.7.
If \( \tilde{d}(t) = C(\sigma(t)) \), so, we obtain

\[
\int_{T}^{T} E^{q+1} \phi' \int_{R^n} uu' dx + \int_{T}^{T} \left( qE' E^{q-1} \phi' + E^{q} \phi'' \right) \int_{R^n} uu' dx dt
\]

\[
\int_{T}^{T} E^{q} \phi' \int_{|u'| \geq 1} u'^2 dx dt \int_{T}^{T} E^{q} \phi' \int_{|u'| \geq 1} \sigma(t) u' g(u') dx dt
\]

\[
+ c(\varepsilon) \int_{T}^{T} E^{q} \phi' \int_{|u'| \leq 1} \left( \frac{\sigma(t)}{\lambda(x)} \right)^2 |u'|^2 dx dt.
\]

We consider the case \( m = 1 \). Thus under (2.2) and (2.3), we have

\[
\int_{T}^{T} E^{q} \phi' \int_{R^n} \left( \frac{\sigma(t)}{\lambda(x)} \right)^2 u'^2 dx dt \leq C \int_{T}^{T} E^{q} \phi' \int_{R^n} \left( \frac{\sigma(t)}{\tilde{d}^2(t)} \right) \sigma(t) u' g(u') dx dt
\]

for all \( 0 \leq \alpha < 1 \). We choose

\[
\phi(t) = \int_{0}^{t} \frac{\tilde{d}^2(s)}{\sigma^\alpha(s)} ds.
\]

It is clear that \( \phi \) is a nondecreasing function of class \( C^2 \) on \( R_+ \). Hypothesis (2.33) ensures that

\[
\phi(t) \longrightarrow +\infty \quad \text{as} \quad t \longrightarrow +\infty.
\]

By (2.85), the definition of \( E \), and the Cauchy-Schwartz inequality, we have

\[
- \left[ E^{q} \phi' \int_{R^n} uu' dx \right]_{T}^{T} = E^{q} (S) \phi'(S) \int_{R^n} u(S) u'(S) dx - E^{q} (T) \phi'(T) \int_{R^n} u(T) u'(T) dx
\]

\[
\leq CE^{q+1} (S) \left[ \frac{\phi'(S)}{d(S)} + \frac{\phi'(T)}{d(T)} \right] \leq CE^{q+1} (S),
\]

\[
\int_{T}^{T} \left( qE' E^{q-1} \phi' + E^{q} \phi'' \right) \int_{R^n} uu' dx dt \leq \int_{T}^{T} qE' E^{q} \phi'(t) dt + \int_{T}^{T} E^{q+1} \frac{\phi''(t)}{d(t)} dt
\]

when we have (in the case \( m = 1 \))

\[
\phi' = \frac{\tilde{d}^2(t)}{\sigma^\alpha(t)}, \quad \phi''(t) = 2 \tilde{d}(t) \frac{\tilde{d}^2(t)}{\sigma^\alpha(t)} - \alpha \frac{\sigma'(t) \tilde{d}^2(t)}{\sigma^{\alpha+1}(t)}.
\]

So

\[
\left| \frac{\phi''(t)}{d(t)} \right| \leq - \frac{2 \tilde{d}'(t) \tilde{d}^2(t)}{d^2(t) \sigma^\alpha(t)} - \alpha \frac{\tilde{d}(t) \sigma'(t)}{\sigma(t) \sigma^\alpha(t)}.
\]
Using the condition that \( \tilde{d}(t) \) is bounded, so we obtain

\[
\int_S^T E^{q+1} \left| \frac{\phi''(t)}{d(t)} \right| dt \leq -E^{q+1}(S) \left[ \tilde{d}^{1-\alpha}(t) + \sigma^{1-\alpha}(t) \right]_S
\]

\[
\leq E^{q+1}(S)(\tilde{d}^{1-\alpha}(t) + \sigma^{1-\alpha}(t))
\leq CE^{q+1}(S).
\]

Then we deduce from (2.88) that

\[
\int_S^T E\phi' dt \leq CE(S) + 2C \int_S^T \int_{\mathbb{R}^n} \sigma(t)u'g(u') dx dt \leq 3CE(S),
\]

and thanks to Lemma 2.4 we obtain

\[
E(t) \leq E(0)e^{(1-\phi(t))/3C}.
\]

Using the condition that \( \tilde{d}(t) = O(\sigma(t)) \) and using Hölder’s inequality, we get that

\[
\int_S^T E^q \phi' \int_{|u'| \leq 1} \frac{\sigma^2(t)}{\lambda^2(x)} u'^{2} dx dt
\]

\[
\leq 2 \int_S^T E^q \phi' \int_{\mathbb{R}^n} \frac{\sigma^2(t)}{\lambda^2(x)} \left( \frac{1}{\sigma(t)} \sigma(t)u'g(u') \right)^{2(1/m+1)} dx dt
\]

\[
\leq 2 \int_S^T E^q \phi' \int_{|x| \leq L+1} \frac{\sigma^2(t)}{\lambda^2(x)} \left( \frac{1}{\sigma(t)} \sigma(t)u'g(u') \right)^{2(1/m+1)} dx dt
\]

\[
\leq 2 \int_S^T E^q \phi' \left( \frac{\sigma(t)}{d(t)} \right)^2 (1 + t)^{n(1/m+1)} \left( \int_{\mathbb{R}^n} u'g(u') dx \right)^{2(1/m+1)} dt
\]

\[
\leq c' \int_S^T E^q \phi' \left( \frac{\sigma(t)}{d(t)} \right)^2 (1 + t)^{n(1/m+1)} \left( \frac{-E'/(\sigma(t))}{\sigma(t)} \right)^{2(1/m+1)} dt
\]

\[
\leq c' \int_S^T E^q \phi' \left( \frac{\sigma(t)}{d(t)} \right)^2 \sigma^{-2/(1/m+1)}(t)(-E')^{2/(1/m+1)} dt
\]

\[
\leq c' \int_S^T E^q \phi' \frac{\sigma^{a+1}(t)}{d^2(t)} (1 + t)^{n(1/m+1)} \sigma^{-2/(1/m+1)}(t)(-E')^{2/(1/m+1)} dt.
\]

Set \( \varepsilon > 0 \); thanks to Young’s inequality and to our definitions of \( p \) and \( \phi \), we obtain

\[
\int_S^T E^q \phi' \int_{\mathbb{R}^n} \left( \frac{\sigma(t)}{\lambda(x)} \right)^2 u'^2 dx dt
\]

\[
\leq cE(S)^{1+q} + 2m-1 \frac{m-1}{m+1} \varepsilon^{(1+q)/(m+1)} + \varepsilon^{(1+q)/(m+1)} \left( \int_{\mathbb{R}^n} \phi'(1/m+1) \sigma^{1+a(m+1)/(m-1)}(t) \right) (1 + t)^{n(1/m+1)} \sigma^{-2/(1/m+1)}(t) dt + \frac{4}{m+1} \varepsilon^{(1+q)/(m+1)/2} E(S).
\]
We choose \( \phi \) such that
\[
\phi(t) = \int_0^t (1 + \tau)^{-n(m-1)/2} \sigma^{-(1+\alpha)(m+1)/2}(\tau) \tilde{d}^{m+1}(\tau) \, d\tau. \tag{2.100}
\]

It is clear that \( \phi \) is a nondecreasing function of class \( C^2 \) on \( \mathbb{R}_+ \). The hypothesis (2.35) ensures that \( \phi(t) \to +\infty \) as \( t \to +\infty \). By (2.85), the definition of \( E \), and the Cauchy-Schwartz inequality we have (2.92) when we have (the case \( m > 1 \))
\[
\begin{align*}
\phi'(t) &= (1 + t)^{-n(m-1)/2} \sigma^{-(1+\alpha)(m+1)/2}(t) \tilde{d}^{m+1}(t), \\
\phi''(t) &= -\frac{n(m-1)}{2} (1 + t)^{-n(m-1)/2-1} \sigma^{-(1+\alpha)(m+1)/2}(t) \tilde{d}^{m+1}(t) \\
&
+ (1 + t)^{-n(m-1)/2} \left( -\frac{(1+\alpha)(m+1) - 2}{2} \sigma^{-(1+\alpha)(m+1)/2}(t) \phi'(t) \tilde{d}^{m+1}(t) \\
&
+ (m+1) \tilde{d}^m(t) \phi'(t) \sigma^{-(1+\alpha)(m+1)/2}(t) \right). \tag{2.101}
\end{align*}
\]

Thus
\[
\left| \frac{\phi''(t)}{\tilde{d}(t)} \right| \leq C \frac{\tilde{d}^m(t)}{\sigma^m(t)} \sigma^{(1-\alpha)(m+1)/2}(t) - C' \frac{\tilde{d}^m(t)}{\sigma^m(t)} \frac{\phi'(t)}{\sigma^{((1+\alpha)(m+1)/2)-2m/2}(t)} \\
- C'' \frac{\tilde{d}^{((1+\alpha)(m+1)/2)-2/2}(t)}{\sigma^{((1+\alpha)(m+1)/2)-2m/2}(t)} \frac{\phi'(t)}{\tilde{d}(t)}, \tag{2.102}
\]

\( \tilde{d}(t)/\sigma(t) \) is bounded, so we obtain
\[
\begin{align*}
\int_S^T E^{q+1} \left| \frac{\phi''(t)}{\tilde{d}(t)} \right| \, dt &\leq E^{q+1}(S) \left[ \tilde{d}^{(1-\alpha)(m+1)/2}(t) + \sigma^{(1-\alpha)(m+1)/2}(t) \right]_S^T \\
&\leq E^{q+1}(S) (\tilde{d}^{(1-\alpha)(m+1)/2}(S) + \sigma^{(1-\alpha)(m+1)/2}(S)) \\
&\leq CE^{q+1}(S). \tag{2.103}
\end{align*}
\]

We deduce from this choice
\[
\int_S^T E^{1+q} \phi' \, dt \leq 2CE(S), \tag{2.104}
\]

and thanks to Lemma 2.4 (applied with \( c = 0 \), we obtain
\[
E(t) \leq \frac{C(E(0))}{\phi^{2/(m-1)}}. \tag{2.105}
\]

Since \( u_0 \in \tilde{W}^{**} \) and \( \tilde{W}^{**} \) is an open set, putting
\[
T_1 = \sup \{ t \in [0, +\infty) : u(s) \in \tilde{W}^{**} \text{ for } 0 \leq s \leq t \}, \tag{2.106}
\]

we see that \( T_1 > 0 \) and \( u(t) \in \tilde{W}^{**} \) for \( 0 \leq t < T_1 \). If \( T_1 < T_{\text{max}} < \infty \), where \( T_{\text{max}} \) is the lifespan of the solution, then \( u(T_1) \in \partial \tilde{W}^{**} \); that is,
\[
I(u(T_1)) = 0, \quad u(T_1) \neq 0. \tag{2.107}
\]
We see from Lemma 2.2 and (2.85) that
\[ \|u(t)\|_{p+1}^{p+1} \leq C\|u(t)\|_2^4 \|\nabla_x u(t)\|_2 \]
\[ \leq (\tilde{d}(t))^{-(n-2)(p-1)/2} E^{(p-1)/2} \|\nabla_x u(t)\|_2^2 \]
\[ \leq B(t)\|\nabla_x u(t)\|_2^2 \]  
\[ (2.108) \]
for 0 ≤ t ≤ T, where we have used the assumption p ≥ (n + 4)/n and
\[ B(t) = \frac{C(E(0))\tilde{d}^{-(n-2)(p-1)/2}(t)}{\left(\int_0^t (1 + \tau)^{-n(m-1)/2} \sigma^{-(1+a)(m+1)/2} \tilde{d}^{m+1}(\tau) d\tau\right)^{(p-1)/(m-1)}} \]  
\[ (2.109) \]
Next, we put
\[ T_2 \equiv \sup \left\{ t \in [0, +\infty) : B(s) < \frac{1}{2} \text{ for } 0 \leq s < t \right\} , \]
\[ (2.110) \]
and then we see that T > 0 and T = T_1 because B(t) < 1/2 by the condition that E(0) is small. Then
\[ I(u(t)) = \|\nabla_x u(t)\|_2^2 - B(t)\|\nabla_x u(t)\|_2^2 \geq \frac{1}{2}\|\nabla_x u(t)\|_2^2 \]
\[ (2.111) \]
for 0 ≤ t ≤ T_1. Moreover, (2.107) and (2.111) imply
\[ K(u(T_1)) \geq \frac{1}{2}\|\nabla_x u(T_1)\|_2^2 > 0, \]
\[ (2.112) \]
which is a contradiction, and hence, it might be T_1 = T_{\max}. Therefore, (2.105) holds true for 0 ≤ t ≤ T_{\max}. To prove global existence in H^2 \cap H^1, we need to derive the estimates for second derivatives of u(t) on the basis of the energy estimate of E(t), we utilize the differentiated equation
\[ u_{ttt} = \Delta_x u' + \lambda^2(x)u' + \sigma(t)g(u') + \sigma(t)g(u')u'' + f'(u)u' = 0, \]  
\[ (2.113) \]
where f(u) = |u|^{p-1}u. Multiplying (2.113) by u'', we have
\[ \frac{d}{dt} E_2(t) + 2\sigma(t) \int_{\mathbb{R}^n} g'(u') \left| u''(t) \right|^2 dx \]
\[ \leq 2 \int_{\mathbb{R}^n} \left| f'(u) \right| \left| u'(t) \right| \left| u''(t) \right| dx + 2 \left| \sigma'(t) \right| \int_{\mathbb{R}^n} |g'(u')| \left| u''(t) \right| dx, \]
\[ (2.114) \]
where we set
\[ E_2(t) = \left| u''(t) \right|^2 + \|\nabla_x u(t)\|_2^2 + ||\lambda u'(t)||_2^2. \]
\[ (2.115) \]
By (2.2) and (2.3), we have
\[ \int_{\mathbb{R}^n} \left| g(u') \right|^2 dx \leq C \int_{|u'| \leq 1} |u'|^{2/m} dx + C' \int_{|u'| \geq 1} |u'|^{2r} dx \]
\[ \leq C(L + t)^{n(m-1)/m} E_1^{1/m} + C' t \left( \frac{E_2}{E_2 - (n-2)(r-1)/2} \right)^{n(r-1)/2} \]
\[ (2.116) \]
and by Lemma 2.2

\[ 2 \int_{\mathbb{R}^n} |f'(u)| |u'(t)| |u''(t)| \, dx \leq C\|u(t)\|_{n(p-1)}^{p-1} \|u'(t)\|_{2n/(n-2)}^{2n/(n-2)} \|u''(t)\|_2 \]

\[ \leq \varepsilon \|u(t)\|_{n(p-1)}^{p-1} \|\nabla_x u'(t)\|_2 \|u''(t)\|_2 \]

\[ \leq \varepsilon \|u(t)\|_{n(p-1)}^{p-1} E_2(t). \] (2.117)

Since \((n+2)/n \leq p \leq n/(n-2)\), then

\[ \|u(t)\|_{n(p-1)}^{p-1} \leq \tilde{d}^{-(2-(n-2)(p-1)/2)} E^{(p-1)/2}. \] (2.118)

Thus, we have

\[ \frac{d}{dt} E_2 \leq \tilde{d}^{-(2-(n-2)(p-1)/2)} E^{(p-1)/2} E_2(t) \]

\[ + 2 |\sigma'(t)| \left( (L + t)^{n(m-1)/m} E^{1/m} + CE^{2-(n-2)(r-1)/2} E_2^{n(r-1)/2} \right)^{1/2} E_2^{1/2}(t). \] (2.119)

We have also, applying Young inequality,

\[ E^{(2-(n-2)(r-1)/2)} E_2^{n(r-1)/2} \leq CE^{2-(n-2)(r-1)/(2-n(r-1))}(t) + E_2(t), \] (2.120)

hence, we deduce that

\[ \frac{d}{dt} E_2(t) \leq C(t)(1 + E_2(t)). \] (2.121)

So, we obtain

\[ E_2(t) \leq C' e^{\int_0^t C(s) \, ds}. \] (2.122)

From (2.122) and the first equation of problem (1.1), we also prove easily that

\[ \|\Delta_x u(t)\|_2 \leq C' < \infty \] (2.123)

for all \(t \geq 0\). Indeed, we have

\[ \|\Delta_x u(t)\|_2 \leq \|u''(t)\|_2 + \|\lambda^2 u(t)\|_2 + \sigma(t)\|g(u'(t))\|_2 + \|f(u)\|_2 \] (2.124)

and also we have

\[ \|f(u)\|_2^2 \leq C\|u(t)\|_2^p \leq C\|u(t)\|_{n(p-1)/2}^{2(p-1)} \|\Delta_x u(t)\|_2^2. \] (2.125)

Here, to check the last inequality of (2.125), we note that if \((n+4)/n \leq p \leq (n+2)/(n-2)\), then

\[ C\|u(t)\|_{n(p-1)/2}^{2(p-1)} \leq C\|u(t)\|_2^{4-(n-2)(p-1)} \|\nabla_x u(t)\|_2^{n(p-1)-4} \]

\[ \leq \left( \tilde{d}(t) \right)^{4-(n-2)(p-1)} E^{p-1}(t) < \frac{1}{2}. \] (2.126)
Thus the solution in the sense of Theorem 2.6 exists globally in time $t$ under the assumption $(u_0, u_1) \in H^2 \times H^1$.

When $(u_0, u_1) \in H^1 \times L^2$ we approximate $(u_0, u_1)$ by $(u^k_0, u^k_1) \in H^2 \times H^1$, $k = 1, 2, \ldots$, in the topologies of $H^1 \times L^2$, which satisfy

$$\text{supp } u^k_0 \cap \text{supp } u^k_1 \subset \{ x \in \mathbb{R}^n \mid |x| \leq L \}.$$  \hfill (2.127)

Since $\lim_{k \to \infty} (u^k_0, u^k_1) = (u_0, u_1)$ in $H^1 \times L^2$, then for these initial data problem (1.1) has global solutions $u^k \in W^{2,\infty}_{\text{loc}}([0, \infty); L^2) \cap W^{1,\infty}_{\text{loc}}([0, \infty); H^1) \cap L^\infty_{\text{loc}}([0, \infty); H^2)$, which satisfy (2.122) and (2.123). We can easily see that $\{u^k(t)\}$ converges uniformly on each compact interval $[0, T]$, $T > 0$. Uniqueness follow from a standard argument. The proof of Theorem 2.8 is now completed. \hfill \Box

Special Issue on
Decision Support for Intermodal Transport

Call for Papers

Intermodal transport refers to the movement of goods in a single loading unit which uses successive various modes of transport (road, rail, water) without handling the goods during mode transfers. Intermodal transport has become an important policy issue, mainly because it is considered to be one of the means to lower the congestion caused by single-mode road transport and to be more environmentally friendly than the single-mode road transport. Both considerations have been followed by an increase in attention toward intermodal freight transportation research.

Various intermodal freight transport decision problems are in demand of mathematical models of supporting them. As the intermodal transport system is more complex than a single-mode system, this fact offers interesting and challenging opportunities to modelers in applied mathematics. This special issue aims to fill in some gaps in the research agenda of decision-making in intermodal transport.

The mathematical models may be of the optimization type or of the evaluation type to gain an insight in intermodal operations. The mathematical models aim to support decisions on the strategic, tactical, and operational levels. The decision-makers belong to the various players in the intermodal transport world, namely, drayage operators, terminal operators, network operators, or intermodal operators.

Topics of relevance to this type of decision-making both in time horizon as in terms of operators are:

- Intermodal terminal design
- Infrastructure network configuration
- Location of terminals
- Cooperation between drayage companies
- Allocation of shippers/receivers to a terminal
- Pricing strategies
- Capacity levels of equipment and labour
- Operational routines and lay-out structure
- Redistribution of load units, railcars, barges, and so forth
- Scheduling of trips or jobs
- Allocation of capacity to jobs
- Loading orders
- Selection of routing and service

Before submission authors should carefully read over the journal’s Author Guidelines, which are located at http://www.hindawi.com/journals/jamds/guidelines.html. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/, according to the following timetable:

| Manuscript Due       | June 1, 2009 |
|----------------------|--------------|
| First Round of Reviews| September 1, 2009 |
| Publication Date     | December 1, 2009 |
