Abstract

India is well known as "Land of Spices" across the world since long back. We have been cultivating these precious spices for fulfilling our various needs since ages. Our ancestors have been using these seed spices for adding taste and flavor in edibles and beverages. It has been used in treatment of various ailments, which is evident from our old literature. These spices are collections of a wide variety of volatile and non-volatile staple dietary additives. These spices have been known for ages as effective therapeutic food. The power of seed spices to impart biological activity is now slowly re-emerging as an area of interest for human health. Nowadays people are moving towards naturopathy because they don't want to bear silently the aftermath of allopathic medicines. Now, time has changed and it's high time for Ayurveda and Unani medicine system to regain its lost glory. In these systems, only natural products are used for preparing medicines, which don't have any side effects.

In this way, the seed spices, which have many medicinal properties, can be a good alternative. Seed spices produce numerous secondary metabolites or phytochemicals, these are naturally occurring, biologically active chemical compounds in plants, where they act as a natural defense system for host plants and that have historically been used as fragrance and flavor agent and pharmaceuticals compounds. These are a gold mine of possibilities in our search for beneficial bioactive compounds for pharmacology and other health related issues. Seed spices influence various systems in the body such as gastrointestinal, cardiovascular and reproductive and nervous systems resulting in diverse metabolic and physiologic actions. Seed spices have a diverse array of natural phytochemicals that have complementary and overlapping actions, including antioxidant effects, Anticancer, Antidiabetic, Antimicrobial Activity, Hypolipidemic effect, Insecticidal, useful in menstrual disorders, helping in digestion, Modulation of hypertension, detoxification enzymes, reduction of inflammation, modulation of steroid metabolism, stimulation of immune system and helps in improve other several human disorder. The present review on therapeutic potential of seed spices namely Ajwain, Coriander; Cumin, Dill, Fennel, Fenugreek and Nigella.

Keywords: Seed spices; Ajwain; Coriander; Cumin; Dill; Fennel; Fenugreek; Nigella; Medicinal; Therapeutic; Nutraceutical; Antioxidant

Abbreviations: TAE: Total Alcoholic Extract; HCH: Hexachlorocyclohexan; GST: Glutathione-S-Transferase; LPO: Lipid Peroxidation; COX: Cyclooxygenase Enzyme; TQ: Thymoquinone; MND: Minimal Neurological Deficit

Introduction

To treat and prevent the diseases use of seed spices have a long history. It is confirmed by many studies that seed spices can be useful medicines, but how to provide scientific evidence and plausible mechanisms for their therapeutic responses is still a major challenge. Therapeutic potential of seed spices to treat multiple symptoms of the metabolic syndrome such as diabetes, obesity, insulin resistance, hypertension and altered lipid profile given focus in this review. Oxidative stress and inflammation have been proposed as initiators of the metabolic syndrome, which prevalent and has become an important financial burden to the healthcare mechanisms in both developing and developed countries. Natural constituents with anti-inflammatory and anti-oxidant properties are present in seed spices. Proper doses of these compounds may be effective in curing the metabolic syndrome. Spices have been known for ages as effective therapeutic food. The power of spices to impart biological activity is now slowly reemerging as an area of interest for human health. Dietary choice remains the basis for maintaining a healthy lifestyle and well-being, despite remarkable advances in medicine and pharmaceutical drug development [1,2].

Besides food being a lifestyle choice, age-old anecdotal reports from many cultures strongly suggest a role for diet as well as Indian spices in both preventive and therapeutic medicine [3,4]. However, the major challenge in the use of seed spices as preventive and therapeutic medicines is in demonstrating their health benefits by scientific means, comparable with the standards applied for pharmaceutical agents [3]. Further, unlike pharmaceutical agents which are administered in predetermined doses as pure and concentrated preparations, seed spices are consumed in combinations and in unmeasured and variable quantities in different cultural settings. Therefore, the major challenge is to provide scientific evidence to define these benefits as well as plausible mechanisms by which these products are effective in a...
disease setting. Around 60% of the world’s population depends on herbal medicine, a broad term including spices, for primary healthcare [5]. Spices are pungent or aromatic substances from dried seeds, fruits, roots, bark and leaves used as additives to colour, flavour, and preserve food. Seed spices are part of everyday cooking and significant quantities may be consumed in India in meals. These data show a realistic possibility to achieve therapeutic doses of the active ingredients in seed spices by dietary consumption alone. However, for many patients, treatment with functional foods or nutraceuticals with enhanced concentrations of the active ingredients of the spices may be necessary.

There is a widespread research effort in India to define the potential health benefits of herbal medicines, including spices, and identify the active ingredients, especially compounds with anti-oxidant and anti-inflammatory properties [4,5]. The seed spices constitute an important group of agricultural commodities and play a significant role in our national economy. Historically, India has been recognized as a land of spices. The states, Rajasthan and Gujarat have together contributed more than 80 per cent of the total seed spices produced in the country. Seed spices produce numerous secondary metabolites or phytochemicals, these are naturally occurring, biologically active chemical compounds in plants, where they act as a natural defense system for host plants and that have historically been used as pharmaceuticals, fragrances, flavor compounds, dyes, and agrochemicals. With the help of modern biological and computational science technology chemoinformatics will help us to development of novel drugs. Even today, these metabolites are a major source of new drugs [6]. They are a gold mine of possibilities in our search for beneficial bioactive compounds for pharmacology and other health related issues. Chemoinformatics opens a new ways to explore seed spices as gold mines for pharmaceuticals industries [7].

They are classified by functional groups, e.g. alcohols, aldehydes, amines, esters, ethers, ketones, terpenes, thioles and other miscellaneous compounds. In spices, the volatile oils constitute these components [8]. Population demographics, increased focus on health versus disease, drive towards self care and self diagnosis and growing knowledge of consumers about traditional medicines are the main driving force for the growth of global phytochemical industry. Today, these metabolites are a major source of new drugs. Plant-derived substances have recently become of great interest owing to their versatile applications. The present review is an effort to present a consolidated report on the current status of research related medicinal and therapeutic potential of Seed Spices namely Ajwain (Trachyspermum ammi L.), Cumin (Cuminum cyminum L.), Coriander (Coriandrum sativum L.), Dill (Anethum sowaL.), Fennel (Foeniculum vulgare Mill.), Fenugreek (Trigonellafoenum-graecum L.) and Nigella (Nigella sativa L.).

Health benefits of Seed Spices: what is the Evidence?

The contribution of oxidative stress and inflammation in initiating the symptoms of metabolic syndrome is now well-known. Suitable therapeutic interventions targeting these oxidative and inflame-matory processes may be effective in preventing and treating the metabolic syndrome. Several reviews have discussed the use of herbal medicines, including seed spices, in the treatment of the symptoms of metabolic syndrome such as diabetes [4,9], insulin resistance [10], hypertension and other cardiovascular diseases [11] and inflammation [12]. This section deals with the possible therapeutic benefits of the seed spices in the treatment of the symptoms of metabolic syndrome, in particular because of their anti-oxidant or anti-inflammatory effects.

Ajwain (Trachyspermum ammi)

Name for ajwain (Trachyspermum ammi) is derived from Sanskrit ajamoda or ajamodika. It is a member of the Apiaceae family and considered to be originated in the Egypt and the Indian subcontinent, but also in Iran and Afghanistan. It is having good place in Indian cooking, where it is also known as bishop’s weed or carom [13]. There are 26 identified components present in ajwain essential oil accounting 96.3% of the total quantity. Major component found was thymol (39.1%) followed by p-cymene (30.8%), γ-terpinene (23.2%), γ-pinene (1.7%); terpinene 4-ol (0.8%), while acetone extract of ajwain exhibited the presence of 18 identified components which account for 68.8% of the total quantity. The main component found are thymol (39.1%) followed by oleic acid (10.4%), linoleic acid (9.6%), γ-terpinene (2.6%), p-cymene (1.6%), palmitic acid (1.6%) and xylene (0.1%) [14].

Ajwain also used sometimes as an ingredient in barbered, a spice mixture favored in Eritrea and Ethiopia [15,16]. Ajwain is an annual herbaceous plant having 30-70 cm (1-2 ft) height, with feathery leaves and red flowers. Ripe seeds are dried and threshed [17,18] manually and/or mechanically. Ajwain seed (fruit) is reported to have antifungal/antibacterial, anti-septic and antithelminitic effects [19]. The major phenolic compound thymol found in ajwain has been reported to be an antispasmodic, germicide and antifungal agent [20]. The principle active constituents of ajwain oil are phenols, mainly thymol (35-60%) and some carvacrol [21]. Both the phenols thymol and carvacrol are having antiseptic, expectorant and antitusive properties [22]. Thymol also has antiseptic activity and carvacrol possesses antifungal properties [23].

Medicinal and Pharmacological Properties

a) Gastro protective activity: Ajwain (Trachyspermum ammi) seed manifest anti-ulcer activity. Animals pre-treated with ethanolic extract exhibit remarkable decrease in ulcer protection per cent and ulcer index in all models. The findings inferred that the extract showed significant protection by reducing ulcerative lesions when compared with control group of animals [24].

b) Abdominal pain: Ajwain is considered as traditional medicine for relieving abdominal pain especially in rural hemlets from time immemorial. A traditional remedy of ajwain for abdominal pain is to make a standard infusion using 2 tsp of bruised seeds or 1 tsp of ajwain powder to 570 ml cold water in a small pan. Boil, simmer for up to 2 minutes and then strain for use. It can be used for treating respiratory and digestive infections, asthma, cramp muscle spasms, colic gripping pains,
edema, arthritis and rheumatism. Wound cleaning and skin infection treatment can also be done by external use of ajwain as an antiseptic. Like all medicinal herbs, ajwain is grown organically to avoid its intrinsic properties being partly or completely eliminated by the presence of foreign substances [25].

c) Hepatoprotective activity: The results revealed [26] that hepatoprotective actions in vivo of ajwain was 80% protective in mice against a normally-lethal dose of paracetamol (1 g kg⁻¹). It prevented the CCl₄-induced prolongation of pentobarbital sleeping time in mice and it tended to normalize the high serum levels of liver enzymes caused by CCl₄-induced liver damage in rats.

d) Anti-spasmodic: Ajwain seeds and its oil used for medicine. The seed can also be powdered with the help of grinder or pin mill and tied tightly in a thin cloth to treat migraine headaches and heavy colds by inhaling the aroma frequently throughout the day. Take 100 g of ajwain, 50 g of ginger powder and 25 g of black salt and crush them together to be put in a dry container. Applying hot formation on the area of pain will bring faster relief [24,27].

e) Digestive stimulant actions: Ajwain would increase the secretion of gastric acid nearly four times. In experimental rats in vivo, the addition of ajwain to the diet reduced food transit time and also enhanced the activity of digestive enzymes and/ or caused a higher secretion of bile acids [24].

f) Antiflatulent: Traditionally ajwain is used to allay the retention of gas and flatulence. It is in practice in rural areas to use ajwain in a very special way. One famous preparation can be made by taking 500g ajwain seed, 20g rock salt, 20g black salt and 20g table salt. Put all of these in 500ml lemon juice for a few days to be dried at its own. Taking with warm water half to one teaspoonful of this specially prepared ajwain mixture is an excellent home remedy to treat abdominal gas anorexia, nausea, travel sickness and vomiting [28].

g) Antimicrobial influence: Ajwain is also known for its excellent antimicrobial influence. It protect the food stuff against microbial spoilage, conducting laboratory assays of antimicrobial efficacy in vitro and its use as antimicrobials in humans are also investigated. The active compounds of ajwain viz., carvacol and thymol considered to be responsible for the antimicrobial activity. Third generation antibiotics and multidrug resistant microbial pathogens can be killed by thymol and thus works as a plant based 4th generation herbal antibiotic formulation [29,30].

h) Antifungal effect: Antifungal effect of volatile oil of ajwain seeds on 10 fungi (Alternaria grisea, A. tenuissima, Acrophialophora fassipora, Curvularia lunata, Drechslera tetramera, Fusarium chlamydosporum, F. poae, Myrothecium roridum, Papulospora sp. and Rhizoctonia solani) was tested and found to curb the growth of all tested fungi by 72-90%. Phenolic compounds, such as carvacol and thymol, are known to be either bactericidal or bacteriostatic agents depending on the used concentration [14,31].

i) Anti-inflammatory power: Anti-inflammatory power of the Total Alcoholic Extract (TAE) and Total Aqueous Extract (TAQ) of the Ajwain seeds was also determined. The TAE and TAQ shown significant (p<0.001) antiinflammatory activity in both the animal models. The weights of the adrenal glands were found to be significantly increased in TAE and TAQ treated animals. The TAE and TAQ extracts from the ajwain seeds exhibit significant anti-inflamatory potential [32].

j) Anthelmintic effect: Ajwain seed having anthelmintic influence and very much effective against specific helminths, e.g. Ascaris lumbricoides in humans and Haemonchus contortus in sheep. The activity exerted by interference with the energy metabolism of parasites through potentiation of ATPase activity and thus loss of energy. Ajwain plant has also been reported to have cholinergic activity with gut’s peristaltic movements, thus helps in expulsion of intestinal parasites [33].

k) Nematicidal action: Wilt disease in pine caused by the pinewood nematode (PWN), Bursaphelenchus xylophilus. Nematicidal activity of ajwain oil constituents (camphene, pinene, myrcene, limonene, terpinene, terpinen-4-ol, thymol and carvacrol) found to be against PWN. Amino and hydroxyl groups have also been reported as target sites of methyl isothiocyanate in nematicides. Essential oils have been reported to interfere with the neuromodulator octopamine or GABA gated chloride channels of insect pests. Carvacrol and thymol are found to be very effective against PWN. These findings confirm that the nematicidal activity of ajwain oil is mainly attributed to the activity of carvacrol and thymol [34,35].

l) Amebiasis: In the Unani system, Ajwain is used as a crude drug to enhance the body’s resistance and is prescribed in amebiasis [36].

m) Antihypertensive and broncho-dilating property: The antihypertensive effect of Trachyspermum ammi administered intravenously in vivo and the antispasmodic and broncho-dilating actions. In vitro showed that calcium channel blockade has been found to mediate the spasmolytic effects of plant materials and it is being considered that this mechanism contributed to their observed result and supported the traditional use of Trachyspermum ammi in hyperactive disease states of the gut such as colic and diarrhea as well as in hypertension [26].

n) Antitussive actions: These effects of aerosols of two different concentrations of aqueous and macerated extracts and carvacrol, codeine and saline were tested by counting the number of coughs. Significant reduction of cough number obtained in the presence of both concentrations of aqueous and macerated extracts and codeine (p<0.001 for extracts and p<0.01 for codeine) [37].

o) Antiplatelet-aggregatory property: A research study [38] was intended to support the traditional use of ajwain in
women post parturition. Antiplatelet-aggregatory experiments in vitro with blood from human volunteers, it that a dried ethereal extract of ajwain seeds, inhibited aggregation of platelets induced by collagen, arachidonic acid, and epinephrine.

p) Hypolipidemic action: In albino rats antihyperlipidemic effect of ajwain seed has been obtained. It was assessed that powder made by ajwain seed at a dose rate of 2 g kg⁻¹ body weight and its equivalent methanol extract were extensively effective in lipid lowering action by decreased LDL-cholesterol, total cholesterol, triglycerides and total lipids [39].

q) Antilithiasis and diuretic property: It was found in a study conducted on antilithiasis and diuretic property in vivo that ajwain was not effective in increasing the 24 hour urine production. Hence, it was concluded that the traditional use of T. ammi in the treatment of kidney stones was not supported by their experimental evidence [40].

r) Abortifacient and galactogogue effect: At ICAR-National Dairy Research Institute, Karnal, India a study was carried out on the estrogenic content in some herbs which are traditionally used to increase milk yield in dairy cattle. Ajwain has also been traditionally used as a galactogogue in human beings. Total phytoestrogen content of dry Trachyspermum ammi seed was 473 ppm, which was the second highest in the list of eight herbs tested [41].

s) Detoxification of aflatoxin action: Ajwain seed extract exhibited maximum degradation of aflatoxin G1 (AFG1). Aflatoxin detoxifying action of the seed extract reduced significantly while boiling. Remarkable levels of degradation of other aflatoxins namely, AFB1, AFB2 and AFG2 by the dialyzed seed extract were also recorded. Time course study of AFG1 detoxification by dialyzed ajwain seed extract exhibited more than 91% degradation at 24 h and 78% degradation within 6 h after incubation [42].

t) Ameliorative influence: Influence of ajwain seed extract on hexachlorocyclohexane (HCH)-induced oxidative stress and toxicity in rats were studied. Ajwain seed extract pre-feeding resulted in increased GSH, GSH-peroxidase, SOD, G-6-PDH, catalase, Glutathione-S-Transferase (GST) activities and decreased hepatic levels of lipid peroxides. It was inferred from the investigation that HCH administration as in produce the hepatic free radical stress, causing toxicity, which could be reduced by the dietary ajwain seed extract [14].

u) Coriander (Coriandrum sativum L.): Coriander (Coriandrum sativum L.) is an important seed spice crop belongs to Apiaceae family. It is a well-known herb, originated in the native to Europe and Western Asia. Coriander is now widely cultivated in many other parts of the world for its leaves, seeds and essential oil production. It is commonly grown in India, Pakistan, Bangladesh, Russia, Central Europe, Morocco, and China. The volatile oil content of the spice can vary considerably according to the type and source and usually ranges from 0.1 to 1.7% and, in some cases, up to 2.7%. European coriander is mainly of the small fruited type and usually has volatile oil content greater than 0.4%, with the highest values exhibited by some Russian cultivars. It is generally used in gastrointestinal complaints such as anorexia, dyspepsia, flatulence, diarrhoea, gripping pain and vomiting [43]. The stems and leaves contain caffeic, chlorogenic, ferulic and gallic acids [44]. The seeds were effective as an antidiabetic agent administered as 6.25% in food in streptozotocin-diabetic mice [45], and as a hypolipidaemic agent as 10% in food in rats fed 15% coconut oil and 2% cholesterol [46].

Continuous intravenous infusion of the crude aqueous extract of coriander (40 and 100 mg/kg) induced dose-dependent diuresis, natriuresis, kaliuresis, increased chloride excretion and increased glomerular filtration rate in anaesthetized Wistar rats [47]. Alcoholic extract of coriander (200 mg/kg) decreased fasting serum glucose concentration and increased insulin release from pancreatic β-cells in streptozotocin-induced diabetic rats [48]. Oral intake of fruit powder (8% w/w of food) in cholesterol-fed rats decreased plasma total cholesterol, LDL-cholesterol and total lipid concentrations, while increasing the HDL-cholesterol [49]. The composition of the volatile oil, which determines the odour and flavour character, contains both volatile and fixed oil. The volatile oil is rich in beneficial phytonutrients, including carvone, geraniol, limonene, bornyl, camphor, elemol, and linalool. Linalool is the major constituent (25-80 per cent) [50]. Coriander seeds have a health-supporting reputation that is high on the list of the healing spices. In parts of Europe, coriander has traditionally been referred to as an anti-diabetic plant. In some parts of India, it has traditionally been used for its anti-inflammatory properties.

**Medicinal and Pharmacological Properties**

a) Antibacterial activity: Essential oils from commercial samples of coriander were showed antibacterial, antifungal and antioxidant activities. The essential oils of coriander showed a high degree of inhibition against twenty-five genera of bacteria and one fungal species (Aspergillus niger) [51].

b) Hypoglycemic activity: Coriander has been documented as a traditional treatment for diabetes from immortal time. Coriander lowered the blood sugar when added to the diet of diabetic mice. The antihyperglycemic action of coriander is associated with stimulation of insulin secretion and enhancement of glucose uptake and metabolism by muscle, reflecting the effects of more than one active constituent. Coriander therefore, represents a possible antihyperglycemic dietary adjunct and potential source of orally active agent(s) for diabetes therapy. The presences of antihyperglycaemic, insulin releasing and insulin-like activity in coriander were demonstrated by Sevan [52].

c) Hypolipidemic activity: The study shows that the concentrations of cholesterol and cholesterol to phospholipid ratio decreased while the level of phospholipid increased. Coriander plays a protective role against the deleterious effects in lipid metabolism in experimental colon cancer [53,54]. Some
of the acids present in coriander viz. linoleic acid, oleic acid, palmitic acid, stearic acid and ascorbic acid (vitamin-C) are very effective in reducing the cholesterol level in the blood. They also reduce the cholesterol deposition along the inner walls of the arteries and veins [55].

d) Aflatoxin control: The essential oil of coriander showed significant inhibitory effects of on the mycelial growth and toxin produced by A. ochraceus [56]. The potential of coriander oil in the control of A. niger, Saccharomyces cerevisiae, Mycoderma sp., L. acidophilus and Bacillus cereus [57].

e) Antioxidant activity: Leaf and seed extracts of coriander and coriander oil were tested for their antioxidant activity using different bioassay techniques and a positive correlation were found between total phenolic content in the extracts and antioxidant activity. Coriander leaves showed stronger antioxidant activity than the seeds [58].

f) Cumin (Cuminum cyminum L): Cumin (Cuminum cyminum L) is an annual herb that belongs to the family Apiaceae having the somatic chromosome number of 2n=14. The Latin name Cuminum is derived from the Greek “Kuminon”, originated probably from the old Babyleniun name for cumin-‘ka-ma-nu’. Cumin, native of Egypt, is now grown in most hot regions like India, North Africa, China and America. The spice is especially associated with Morocco, where it is often smelt in the abundant street cookery of the medinas. Cumin was known to the Egyptians five million years ago. Its seeds have been found in the old kingdom pyramids. The Romans and Greeks used it medicinally and cosmetically to induce a pallid complexion. Cumin and value added products from cumin are used in food flavoring and perfumery. Cumin contains volatile oil (3-4%), the major active principle of volatile oil is cuminaldehyde, which is present to an extent of 45-50% and is an important phytochemical and possesses many health benefits [59], reported that the main constituents of cumin seed oil were cuminaldehyde which is responsible for its characteristic odour other components are -pinene, -terpinene, p-metha-1,3-dien-7-al, p-mentha-1,4-dien-7-al, and p-cymene [59].

Cumin seed contains moisture (7%), volatile oil (3-4%), protein (12%), total ash (1%), fiber (11%), carbohydrate (33%), starch (11%), and fat (15%). The composition of cumin changes according to the region and climate where it is grown. Cumin seeds are a common dietary spice consumed in fairly large quantities in India. They are widely used in Ayurvedic medicine for treatment of dyspepsia, diarrhoea and jaundice [60]. Cuminaldehyde is suggested as the active ingredient in cumin seeds (Figure 1) [3,7]. An aqueous extract of cumin seeds prevented the accumulation of advanced glycation end-products due to fructose-mediated in vitro glycation of eye lens soluble proteins [61]. Hypoglycaemic effects of cumin seeds were also observed in normal rabbits [62]. Dietary cumin showed marked hypoglycaemic responses in streptozotocin-diabetic rats by reducing blood and urinary glucose concentrations [63]. An aqueous extract of seeds lowered blood glucose and plasma and tissue lipid concentrations in alloxan-induced diabetic rats [60]. Cumin also has a number of medicinal uses and helps in curing many diseases. In Ayurvedic medicine, cumin is considered a warming spice, invaluable for digestion. It is also a cleansing spice that helps burn toxins and enhances the appetite. Traditional uses of cumin include anti-inflammatory, diuretic, carminative, and antispasmodic. It has also been used to treat dyspepsia, jaundice, diarrhea, flatulence, and indigestion. Cumin powder is used as a poultice and smoked in a pipe and also taken orally.

![Cuminaldehyde](image)

**Figure 1:** Cuminaldehyde, an active ingredient of cumin

### Medicinal and Pharmacological Properties

- **Antioxidant Activity:** Cumin seeds contain flavonoids, viz., apigenin and luteolin, which are now generally recognized to have antioxidant activity. The petroleum ether soluble fraction of cumin has been reported to have antioxidant activity [64]. Cuminaldehyde has been demonstrated to scavenge the superoxide anion [65].

- **Blood Platelet Aggregation:** Cumin extract in etherinhibited arachidonate-induced platelet aggregation in human platelets in a dose-dependent manner [66].

- **Antidiabetic:** Dietary cumin countered other metabolic terations as revealed by lowered blood urea level and reduced excretions of urea and creatinine by diabetic animals [67]. The elevated plasma urea level of diabetic animals was significantly lowered by about 50% by dietary cumin. Cumin has been used as one of the ingredients of a herbal antidiabetic drug, which was found to be effective in human subjects [68].

- **Antimicrobial Activity:** Essential oil and alcoholic extract of cumin has shown antimicrobial activity against Klebsiella pneumoniae ATCC 13883 and ceftazidime-resistant strain. Cumin oil and cuminaldehyde have been reported to exhibit strong larvicidal and antibacterial activity. The essential oil and alcoholic extract of cumin seed could be used in medicinal industries (disinfectant or antiseptic) [69].

- **Anticancer Effects:** The spice appears to have an anticancer effect as demonstrated by the ability of cumin seeds to inhibit the induction of gastric squamous cell carcinomas [70]. In rats fed with cumin, a protective effect against induced colonic cancer was demonstrated.

- **Dillseed (Anethum sowa L.):** Dill seed (Anethum sowa L.) also known as Bengali- Shulfa, belonging to the family Apiaceae, comes undergenus Anethumandit is an annualand winter spice crop in Bangladesh. It is mostly grown in the northern part of Bangladesh. A variant called Indian dillorsowa (Anethum sowa
The essential oil of dill is having activate the secretion of some enzymes Major phytochemicals'82.80 81.

Table 1:

| Seed Spices | Major phytochemicals | Medicinal uses |
|-------------|----------------------|----------------|
| Ajwain      | Thymol, oleic acid, linoleic acid, γ-terpinene, p-cymene, palmitic acid and xylene | Digestive, pungent, mild stimulant, stomachic, carminative, aphrodisiac, anti-flatulence, anti-septic, anti-fungal, antibiotic, antithrombinic, anti-pasmodic, germicide, anti-thussive and expectorant |
| Cumin       | cuminaldehyde, β-pine, γ-terpinene | Gastrointestinal, reproductive, nervous and immune system. Antimicrobial, antioxidant and chemo-protective activity. |
| Coriander   | Linalool, carvone, geraniol, limonene, borneol, camphor, elemol | Digestive, carminative, diuretic, tonic, stimulant, refrigerant, aphrodisiac, analgesic, anti-inflammatory, antioxidant, insulin-like and anti-spargillus activity. |
| Dill        | Limonene, carvone, anethofuran | Digestion, insomnia, diarrhoea, dysentery, menstrual disorders, respiratory disorders, arthritis, gas, carminative, pain killer, antipyretic, stomachic and anti-flatulence |
| Fennel      | Anethole, fenchone, phenols | Aromatherapy, antioxidant, hepatoprotective, anticancer, Stimulant, carminative, stomachic, emmenagogue, refrigerant, cardiac stimulant, anti-emetic, aphrodisiac, antihelmintic and antimicrobi |
| Fenugreek   | Steroidal saponins(diogenin), Galactomanan, 4-HII | Carminative, tonic, aphrodisiac, emollient, antibiotic, used in vomiting, fever, anorexia, colitis, complementary medicines for cancer therapy, diabetes and oral contraceptive. |
| Nigella     | Nigellone, nigellicine, nigellimine, nigellimine-N-oxide, 4-ethyl-l-hopenol, β-amyrin, butyropermol, cycloartenol, 2-4-methyl-cycloartenol, taraxerol, tirucallol | Diuretic, antihypertensive, anti-diabetic, anticancer, immunomodulatory, analgesic, antimicrobial, antihelmintics, analgesics and anti-inflammatory, spasmylic, bronchodilator, liver tonic, gastrointestinal, epatoprotective, renal protective and antioxidant properties |

Medicinal and Pharmacological Properties

a) Medicinal uses: Anethum is used as an ingredient in grape water, given to relieve colic pain in babies and flatulence in young children [81]. The seed is aromatic, carminative, mildly diuretic, galactogogue, stimulant and stomachic [82] The essential oil in the seed relieves intestinal spasms and griping, helping to settle colic [78,83] The carminative volatile oil improves appetite, relieves gas and aids digestion. Anethum stimulates milk flow in lactating mothers and is often given to cattles for this reason. It also cures urinary complaints, piles and mental disorders [84].

b) Prevents Insomnia: The essential oil of dill is having properties like stimulating, sedative and hypnotic, those are they stimulate [85] as well as pacify. The essential oils in dill are no exception. Vitamin-B complex and flavonoids present in essential oil of dill seed activate the secretion of some enzymes and hormones which are having calm and hypnotic effects, hence helping people get a good night’s sleep.
c) Maintains Bone Health: Dill seed is also having good quality of calcium [86] of which, is an important element [86] protect from bone loss and bone mineral density reduction. Millions of people affected by osteoporosis each year and calcium, along with other essential minerals, is a key component in the proper growth and development of bones and the repair of injured bones as well.

d) Manages Diabetes: Dill seed is also having antidiabetic properties [81] diabetes and helps in management of insulin levels. It also reduces the fluctuations of serum lipids and insulin levels in corticosteroid-induced diabetes.

e) Prevents Excess Gas: As a well-known [87] carminative, dill can help prevent the embarrassing condition of excessive gas. It is not only an uncomfortable condition to experience in public, but if gas continues to build up, it can actually be a dangerous situation where it pressures on the delicate organs of the chest cavity. A carminative force gas downward through the digestive tract and allows it to leave the body in a safe way.

f) Boosts Immunity: Dill has long been associated with antimicrobial activity [88]. It can prevent a number of microbial infections of the body including the infections result in open wounds or small cuts on the skin.

g) Calms Hiccups: Dill seed is having the properties to calm hiccups which is caused due to trapped gas, its repeated upward movement through the food pipe, certain allergies, hypersensitivity, hyperactivity, and nervous malfunctioning. It also acts as a carminative, helps the expulsion of gases and also reduces gas formation; while as a sedative, dill seed helps to calm down hiccups [89].

h) Cures Diarrhea: Indigestion and microbial actions are the causes of diarrhea. Dill seed is having very good digestive properties can be quite helpful in indigestion. It is also helpful to cure diarrhea by inhibiting [90] microbial infections due to the monoterpenes and flavonoids present in its essential oils, which are gemicidal or bactericidal in nature.

i) Treats Dysentery: Dysentery is primarily caused [89] due to fungal infections. Dill essential oil is disinfectant in nature and it helps to inhibit fungal infections effectively.

j) Prevents Cancer: Let’s turn our attention to the monoterpenes we have been talking about. Monoterpenes are chemopreventive, and since they are stimulating in nature, they activate the secretion of an enzyme called glutathione S-transferase (the radical glutathione is an effective antioxidant) which is very effective in neutralizing carcinogens. It is particularly effective at neutralizing cyano- and benzo-derivatives and free radicals, thereby protecting the body from cancer. The other antioxidants in the essential oils of dill also contribute to cancer prevention [83].

k) Fennel (Foeniculum vulgare Mill.): Fennel (Foeniculum vulgare Mill.) belongs to family Apiaceae is a native of Southern Europe and Mediterranean region. It is widely cultivated throughout the temperate and subtropical regions of the world and major growing countries are Romania, Russia, Germany, France, Italy, India, Argentina and USA. It is also a very popular medicinal and economic plant in Asian countries. The herb has many culinary and traditional medicine uses. The bulb, young shoots, leaves and fully ripened and dried fruits are commonly used for homemade remedies. Its aromatic fruits have been used as a culinary spice in many countries [91]. Fennel herbal tea is a common household remedy traditionally used for the treatment of a variety of symptoms of the gastrointestinal and respiratory tract [92]. The chemical constituents from the fennel include essential oil, fatty acid, phenylpropanoids, monoterpenoids, sesquiterpenes and coumarins.

It also contains triterpenoids, tannins, flavonoids, cardiac glycosides, saponins, and other types of compounds. The relative content of essential oil in fennel fruits was about 3.0 to 5.0 % by weight. The essential oil of the most important fennel variety (var. dulce) contains anethol (50-80%), limonene (5%), fenchone (5%), estragol (methyl-chavicol), safrol, alpha-pinene (0.5%), alpha-phellandrene, camphene, beta-pinene, beta-myrcone and p-cymen.

In contrast, the uncultivated form (var. vulgare) contains often more essential oil, but since it is characterized by the bitter fenchone (12 to 22%), it is of little value [93]. The essential oil of fennel fruits is used for flavouring purpose, cosmetic and pharmaceutical products [94,95], identified 78 compounds from fennel fruits by GC-FID-MS, representing more than 98% of the oils. The seeds of fennel contain about 20% fatty acids and petroselinic acid is a characteristic fatty acid of fennel oil. The level of petroselinic acid could be as high as 70 to 80% [96]. The chemical analysis of the acetone extract of fennel showed that linoleic acid (54.9%), palmitic acid (54.4%) and oleic acid (5.4%) were major components in acetone extract [97].

There has been a growing interest in phenolic components of fruits and vegetables, which may promote human health or lowering the risk of disease. Aqueous extract of fennel fruits contains rich phenolic compounds. Many of them have antioxidant activities, such as 3-caffeoylquinic acid, 4-caffeoylquinic acid, rosmarinic acid, eriodictyol-7-orutinoside, quercetin-3-o-galactoside, kaempferol-3-orutinoside and kaempferol-3-o-glucoside. Besides, these compounds, fennel was reported containing hydroxyxlinamic acid derivatives, flavonoid glycosides and flavonoid aglycones [98].

Flavonoids were generally considered as an important category of antioxidants in the human diet. Some flavonoids such as quercetin arabinoside were identified from Foeniculum vulgare [99]. Flavonoids such as quercetin, rutin and isoorcicitrin were reported to have the immunomodulatory activities. It is prescribed as an aromatic stomachic and treats various conditions, particularly rheumatism, cold pain and stomach. Fennel essential oil possessed carminative and stimulant activities as well as spasmylic actions on the smooth muscles of experimental animals [100]. Furthermore, it possessed analgesic, anti-inflammatory and antioxidant activities. Oral administration of methanol extract of fennel exhibited inhibitory effect against acute and subacute inflammatory diseases and showed a central analgesic effect by inhibition of the allergic reactions. It significantly decreased the high density lipoprotein-
cholesterol level, thus decreasing the peroxidative damage [101]. The essential oil of fennel exhibited antibacterial and antiviral activities [102]. The aqueous and ethanol extracts of fennel exhibited potential antioxidant properties in vitro studies [103]. It might be useful for the treatment of cognitive disorders such as dementia and Alzheimer’s disease [104].

**Medicinal and Pharmacological Properties**

**a) Antimicrobial, antibacterial and antifungal activities:** Antimicrobial activities of plant oils and extracts have many applications, including raw and processed food preservation, pharmaceuticals, alternative medicine and natural therapies. Chloroform soluble fraction from fennel plant parts showed a robust antimicrobial action against fungi and bacteria. The compounds found in fennel like dillapiol, diillapiol, psoralen, scopoletin, bergapten and imperatorin were found to be having antimicrobial actions against *Aspergillus niger, Bacillus subtilis* and *Cladosporium cladosporioides* [105]. Essential oils from the fruits of fennel showed significant antibacterial activity to *Escherichia coli* and *Bacillus megaterium* [106]. Fennel essential oils may be useful natural bactericides for the control of bacterial diseases of plants. Essential oils components viz., anethole, fenchone and camphor exhibited antifungal properties against *C. cladosporioides, Penicillium helianthi* and *Trichophyton mentagrophytes*, however *Penicillium ochrochloron, Penicillium funiculosum* and *Trichoderma viride* were found resistant species [97,107]. Dichloromethane extracts and essential oils from *F. vulgare* showed antifungal activity against *Candida albicans*. It could be the candidate for a new antifungal agent for candidiasis and other fungal diseases [108].

**b) Antioxidant activities:** Now a day’s naturally-occurring antioxidants are popular to use to protect human beings from oxidative stress damage. Fennel was known as excellent sources of nature antioxidants and contributed to the daily antioxidant diet [109]. Wild fennel was found to exhibit a radical scavenging activity with higher content phenolic and flavonoid than medicinal and edible fennel, and the aerial parts of the Italian populations showed the highest DPPH scavenging activity [110]. The volatile oil exhibited strong antioxidant influence as compared to butyrylated hydroxyanisole and butylated hydroxytoluene [6,97] concluded that fennel genotype RF-101 show higher TPC, TFC and antioxidant activity in methanolic extract of oleeosin in comparison volatile oil of fennel seeds.

**c) Acaricidal activity:** Fennel oil show significant acaricidal activity and works very well against *Dermatophagoides pteronyssinus* and *Dermatophagoides farinae*. The main bioactive component is fenchone. *p*-anisaldehyde was the most toxic compound to *D. Farina*. Carvone characterized as bioactive constituent to potential house dust mite *Tyrophagus putrescentiae* [111].

**d) Estrogenic activity:** Fennel oil was reported to exhibit estrogenic activity, promote menstruation, alleviate the symptoms of female climacteric, and increase libido [112].

**e) Insecticidal activity:** The fennel extracts was reported to have insecticidal activity against different mites and insects [107]. An important compound found in fennel namely *Trans-pipiens* was known to have effective mosquito larvicidal activity [113]. Fennel extracts were found toxic against *Culex pipiens* larvae, and terpineol and 1,8-cineole were the most effective components against *Anopheles dirus* and *Aedes aegypti*. Hence, it was suggested that fennel can be used as an alternative of synthetic insecticides [111].

**f) Hepatoprotective activity:** Fennel essential oil could inhibit the CCl₄ induced acute hepatotoxicity. D-limonene and b-myrcene of the oil might be the potential candidates [112].

**g) Fenugreek (Trigonella foenum graecum L.):** Fenugreek is commercially important seed spice crop due to its multiligious uses. It is belongs to the family Fabaceae. There are two cultivated species of genus *Trigonella viz. foenum-graecum* (common fenugreek) and *corniculata* (Kasuri type fenugreek). Centre of origin of fenugreek is South-Europe, Mediterranean area and Western Asia. The major fenugreek producing countries are India, Argentina, Egypt, Southern France, Morocco, Spain, Turkey and China. Fenugreek, a strongly scented annual herb, is recommended for the treatment of rheumatism in traditional medicine. Saponins, glycoside-D and triglofoxenide-A are major components in the seeds [113], while alkaloids, cardiac glycosides and phenols are found in the leaf extract [114]. The steroidal saponins present in the seeds as parent compounds for physiological steroid production could influence the local inflammatory response [115,116].

Galactomannan, a guar gum comprising approx. 50% of the seed weight is postulated as another active ingredient in fenugreek seeds [117]. In high sucrose-fed rats, galactomannan feeding reduced appetite, body weight gain, glycemic response, plasma insulin concentrations and plasma triglycerides and total cholesterol concentrations [118]. In human studies, galactomannan reduced post-prandial blood glucose concentrations [119,120] and improved insulin sensitivity in both non-diabetic [121] and diabetic subjects [122]. Feeding guar-galactomannan fibre reduced both total and LDL cholesterol concen-trations in healthy and type 2 diabetic subjects [123]. It has a long history as both a culinary and medicinal herb. The seeds of fenugreek are commonly used as a spice in food preparations due to the strong flavour and aroma.

Fenugreek seed contains 45-60% carbohydrates, mainly mucilaginous fiber (galactomannan); 20-30% proteins high in lysine and tryptophan; 5-10% fixed oils (lipids); pyridine type alkaloids, mainly trigonelline (0.2-0.36%) choline (0.5%), gentianine and carpaine; flavonoids, such as apigenin, luteolin, orientin, quercetin, vitexin and isovitexin; free amino acids, such as 4-hydroxyisoleucine; arginine, histidine and lysine; calcium and iron; saponins (0.6 -1.7%); cholesterol and sitosterol; vitamins A, B, C and nicotinic acid; and 0.015% volatile oils (nalkanes and sesquiterpenes) [135]. Trigonelline degraded to nicotinic acid and related pyridines during roasting is responsible for the flavor of the seed [124]. The importance of diosgenin in the synthesis of oral
contraceptives and sex hormones have been documented [125]. Numerous studies have been carried out to reveal the therapeutic potential of fenugreek in various pathological conditions such as diabetes mellitus, cancer, hypertension, cataract, gastric disorders and obesity [126,127,128,129,130,131]. In a study [132], found that methyl fatty acid esters shows significant variation among genotypes and grinding methods.

**Medicinal and Pharmacological Properties**

a) **Diabetes Mellitus:** The fenugreek alkaloidal extract prevent the increased blood glucose level reduced lipid profile to almost normal and showed antioxidant effect on the tissues of liver and kidney in experimental rats [133]. Further, fenugreek powder treatment in patients suffering from mild Non-insulin dependent diabetes mellitus produced marked reduction in blood sugar and serum triglycerides and total cholesterol [127]. It has been documented from various studies that saponins and diosgenin present in fenugreek are responsible for hypoplipidemic and anti-diabetic action on hypercholesterolaemic rats [134]. It has been observed that supplementation of diet with fenugreek leaves and seeds in hyperglycemic rats prevented the increased levels of glucose by stimulating the process of glycolysis and inhibiting gluconeogenesis via stimulating enzymes such as hexokinase and inhibiting enzymes such as glucose 6-phosphatase and fructose 1, 6-biphosphatase and subsequently increasing the secretion of insulin [135]. It has been reported that the active principle present in water extract of fenugreek seeds in subdiabetic and overtly diabetic rabbits stimulated insulin synthesis and secretion from the beta pancreatic cells of langerhans and increased the sensitivity of tissues to available insulin [136]. The soluble dietary fibre fraction known as galactomannan present in endosperm of fenugreek seeds, has shown to reduce postprandial elevation in blood glucose level of Type 2 model diabetic rats by delaying the digestion of sucrose.

b) **Cancer:** The effect of fenugreek seeds observed in induced breast cancer in rats [136,137]. Further, the ethanolic extract of fenugreek showed antineoplastic effect on the growth of breast cancer cells by reducing cell viability, inducing early apoptotic changes, declining the mitochondrial membrane potential and degrading cellular DNA into fragments [138]. Moreover, an in vitro study revealed that diosgenin inhibited cell growth and induced apoptosis in the human colon cancer cell [139]. Further, reducing the levels of cholesterol and decreasing the expression of phospholipase A and C are responsible for prevention of tumor formation and improving the histological features. Its estrogenic property can be employed as anticancer and in hormone replacement therapy in which further studies are warranted.

c) **Antioxidant:** It has been documented in various studies that fenugreek bears potential of a powerful antioxidant in which the presences of flavonoids and polyphenols have been found to be responsible for the same [140]. The exposure of polyphenol rich extract of fenugreek seeds which showed protective effects against hydrogen peroxide induced oxidation by protecting the erythrocytes from haemolysis and lipid peroxidation in a dose dependent manner [141]. Further, fenugreek administration to diabetic animals showed a reversal of the disturbed antioxidant levels of enzymes such as catalase, superoxide dismutase and glutathione peroxidase and peroxidative damage in the tissues of heart and kidney [142]. Supplementation of fenugreek seed powder to diabetic rats normalized the alterations in lipid peroxidation and oxidative stress [143]. In different green plant parts of fenugreek, maximum phenolic content and flavonoid contents were observed in distilled water extract followed by methanol and ethyl acetate. Cryogrinding techniques improves its antioxidant activity and retains medicinal properties by prevent molecules which good for human health [144]. The ability of fenugreek as functional food tested by determining the lipid peroxidation (LPO), and cyclooxygenase enzyme (COX) inhibitory activities of hexane, ethyl acetate, methanolic and water extracts. The extracts inhibited the LPO by 50-95%, COX-1 by 6-87 % and COX-2 by 36-70 % respectively [145].

d) **Ulcer:** It is worth noting that fenugreek protects ulcer formation in rats via decreasing gastric volume, ulcer index value, total acidity, lesion formation and curative ratio by markedly increasing the level of mucus secretion [129]. It may be due to the cytoprotective action of fenugreek can be attributed to the presence of flavonoids; which exert their antulcer effect.

e) **Inflammation:** Fenugreek reduced paw edema in rats, the presence of alkaloids in extract of fenugreek has been reported to produce anti-inflammatory property by reducing edema in rats [146]. Fenugreek has been reported to accelerate the process of wound healing via its antioxidant potential in rats injured in the posterior neck area [147]. It may be suggested that the presence of diosgenin in fenugreek plays a key role in producing antiinflammatory action probably by acting the precursor of various steroid hormones such as progesterone and cortisone; which have set a benchmark for preventing inflammation in various pathological conditions.

f) **Obesity:** The beneficial effects of fenugreek fiber was studied in healthy obese subjects which demonstrated that fenugreek administration showed marked increase in satiety and fullness and marked fall in hunger and prospective food consumption with reduced energy intake using visual analog scale which may act supportive for treating acute obesity patients. Galactomannan and unpalatably of the fenugreek is assumed to be responsible for promoting satiety by decreasing the rates of gastric emptying and decreased energy intake respectively [130].

g) **Hypertension:** It has been elucidated that the administration of fenugreek methanol extract and methanol fraction to rats shows antihypertensive. The essential oil obtained from fenugreek in combination with other essential oils has been employed to reduce systolic blood pressure.
in spontaneously hypertensive rats [148]. The aqueous and benzene extract of fenugreek has been found to show diuretic activity in rats; which can be employed to treat hypertension [149].

h) Other Disorders: Administration of fenugreek seed extract to both mice and rats revealed its effect on thyroid hormone that fenugreek inhibits the synthesis of tri-iodothyronine concentration estimated by decrease in serum tri-iodothyronine concentration and T3/T4 ratio and consequently increased thyroxine levels which can be mediated through fenugreek-induced hypoglycaemia [150]. It has been reported that oral treatment with fenugreek reduced the quantity of calcium oxalate deposited in the kidneys induced by 3% glycolic acid in rats; which further supports its use in Saudi folk medicine [151]. Fenugreek showed anti-cataract property in sodium selenite-induced cataract in rats by restoring the levels of glutathione and other antioxidant enzymes such as superoxide dismutase, catalase, etc., in the lens and inhibiting the lipid peroxidation [131]. The alkaloidal, ethanol and butanol extract of fenugreek has been documented to possess anti-plasmodial activity against in vitro culture of chloroquine sensitive and resistant Plasmodium falciparum [152].

i) Nigella (Nigella sativa L.): Among various medicinal plants, Nigella sativa belongs to family Ranunculaceae, is emerging as a miracle herb with a rich historical and religious background. Many researches reported its wide spectrum of pharmacological potential. Nigella is considered to be originated in Southwest Asia, Southern Europe and North Africa. It is cultivated in many countries mainly in the world like India followed by Pakistan, Middle Eastern Mediterranean region, Southern Europe, Syria, Turkey, Saudi Arabia. The seeds of nigella and their oil have been widely used for centuries in the treatment of various ailments throughout the world. It is an important drug in the Indian traditional system of medicine like Unani and Ayurveda [153, 154].

Nigella is considered one of the important healing medicines for all diseases except death in one of the Prophetic hadith. It is also mentioned for use on regular basis in Tibb-e-Nabwi (Prophetic Medicine) [154]. Nigella possess wide spectrum of activities viz. as antidiabetic, diuretic, antihypertensive, anticancer and analgesic, immunomodulatory, antimicrobial, antihelminthic, antiglucosidic and anti-inflammatory, spasmyloytic, gastroprotective, bronchodilator, hepatoprotective, renal protective and antioxidant properties. The seeds of nigella are widely used in the treatment of various diseases like asthma, bronchitis, diarrhea, rheumatism and skin disorders. Nigella is also used as digestive, liver tonic, appetite stimulant, anti-diarrheal, emmenagogue, to increase milk production in nursing mothers to fight parasitic infections and to support immune system [155], [156]. Therapeutic properties of this herb are due to the presence of thymoquinone compound present in its essential oil. Nigella seeds are also used in food like flavoring additive in the breads and pickles because it has very low level of toxicity [157].

j) Chemical composition of nigella seeds: Many active compounds have been identified, isolated and reported in different varieties of nigella seeds. The important active compounds are thymoquinone (30%-48%), p-cymene (7%-15%), carvacrol (6%-12%), terpineol (2%-7%), l-anethol (1%-4%), sesquiterpene longifolene (1%-8%) thymohydroquinone (1.17% - 2.31%), α-pinene and thymol etc. Its seeds also contain two different types of alkaloids; i.e. isoquinoline alkaloids e.g. nigellicine and indazole ring bearing alkaloids or nigellicine-N-oxide and pyrazol alkaloids which include nigelicine and nigellidine. Besides, Nigella seeds also contain α-hederin, a water soluble pentacyclic triterpene and saponin, an important anticancer agent [158,159].

Some other compounds e.g. carvone, limonene, citronellol were also found in trace amounts. Most of the pharmacological properties of Nigella sativa are mainly attributed to quinine constituents, of which TQ is the most abundant. On storage, TQ yields dithymoquinone and higher oligocondensation products. The seeds of Nigella sativa contain protein (26.7%), fat (28.5%), carbohydrates (24.9%), crude fibre (8.4%) and total ash (4.8 %). The seeds are also containing good amount of various vitamins and minerals like Cu, Zn and Fe etc. The seeds contain carotene which is converted by the liver to vitamin A. Root and shoot are reported to contain vanillic acid [160,161]. Nigella seeds also reported to contain fatty oils rich in unsaturated fatty acids, mainly linoleic acid (50-60%), oleic acid (20%), dihomolinoctic acid (10%) and eicodadienoic acid (3%). Palmstic, stearic acid (saturated fatty acids) (30% or less), α-sitosterol is a major sterol, which accounts for 44% and 54% of the total sterols in Tunisian and Iranian varieties of nigella seed oils respectively, followed by stigmastanol (6.57-20.92% of total sterol) [162,163]. Some other reports of chemical components includes niggellone, campessterol, cholesterol, citrostadienol, cycloecuclenol, gramisterol, lophenol, obtusifoliol, stigmastanol, avenasterol-5-ene, avenasterol-7-ene, stigmastanol-7-ene, β-amyrin, butyro-spermol, cycloartenol, 24-methylene-cycloartenol, taraxerol, tircalol, 3-0-[β-D-xylpyranosyl (1→3)-α-L-rhamnopyranosyl (1→2)-α-L-arabinopyranosyl]-28-O-[α-L-rhamnopyranosyl (1→4)-β-D-glucopyranosyl (1→6)-β-D-glucopyranosyl] hederagenin, volatile oil (0.5-1.6%), fatty oil (35.6-41.6%), oleic acid, esters of unsaturated fatty acids with C15 and higher terpenoids, esters of dehydrostearcic and linoleic acid, aliphatic alcohol, β-unsaturated hydroxy keto, hederagenin glycoside, melathion, melathigenin, bitter principle, tannin, resin, protein, reducing sugar, glycosidal saponin, 3-0-[β-D-xylpyranosyl-(1→2)-α-L-rhamno-pyranosyl-(1→2)-β-D-glucopyranosyl]-11-methoxy-16,23-dihydroxy-28-methyl-olean-12 enoate, stigma-5, 22-dien-3-β-D-gluco- pyranoside, cycloa-23-methyl-7, 20, 22-triene-3β, 25-diol, niggellidine-4-O-sulfite, N. mines A3, A4, A5, C, N. mines A1, A2, B1, and B2 [164,165].

k) Traditional uses of folk remedies: Nigella has been traditionally used for the treatment of a variety of disorders, diseases and conditions pertaining to respiratory system, digestive tract, kidney and liver function, cardio vascular system and immune system support, as well as for general well-being [153,155]. Avicenna refers to blackseeds in the "The Canon of Medicine", as seeds stimulate the body’s energy and helps recovery from fatigue and dispiritedness. Nigella seeds
and their oil have a long history of folkloric usage in Indian
and Arabian civilization as food and medicine [166, 167]. The
seeds have been traditionally used in Southeast Asian and the
Middle East countries for the treatment of several diseases and
ailments including asthma, bronchitis, rheumatism and related
inflammatory diseases. Its many uses have earned Nigella the
Arabic approbation ‘Habbatul barakah’, meaning the seed of
blessing. Tincture prepared from nigella seeds is useful in the
treatment of worms and skin eruptions. Externally the oil is
used as an antiseptic and local anesthetic. Roasted black seeds
are given internally to stop the vomiting [153, 168-170].

Medicinal and Pharmacological Properties

a) Antimicrobial activity: Bacteria like gram-positive and
gram-negative can be suppressed by nigella essential oil. It
exhibited strong antimicrobial activity against Salmonella typhi, Pseudomonas aeruginosa and others. Comparatively higher
sensitivity against gram-positive bacteria Staphylococcus aureus and Vibrio cholera was found to be stronger than gram
negative bacteria. Staphylococcus aureus, Staphylococcus pyogenes
and Staphylococcus viridans are more susceptible to Nigella sativa. The dried seeds of N. sativa exhibited bactericidal
activity against Pseudomonas aeruginosa [171, 172]. The
activity of the volatile oil against drug – resistant strains of
Shigellapp, Vibriocholera and Escherichia coli was found to have
a synergistic action with streptomycin and gentamycin.
A clear inhibition of the growth of Staphylococcus aureus
was observed by concentration of 300mg/ml. The positive
inhibition may be attributed to the two important active in
gredients of Nigellastativa, Thymoquinone (TQ) and melalin.
TQ exhibited a significant bactericidal activity against various
human pathogenic bacteria especially gram positive cocci, i.e.
Staphylococcus aureus and Staphylococcus epidermidis [173-
177].

b) Antifungal activity: Methanolic extracts of Nigella have
the strongest antifungal effect followed by the chloroform
extracts against different strains of Candida albicans. An
intravenous inoculum of Candida albicans produced colonies
of the organism in the liver, spleen and kidneys. Treatment of
mice with the plant extract 24h after the inoculation caused a
considerable inhibitory effect on the growth of the organism
in all organs studied. Khan et al in 2003 reported that the aqueous
extract of Nigella seeds exhibits inhibitory effect against
candidiasis in mice. A 5-fold decrease in Candida in kidneys,
8-fold in liver and 11-fold in spleen was observed in the groups
of animals post-treated with the plant extract. These findings
were also confirmed by Histopathological examination of the
respective organs [178]. The anti-yeast activity of the black
cumin seed quinones, dithioquinoxine, thymohydroquinone,
and TQ were evaluated in vitro with a broth microdilution
method against six dairy spoilage yeast species. It was found
that Antifungal effects of the quinones were compared with
those of preservatives commonly used in milk products
(calcium propionate, natamycin, and potassium sorbate) at
two pH levels (4.0 and 5.5), while thymohydroquinone and
TQ possessed significant antiyeast activity [179]. Two novel
antifungal defensins namedNs-D1 and Ns-D2, were isolated
from seeds of Nigella and sequenced. The Ns-D1 and Ns-
D2 defensins displayed strong divergent antifungal activity
towards a number of phytopathogenic fungi [180].

c) Anti-schistosomiasis activity: The effect of NSO against
the liver damage induced by Schistosoma mansoni (S. mansoni)
infection in mice was studied by Mahmoud et al. When the NSO
was given alone, it reduced the number of S. mansoni worms
in the liver and decreased the total number of ova deposited
in both the liver and the intestine. These results suggest
that NSO may play a role against the alterations caused by S.
mansoni infection [181]. Results of in vitro testing of N. Sativa
seeds against Schistosoma mansoni, miracidia, cercariae, and
adult worms indicate its strong biocidal effects against all
stages of the parasite and an inhibitory effect on egg-laying of
adult female worms.

d) Antioxidant activity: Treating broiler chicks with
black seeds for 6 weeks prevented the liver from oxidative
stress by increasing the activities of enzymes such as
myeloperoxidase, glutathione-S-transferase, catalase,
adrenochrome deaminase, myeloperoxidase and by decreasing
hepatic lipid peroxidation. The crude methanolic extract of black
cumin seed cake was found to show significant antioxidant
properties under in vitro systems. The thymoquinone pre-
treatment restored the increased level of malonyl dialdehyde
and conjugated diene levels [182 - 187].

e) Antidiabetic activity: Significantly hypoglycaemic activity
was reported. Antihyperglycemic effects of Nigella seed extract
are attributed to a combination of the rapietually relevant
insulinotropic and insulin-like properties [188-190].
Polyherbal formulation kalonji sugar powder) has antidiabetic
effect. It reverses the abnormal lipid profile observed in diabetic
animals. Therefore the water extract of this formulation is useful
in maintaining healthy glucose levels and cholesterol levels
[191]. Combination of α-lipoic acid, L-carnitine and Nigella may
contribute significantly in improvement of the carbohydrate
metabolism in diabetic rats, thus increasing the rate of success
in management of diabetes. It was also demonstrated that in
vivo treatment with Nigellalativa seed extract exerts an insulin
sensitizing action by enhancing ACC phosphorylation, a major
component of the insulin – independent AMPK signalling path
way and by enhancing muscleGlut4content [192-195].

f) Anticancerous activity: Treatment of hamsters with
Nigella volatile oil did not induce any dysplastic alterations
or carcinomas in the cheek pouches of the animals [196].
Furthermore, chemical treatment of rats with 1, 2-dimethyl-
hydrazine-induced colon cancer in the post initiation stage but
daily treatment with N. sativa volatile oil for 14 weeks induced
significant reductions in the colonic lesions via suppression of
the cell proliferation in the colonic mucosa [197]. The treatment
did not induce any harmful effects in the blood or urine
parameters and no pathological changes in the various vital
body organs. Furthermore, exposure of various human cancer cell lines to the volatile oil in concentrations of 120-380 µg/ml induced significant death of the cells showing clear cytotoxic effect [198-204].

g) Anti-inflammatory and analgesic activity: The chronic inflammatory disorders, asthma and arthritis involve a variety of inflammatory mediators and pathways. Nigella fixed oil and thymoquinone were found to inhibit membrane lipid peroxidation and eicosanoid generation in leucocytes, significantly reduced rat paw oedema and granulomapouch weight. Nigellonein low concentration is effective in inhibiting the histamine release from the mast cells, which supports an antiallergic matricrole for theplant [205]. Osteoporosis has been linked to oxidative stress and inflammation. The studies on the anti-osteoporotic effects of Nigella and TQ were carried out. It was revealed that Nigella and TQ were shown to inhibit inflammatory cytokines such as interleukin-1 and 6 and the transcription factor, nuclear factor κB. Both NS and TQ have shown potential as anti-osteoporotic agent [206]. The anti-allergic effects of Nigella seed components could be attributed to allergic rhinitis. Moreover, Nigella should be considered for treating allergic rhinitis when the effects of other anti-allergic drugs need to be avoided [207].

h) Immunomodulatory activity: The potential immunomodulatory effects of Nigella were investigated in light of splenocyte proliferation, macrophage function, and NK anti-tumor activity using BLAB/c and C57/BL6 primary cells. Finally, experimental evidence indicates that the aqueous extract of N. sativa significantly enhances NK cytotoxic activity against YAC-1 tumor cells, suggesting that the documented anti-tumor effects of N. sativa may be, at least in part, attributed to its ability to serve as a stimulant of NK anti-tumor activity. It was anticipated that N. Sativa ingredients may be employed as effective therapeutic agents in the regulation of diverse immune reactions implicated in various conditions and diseases such as cancer [208]. Treatment (intraperitoneal injection) with five doses of methanolic extract for Black seed was found to enhance the total white blood cells count [up to 1.2×10⁸ cells/mm³]. Bone marrow cellularity also increased significantly (P<0.01) after the administration of the Black seed extract. Spleen weight of the black seed treated groups was significantly increased (P<0.01). These results indicated that the Nigella sativa seeds could be considered as a potential immunosuppressive cytotoxic agent [209]. Nigella sativa oil is a promising natural radioprotective agent against immunosuppressive and oxidative effects of ionizing radiation [210]. Daily oral administration of Nigella sativa oil to rats before whole body gamma irradiation resulted in significant reversal of reduction of hemolysin antibodies titers [211].

i) Gastro-protective activity: The anti-ulcer potential of Nigella sativa aqueous suspension on experimentally induced gastric ulcers and basal gastric secretion in rats was examined to rationalize its use by herbal and Unani medicine practitioners. Acute gastric ulceration was produced by various noxious chemicals (80% ethanol, 0.2 mol/L NaOH, 25% NaCl and indomethacin) in Wistar albino rats. Anti-secretory studies were undertaken in a separate group of rats. The anti-ulcer effect of Nigella sativa is possibly prostaglandin-mediated and/or through its antioxidant and anti-secretory activities [212]. Nigella sativa prevents alcohol induced increase in lipid peroxidation (i.e. thiobarbituric acid reactive substances) and reduced gastric GSH content, enzyme activities of gastric SOD, GSH-S-Transferase [213]. These findings suggest that TQ could serve as a potential therapeutic agent for the treatment of patients with inflammatory bowel disease [214]. Decoction of nigella with rock salt is given for relief in dyspepsia and stomach ache [89].

j) Hepato-protective activity: It is reported that Nigella sativa (0.2 mL/kg) intraperitoneally relieves the deleterious effects of ischemia reperfusion injury on liver. Biochemical parameters like the serum aspartate aminotransferase, alanine aminotransferase lactate dehydrogenase levels and total antioxidant capacity (TAC), CAT, total oxidative status (TOS), oxidative stress index (OSI) and MPO were determined in hepatic tissue in rats with hepatic ischemia. Results suggested that Nigella sativa treatment protects the rat liver against hepatic ischemia reperfusion injury [215]. Nigella sativa administration protects hepatic tissue from deleterious effects of toxic metals such as lead, and attenuates hepatic lipid peroxidation following exposure to chemicals such as carbon tetrachloride [216].

k) Nephroprotective activity: The nephroprotective effect of vitamin C and Nigella sativa oil was observed against gentamicin (GM) associated nephrotoxicity in rabbits. Serum creatinine, blood urea nitrogen, and antioxidant activity were measured as indicators of nephrotoxicity for all the groups of rabbits. It was revealed that vitamin C and Nigella sativa oil both had nephroprotective effect as they lowered the values of serum creatinine, blood urea nitrogen, and antioxidant activity as compared to GM control group values. When these two antioxidants were given as combination, they proved to have synergistic nephro protective effect [217- 219].

l) Pulmonary-protective activity and anti-asthmatic effects: Nigellone and high concentrations of TQ had a concentration-dependent inhibitory effect on the trachea when being contracted by the depolarizing effect of Ba²⁺. The trachea contractions induced by leukotriene-d(4)LT4 were inhibited by nigelone and by TQ. It was concluded that nigelone possesses an antispasmodic effect and an increase in mucociliary clearance but TQ do not have such effects. Therefore, it is suggested that nigelone but not TQ may be useful in treatment of different respiratory diseases [220]. It showed relaxant effect of most fractions from Nigella sativa on tracheal chains of guinea pigs which was more potent for methanol and dichloromethane fractions [221].

The possible beneficial effects of the seeds of Nigella sativa on experimental lung injury in male Wistar rats after pulmonary
aspiration of different materials were investigated. Results showed that *Nigella sativa* treatment inhibits the inflammatory pulmonary responses, reducing significantly (*P*<0.05) peribronchial inflammatory cell infiltration, alveolar septal infiltration, alveolar edema, alveolar exudate, alveolar macrophages, interstitial fibrosis, granuloma and necrosis formation in different pulmonary aspiration models. Data indicated a significant reduction in the activity of inducible nitric oxide synthase and a rise in surfactant protein D in lung tissue of different pulmonary aspiration models after *Nigella sativa* therapy. It was concluded that *Nigella sativa* treatment might be beneficial in lung injury and have potential clinical use [222]. A study showed that *Nigella sativa* has a relatively potent antiasthmatic effect on asthmatic airways. However, the effects of boiled extract of this plant on most measured PFTs were less than those of theophylline at concentrations used [223].

j) **Testicular-protective activity:** The protective role of TQ on testicular toxicity of methrotrexate on male C57BL/6 mice (6 weeks old, 20±2 g) was investigated. TQ treatment decreased TAC and prevented the increase in the myeloperoxidase activity. Light microscopy showed in mice that receiving methotrexate resulted in interstitial space dilatation, edema, severe disruption of the seminiferous epithelium and reduced diameter of the seminiferous tubules. Administration of TQ reversed histological changes of methotrexate significantly. It was suggested that TQ use may decrease the destructive effects of methotrexate on testicular tissue of patients using this agent [224].

k) **Neuro pharmacological activities:** The aqueous and methanol extracts of defatted *Nigella sativa* seeds were shown to possess a potent central nervous system and analgesic activities, especially depressant action in the case of the methanolic extract. The neuroprotective effects of both the extracts of *Nigella sativa* in cerebralischemia were observed. The neuroprotective effects could be due to its antioxidant, free radical scavenging, and anti-inflammatory properties [225-227].

l) **Anticonvulsant activity:** The antiepileptic effects of aqueous extract, fixed oil, volatile oil of *N. sativa* seeds and its major constituents i.e. TQ, α-pinene and p-cymene against PTZ and maximal electroshock (MES)-induced convulsions were investigated. The potential of these constituents to induce minimal neurological deficit (MND) was also evaluated by using chimney test. All of the *Nigella sativa* seed constituents protected mice effectively against PTZ-induced convulsions except fixed oil. The antiepileptic activity of the volatile oil in this model maybe attributed mainly to its content of TQ and p-cymene and to a lesser extent, α-pinene. [228].

m) **Contraceptive and anti-fertility activity:** Oral administration of Hexane extract of *Nigella sativa* L. seeds prevented pregnancy in Sprague-Dawley rats at a dose of 2 g/kg daily on day’s 1-10 postcoitum. While column fractions and sub-fractions of Hexane extract of *Nigella sativa* L. seeds also showed significant anti-fertility activity. At contraceptive dose, the active hexane extract exhibited only mild uterotrophic activity comparable almost to 0.002 mg/kg dose of 17 varies; is directly proportional to-Ethylhexylstradiol, but was devoid of any estrogrenicity in the immature rat bioassay [229]. The ethanolic extract of *N. sativa* seeds was found to possess an anti-fertility activity in male rats which might be due to inherent estrogenic activity of *Nigellahasativa* [230].

n) **Antioxytocic activity:** The antioxytocic properties of *Nigella sativa* were reported in some preliminary studies. *N. sativa* seeds inhibit the uterine smooth muscle contraction induced by oxytocin stimulation. The volatile oil of *N. sativa* seeds inhibited the spontaneous movements of rat and guinea piguterine smooth muscle and also the contractions induced by oxytocin stimulation which suggest the antioxytocic potential of *Nigella sativa* seeds oil [231].

o) **Toxicological studies:** Many toxicological studies have been carried out on *Nigella sativa* seeds. No toxic effects were reported when nigella fixed oil was given to mice via the stomach in a study. In another chronic toxicity study rats treated daily with an oral dose for 3 months caused no changes in key hepatic enzyme levels particularly alanine-amino transferase, aspartate-aminotransferase, and gammaglutamyl-transferase. Moreover, the histopathological results also showed to be normal for the tissues of heart, liver, kidneys and pancreas LD<sub>50</sub> values of fixed oil of *N. sativa* obtained by single doses orally and intraperitoneal in mice, were reported to be 26-31.6 and 1.86-2.26, respectively. The low toxicity of nigella fixed oil, evidenced by high LD<sub>50</sub> values, organ integrity and key hepatic enzyme stability, suggests a wide margin of safety for therapeutic doses of Nigella fixed oil [232]. In another study, the LD<sub>50</sub> of TQ was found to be 104.7 mg/kg (89.7-119.7) and 870.9 mg/kg (647.1-1 094.8) after intra-peritoneal injection and oral ingestion, respectively. However, LD<sub>50</sub> in rats was found to be 57.5 mg/kg (45.6-69.4) and 794.3 mg/kg (469.8-1 118.8) after intra-peritoneal injection and oral ingestion, respectively. The LD<sub>50</sub> values shown here after intra-peritoneal injection and oral ingestion are 10-15 times and 100-150 times greater than doses of TQ reported for its anti-oxidant, anti-inflammatory, and anti-cancer effects [156,233].

p) **Drugs-nigella interaction:** There is a possibility that *Nigella sativa* may interact with co-administered drugs and affect their intestinal availability and pharmacological effect. *In vitro* studies have shown that *N. sativa* extracts inhibit cDNA-expressed human cytochrome P-450 3A4, 2C9, 3A5 and 3A7-mediated metabolism of marker substrates therefore may affect and/or inhibit the metabolism of a wide range of drugs (J). Further, the effect of *Nigella sativa* on bioavailability of amoxicillin was investigated in everted rat intestinal sacs. The *in vitro* studies both with methanol and hexane extracts of *Nigella* increased the permeation of amoxicillin significantly (P<0.001) as compared to control. Permeation was also found to be significantly higher for the hexane extract (P<0.001) in comparison to methanol extract at the same dose levels. *In vivo* experiments revealed that Cmax of amoxicillin in rat
plasma when administered orally alone and in combination with hexane extract correspondingly from 4 138.25±156.930 to 5 995.045±196.280 ng/mL while as AUC 0→t increased from 8 890.40±143.33 to 13 483.46±152.45 ng/mL/h. *Nigella* enhanced amoxicillin availability in both *in vivo* and *in vitro* studies [234].

**Conclusion**

Ajwain seed possesses stimulant, antispasmodic and carminative properties and is used traditionally as an important remedial agent for flatulence, atonic dyspepsia, diarrhea, abdominal tumors, abdominal pains, piles, and bronchial problems, lack of appetite, galactagogue, asthma and amenorrhea. Medicinally, it has been proven to possess various pharmacological activities like antifungal, antioxidant, antimicrobial, antinoceptive, cytotoxic, hypolipidemic, antihypertensive, antispasmodic, bronchodilating actions, antilithiasis, diuretic, abortifacient, antitussive, nematicidal, anthelmintic and antifilarial. Further, studies reveal the presence of various phytochemical constituents mainly carbohydrates, glycosides, saponins, phenolic compounds, volatile oil (thymol, γ-terpinene, para-cymene and α and β-pinene), protein, fat, fiber and mineral matter containing calcium, phosphorous, iron and nicotinic acid. These studies reveal that *Trachyspermum ammi* is a source of medicinally active compounds and have various pharmacological effects; hence, it is encouraging to find its new therapeutic uses.

Coriander volatile oil is rich in beneficial phytonutrients and the seeds have a health-supporting reputation that is high on the list of the healing spices and has been used as antispasmodic, carminative, stimulant, cytotoxic, lipolytic, fungicidal and stomachic compound. Coriander also possesses hypoglycemic, hypolipidemic, antibacterial, antimitogen activity, insecticidal and aflatoxin controlling effects. Besides, coriander also possesses many other traditional health benefits. The healing properties of coriander can be attributed to its exceptional phyto-nutrient content. Considering these potentials, coriander biomolecules possess a tremendous future in the health-related industry. The different forms of cumin possess many remarkable health benefits, viz., anti-diabetic, antimicrobial, antiseptic, and antioxidant, inhibition of blood platelet aggregation etc. The flavonoids apigenin, luteolin, and their glycosides present in cumin are reported to be responsible for many of the biological activities of cumin. Cuminaldehyde, the major constituent of volatile oil, is responsible for the antimicrobial and anti-mutagenic properties. Spent residue from cumin has the potential as a new source of dietary fiber which can be utilized for incorporation into many food formulations. Dill has been used mainly for culinary and medicinal purposes for hundreds of years. The health benefits of dill include improvement in digestion, relief from inomnia, hicups, dysentery, diarrhea, respiratory disorders, menstrual disorders, protects from bone degradation and various types of cancers.

It is also good for oral care and can be a powerful boost for immune system of human body. It is also used as an anti-inflammatory, can a carminative substance. Fennel has been used as food and medicine with long history in central Europe and Mediterranean region as well as in China. It is also a flavor food with health value. Numerous compounds including *trans*-anethole, estragole, fenchone, sesquiterpenoids, coumarins and polyphenolics were isolated from this plant, most of which exhibited significant bioactivities. The fennel has potential beneficial therapeutic actions in the management of bacterial and fungal infections and colic pain. Both the fruit and whole plant of this plant might be the source of chemical and biological materials in future. For further utilization of this plant, systematic phytochemical and biological mechanic studies are needed.

Fenugreek has an extensive variety of actions which are likely to protect the human body against a variety of insults. Fenugreek has the potential to ameliorate diabetes mellitus exhibited by stimulating glycolytic enzymes, inhibiting glucogenogenesis. Further, the exaggerated action of fenugreek in treating cancer has been demonstrated through various mechanisms such as induction of apoptosis, inhibition of cell proliferation and arachidonic acid pathway.

Increasing body of evidences suggests that oxidative stress plays a vital role in the induction and progression of various disorders such as atherosclerosis, Parkinson’s disease, heart failure, myocardial infarction and Alzheimer’s disease. But the promising antioxidant effect of fenugreek needs to be explored in these diseases. In spite of various pleiotropic actions of fenugreek on chronic disorders such as obesity, inflammation, hypertension and ulcers, the relevant clinical applications of fenugreek is still in the queue of thirst area of research. Therefore, more focused research on specific experimental models, human trials and an understanding the mechanism of action is necessary. *Nigella sativa* L., a common herb acoz seed spic of India and Middle East, was identified by many researchers to have as spectrum of pharmacological and nutraceutical potentials. The seeds of nigella and it soil were widely used for centuries in the treatment of various ailments throughout the world. It is an important drug in the Indian traditional system of medicine. It is established that most of the potential and fruitful activities are inbuilt in its volatile oil and protein components. Most of the therapeutic properties of this herb are due to the presence of thymoquinone and its isomers which are the major active chemical component of the essential oil.

Nigella seeds are also used in food as flavouring, additive in the breads and pickles because it has very low level of toxicity. Mechanism of actions of Nigella seed extract sand its constituents by which they exert their rapeutic effects needs to be further investigated and tested. Chemical modifications in the molecular structure of Thymoquinone, α-Hedener and other constituents of nigella seeds could lead to prepare more effective and safer drugs for the treatment of wide variety of diseases in the future in suitable combinations. Moreover, further researches should focus and explore the specific cellular and molecular targets of various constituents of Nigella, particularly Thymoquinone. This review article is dedicated to all those researchers who are interested in focussing their research on this miracle herb and hope, this review
article would help the min investigating and conducting further preclinical and clinical studies on the use of seed spices for the treatment of variety of diseases.

Rohini RM, Nayeen M, Das AK (2009) Diuretic effect of Trigonella foenum-graecum seed extracts. Intern J Altern Med 6: 2.
The antidiabetic activity of Nigella sativa is well-documented, as highlighted in various studies. For instance, Al-Bukhari MI (1976) in his work on the collection of authentic sayings of prophet Mohammad (peace be upon him), division 71 on medicine (2nd Edn.), explored the therapeutic potential of black seeds and beyond. Cancer Ther 6: 495-510.

In vitro anti-plasmodial activity of Trigonella foenum-graecum is another area of focus. Cheikh-Rouhou S, Besbes S, Lognay G, Blecker C, Deroanne C, et al. (2008) demonstrated in Pharmaceutical biology 46(1-2): 1-29 that Trigonellafoenumgraecum and Ammi majus on calciumoxalate biofilm formation. BMComplementary and Alternative Medicine 11: 29-33.

Antibacterial activity of Thymoquinone, an active principle of Nigella sativa and its potency to prevent bacterial biofilm formation, was also explored by Morsi N M (2000) in Antimicrobial effect of crude extracts of Nigella sativa on multiple antibiotics-resistant bacteria. Acta Microbiol Pol 49(1): 63-74.
