NONHOMOGENEOUS DIRICHLET PROBLEMS WITHOUT THE AMBROSETTI-RABINOWITZ CONDITION

GANG LI, VICENȚIU D. RĂDULESCU, DUŠAN D. REPOVŠ AND QIHU ZHANG

Abstract. We consider the existence of solutions of the following $p(x)$-Laplacian Dirichlet problem without the Ambrosetti-Rabinowitz condition:

$$
\begin{cases}
-\text{div}(|\nabla u|^{p(x)-2}\nabla u) = f(x, u), & \text{in } \Omega, \\
u = 0, & \text{on } \partial \Omega.
\end{cases}
$$

We give a new growth condition and we point out its importance for checking the Cerami compactness condition. We prove the existence of solutions of the above problem via the critical point theory, and also provide some multiplicity properties. Our results extend previous results of Q. Zhang and C. Zhao (Existence of strong solutions of a $p(x)$-Laplacian Dirichlet problem without the Ambrosetti-Rabinowitz condition, Computers and Mathematics with Applications, 2015) and we establish the existence of solutions under weaker hypotheses on the nonlinear term.

1. Introduction

In recent years, the study of differential equations and variational problems with variable exponent growth conditions has been a topic of great interest. This type of problems has very strong background, for instance in image processing, nonlinear electro-rheological fluids and elastic mechanics. Some of these phenomena are related to the Winslow effect, which describes the behavior of certain fluids that become solids or quasi-solids when subjected to an electric field. The result was named after the American engineer Willis M. Winslow.

There are many papers dealing with problems with variable exponents, see [1]-[8], [10]-[25], [28], [33]-[34], [37], [38], [40]-[46], [48]-[49]. On the existence of solutions of these kinds of problems, we refer to [8, 14, 15, 18, 21, 33, 36, 45]. We also refer to the recent monograph [35] dealing with variational methods in the framework of nonlinear problems with variable exponent.

In this paper, we consider the existence of solutions of the following class of Dirichlet problems:

$$(P) \begin{cases}
-\Delta_{p(x)} u := -\text{div}(|\nabla u|^{p(x)-2}\nabla u) = f(x, u), & \text{in } \Omega, \\
u = 0, & \text{on } \partial \Omega,
\end{cases}$$

where $\Omega \subset \mathbb{R}^N$ is a bounded domain with $C^{1,\alpha}$ smooth boundary, and $p(\cdot) > 1$ is of class $C^1(\overline{\Omega})$.

Key words and phrases. $p(x)$–Laplace operator, Dirichlet problem, Ambrosetti-Rabinowitz condition, variable exponent space, critical point.

2010 Mathematics Subject Classification. Primary: 35J60. Secondary: 35J20, 35J25, 58E05.
Since the elliptic operator with variable exponent is not homogeneous, new methods and techniques are needed to study these types of problems. We point out that commonly known methods and techniques for studying constant exponent equations fail in the setting of problems involving variable exponents. For instance, the eigenvalues of the $p(x)$-Laplacian Dirichlet problem were studied in [16]. In this case, if $\Omega \subset \mathbb{R}^N$ is a smooth bounded domain, then the Rayleigh quotient
\[
\lambda_{p(\cdot)} = \inf_{u \in W^{1,p}_{\text{loc}}(\Omega) \setminus \{0\}} \frac{\int_{\Omega} \frac{1}{p(x)} |\nabla u|^{p(x)} \, dx}{\int_{\Omega} \frac{1}{p(x)} |u|^{p(x)} \, dx}
\]
is in general zero, and $\lambda_{p(\cdot)} > 0$ holds only under some special conditions.

In [41], the author generalized the Picone identities for half-linear elliptic operators with $p(x)$-Laplacian. In the same paper some applications to Sturmian comparison theory are also presented, but the formula is different from the constant exponent case. In a related setting, we point out that the formula
\[
\int_{\Omega} |u(x)|^p \, dx = p \int_0^{\infty} t^{p-1} \{ \{ x \in \Omega ; |u(x)| > t \} \} \, dt
\]
has no variable exponent analogue.

In [23] and [46] the authors deal with the local boundedness and the Harnack inequality for the $p(x)$-Laplace equation. But it was shown in [23] that even in the case of a very nice exponent, for example,
\[
p(x) := \begin{cases} 
3, & \text{for } 0 < x \leq \frac{1}{2} \\
3 - 2 \left( x - \frac{1}{2} \right), & \text{for } \frac{1}{2} < x < 1
\end{cases}
\]
the constant in the Harnack inequality depends on the minimizer, that is, the inequality $\sup u \leq c \inf u$ does not hold for any absolute constant $c$.

The standard norm in variable exponent Sobolev spaces is the so-called Luxemburg norm $|u|_{p(\cdot)}$ (see section 2) and the integral $\int_{\Omega} |u(x)|^{p(x)} \, dx$ does not satisfy the constant power relation.

In many instances, it is difficult to judge whether or not results about $p$-Laplacian can be generalized to $p(x)$-Laplacian, and even if this can be done, it is still difficult to figure out the form in which the results should be.

Our main goal is to obtain a couple of existence results for the problem (P) without the Ambrosetti-Rabinowitz condition via critical point theory. For this purpose, we use a new method for checking the Cerami compactness condition under a new growth condition. Our results can be regarded as extensions of the corresponding results for the $p$-Laplacian problems, but the growth condition and the methods for checking the Cerami compactness condition are different with respect to quasilinear equations with constant exponent.
Next, we give a review of some results related to our work. Since the Ambrosetti-Rabinowitz type condition is quite restrictive and excludes many cases of nonlinearity, there are many papers dealing with the problem without the Ambrosetti-Rabinowitz type growth condition. For the constant exponent case $p(\cdot) \equiv p$, we refer to [26, 27, 31, 39].

In [26], the authors considered the problem (P) for $p(\cdot) \equiv p$, and proved the existence of weak solutions under the following assumptions: $\lim_{|t| \to +\infty} \frac{F(x,t)}{|t|^p} = +\infty$, where $F(x,t) = \int_0^t f(x,s)ds$; and there exists a constant $C_\ast > 0$ such that $H(x,t) \leq H(x,s) + C_\ast$ for each $x \in \Omega$, $0 < t < s$ or $s < t < 0$, where $H(x,t) = tf(x,t) - pF(x,t)$.

In [27], the author studied the problem (P) for $p(\cdot) \equiv p$. Under the assumption that $\frac{f(x,s)}{s}$ is increasing when $s \geq s_0$ and decreasing when $s \leq -s_0$, $\forall x \in \Omega$, the existence of weak solutions was obtained.

In [31], the authors studied the problem (P) for $p(\cdot) \equiv 2$, which becomes a Laplacian problem. The main result in [31] establishes the existence of weak solutions by assuming that $\frac{f(x,s)}{s}$ is increasing when $s \geq s_0$ and decreasing when $s \leq -s_0$, for all $x \in \Omega$.

In [39], the author also studied the problem (P) for $p(\cdot) \equiv 2$ and proved the existence of weak solutions under the assumption

$$sf(x,u) \geq C_0 |s|^\mu,$$

where $\mu > 2$ and $C_0 > 0$.

If $p(\cdot)$ is a general function, results on variable exponent problem without the Ambrosetti-Rabinowitz type growth condition are rare due to the complexity of $p(x)$-Laplacian (see [3, 5, 19, 20, 42]). However their assumptions imply $G_{p(\cdot)}(x,t) = f(x,t)t - pF(x,t) \geq 0$ and $F(x,t) > 0$ as $t \to +\infty$, so we can see that $F(x,t) \geq C\mu t^\mu$ as $t \to +\infty$. This is too strong and unnatural for the $p(x)$-Laplacian problems.

In [45], the author considered the problem (P) under the following growth condition:

there exist constants $M, C_1, C_2 > 0$, $a > p$ on $\overline{\Omega}$ such that

$$(2)\quad C_1 |t|^{p(x)} \left[\ln(e+|t|)\right]^{a(x)-1} \leq C_2 \frac{tf(x,t)}{\ln(e+|t|)} \leq tf(x,t) - p(x)F(x,t), \forall |t| \geq M, \forall x \in \Omega.$$

A typical example is $f(x,t) = |t|^{p(x)-2}t[\ln(1+|t|)]^{a(x)}$. This function satisfies the above condition (2), but does not satisfy the Ambrosetti-Rabinowitz condition.

Our paper was motivated by [45]. We further weaken the condition (2). To begin we point out that the assumption $a > p$ on $\overline{\Omega}$ is unnecessary in the present paper.

Before stating our main results, we make the following assumptions:

$(f_0)$: $f: \Omega \times \mathbb{R} \to \mathbb{R}$ satisfies the Carathéodory condition and

$$|f(x,t)| \leq C(1+|t|)^{\alpha(x)-1}, \forall (x,t) \in \Omega \times \mathbb{R},$$

where $\alpha \in C(\overline{\Omega})$ and $p(x) < \alpha(x) < p^*(x)$ on $\overline{\Omega}$. 

where $K$ satisfies the following hypotheses:

(K): $1 \leq K(t) \in C^1([0, +\infty), [1, +\infty))$ is increasing and $[\ln(e + t)]^2 \geq K(t) \to +\infty$ as $|t| \to +\infty$, which satisfies $tK'(t)/K(t) \leq \sigma_0 \in (0, 1)$, where $\sigma_0$ is a constant.

(f2): $f(x, t) = o([t]^{p(x) - 1})$ uniformly for $x \in \Omega$ as $t \to 0$.

(f1): $f(x, -t) = -f(x, t)$, $\forall x \in \Omega$, $\forall t \in \mathbb{R}$.

(f4): $F$ satisfies

$$F(x, t) \to +\infty \text{ uniformly as } |t| \to +\infty \text{ for } x \in \overline{\Omega}.$$  

Assume that hypotheses (f1), (f3), and (f4) or (p2) are fulfilled. Then problem (P) has a nontrivial solution.

Theorem 1.2 Assume that hypotheses (f0), (f1), (f3), and (f4) or (p3) are fulfilled. Then problem (P) has infinitely many pairs of solutions.

Remark. (i). The following functions satisfy the hypothesis (K):

$$K_1(t) = \ln(e + |t|)$$
$$K_2(t) = \ln(e + \ln(e + |t|))$$
$$K_3(t) = [\ln(e + \ln(e + |t|))]\ln(e + |t|).$$

Let $K = K_1$, and $f(x, t) = [t]^{p(x) - 1} \ln(1 + |t|)\ln(e + |t|)$, where $1 \leq \rho(|t|) \leq [\ln(e + |t|)]^2$, $\rho' \geq 0$ and $\rho(|t|) \to +\infty$ as $|t| \to +\infty$, for example $\rho(|t|) = \ln(e + \ln(e + |t|))$. Then $f$ satisfies the condition (f0)-(f4), but it does not satisfy the Ambrosetti-Rabinowitz condition, and does not satisfy (2) (ii). We do not need any monotonicity assumption on $f(x, \cdot)$. 

(f1): there exist constants $M, C > 0$, such that

$$C tf(x, t) \leq tf(x, t) - p(x)F(x, t), \forall |t| \geq M, \forall x \in \overline{\Omega},$$

and

$$\frac{tf(x, t)}{[t]^{p(x)} [K(t)]^{p(x)}} \to +\infty \text{ uniformly as } |t| \to +\infty \text{ for } x \in \overline{\Omega},$$

where $\Omega$ is a nonempty bounded domain in $\mathbb{R}^N$. Then problem (P) has a nontrivial solution.
This paper is organized as follows. In Section 2, we do some preparatory work including some basic properties of the variable exponent Sobolev spaces, which can be regarded as a special class of generalized Orlicz-Sobolev spaces. In Section 3, we give proofs of the results stated above.

2. Preliminary results

Throughout this paper, we use letters \(c, c_i, C, C_i, i = 1, 2, \ldots\) to denote generic positive constants which may vary from line to line, and we will specify them whenever necessary.

One of the reasons for the huge development of the theory of classical Lebesgue and Sobolev spaces \(L^p\) and \(W^{1,p}\) (where \(1 \leq p \leq \infty\)) is its usefulness for the description of many phenomena arising in applied sciences. For instance, many materials can be modeled with sufficient accuracy by using the function spaces \(L^p\) and \(W^{1,p}\), where \(p\) is a fixed constant. For some materials with nonhomogeneities, for instance electro-rheological fluids (sometimes referred to as “smart fluids”), this approach is not adequate, but rather the exponent \(p\) should be allowed to vary. This leads us to the study of variable exponent Lebesgue and Sobolev spaces, \(L^{p(\cdot)}\) and \(W^{1,p(\cdot)}\), where \(p\) is a real-valued function.

In order to discuss problem (P), we need some results about the space \(W^{1,p(\cdot)}_0(\Omega)\), which we call variable exponent Sobolev space. We first state some basic properties of \(W^{1,p(\cdot)}_0(\Omega)\) (for details, see [12, 15, 17, 25, 35, 38]). Denote \(C_+^-(\Omega) = \{h \mid h \in C(\Omega), h(x) > 1 \text{ for } x \in \Omega\}\),

\[ h^+ = \max_{\Omega} h(x), h^- = \min_{\Omega} h(x), \text{ for any } h \in C(\Omega), \]

\[ L^{p(\cdot)}(\Omega) = \left\{ u \mid u \text{ is a measurable real-valued function, } \int_{\Omega} |u(x)|^{p(x)} \, dx < \infty \right\}. \]

We introduce the norm on \(L^{p(\cdot)}(\Omega)\) by

\[ |u|_{p(\cdot)} = \inf \left\{ \lambda > 0 \mid \int_{\Omega} \left| \frac{u(x)}{\lambda} \right|^{p(x)} \, dx \leq 1 \right\}. \]

Then \((L^{p(\cdot)}(\Omega), |\cdot|_{p(\cdot)})\) becomes a Banach space and it is called the variable exponent Lebesgue space.

**Proposition 2.1** (see [12, 35]). i) The space \((L^{p(\cdot)}(\Omega), |\cdot|_{p(\cdot)})\) is a separable, uniform convex Banach space, and its conjugate space is \(L^{q(\cdot)}(\Omega)\), where \(\frac{1}{q(\cdot)} + \frac{1}{p(\cdot)} \equiv 1\). For any \(u \in L^{p(\cdot)}(\Omega)\) and \(v \in L^{q(\cdot)}(\Omega)\), we have

\[ \left| \int_{\Omega} uv \, dx \right| \leq \left( \frac{1}{p} + \frac{1}{q} \right) |u|_{p(\cdot)} |v|_{q(\cdot)}. \]

ii) If \(p_1, p_2 \in C_+(\Omega)\), \(p_1(x) \leq p_2(x)\) for any \(x \in \Omega\), then \(L^{p_2(\cdot)}(\Omega) \subset L^{p_1(\cdot)}(\Omega)\), and this imbedding is continuous.
where $p$ satisfies $6 \leq G$, L. V. D. Rădulescu, D. D. Repovš and Q. Zhang.

and it can be equipped with the norm

the following statement are equivalent:

We denote by $W^{1,p}(\Omega)$ the closure of $C^\infty_0(\Omega)$ in $W^{1,p}(\Omega)$ and set

The space $W^{1,p}(\Omega)$ is defined by

and it can be equipped with the norm

We denote by $W^{1,p}(\Omega)$ the closure of $C^\infty_0(\Omega)$ in $W^{1,p}(\Omega)$ and set

Then we have the following properties.

Proposition 2.5 (see [12, 15, 35]). i) $W^{1,p}(\Omega)$ and $W^{1,p}_0(\Omega)$ are separable reflexive Banach spaces;

ii) if $q \in C_+(\overline{\Omega})$ and $q(x) < p^*(x)$ for any $x \in \overline{\Omega}$, then the imbedding from $W^{1,p}(\Omega)$ to $L^q(\Omega)$ is compact;

iii) there is a constant $C > 0$ such that

$$ |u|_{p^*} \leq C |\nabla u|_{p^*}, \forall u \in W^{1,p}_0(\Omega). $$
It follows from iii) of Proposition 2.5 that $|\nabla u|_{p(\cdot)}$ and $\|u\|$ are equivalent norms on $W_0^{1,p(\cdot)}(\Omega)$. From now on, we will use $|\nabla u|_{p(\cdot)}$ instead of $\|u\|$ as the norm on $W_0^{1,p(\cdot)}(\Omega)$.

The Lebesgue and Sobolev spaces with variable exponents coincide with the usual Lebesgue and Sobolev spaces provided that $p$ is constant. These function spaces $L^{p(x)}$ and $W^{1,p(x)}$ have some non-usual properties, see [35, p. 8-9]. Some of these properties are the following:

(i) Assuming that $1 < p^- \leq p^+ < \infty$ and $p : \bar{\Omega} \rightarrow [1, \infty)$ is a smooth function, then the following co-area formula

$$\int_{\Omega} |u(x)|^p dx = p \int_0^{\infty} t^{p-1} \left| \{x \in \Omega; |u(x)| > t\} \right| dt$$

has no analogue in the framework of variable exponents.

(ii) Spaces $L^{p(x)}$ do not satisfy the mean continuity property. More exactly, if $p$ is nonconstant and continuous in an open ball $B$, then there is some $u \in L^{p(x)}(B)$ such that $u(x + h) \notin L^{p(x)}(B)$ for every $h \in \mathbb{R}^N$ with arbitrary small norm.

(iii) Function spaces with variable exponent are never invariant with respect to translations. The convolution is also limited. For instance, the classical Young inequality

$$|f * g|_{p(x)} \leq C |f|_{p(x)} \|g\|_{L^1}$$

remains true if and only if $p$ is constant.

Proposition 2.6 (see [16]). If the assumption $(p_1)$ is satisfied, then $\lambda_{p(\cdot)}$ defined in (1) is positive.

Next, we prove some results related to the $p(x)$-Laplace operator $-\Delta_{p(x)}$ as defined at the beginning of Section 1. Consider the following functional

$$J(u) = \int_{\Omega} \frac{1}{p(x)} |\nabla u|^{p(x)} dx, \ u \in X := W_0^{1,p(\cdot)}(\Omega).$$

Then (see [9]) $J \in C^1(X, \mathbb{R})$ and the $p(x)$-Laplace operator is the derivative operator of $J$ in the weak sense. We denote $L = J' : X \rightarrow X^*$, then

$$(L(u), v) = \int_{\Omega} |\nabla u|^{p(x)-2} \nabla u \nabla v dx, \ \forall v, u \in X.$$

Theorem 2.7 (see [15, 21]). i) $L : X \rightarrow X^*$ is a continuous, bounded and strictly monotone operator;

ii) $L$ is a mapping of type $(S_+)$, that is, if $u_n \rightharpoonup u$ in $X$ and $\lim_{n \rightarrow +\infty} (L(u_n) - L(u), u_n - u) \leq 0$, then $u_n \rightarrow u$ in $X$;

iii) $L : X \rightarrow X^*$ is a homeomorphism.

Denote

$$B(x_0, \varepsilon, \delta, \theta) = \left\{ x \in \mathbb{R}^N \mid \delta \leq |x - x_0| \leq \varepsilon, \frac{x - x_0}{|x - x_0|} \cdot \frac{\nabla p(x_0)}{|\nabla p(x_0)|} \geq \cos \theta \right\},$$

$$\frac{\nabla p(x_0)}{|\nabla p(x_0)|} \geq \cos \theta,$$
where $θ \in (0, \frac{π}{2})$. Then we obtain the following.

**Lemma 2.8.** If $p \in C^4(\overline{\Omega})$, $x_0 \in \Omega$ satisfy $\nabla p(x_0) \neq 0$, then there exists small enough $ε > 0$ such that

\[
(5) \quad (x - x_0) \cdot \nabla p(x) > 0, \forall x \in B(x_0, ε, δ, θ),
\]

and

\[
(6) \quad \max\{p(x) \mid x \in \overline{B(x_0, ε)}\} = \max\{p(x) \mid x \in B(x_0, ε, δ, θ), |x - x_0| = ε\}.
\]

**Proof.** A proof of this lemma can be found in [45]. For readers’ convenience, we include it here.

Since $p \in C^4(\overline{\Omega})$, for any $x \in B(x_0, ε, δ, θ)$, when $ε > 0$ is small enough, we have

\[
\nabla p(x) \cdot (x - x_0) = (\nabla p(x_0) + o(1)) \cdot (x - x_0)
\]

\[
= \nabla p(x_0) \cdot (x - x_0) + o(|x - x_0|)
\]

\[
\geq |\nabla p(x_0)||x - x_0| \cos θ + o(|x - x_0|) > 0,
\]

where $o(1) \in \mathbb{R}^N$ is a function and $o(1) \to 0$ uniformly as $|x - x_0| \to 0$.

When $ε$ is small enough, condition (5) is valid. Since $p \in C^4(\overline{\Omega})$, there exist a small enough positive $ε$ such that

\[
p(x) - p(x_0) = \nabla p(y) \cdot (x - x_0) = (\nabla p(x_0) + o(1)) \cdot (x - x_0),
\]

where $y = x_0 + τ(x - x_0)$ and $τ \in (0, 1)$, $o(1) \in \mathbb{R}^N$ is a function and $o(1) \to 0$ uniformly as $|x - x_0| \to 0$.

Suppose that $x \in B(x_0, ε)\backslash B(x_0, ε, δ, θ)$. Denote $x^* = x_0 + ε\nabla p(x_0)/|\nabla p(x_0)|$.

Suppose that $\frac{x - x_0}{|x - x_0|} \frac{\nabla p(x_0)}{|\nabla p(x_0)|} < \cos θ$. When $ε$ is small enough, we have

\[
p(x) - p(x_0) = (\nabla p(x_0) + o(1)) \cdot (x - x_0)
\]

\[
< |\nabla p(x_0)||x - x_0| \cos θ + ε \cdot o(1)
\]

\[
\leq (\nabla p(x_0) + o(1)) \cdot ε\nabla p(x_0)/|\nabla p(x_0)|
\]

\[
= p(x^*) - p(x_0),
\]

where $o(1) \in \mathbb{R}^N$ is a function and $o(1) \to 0$ as $ε \to 0$.

Suppose that $|x - x_0| < δ$. When $ε$ is small enough, we have

\[
p(x) - p(x_0) = (\nabla p(x_0) + o(1)) \cdot (x - x_0)
\]

\[
\leq |\nabla p(x_0)||x - x_0| + ε \cdot o(1)
\]

\[
< (\nabla p(x_0) + o(1)) \cdot ε\nabla p(x_0)/|\nabla p(x_0)|
\]

\[
= p(x^*) - p(x_0),
\]

where $o(1) \in \mathbb{R}^N$ is a function and $o(1) \to 0$ as $ε \to 0$. Thus

\[
(7) \quad \max\{p(x) \mid x \in B(x_0, ε)\} = \max\{p(x) \mid x \in B(x_0, ε, δ, θ)\}.
\]

It follows from (5) and (7) that relation (6) holds.

The proof of Lemma 2.8 is thus complete. □
Lemma 2.9 Suppose that \( F(x, u) \) satisfies (f4). Let
\[
h(x) = \begin{cases} 0, & \text{if } |x - x_0| > \varepsilon, \\ \varepsilon - |x - x_0|, & \text{if } |x - x_0| \leq \varepsilon, \end{cases}
\]
where \( \varepsilon \) is defined as in Lemma 2.8. Then there exists large enough \( t \) such that
\[
\int_{\Omega} |
abla th|^{p(x)} dx - \int_{\Omega} F(x, th)dx \to -\infty \quad \text{as } t \to +\infty.
\]

Proof. Obviously,
\[
\int_{\Omega} \frac{1}{p(x)} |
abla th|^{p(x)} dx \leq C_2 \int_{B(x_0, \varepsilon, \delta, \theta)} |
abla th|^{p(x)} dx.
\]

We make a spherical coordinate transformation. Denote \( r = |x - x_0| \). Since \( p \in C^1(\overline{\Omega}) \), it follows from (5) that there exist positive constants \( c_1 \) and \( c_2 \) such that
\[
p(\varepsilon, \omega) - c_2(\varepsilon - r) \leq p(r, \omega) \leq p(\varepsilon, \omega) - c_1(\varepsilon - r), \quad \forall (r, \omega) \in B(x_0, \varepsilon, \delta, \theta).
\]
Therefore
\[
\int_{B(x_0, \varepsilon, \delta, \theta)} |
abla th|^{p(x)} dx = \int_{B(x_0, \varepsilon, \delta, \theta)} |t|^{p(r, \omega)} r^{N-1} dr d\omega
\leq \int_{B(x_0, \varepsilon, \delta, \theta)} |t|^{p(\varepsilon, \omega) - c_1(\varepsilon - r)} r^{N-1} dr d\omega
\leq \varepsilon^{N-1} \int_{B(x_0, \varepsilon, \delta, \theta)} t^{p(\varepsilon, \omega) - c_1(\varepsilon - r)} dr d\omega
\leq \varepsilon^{N-1} \int_{B(x_0, 1.1, \theta)} \frac{t^{p(\varepsilon, \omega)}}{c_1 \ln t} d\omega.
\]

(8)

Denote
\[
G(x, u) = \frac{F(x, u)}{|u|^{p(x)} [\ln(e + |u|)]^{p(x)}}.
\]

Then
\[
(9) \quad G(x, u) \to +\infty \quad \text{uniformly as } |u| \to +\infty \quad \text{for } x \in \overline{\Omega}.
\]

Thus there exists a positive constant \( M \) such that
\[
G(x, u) \geq 1, \quad \forall |u| \geq M, \quad \forall x \in \overline{\Omega}.
\]

Denote
\[
E_1 = \{ x \in B(x_0, \varepsilon) \mid th \geq M \} = \left\{ x \in B(x_0, \varepsilon) \mid |x - x_0| \leq \varepsilon - \frac{M}{t} \right\},
\]
\[
E_2 = B(x_0, \varepsilon) \setminus E_1.
\]
Then we have
\[
\int F(x, th)dx = \int_{B(x_0, \varepsilon)} F(x, th)dx
\]
\[
= \int_{E_1} F(x, th)dx + \int_{E_2} F(x, th)dx
\]
\[
\geq \int_{E_1} F(x, th)dx - C_1.
\]

When \( t \) is large enough, we have
\[
\int_{E_1} F(x, th)dx
\]
\[
= \int_{E_1} |th|^{p(x)} [\ln(e + |th|)]^{p(x)} G(x, th)dx
\]
\[
= \int_{B(x_0, \varepsilon - \frac{\delta}{2}, \delta, \theta)} C_1 |th|^{p(x)} [\ln(e + |th|)]^{p(x)} G(x, th)dx
\]
\[
= \int_{B(x_0, \varepsilon - \frac{\delta}{2}, \delta, \theta)} C_1 |t(\varepsilon - r)|^{p(r, \omega)} r^{N-1} \ln(e + t(\varepsilon - r))]^{p(r, \omega)} G(r, \omega, t(\varepsilon - r))drd\omega
\]
\[
\geq C_1 \delta^{-N-1} \int_{B(x_0, \varepsilon - \frac{\delta}{2}, \delta, \theta)} |t|^{p(\varepsilon, \omega)-c_2(\varepsilon - r)} \varepsilon - r^{p(\varepsilon, \omega)-c_1(\varepsilon - r)} \ln(e + t(\varepsilon - r))]^{p(r, \omega)} G(r, \omega, t(\varepsilon - r))drd\omega
\]
\[
= C_1 \delta^{-N-1} \int_{B(x_0, 1, 1, \theta)} d\omega
\]
\[
\int_{\delta}^{\varepsilon - \frac{\delta}{2}} |t|^{p(\varepsilon, \omega)-c_2(\varepsilon - r)} \varepsilon - r^{p(\varepsilon, \omega)-c_1(\varepsilon - r)} \ln(e + t(\varepsilon - r))]^{p(r, \omega)} G(r, \omega, t(\varepsilon - r))dr
\]
\[
\geq C_2 \delta^{-N-1} G(r_1, \omega_t, t(\varepsilon - r_1)) \int_{B(x_0, 1, 1, \theta)} \frac{|t|^{p(\varepsilon, \omega)-c_2(\varepsilon - r)}}{c_2 \ln t} d\omega
\]
\[
\geq C_3 \delta^{-N-1} G(r_1, \omega_t, t(\varepsilon - r_1)) \int_{B(x_0, 1, 1, \theta)} \frac{|t|^{p(\varepsilon, \omega)}}{c_2 \ln t} d\omega,
\]
where \( (r_1, \omega_t) \in E_1 \) is such that
\[
G(r_1, \omega_t, t(\varepsilon - r_1)) = \min \left\{ G(r, \omega, t(\varepsilon - r)) \mid (r, \omega) \in B(x_0, \varepsilon - \frac{1}{\ln t}, \delta, \theta) \right\}.
\]
Note that $t(\varepsilon - r_t) \geq \frac{1}{\ln t} \to +\infty$ as $t \to +\infty$. Thus

$$\int_\Omega F(x, th)\,dx \geq G(r_t, \omega_t, t(\varepsilon - r_t))C_5 \int_{B(z_0, 1, \theta)} |t|^{p(\epsilon, \omega)} \ln t \,d\omega - C_1$$ as $t \to +\infty$.

It follows from (8), (9) and (10) that $\Psi(th) \to -\infty$. Proof of Lemma 2.9 is thus complete. □

**Lemma 2.10** The following $K_i$ ($i = 1, 2, 3$) satisfy the hypothesis $(K)$

- $K_1(t) = \ln(e + |t|)$;
- $K_2(t) = \ln(e + \ln(e + |t|))$; and
- $K_3(t) = [\ln(e + \ln(e + |t|))] \ln(e + |t|)$.

**Proof.** We only need to check that $K_3(t)$ satisfies the hypothesis $(K)$. The proofs for the other functions are similar.

We observe that $1 \leq K(\cdot) \in C^1([0, +\infty), [1, +\infty))$ is increasing and $K(t) \to +\infty$ as $t \to +\infty$. So we only need to prove that $tK'(t)/K(t) \leq \sigma \in (0, 1)$, where $\sigma$ is a constant. By computation we obtain

$$\frac{tK'}{K} = \frac{t}{K} \left\{ \frac{\ln(e + |t|)\ln t}{|e + \ln(e + |t|)|} + \frac{\ln(e + \ln(e + |t|))\ln t}{(e + |t|)} \right\}$$

$$= \frac{|\ln(e + \ln(e + |t|))|}{|e + \ln(e + |t|)|} \frac{|\ln(e + |t|)|}{(e + |t|)} \frac{\ln(e + |t|)}{e + |t|}.$$

We have

$$|t| \leq \frac{1}{3} |\ln(e + \ln(e + |t|))| e + \ln(e + |t|)$$

and

$$|t| \leq \frac{1}{2} |\ln(e + |t|)| (e + |t|)$$

and we complete the proof by observing that

$$\frac{tK'}{K} \leq \frac{5}{6}, \forall t \in \mathbb{R}. $$

3. **Proofs of main results**

In this section we give the proofs of our main results.

**Definition 3.1** We say that $u \in W^{1, p(\cdot)}_0(\Omega)$ is a weak solution of (P) if

$$\int_\Omega |\nabla u|^{p(x)-2} \nabla u \cdot \nabla v\,dx = \int_\Omega f(x, u)v\,dx, \forall v \in X := W^{1, p(\cdot)}_0(\Omega).$$

The corresponding functional of (P) is

$$\varphi(u) = \int_\Omega \frac{1}{p(x)} |\nabla u|^{p(x)}\,dx - \int_\Omega F(x, u)\,dx, \forall u \in X,$$

where $F(x, t) = \int_0^1 f(x, s)\,ds.$
\section*{Definition 3.2} We say that \( \varphi \) satisfies the Cerami condition in \( X \), if any sequence \( \{ u_n \} \subset X \) such that \( \{ \varphi(u_n) \} \) is bounded and \( \| \varphi'(u_n) \| (1 + \| u_n \|) \to 0 \) as \( n \to +\infty \) has a convergent subsequence.

\section*{Lemma 3.3} If \( f \) satisfies \((f_0)\) and \((f_1)\), then \( \varphi \) satisfies the Cerami condition.

\textbf{Proof.} Let \( \{ u_n \} \subset X \) be a Cerami sequence, that is \( \varphi(u_n) \to c \) and \( \| \varphi'(u_n) \| (1 + \| u_n \|) \to 0 \). Therefore \( \varphi'(u_n) = L(u_n) - f(x, u_n) \to 0 \) in \( X^* \), then we have \( L(u_n) = f(x, u_n) + o_n(1) \), where \( o_n(1) \to 0 \) in \( X^* \) as \( n \to \infty \). Suppose that \( \{ u_n \} \) is bounded, then \( \{ u_n \} \) has a weakly convergent subsequence in \( X \). Without loss of generality, we assume that \( u_n \rightharpoonup u \), then by Proposition 2.2 and 2.5, we have \( f(x, u_n) \to f(x, u) \) in \( X^* \). Thus \( L(u_n) = f(x, u_n) + o_n(1) \to f(x, u) \) in \( X^* \). Since \( L \) is a homeomorphism, we have \( u_n \rightharpoonup L^{-1}(f(x, u)) \) in \( X \), and so \( \varphi \) satisfies the Cerami condition. Therefore \( u = L^{-1}(f(x, u)) \), then \( L(u) = f(x, u) \), this means \( u \) is a solution of \((P)\). Thus we only need to prove the boundedness of the Cerami sequence \( \{ u_n \} \).

We argue by contradiction. Then there exist \( c \in \mathbb{R} \) and \( \{ u_n \} \subset X \) satisfying:

\[ \varphi(u_n) \to c, \quad \| \varphi'(u_n) \| (1 + \| u_n \|) \to 0, \quad \| u_n \| \to +\infty. \]

Obviously,

\[ \left| \frac{1}{p(x)} u_n \right|_{p(x)} \leq \frac{1}{p'} |u_n|_{p'} \cdot \left| \nabla \frac{1}{p(x)} u_n \right|_{p'} \leq \frac{1}{p'} |\nabla u_n|_{p'} + C |u_n|_{p'}. \]

Thus \( \left| \frac{1}{p(x)} u_n \right| \leq C \| u_n \| \). Therefore \( (\varphi'(u_n), \frac{1}{p(x)} u_n) \to 0 \). We may assume that

\[ c + 1 \geq \varphi(u_n) - (\varphi'(u_n), \frac{1}{p(x)} u_n) \]

\[ = \int \frac{1}{p(x)} |\nabla u_n|_{p(x)}^2 dx - \int F(x, u_n) dx - \{ \int \frac{1}{p(x)} |\nabla u_n|_{p(x)}^2 dx - \int \frac{1}{p(x)} f(x, u_n) u_n dx \}
\]

\[ \geq \int \frac{1}{p(x)} |\nabla u_n|_{p(x)}^2 dx - \int \frac{1}{p(x)} f(x, u_n) u_n dx + \int \{ \frac{1}{p(x)} f(x, u_n) u_n - F(x, u_n) \} dx. \]

Hence

\[ \int \frac{f(x, u_n) u_n}{p(x)} - F(x, u_n) dx \leq C_0 \left( \int |u_n| |\nabla u_n|_{p(x)-1}^2 dx + 1 \right) \]

\[ \leq \sigma \int |\nabla u_n|_{p(x)}^2 dx + C_1 \]

\[ + C(\sigma) \int |u_n|_{p(x)} |K(|u_n|)|_{p(x)-1}^2 dx, \]

where \( \sigma \) is a small enough positive constant.
Due to hypothesis (K), it is easy to check that \( \frac{u_n}{K([u_n])} \in X \), and \( \left\| \frac{u_n}{K([u_n])} \right\| \leq C_2 \left\| u_n \right\| \). Let \( \frac{u_n}{K([u_n])} \) be a test function. We have

\[
\int_{\Omega} f(x, u_n) \frac{u_n}{K([u_n])} \, dx
= \int_{\Omega} |\nabla u_n|^{p(x)-2} \nabla u_n \nabla \frac{u_n}{K([u_n])} \, dx + o(1)
= \int_{\Omega} \frac{|\nabla u_n|^{p(x)}}{K([u_n])} \, dx - \int_{\Omega} u_n |\nabla u_n|^{p(x)-2} \nabla u_n \nabla \frac{1}{K([u_n])} \, dx + o(1).
\]

By computation, we obtain

\[
\left| \int_{\Omega} u_n |\nabla u_n|^{p(x)-2} \nabla u_n \nabla \frac{1}{K([u_n])} \, dx \right|
\leq \int_{\Omega} |u_n| |\nabla u_n|^{p(x)-1} \frac{|\nabla K([u_n])|}{K^2([u_n])} \, dx
\leq \int_{\Omega} \frac{|\nabla u_n|^{p(x)} |u_n|}{K([u_n])} K'([u_n]) \, dx.
\]

Note that \( \frac{|u_n| K'([u_n])}{K([u_n])} \leq \sigma_0 \in (0, 1) \). Thus

\[
(12) \quad C_3 \int_{\Omega} \frac{|\nabla u_n|^{p(x)}}{K([u_n])} \, dx - C_4 \leq \int_{\Omega} \frac{f(x, u_n) u_n}{K([u_n])} \, dx \leq C_5 \int_{\Omega} \frac{|\nabla u_n|^{p(x)}}{K([u_n])} \, dx + C_6.
\]

By (11), (12) and conditions \((f_0)\) and \((f_1)\), we have

\[
\int_{\Omega} f(x, u_n) \frac{u_n}{K([u_n])} \, dx
\overset{(f_1)}{\leq} C_7 \int_{\Omega} \left\{ \frac{f(x, u_n) u_n}{p(x)} - F(x, u_n) \right\} \, dx + C_7
\leq C_7 \sigma \int_{\Omega} \frac{|\nabla u_n|^{p(x)}}{K([u_n])} \, dx + C_8 + C(\sigma) \int_{\Omega} |u_n|^{p(x)} [K([u_n])]^{p(x)-1} \, dx
\leq C_7 \sigma \int_{\Omega} \frac{|\nabla u_n|^{p(x)}}{K([u_n])} \, dx + C_7 C(\sigma) \int_{\Omega} |u_n|^{p(x)} [K([u_n])]^{p(x)-1} \, dx + C_9
\overset{(12)}{\leq} \frac{1}{2} \int_{\Omega} \frac{f(x, u_n) u_n}{K([u_n])} \, dx + C_7 C(\sigma) \int_{\Omega} |u_n|^{p(x)} [K([u_n])]^{p(x)-1} \, dx + C_{10}.
\]

Thus, by condition \((f_1)\) and the above inequality, we can see

\[
\int_{\Omega} f(x, u_n) \frac{u_n}{K([u_n])} \, dx
\overset{(f_1)}{\leq} C_{11} \int_{\Omega} |u_n|^{p(x)} [K([u_n])]^{p(x)-1} \, dx + C_{12}.
\]

Note that \( \frac{f(x, t)}{t^{p(x)} [K(t)]^{p(x)}} \to +\infty \) uniformly as \( |t| \to +\infty \) for \( x \in \overline{\Omega} \). We claim that

\[
\int_{\Omega} |u_n|^{p(x)} [K([u_n])]^{p(x)-1} \, dx \text{ is bounded.}
\]
This means that
\[ \int_\Omega f(x, u_n) \frac{u_n}{K(|u_n|)} \, dx \] is bounded.

In fact, by (K), we observe that there exists \( M > 0 \) large enough such that
\[ \frac{t f(x, t)}{K(t)} > 2C_{11} |t|^{p(x)} [K(t)]^{p(x)-1}, \forall |t| \geq M. \]

Denote \( \Omega_n = \{ x \in \Omega \mid |u_n| \geq M \} \). We have
\[ \int_\Omega f(x, u_n) \frac{u_n}{K(|u_n|)} \, dx \geq \int_{\Omega_n} 2C_{11} |u_n|^{p(x)} [K(|u_n|)]^{p(x)-1} \, dx - C_{12}. \]

Combining (13)-(15), we obtain
\[ \int_{\Omega_n} C_{11} |u_n|^{p(x)} [K(|u_n|)]^{p(x)-1} \, dx \leq C_{13}, \]
and hence
\[ \int_\Omega C_{11} |u_n|^{p(x)} [K(|u_n|)]^{p(x)-1} \, dx \leq C_{14}. \]

Thus
\[ \int_\Omega f(x, u_n) \frac{u_n}{K(|u_n|)} \, dx \leq C_{14}, \text{ for any } n = 1, 2, \ldots. \]

This combine (f0) implies that
\[ \{ \int_\Omega \frac{|f(x, u_n)| u_n}{K(|u_n|)} \, dx \} \text{ is bounded.} \]

Let \( \varepsilon > 0 \) satisfy \( \varepsilon < \min\{1, p^{-1} - 1, \frac{1}{p_f}, (\frac{2}{\alpha})^{-1} - 1\} \). Since \( \|\varphi'(u_n)\| u_n \to 0 \), we get
\[ \int_\Omega |\nabla u_n|^{p(x)} \, dx = \int_\Omega f(x, u_n) u_n \, dx + o(1) \leq \int_\Omega \varepsilon |f(x, u_n) u_n|^{\varepsilon} [K(|u_n|)]^{1-\varepsilon} \left[ \frac{|f(x, u_n) u_n|}{K(|u_n|)} \right]^{1-\varepsilon} \, dx + o(1). \]

By condition (f1), we have
\[ |f(x, u_n) u_n| \geq |u_n|^{p(x)} \text{ for large enough } |u_n|, \]
and
\[ [K(|u_n|)]^{1-\varepsilon} \leq |\ln(\varepsilon + |u_n|)|^{2(1-\varepsilon)} \text{ for large enough } |u_n|, \]
then we have
\[ |f(x, u_n) u_n|^{\varepsilon} [K(|u_n|)]^{1-\varepsilon} \leq C_{15} (|f(x, u_n) u_n|^{\varepsilon(1+\varepsilon)} + 1). \]

Therefore
\[ \int_\Omega |\nabla u_n|^{p(x)} \, dx = \int_\Omega f(x, u_n) u_n \, dx + o(1) \leq C_{15} (1 + \|u_n\|)^{1+\varepsilon} \int_\Omega \left[ \frac{|f(x, u_n) u_n|^{1+\varepsilon} + 1}{(1 + \|u_n\|)^{1+\varepsilon}} \right]^{\varepsilon} \left[ \frac{|f(x, u_n) u_n|}{K(|u_n|)} \right]^{1-\varepsilon} \, dx + o(1). \]
By Young’s inequality, we have
\[
\int_{\Omega} |\nabla u_n|^{p(x)} dx \leq C_{15} (1 + \|u_n\|)^{1+\varepsilon} \int_{\Omega} \frac{|f(x, u_n)u_n|^{1+\varepsilon} + 1}{(1 + \|u_n\|)^{\frac{1+\varepsilon}{\varepsilon}}} dx + o(1). \tag{17}
\]

According to the definition of $\varepsilon$, we have
\[
|f(x, u_n)u_n|^{1+\varepsilon} + 1 \leq C(|u_n|^{p^*(x)} + 1)
\]
and
\[
(1 + \|u_n\|)^{\frac{1+\varepsilon}{\varepsilon}} \geq (1 + \|u_n\|)^{(1+\varepsilon)(p^-)^+}.
\]

Therefore
\[
\int_{\Omega} \frac{|f(x, u_n)u_n|^{1+\varepsilon} + 1}{(1 + \|u_n\|)^{\frac{1+\varepsilon}{\varepsilon}}} dx \leq \int_{\Omega} \frac{C(|u_n|^{p^*(x)} + 1)}{(1 + \|u_n\|)^{\frac{1+\varepsilon}{\varepsilon}}} dx \leq C_{16} (1 + \|u_n\|)^{1+\varepsilon} + C_{17}.
\]

Thus, the sequence
\[
\left\{ \int_{\Omega} \frac{|f(x, u_n)u_n|^{1+\varepsilon} + 1}{(1 + \|u_n\|)^{\frac{1+\varepsilon}{\varepsilon}}} dx \right\}
\]
is bounded. This combine (16) and (17) implies
\[
\int_{\Omega} |\nabla u_n|^{p(x)} dx \leq C_{16} (1 + \|u_n\|)^{1+\varepsilon} + C_{17}.
\]

Note that $\varepsilon < p^- - 1$. This is a contradiction, hence $\{u_n\}$ is bounded in $X$.

The proof of Lemma 3.3 is thus complete. \qed

**Proof of Theorem 1.1.** We first establish the existence of a nontrivial weak solution.

We show that $\varphi$ satisfies conditions of the mountain pass lemma. By Lemma 3.3, $\varphi$ satisfies the Cerami condition. Since $p(x) < \alpha(x) < p^*(x)$, the embedding $X \hookrightarrow L^{\alpha(\cdot)}(\Omega)$ is compact. Hence there exists $C_0 > 0$ such that
\[
|u|_{p(\cdot)} \leq C_0 \|u\|, \ \forall u \in X.
\]

Let $\sigma > 0$ be small enough such that $\sigma \leq \frac{1}{4} \lambda_{p(\cdot)}$. By the assumptions $(f_0)$ and $(I_2)$, we obtain
\[
F(x, t) \leq \sigma \frac{1}{p(x)} |t|^{p(x)} + C(\sigma) |t|^{p(x)}, \ \forall (x, t) \in \Omega \times \mathbb{R}.
\]

By $(p_1)$ and Lemma 2.6, we have $\lambda_{p(\cdot)} > 0$ and
\[
\int_{\Omega} \frac{1}{p(x)} |
abla u|^{p(x)} dx - \sigma \int_{\Omega} \frac{1}{p(x)} |u|^{p(x)} dx \geq \frac{3}{4} \int_{\Omega} \frac{1}{p(x)} |
abla u|^{p(x)} dx.
\]

Since $\alpha \in C(\overline{\Omega})$ and $p(x) < \alpha(x) < p^*(x)$, we can divide the domain $\Omega$ into $n_0$
disjoint small subdomains $\Omega_i$ $(i = 1, \cdots, n_0)$ such that $\overline{\Omega} = \bigcup_{i=1}^{n_0} \Omega_i$ and
\[
\sup_{\Omega_i} p(x) < \inf_{\Omega_i} \alpha(x) \leq \sup_{\Omega_i} \alpha(x) < \inf_{\Omega_i} p^*(x).
\]
Let
\[ \epsilon = \min_{1 \leq i \leq n_0} \{ \inf_{\Omega_i} (x) - \text{supp}(x) \}. \]
and denote by \( \|u\|_{\Omega_i} \) the norm of \( u \) on \( \Omega_i \), that is
\[ \int_{\Omega_i} \frac{1}{p(x)} \left| \nabla \frac{u}{\|u\|_{\Omega_i}} \right|^p \, dx + \int_{\Omega_i} \frac{1}{p(x)} \left| \frac{u}{\|u\|_{\Omega_i}} \right|^p \, dx = 1. \]

Then \( \|u\|_{\Omega_i} \leq C \|u\| \) and there exist \( \xi_i, \eta_i \in \Omega_i \) such that
\[ |u|_{\alpha(\xi_i)}^{\alpha(\xi_i)} = \int_{\Omega_i} |u|^{\alpha(\xi_i)} \, dx, \]
\[ \|u\|^{\alpha(\eta_i)}_{\Omega_i} = \int_{\Omega_i} \left( \frac{1}{p(x)} |\nabla u|^p + \frac{1}{|p(x)|} |u|^p \right) \, dx. \]

When \( \|u\| \) is small enough, we have
\[ C(\sigma) \int_{\Omega} |u|^{\alpha(x)} \, dx = C(\sigma) \sum_{i=1}^{n_0} \int_{\Omega_i} |u|^{\alpha(x)} \, dx \]
\[ = C(\sigma) \sum_{i=1}^{n_0} |u|^{\alpha(\xi_i)}_\xi \quad (\text{where } \xi_i \in \Omega_i) \]
\[ \leq C \|u\| \sum_{i=1}^{n_0} \|u\|^{\alpha(\eta_i)}_{\Omega_i} \quad (\text{by Proposition 2.5}) \]
\[ \leq C \|u\| \sum_{i=1}^{n_0} \|u\|^{\alpha(\eta_i)}_{\Omega_i} \quad (\text{where } \eta_i \in \Omega_i) \]
\[ = C \|u\| \int_{\Omega} \left( \frac{1}{p(x)} |\nabla u|^p + \frac{1}{|p(x)|} |u|^p \right) \, dx \]
\[ \leq \frac{1}{4} \int_{\Omega} \frac{1}{p(x)} |\nabla u|^p \, dx. \]

Thus
\[ \varphi(u) \geq \int_{\Omega} \frac{1}{p(x)} |\nabla u|^p - \sigma \int_{\Omega} \frac{1}{p(x)} |u|^p \, dx - C(\sigma) \int_{\Omega} |u|^{\alpha(x)} \, dx \]
\[ \geq \frac{1}{2} \int_{\Omega} \frac{1}{p(x)} |\nabla u|^p \quad \text{when } \|u\| \text{ is small enough.} \]

Therefore, there exist \( r > 0 \) and \( \delta > 0 \) such that \( \varphi(u) \geq \delta > 0 \) for every \( u \in X \) and \( \|u\| = r \).

Suppose (p2) is satisfied. Define \( h \in C_0(B(x_0, 3\delta)) \) as follows:
\[ h(x) = \begin{cases} 
0, & |x - x_0| \geq 3\delta \\
3\delta - |x - x_0|, & 2\delta \leq |x - x_0| < 3\delta \\
\delta, & |x - x_0| < 2\delta.
\end{cases} \]

Note that
\[ \min_{|x-x_0| \leq \delta} p(x) > \max_{2\delta \leq |x-x_0| \leq 3\delta} p(x). \]
It is now easy to check that
\[
\varphi(th) = \int_{\Omega} \frac{1}{p(x)} |\nabla th|^{p(x)} - \int_{\Omega} F(x, th) \, dx \leq \int_{B(x_0, \delta)} \frac{1}{p(x)} |\nabla th|^{p(x)} - \int_{B(x_0, \delta)} C_1 |th|^{p(x)} \, dx + C_2 \to -\infty \text{ as } t \to +\infty.
\]

Since \( \varphi(0) = 0 \), \( \varphi \) satisfies the conditions of the mountain pass lemma. So \( \varphi \) admits at least one nontrivial critical point, which implies the problem (P) has a nontrivial weak solution \( u \).

Suppose (f\(_4\)) is satisfied. We may assume that there exists \( x_0 \in \Omega \) such that \( \nabla p(x_0) \neq 0 \).

Define \( h \in C_0(B(x_0, \varepsilon)) \) as follows:
\[
h(x) = \begin{cases} 0, & |x - x_0| \geq \varepsilon \\ \varepsilon - |x - x_0|, & |x - x_0| < \varepsilon. \end{cases}
\]

By (f\(_4\)) and Lemma 2.9, there exists \( \varepsilon > 0 \) small enough such that
\[
\varphi(th) = \int_{\Omega} \frac{1}{p(x)} |\nabla th|^{p(x)} - \int_{\Omega} F(x, th) \, dx \to -\infty \text{ as } t \to +\infty.
\]

Since \( \varphi(0) = 0 \), \( \varphi \) satisfies the conditions of the mountain pass lemma. So \( \varphi \) admits at least one nontrivial critical point, which implies that problem (P) has a nontrivial weak solution \( u \). The proof of Theorem 1.1 is thus complete. □

In order to prove Theorem 1.2, we need to do some preparations. Note that \( X := W^{1,p}(\Omega) \) is a reflexive and separable Banach space (see [47], Section 17, Theorem 2-3). Therefore there exist \( \{e_j\} \subset X \) and \( \{e_j^*\} \subset X^* \) such that
\[
X = \text{span} \{e_j, j = 1, 2, \cdots \}, \quad X^* = \text{span}^{W^*} \{e_j^*, j = 1, 2, \cdots \},
\]
and
\[
\langle e_j^*, e_j \rangle = \begin{cases} 1, & \text{if } i = j, \\ 0, & \text{if } i \neq j. \end{cases}
\]

For convenience, we write \( X_j = \text{span} \{e_j\}, Y_k = \bigoplus_{j=1}^k X_j \) and \( Z_k = \bigoplus_{j=k}^{\infty} X_j \).

**Lemma 3.4.** Assume that \( \alpha \in C_+ (\overline{\Omega}) \), \( \alpha(x) < p^*(x) \) for any \( x \in \overline{\Omega} \). If
\[
\beta_k = \sup \left\{ |u|_{\alpha(\cdot)} \|u\| = 1, u \in Z_k \right\},
\]
then \( \lim_{k \to \infty} \beta_k = 0 \).

**Proof.** Obviously, \( 0 < \beta_{k+1} \leq \beta_k \), so \( \beta_k \to \beta \geq 0 \). Let \( u_k \in Z_k \) satisfy
\[
\|u_k\| = 1, 0 \leq \beta_k - |u_k|_{\alpha(\cdot)} < \frac{1}{k}.
\]
Then there exists a subsequence of \( \{u_k\} \) (which we still denote by \( u_k \)) such that
\[ u_k \to u, \]
and
\[
\langle e_j^*, u \rangle = \lim_{k \to \infty} \langle e_j^*, u_k \rangle = 0, \forall e_j^*.
\]
This implies that $u = 0$, and so $u_k \to 0$. Since the embedding from $W^{1,p(\cdot)}_0(\Omega)$ into $L^{p(\cdot)}(\Omega)$ is compact, we can conclude that $u_k \to 0$ in $L^{p(\cdot)}(\Omega)$. Hence we get $\beta_k \to 0$ as $k \to \infty$. The proof of Lemma 3.4 is thus complete. □

In order to prove Theorem 1.2, we need the following auxiliary result, see [50, Theorem 4.7]. If the Cerami condition is replaced by PS condition, we can use the following property, see [9, Theorem 3.6].

**Lemma 3.5.** Suppose that $\varphi \in C^1(X, \mathbb{R})$ is even and satisfies the Cerami condition. Let $V^+, V^- \subset X$ be closed subspaces of $X$ with $\text{codim} V^+ + 1 = \text{dim} V^-$. Suppose that:

1. $\varphi(0) = 0$;
2. $\exists \tau > 0$, $\gamma > 0$ such that $\forall u \in V^+ : \|u\| = \gamma \Rightarrow \varphi(u) \geq \tau$; and
3. $\exists \rho > 0$ such that $\forall u \in V^- : \|u\| \geq \rho \Rightarrow \varphi(u) \leq 0$.

Consider the following set:

$$
\Gamma = \{ g \in C^0(X, X) \mid g \text{ is odd, } g(u) = u \text{ if } u \in V^- \text{ and } \|u\| \geq \rho \}.
$$

Then

(a) $\forall \delta > 0$, $g \in \Gamma$, $S^+_\delta \cap g(V^-) \neq \emptyset$, here $S^+_\delta = \{ u \in V^+ \mid \|u\| = \delta \}$; and

(b) the number $\tau := \inf_{g \in \Gamma} \sup_{u \in V^-} \varphi(g(u)) \geq \tau > 0$ is a critical value for $\varphi$.

**Proof of Theorem 1.2.** We first establish the existence of infinitely many pairs of weak solutions.

According to $(f_0)$, $(f_1)$ and $(f_3)$, $\varphi$ is an even functional and satisfies the Cerami condition. Let $V_k^+ = Z_k$ be a closed linear subspace of $X$ and $V_k^+ \oplus Y_{k-1} = X$.

Suppose that $(f_4)$ is satisfied. We may assume that there exists $x_n \in \Omega$ such that $\nabla p(x_n) \neq 0$.

Define $h_n \in C_0(\overline{B(x_n, \varepsilon_n)})$ by

$$
h_n(x) = \begin{cases} 0, & |x - x_n| \geq \varepsilon_n \\
\varepsilon_n - |x - x_n|, & |x - x_n| < \varepsilon_n. 
\end{cases}
$$

Without loss of generality, we may assume that

$$
supp h_i \cap supp h_j = \emptyset, \forall i \neq j.
$$

By Lemma 2.9, we can let $\varepsilon_n > 0$ be small enough so that

$$
\varphi(t h_n) = \int_{\Omega} \frac{1}{p(x)} |\nabla t h_n|^{p(x)} - \int_{\Omega} F(x, t h_n) dx \to -\infty \text{ as } t \to +\infty.
$$

Suppose that $(p_3)$ is satisfied. Define $h_n \in C_0(\overline{B(x_n, \varepsilon_n)})$ by

$$
h_n(x) = \begin{cases} 0, & |x - x_n| \geq 3\delta_n \\
3\delta_n - |x - x_n|, & 2\delta_n \leq |x - x_n| < 3\delta_n \\
\delta_n, & |x - x_n| < 2\delta_n.
\end{cases}
$$
Note that \( \min_{|x - x_n| \leq \delta_n} p(x) > \max_{2\delta_n \leq |x - x_n| \leq 3\delta_n} p(x) \). It follows that
\[
\varphi(t_{n_0}) = \int_{\Omega} \frac{1}{p(x)} |\nabla t_{n_0}|^{p(x)} - \int_{\Omega} F(x, t_{n_0}) dx \\
\leq \int_{2\delta_n \leq |x - x_n| \leq 3\delta_n} \frac{1}{p(x)} |\nabla t_{n_0}|^{p(x)} - \int_{|x - x_n| \leq \delta_n} C_1 |t_{n_0}|^{p(x)} dx + C_2 \to -\infty
\]
as \( t \to +\infty \).

Set \( V_k^- = \text{span} \{ h_1, \cdots, h_k \} \). We will prove that there exist infinitely many pairs of \( V_k^+ \) and \( V_k^- \), such that \( \varphi \) satisfies the conditions of Lemma 3.5 and the corresponding critical value satisfies
\[
\omega_k := \inf_{g \in F} \sup_{u \in V_k^-} \varphi(g(u)) \to +\infty
\]
when \( k \to +\infty \). This shows that there are infinitely many pairs of solutions of the problem (P).

For any \( m = 1, 2, \cdots \), we will prove that there exist \( \rho_m > \gamma_m > 0 \) and large enough \( k_m \) such that
\[
(A_1) \quad b_{k_m} : = \inf \{ \varphi(u) \mid u \in V_{k_m}^+, \| u \| = \gamma_m \} \to +\infty \quad (m \to +\infty); \text{ and}
\[
(A_2) \quad a_{k_m} : = \max \{ \varphi(u) \mid u \in V_{k_m}^-, \| u \| = \rho_m \} \leq 0.
\]

First, we prove \( (A_1) \) as follows. By computation, for any \( u \in Z_{k_m} \) with \( \| u \| = \gamma_m = m \), we have
\[
\varphi(u) = \int_{\Omega} \frac{1}{p(x)} |\nabla u|^{p(x)} dx - \int_{\Omega} F(x, u) dx \\
\geq \frac{1}{p^+} \int_{\Omega} |\nabla u|^{p(x)} dx - C \int_{\Omega} |u|^{\alpha(x)} dx - C_1 \int_{\Omega} |u| dx \\
\geq \frac{1}{p^+} \| u \|^{p^-} - C |u|^{\alpha(\xi)} - C_2 |u|^{\alpha(\xi)} \quad (\text{where } \xi \in \Omega) \\
\geq \left\{ \begin{array}{ll}
\frac{1}{p^+} \| u \|^{p^-} - C \beta_{k_m}^- |u|^{\alpha^-} - C_2 \beta_{k_m} |u|, & \text{if } |u|_{\alpha(\xi)} \leq 1, \\
\frac{1}{p^+} \| u \|^{p^-} - C \beta_{k_m}^+ |u|^{\alpha^+} - C_2 \beta_{k_m} |u|, & \text{if } |u|_{\alpha(\xi)} > 1,
\end{array} \right.
\geq \frac{1}{p^+} \| u \|^{p^-} - C \beta_{k_m}^- (|u|^{\alpha^-} + 1) - C_2 \beta_{k_m} |u|.
\]

Obviously, there exists a large enough \( k_m \) such that
\[
\frac{1}{p^+} \| u \|^{p^-} - C \beta_{k_m}^- (|u|^{\alpha^-} + 1) - C_2 \beta_{k_m} |u| \geq \frac{1}{2p^+} \| u \|^{p^-}, \quad \forall u \in Z_{k_m} \text{ with } \| u \| = \gamma_m = m.
\]

Therefore \( \varphi(u) \geq \frac{1}{2p^+} \| u \|^{p^-}, \quad \forall u \in Z_{k_m} \text{ with } \| u \| = \gamma_m = m. \) Hence \( b_{k_m} \to +\infty \) as \( m \to +\infty \).

Now we give a proof of \( (A_2) \). According to the above discussion, it is easy to see that \( \Psi(t_{k_m}) \to -\infty \) as \( t \to +\infty \). Therefore
\[
\varphi(t) \to -\infty \quad \text{as } t \to +\infty, \forall h \in V_{k_m}^- = \text{span} \{ h_1, \cdots, h_{k_m} \} \text{ with } \| h \| = 1.
\]

This completes the proof of Theorem 1.2. □
