Supplementary Figure 2. Concentrations of IgG, as measured by the N+S-assay, over time in 31 PCR-positive health care workers. Concentrations of IgG (AU/ml) starting from the day of positive PCR test in each study subject. Health care workers with detectable IgG throughout the follow-up to time-point 4 and/or 5 in black (n=29) and without detectable IgG in the assay at any time in orange (n=2).
