Abstract

Do online platforms facilitate the consumption of potentially harmful content? Despite widespread concerns that YouTube’s algorithms send people down “rabbit holes” with recommendations to extremist videos, little systematic evidence exists to support this conjecture. Using paired behavioral and survey data provided by participants recruited from a representative sample (n=1,181), we show that exposure to alternative and extremist channel videos on YouTube is heavily concentrated among a small group of people with high prior levels of gender and racial resentment. These viewers typically subscribe to these channels (causing YouTube to recommend their videos more often) and often follow external links to them. Contrary to the “rabbit holes” narrative, non-subscribers are rarely recommended videos from alternative and extremist channels and seldom follow such recommendations when offered.

†We are grateful to the Russell Sage Foundation, Anti-Defamation League, Carnegie Corporation of New York, and the National Science Foundation for financial support, to Samantha Luks at YouGov for survey assistance, to Kasey Rhee for research assistance, to Andy Guess for helping design this project in its initial stages, and to Tanushree Mitra, Joseph B. Phillips, David Rothschild, Gianluca Stringhini, and Savvas Zannettou for comments and feedback. We also thank Virgilio A.F. Almeida, Stephen Ansolabehere, Manoel Horta Ribeiro, Aaron Sarkin, Brian Schaffner, Robert West, and Anna Zaitsev for sharing their data with us or making it publicly available. This research utilized equipment funded by NSF grant IIS-1910064. Any opinions, findings, and conclusions or recommendations expressed in this material are those of the authors and do not necessarily reflect the views of the funders. In general, all conclusions and errors are our own.
What role do technology platforms play in exposing people to dubious and hateful information and enabling its spread? Concerns have grown in recent years that online communication is exacerbating the human tendency to engage in preferential exposure to congenial information (1–3). Such concerns are particularly acute on social media, where people may be especially likely to view content about topics such as politics and health that is false, extremist, or otherwise potentially harmful. The use of algorithmic recommendations and platform affordances such as following and subscribing features may enable this process, helping people to find potentially harmful content and helping content creators build and monetize an audience for it.

These concerns are particularly acute for YouTube, the most widely used social media platform in the U.S. (4). Critics highlight the popularity of extreme and harmful content such as videos by white nationalists on YouTube, which they often attribute to the recommendation system that the company itself says is responsible for 70 percent of user watch time (5). Many fear that these algorithmic recommendations are an engine for radicalization. For instance, the sociologist Zeynep Tufekci wrote that the YouTube recommendation system “may be one of the most powerful radicalizing instruments of the 21st century” (6). These claims seem to be supported by reporting that features descriptions of recommendations to potentially harmful videos and accounts of people whose lives were upended by content they encountered online (7–9).

In response to these critiques, YouTube announced changes in 2019 to “reduce the spread of content that comes close to—but doesn’t quite cross the line of—violating our Community Guidelines” (10). It subsequently claimed that these interventions resulted in a 50% drop in watch time from recommendations for “borderline content and harmful misinformation” and a 70% decline in watch time from non-subscribed recommendations (11, 12).

Questions remain, however, about the size and composition of the audience for potentially harmful videos on YouTube and the manner in which people reach those videos. To date, research investigating YouTube has lagged behind studies of its social media counterparts. Studies show that sites like Twitter and Facebook can amplify tendencies toward extreme opinions or spread false information (13, 14), though the extent of these effects and the prevalence of exposure is often overstated
(15–17). YouTube may operate differently, though, given its focus on video and the central role of its recommendation system (18).

YouTube’s 2019 changes do appear to have affected the propagation of some of the worst content on the platform, reducing both recommendations to conspiratorial content on the platform and sharing of YouTube conspiracy videos on Twitter and Reddit (19, 20). In particular, subsequent research has found relatively little support for “rabbit holes.” Though watching videos promoting misinformation can lead to more recommendations of similar videos on some topics (21), random walk simulations find people would very rarely reach extreme content if they followed YouTube recommendations (22). Another study using 2018–2019 data similarly finds that YouTube recommendations tend to direct people away from rather than toward the most extreme videos (23).

However, the studies described above rely on bots and scraping; they cannot observe the recommendations seen by real humans under naturalistic circumstances. Conversely, browsing data has documented the existence of a sizeable audience of dedicated far-right news consumers on YouTube who often reach extremist videos via external links (24), but these data lack information on the recommendations shown to users.

Unlike both of these approaches, we study behavior activity data from a sample weighted to be representative of the US adult population that includes the actual recommendations shown to participants. Our sample consists of 1,181 participants recruited from a sample of 4,000 YouGov panelists, including oversamples of two groups who we identified as especially likely to be exposed to potentially harmful video content: (1) people who previously expressed high levels of gender and/or racial resentment and (2) those who indicated they used YouTube frequently. Participants voluntarily agreed to install a custom browser extension in Chrome or Firefox that monitored their web browsing behavior and to use that browser while the extension was active for at least two days. The study was conducted from July 21–December 31, 2020; respondents were enrolled in data collection for a median of 133 days. (See Methods below for further details on measurement. We provide descriptive statistics on study participants and their browser activity data availability and aggregate consumption patterns in Online Appendix A.)
This research design advances our understanding of exposure to alternative and extremist videos (categories we define below in Methods) on YouTube in several important respects. First, we collect data from real people instead of relying on automated bots, allowing us to measure how these videos are encountered and watched by humans. Second, our browser extension captures the exact videos that YouTube recommends, providing the most precise estimate to date of the extent to which real-world algorithmic recommendations on the platform push people toward potentially harmful content. In particular, we construct a specific definition of what constitutes a “rabbit hole” and measure its prevalence. Finally, we leverage survey data from our participants to examine the association between demographic and attitudinal variables, especially gender and racial resentment, and YouTube video watching behavior.

We report the following key findings. Though almost all participants use YouTube, videos from alternative and extremist channels are overwhelmingly watched by a small minority of people with high levels of gender and racial resentment. Even within this group, total viewership is concentrated among a few superconsumers who watch YouTube at high volumes. Viewers often reach these videos via external links and/or are subscribers to the channels in question. By contrast, we rarely observe recommendations to alternative or extremist channel videos being shown to, or followed by, non-subscribers.

We thus find little support in post-2019 data for prevailing narratives that YouTube’s algorithmic recommendations send unsuspecting members of the public down “rabbit holes” of extremism. The greater threat, our results suggest, is the way that social media platforms and the affordances they offer enable audiences of resentful people to easily and repeatedly access potentially harmful content.
Methods

Study participants

Study participants completed a public opinion survey and installed a browser extension that recorded their browser activity (n=1,181). Specifically, we contracted with the survey company YouGov to conduct a public opinion survey with 4,000 respondents from three distinct populations: a nationally representative sample of 2,000 respondents who previously took part in the 2018 Cooperative Congressional Election Survey (CCES) when it was fielded by YouGov; an oversample of 1,000 respondents who expressed high levels of racial resentment (25), hostile sexism (26), and denial of institutional racism (27) in their responses to the 2018 CCES; and an oversample of 1,000 respondents who did not take part in the 2018 CCES but indicated that they use YouTube “several times per day” or “almost constantly” in their survey response. (The prior measures of racial resentment and hostile sexism, which were collected as part of the 2018 CCES for 3,000 of our 4,000 respondents, are also used as independent variables in our analysis; see below for details on question wording.)

While completing the survey, participants who used an eligible browser (Chrome or Firefox) were offered the opportunity to download a browser extension that would record their browser activity in exchange for additional compensation. A total of 1,181 respondents did so (778 from the nationally representative sample, 97 from the high resentment oversample, and 306 from the high YouTube user oversample).

All analyses we report use survey weights to approximate a nationally representative sample, including the oversamples. These weights were created by YouGov to account for the fact that, in addition to a national sample, we have also specifically recruited participants who fall into one of two groups: (1) those who previously expressed gender and/or racial resentment, or (2) those who are frequent YouTube users. When we apply these weights to all three samples, the total sample is weighted to be nationally representative. (Additional details about respondent demographics and other characteristics are provided in Online Appendix A.)
Ethics and privacy

Our study methods were approved by the Institutional Review Boards (IRBs) at the authors’ respective institutions (REDACTED FOR PEER REVIEW).

All participants were asked to consent to data collection before completing our survey and again when they installed our browser extension. Participants were fully informed about the data collected by our extension when they were invited to install it and this information was provided a second time during installation of the extension. The extension did not collect any data until consent was provided and participants were free to opt out at any time by uninstalling our extension. The extension automatically uninstalled itself from participants’ browsers at the end of the study period. (See Online Appendix B for the full text of our informed consent notices.)

To protect participants’ security and privacy, we adopted a number of best practices. Our participants are indexed by pseudonymous identifiers. Our browser extension used TLS to encrypt collected data while it was in transit. All participant data is stored on servers that are physically secured by key cards. We use standard remote access tools like SSH to access participant data securely.

Data and code will be posted on a publicly available repository such as Dataverse upon publication of this manuscript that allows for the replication of all results in this article. All analysis code will also be posted. However, raw behavior data cannot be posted publicly to protect the privacy of respondents.

Data collection and measurement

The browser extension passively logged user pageviews, including the full URL and a timestamp, and collected HTML snapshots when users viewed YouTube videos, allowing us to examine the video recommendations that participants received. This combination of passive monitoring and HTML snapshots provides us with the ability to measure not just what respondents clicked on but what YouTube showed them prior to that action.

To account for duplicate data, we dropped additional pageviews of the same URL within one
second of the prior pageview on the assumption that the user refreshed the page (28).

Our analysis focuses on browser activity data rather than browser history. While browser history provides a clear record of each time a URL is opened in a browser, it does not account for changes in the active browser tab. For example, if someone opens web page A in a tab, then opens web page B in another tab, and then switches their browser tab back to A, browser history will not register this shift in attention, making it difficult to obtain accurate estimates of time spent on a given web page. Our passive monitoring records all changes in the active tab, allowing us to overcome this issue. (In Online Appendix A, we validate our browser activity data against browser history data from the extension.)

In this article, we refer to YouTube “views,” “consumption,” and “exposure.” These terms refer to videos that appear in the browser activity data described above. As with any passive behavioral data, we cannot verify that every user saw the content that appeared on their device in every instance.

We measured the amount of time a user spent on a given web page by calculating the difference between the timestamp of the page in question and the next one they viewed. This measure is imperfect because we do not have a measure of active viewing. Though some participants might rewind and rewatch videos more than once, we are more concerned about our measure overstating watch time due to users leaving their browser idling. We therefore refine this measure by capping the time spent measure at the length of the video in question (obtained from the YouTube API).

We measure which channels users subscribed to by looking at the HTML snapshots of the videos they watched. Specifically, we parsed the subscribe button from each HTML snapshot: “Subscribe” indicates that the participant was not subscribed to the video channel at the time the video was watched and “Subscribed” indicates that they were already subscribed. Because we must use this indirect method to infer channel subscriptions, we do not know the full set of channels to which participants subscribe. In particular, not all recommended videos in our dataset were viewed by participants. As a result, we could not determine the subscription status for all recommended videos.

We denote the web page that a participant viewed online immediately prior to viewing a YouTube
video as the “referrer.” We are unable to measure HTTP Referrer headers using our browser extension, so instead we rely on browser activity data to identify referrers to YouTube videos. Using prior browsing history is a common proxy used to analyze people’s behavior on the web (29, 30).

**Channel definitions and measurement**

We construct a typology of YouTube channel types identified in previous research. We classify videos as coming from an alternative channel, an extremist channel, a mainstream media channel, or some other type of channel (“other”).

In our typology, alternative channels tend to advocate “reactionary” positions and typically claim to espouse marginalized viewpoints despite the channel owners primarily identifying as White and/or male. This list combines Lewis’ Alternative Influence Network (31), the Intellectual Dark Web and Alt-lite channels from Ribeiro et al. (22), and channels classified by Ledwich and Zaitsev (23) as Men’s Rights Activists or Anti-Social Justice Warriors. Example alternative channels in our typology include those hosted by Steven Crowder, Tim Pool, Laura Loomer, and Candace Owens.

Our list of extremist channels consists of those labelled as white identitarian by Ledwich and Zaitsev (23), white supremacist by Charles (32), extremist or hateful by the Center on Extremism at the Anti-Defamation League, and those compiled by journalist Aaron Sankin from lists curated by the Southern Poverty Law Center, the Canadian Anti-Hate Network, the Counter Extremism Project, and the white supremacist website Stormfront (33). Example extremist channels include those hosted by Stefan Molyneux, David Duke, Mike Cernovich, and Faith J. Goldy.

In total, our alternative and extremist channel lists consist of 322 and 290 channels, respectively. Of the 302 alternative and 213 extremist channels that were still available on YouTube as of January 2021 (i.e., they had not been taken down by the owner or by YouTube), videos from 208 alternative and 55 extremist channels were viewed by at least one participant in our sample. We are not making these lists publicly available to avoid directing attention to potentially harmful channels. We are, however, willing to privately share them with researchers and journalists upon request.

To create our list of mainstream media channels, we collected news channels from Buntain et al.
(20) (65 mainstream news sources), Lediwch et al. (23) (75 mainstream media channels), Stocking et al. (34) (81 news channels), Ribeiro et al. (22) (68 popular media channels), Eady et al. (35) (219 national news domains), and Zannettou et al. (36) (45 news domains). We manually found the corresponding YouTube channels via YouTube search when authors only provided websites (22, 35, 37). In cases where news organizations have multiple YouTube channels (e.g., Fox News and Fox Business), all YouTube channels under the parent organization were included. Any channels appearing in fewer than three of these sources were omitted. Finally, we also included channels that were featured on YouTube’s News hub from February 10, 2021 to March 5, 2021.

The resulting list of mainstream media channels were then checked to identify those that meet all of the following criteria:

1. They must publish credible information, which we define as having a NewsGuard score greater than 60 (https://www.newsguardtech.com) and not being associated with any “black” or “orange” fake news websites listed in Grinberg et al. (38).

2. They must meet at least one criteria for mainstream media recognition or distribution, which we define as having national print circulation, having a cable TV network, being part of the White House press pool, or having won or been nominated for a prestigious journalism award (e.g., Pulitzer Prize, Peabody Award, Emmy, George Polk Award, or Online Journalism Award).

3. They must be a US-based organization with national news coverage.

Our final mainstream media list consists of 127 YouTube channels. We placed all YouTube channels in our dataset that did not fall into one of these three categories (alternative, extremist, or mainstream news) into a residual category that we call “other.”

**Survey measures of racial resentment and hostile sexism**

We measure anti-Black animus with a standard four-item scale intended to measure racial resentment (25). For example, respondents were asked whether they agree or disagree with the statement
“It’s really a matter of some people just not trying hard enough: if blacks would only try harder they could be just as well off as whites.” Responses are provided on a five-point agree/disagree scale and coded such that higher numbers represent more resentful attitudes. Respondents’ racial resentment score is the average of these four questions. Responses to these questions are taken from respondent answers to the 2018 Cooperative Congressional Election Survey (as noted above, participants were largely recruited from the pool of previous CCES respondents).

We operationalized hostile sexism using two items from a larger scale that was also asked on the 2018 Cooperative Congressional Election Survey (CCES) (26). For example, one of the questions asks if respondents agree or disagree with the statement “When women lose to men in a fair competition, they typically complain about being discriminated against.” Responses are provided on a five-point agree/disagree scale and coded such that higher numbers represent more hostile attitudes.

All other question wording is provided in the survey codebook in Online Appendix C. Racial resentment and hostile sexism measures were also included in our 2020 survey; responses showed a high degree of persistence over time ($r = .92$ for racial resentment, $r = .79$ for hostile sexism).

**Results**

**Exposure levels**

Though 91% of participants visited YouTube, the vast majority of participants did not view any alternative or extremist channel videos. Just 15% of the sample for whom we have browser activity data (n=1,181) viewed any video from an alternative channel and only 6% viewed any video from an extremist channel. By comparison, 44% viewed at least one video from a mainstream media channel. (See Methods for how channel types were defined and how view history and watch time were defined.)

The audience for alternative and extreme channels is heavily skewed toward people who subscribe to the channel in question or one like it, which we determine by inspecting whether the subscription button is activated when a participant views a video from that channel (see Methods...
Percentage of views for videos from each type of channel that come from people who are subscribed to that channel (yellow), who subscribe to one or more different channels of the same type but not the channel currently being viewed (green), and who do not subscribe to any channel of that type (blue). Each estimate includes the corresponding 95% confidence interval. Total view counts are displayed at bottom of each bar. Total views for videos of that type as a percentage of all views are displayed under the channel labels.

for more details). Among the set of people who saw at least one extremist channel video, for instance, 52% saw at least one video from an extremist channel they subscribe to during the study period. Similarly, 39% of all people who saw at least one alternative channel video viewed at least one video from a channel to which they subscribed.

Figure 1 illustrates this point by disaggregate video views according to both channel type and subscription status. We observe that 72% of views for videos from alternative channels and 81% of views for videos from extremist channels come from subscribers to the channel in question. If we instead define subscribers to include all people who subscribe to at least one channel of the type in question, the proportion of views from subscribers increases to 88% for alternative channels and 89% for extremist channels.

These patterns for alternative and extreme channels are distinct from mainstream media channels, which receive 41% of their views from people who do not subscribe to any channel in the
Weighted empirical cumulative distribution function (eCDF) showing the percentage of participants responsible for a given level of total observed video viewership of alternative and extremist channels on YouTube (in minutes). Inset graph shows the same data using a log scale for the weighted eCDF.

Among the participants who viewed at least one video from an alternative or extremist channel, the time spent watching them was relatively low: 26 minutes per week for alternative channel videos (62 minutes per week for subscribers to one or more alternative channels [6%] versus 0.2 minutes per week for non-subscribers [9%]) and 8 minutes for extremist channel videos (15 minutes per week for subscribers [3%] versus 0.04 minute per week for non-subscribers [3%]). The comparison statistics are 12 minutes per week for mainstream media channel videos and 214 minutes per week for videos from other channels.

Mirroring patterns observed for Twitter and untrustworthy websites (29, 38), viewership of po-
Figure 3: YouTube video diets of alternative and extremist superconsumers

Total YouTube behavior of alternative (panel A) and extremist (panel B) superconsumers measured in minutes per week of video watch time. Each bar represents one individual and the height of the bar represents total view time of YouTube videos by channel type. The 17 alternative superconsumers are ordered left to right by time spent on videos from alternative channels (orange portions of bars); the eight extremist superconsumers in the right panel are ordered left to right by time spent on videos from extremist channels (red portions of the bars). Red icons under bars in the left panel represent individuals who are also extremist superconsumers; orange icons under bars in the right panel represent individuals who are also alternative content superconsumers.

Potentially harmful videos on YouTube is heavily concentrated among a few participants. As Figure 2 indicates, 1.7% of participants (17 people) account for 79% of total time spent on videos from alternative channels. This imbalance is even more severe for extremist channels, where 0.6% of participants (9 people) were responsible for 80% of total time spent on these videos. Skew is similar when we examine view counts (Figure A13) rather than time spent on videos—1.9% and 1.1% of participants were responsible for 80% of alternative and extremist channel viewership, respectively. We observe a similar pattern of concentration for mainstream media consumption—just 3.8% of participants (40 people) account for 80% of the total views.

We examine the behavior of these “superconsumers” in more detail in Figure 3, which separately
presents watch time totals for the people responsible for 80% of the viewership of videos from alternative and extremist channels in our sample. We note two facts about superconsumers. First, they often watch a great deal of YouTube. Alternative channel superconsumers spend a median of 29 hours each week watching YouTube, while the median time that extremist channel superconsumers spend watching is 16 hours per week. By comparison, the median time per week across all participants is 0.2 hours. Second, there is substantial overlap between the two sets of superconsumers, who number 26 in total (2% of all participants). Five of the nine superconsumers of extremist channel videos (56%) are also among the seventeen superconsumers of alternative channel videos. Conversely, five of the seventeen superconsumers of alternative channel videos (29%) are among the nine superconsumers of extremist channel videos. Figures A3 and A4 show the YouTube video diets by channel type for individuals who viewed any alternative or extremist channel video during the study.

Correlates of exposure

We next evaluate demographic and attitudinal factors that are potentially correlated with time spent watching videos from alternative, extremist, and mainstream media channels. We focus specifically on hostile sexism, racial resentment, and negative feelings toward Jews — three factors that may make people vulnerable to the types of messages offered by alternative and extremist channels, which often target women, racial and ethnic minorities, and Jews (31, 37). Negative attitudes towards these outgroups may make people vulnerable to the types of messages offered by alternative and extremist channels. We therefore estimate the statistical models reported below on the subset of 851 respondents for which prior scale measures of hostile sexism and racial resentment are available from the 2018 Cooperative Congressional Election Study. (Details on survey wording and measurement, including the wording for these scales, are provided in Methods below; feelings toward Jews are measured using a feeling thermometer.)

We estimate models measuring the association between the average time per week that respondents spent on videos from alternative, extremist, or mainstream media channels and the mea-
Quasipoisson regression coefficients for correlates of the amount of time respondents spent on videos from alternative, extremist, and mainstream media channels in minutes per week. Figure includes 95% confidence intervals calculated from robust, survey-weighted standard errors. Stars indicate coefficients that are significant at the $p < .05$ level. See Table A2 for regression table.

The results indicate that prior levels of hostile sexism are significantly associated with time spent on videos from alternative channels and time spent on videos from extremist channels but not time spent watching mainstream media channels. This relationship, which is consistent with the commenter overlap observed between men’s rights/anti-feminist channels and alt-right channels on YouTube (39), is not observed for prior levels of racial resentment when controlling for hostile sexism. However, racial resentment is positively associated with time spent on videos from alternative and extremist channels when entered into statistical models separately (see Table A6). Finally, we find no
Predictions are estimated from the models in Figure 4 holding other covariates at their median (continuous variables) and modal (categorical variables) values. Colored bands represent 95% robust confidence intervals.

association between feelings toward Jews and viewership of any of these types of channels.

Figure 5 illustrates the relationship between prior levels of hostile sexism and time spent per week watching videos from alternative or extremist channels using the model results described above. When hostile sexism is at its minimum value of 1, expected levels are 0.4 minutes per week spent watching alternative channel videos and 0.08 minutes for extremist channel videos. These predicted values increase to 383 and 51 minutes, respectively, when hostile sexism is at its maximum value of 5 (with the greatest marginal increases as hostile sexism reaches its highest levels).

**Internal and external referrers**

We next analyze the process by which people come to watch alternative and extremist videos on YouTube. We denote the page that people viewed immediately prior to a video being opened (within an existing browser tab or within a new tab) as the “referrer” and broadly distinguish between
two different types of referrers: “on-platform” referrers consisting of various types of pages on YouTube (a channel page, the YouTube homepage, a YouTube search page, or another video) and “off-platform” referrers that are not part of the YouTube domain such as search engines, webmail sites, mainstream social media sites (e.g., Facebook, Twitter, Reddit), or alternative social media sites (e.g., Parler, Gab, 4chan). The complete list of external referrers in each category can be found in Table A9. Details on how we identify referrers are provided in Methods below. We consider YouTube’s recommendations directly in the section below.

We find that off-platform referrers are responsible for approximately half of all views of alternative and extremist channel videos, a finding that is broadly consistent with YouTube’s statement that “borderline content gets most of its views from other platforms that link to YouTube” (40). As we show in Figure 6, 49% and 51% of referrers to alternative and extremist channel videos, respectively, were off-platform sources compared to 41% and 44%, respectively, for videos from mainstream media channels and other channels. With respect to on-platform referrers, we observe homophily across the video types, with 18% of referrers to alternative videos coming from other alternative video, 14% of referrers to extreme videos coming from other extreme videos, and 26% of referrers to mainstream media videos coming from other mainstream media videos. Interestingly, we observe 5% of referrals to extreme videos coming from alternative videos, but only 0.7% of referrals from alternative videos coming from extreme videos, which suggests that among our participants it is rare to move from highly radical to less radical videos. Lastly, we observe that alternative, extreme, and mainstream media videos all receive roughly equal referrals from videos in other channels (13–16%) and other on-platform sources (16–19%).

Figure 7 instead reports the proportion of views to each type of YouTube channel video (alternative, extremist, mainstream media, and other) from each type of referrer. This analysis allows us to determine which types of referrers are unusually (un)common across channel types. On-platform, we note that the YouTube homepage, YouTube search, and other YouTube videos are relatively less frequent sources of referrals to alternative and extremist channel videos than videos from mainstream media channels and other channels. In contrast, channel pages are a more common referral
Proportion of each type of URL recorded immediately before viewing a YouTube video of a given channel type. Observations where the preceding link was not a YouTube video are shown in the “non-video, on-platform” and “off-platform” bars. (“Non-video, on-platform” referrers combines YouTube channel pages, YouTube homepage, and YouTube search.)

source to alternative and extremist channel videos. This finding highlights that participants arrive at alternative and extreme videos from a variety of referrers, not just YouTube recommendations.

Among off-platform referrers, social media platforms stand out as playing an especially important role in referring people to alternative and extremist channel videos. Participants are disproportionately more likely to reach alternative channel videos via mainstream social media sites and to reach extremist channel videos via alternative social media sites compared with videos from other types of channels. For instance, about 1 in every 6 (17%) extremist channel video views were preceded by a visit to an alternative social media site. This difference may be the result of the content moderation policies of mainstream social media platforms, which are more likely to moderate extremist posts promoting such videos than platforms like Gab and 4chan that attract extremist users due to their lax content policies.
Proportion of referrals to YouTube videos of each channel type by referrer type. Other on-platform platform referrals such as YouTube playlists and personal user pages were grouped into a separate category. Similarly, off-platform domains that do not fit into any of the labelled categories in panel B are grouped together. A list of all domains included in each group can be found in Online Appendix A.

**Recommendations and YouTube “rabbit holes”**

Critics of YouTube have emphasized the role of its algorithmic recommendations in leading people to potentially harmful content. We therefore first measure which types of videos YouTube recom-
mended to participants and how often those recommendations were followed. Next, we specifically count how often people follow recommendations to more extreme channels to which they don’t subscribe in a manner that is consistent with the “rabbit hole” narrative. Finally, we disaggregate YouTube recommendations and following behavior based on subscription status. In general, we find that recommendations to alternative and extremist channel videos are rare and largely shown to and followed by people who already subscribe to those channels.

We first disaggregate the recommendations shown to participants by the type of video on which the recommendation appears. As Figure 8 shows, recommendations to alternative and extremist channel videos are vanishingly rare, especially while watching videos from mainstream media or other types of channels, which together make up 97% of views in our sample. Recommendations to alternative and extremist channel videos are much more common, however, when people are already viewing videos from alternative and extremist channels, which make up 2.6% and 0.4% of views, respectively. 34.6% of recommendations when viewing an alternative channel video point to another alternative channel video, while 25.5% of recommendations follow the same pattern for extremist channel videos.

Figure 9 provides corresponding statistics for the proportion of recommendations followed by channel type. Given the interest people show by watching an alternative or extremist channel video, it is not surprising that the proportion of recommendations that people followed to other videos of that type are even more skewed. Among people who were watching alternative channel videos, 45.7% of recommendations followed were to alternative or extremist channel videos. Correspondingly, 61.1% of recommendations followed from extremist channel videos were to other extremist channel videos or to alternative channel videos.

Next, we more directly test how often YouTube video recommendations create “rabbit holes” in which people are shown more extreme content than they would otherwise encounter. Specifically, we define three conditions that must be met to constitute a “rabbit hole” sequence of recommendations and exposure and report the number of views, sessions, and users that meet these criteria when sequentially applied:
Figure 8: Recommendation frequency by type of channel being watched

A) Percentage of total recommendations shown:

B) Recommendations shown when watching:

Recommendations shown to: Orange: Alternative channels, Pink: Extremist channels, Blue: Mainstream media, Gray: Other channels

Number of colored tiles shown are proportional to the proportion of recommendations shown for each type of video when watching videos from alternative, extremist, mainstream media, or other channels.

Figure 9: Recommendation follows by video channel type

A) Percentage of total recommendations followed:

B) Recommendations followed when watching:

Recommendations followed to: Orange: Alternative channels, Pink: Extremist channels, Blue: Mainstream media, Gray: Other channels

Number of colored tiles shown are proportional to the proportion of recommendations followed to each type of video when watching videos from alternative, extremist, mainstream media, or other channels.
1. A participant followed a recommendation to an alternative or extremist channel video: 794 instances (0.16% of all video visits) among 65 users (6.05% of all users);

2. The recommendation that the participant followed moved them to a more extreme channel type (i.e., \{mainstream media, other\} → \{alternative\} or \{mainstream media, other, alternative\} → \{extreme\}): 376 instances (0.08% of all video visits) among 53 users (4.94% of all users);

3. The participant does not subscribe to the channel of the recommended video: 108 instances (0.02% of all video visits) among 41 users (3.82% of all users).

We find little evidence for the typical “rabbit hole” story that the recommendation algorithm frequently leads people to extreme content. Sequentially applying these rules leaves us with only 108 instances in which a YouTube visit met all three criteria, which represents 0.022% of all video visits — 97 for recommendations to alternative channel videos (0.020% of all video visits) among 37 users (3.445% of users) and 11 for extremist channel videos (0.002% of all video visits) among 9 users (0.838% of users). (We provide qualitative accounts of three such sequences in Online Appendix A as well as an analysis showing no trend toward greater exposure to alternative or extremist channel videos in longer YouTube sessions.)

Moreover, some of these 108 cases are participants who followed a recommendation to a video from a category in which they already subscribe to one or more other channels (e.g., a person who subscribes to extremist channel A and follows a recommendation to extremist channel B). When we exclude cases of this kind, the set of qualifying “rabbit hole” events declines to just 60 cases (0.012% of all video visits) among only 30 users (2.793% of users).

Contrary to the “rabbit hole” narrative, recommendations to videos from alternative and extremist channels are instead most frequently shown to channel subscribers — the same group that is most likely to follow those recommendations. As Figure 10 demonstrates, people who subscribe to at least one alternative channel received 55.8% of all alternative channel video recommendations and represented 71% of the cases in which a participant followed a recommendation to an
The percentage of recommendations shown and followed to people who subscribe to one or more videos of each channel type (including 95% confidence intervals for both, though these are sometimes not visible due to the sample size of the recommendations shown data). The percentage of views of each type of video are shown in parentheses under the labels.

alternative channel video. This skew was even wider for extremist channel videos—subscribers to one or more extremist channels saw 66.1% of recommendations to videos from extremist channels and made up 82.8% of the cases in which respondents followed a recommendation to watch such a video. These figures far exceed those observed for mainstream media channels or other types of channels.

**Discussion**

Using data on web browsing, we provide behavioral measures of exposure to videos from alternative and extremist channels on YouTube. Our results indicate that exposure to these videos after YouTube’s algorithmic changes in 2019 is relatively uncommon and heavily concentrated in a small minority of participants who previously expressed high levels of hostile sexism and racial resentment. These participants frequently subscribe to the channels in question and reach the videos that they produce via external links. By contrast, we find relatively little evidence of people falling
into so-called algorithmic “rabbit holes.” Recommendations to videos from alternative and extremist channels on YouTube are very rare when respondents are watching other kinds of content and concentrated among subscribers to the channels in question.

Our findings imply that the process by which people are exposed to potentially harmful content on platforms like YouTube may have been misunderstood. Though we cannot rule out every possible account of how YouTube’s algorithms might help expose people to dubious content (e.g., that such radicalization took place prior to our study period), our results provide few examples of the patterns of behavior described in simple “rabbit hole” narratives. Future research expressing concerns about online radicalization should offer more precise definitions of what a “rabbit hole” is and the timescale over which it might be observed.

By contrast, our results make clear that YouTube continues to provide a platform for alternative and extreme content to be distributed to vulnerable audiences. In some ways, this outcome may be even more worrisome. People who view videos from alternative and extremist channels typically already hold extreme views on race and gender and often follow external links to these types of content. The subscription functionality that YouTube offers helps resentful audiences to follow content from alternative and extremist channels and drives recommendations to more of their videos.

Of course, it is important to note several limitations of the study. First, though our browser extension sample is large and diverse and we weight our results to approximate national benchmarks, it is not fully representative and does not capture YouTube consumption on other browsers or on mobile devices. Any outside study of a platform also faces challenges in recruiting large numbers of heavy consumers of fringe content. Second, these results only cover U.S. users; they should be replicated outside the U.S. in contexts including Europe and the global South. Third, YouTube is constantly changing its features, algorithm, etc. and its user and creator populations evolve over time as well. Findings from 2020 may not mirror what would have been observed in prior years—in particular, it is possible that YouTube algorithms recommended alternative and extremist channel videos more frequently prior to the changes made in 2019. Fourth, our results depend on channel-level classifications from scholars and subject matter experts; further research
should examine whether the patterns we observe are robust to alternate measures at the channel and (if possible) video level. Finally, our measures of views, referrals, and subscriptions contain some degree of error due to technical and ethical limitations. In particular, as with any passive behavioral data, we cannot verify that every user paid attention to the content that appeared on their device in every instance.

Ultimately, these findings underscore the need to apply the tools of behavioral science to measure exposure to extremist content across social media platforms and to determine how these platforms may reinforce (or hinder) those patterns of behavior individually and collectively. As our findings from YouTube suggest, these problems often center on the way social media platforms enable the distribution of potentially harmful content to vulnerable audiences rather than algorithmic exposure itself.

Weighted estimates use YouGov survey weights. Standard errors are in parentheses.
Enrollment and consumption over time

Figure A1: Total participants with browser activity data over time

Day-level totals of the number of study participants with browser activity data.
Figure A2: Consumption levels over time by channel type

Each point represents the weighted mean number of views (top panel) or minutes spent (bottom panel) on videos from each channel type per day. Trend lines are three-week moving averages.
Figure A3: YouTube video diets of individuals who viewed any alternative channel video

Participants who watched any alternative channel video (n = 166)

Figure A4: YouTube video diets of individuals who viewed any extremist channel video

Participants who watched any extremist channel video (n = 67)
Additional regressions

The Poisson GLM for rates takes the form:

\[
\log(\lambda_i) = \log(t_i) + \sum_{j=1}^{p} \beta_j x_{ij}
\]

Let \( \lambda_i \) be either the expected number of minutes or the expected number of views of alternative, extremist, or mainstream media channel videos. \( t_i \) is the total number of weeks we have activity data for user \( i \). \( j \) indexes the predictors (racial resentment, hostile sexism, feelings toward Jews, age, gender, education, and race). Due to overdispersion in the data, we relax the mean-variance equivalence assumption (\( \text{Var}[y|x] = \phi E[y|x] \)) of Poisson models in which \( \phi \) (dispersion) is restricted to 1 and estimate \( \phi \) directly from the data through quasi-MLE.

Figure 4 in the main text and Table A2 below report quasipoisson estimates using this estimation approach for time spent on videos from alternative and extremist channels. Figure A5 and Table A3 report corresponding results from zero-inflated Poisson models in which the zero component is modelled with a Binomial regression and a secondary process generating the counts including zeros is governed by a Poisson model.

Table A2: Correlates of time on YouTube videos by channel type

|               | Alternative channel videos (1) | Extremist channel videos (2) | Mainstream channel videos (3) |
|---------------|--------------------------------|-----------------------------|--------------------------------|
| Hostile sexism| 1.71***                        | 1.60**                      | 0.00                           |
|               | (0.37)                         | (0.60)                      | (0.32)                         |
| Racial resentment | 0.19                          | 0.09                        | -0.42                          |
|               | (0.35)                         | (0.43)                      | (0.36)                         |

\( *** p < 0.001; ** p < 0.01; * p < 0.05 \)

Quasipoisson coefficients for correlates of time per week spent on videos from alternative, extremist, and mainstream media channels. Robust standard errors are in parentheses.
Zero-inflated Poisson coefficients for correlates of the time per week spent on videos from alternative, extremist, and mainstream media channels. Figure includes 95% confidence intervals calculated from robust, survey-weighted standard errors. Stars indicate coefficients that are significant at the $p < .05$ level. See Table A3 for the regression table.
Table A3: Zero-inflated Poisson models for correlates of time on YouTube video by channel type

N = 851

Quasipoisson coefficients for correlates of views per week spent on videos from alternative, extremist, and mainstream media channels. Robust standard errors are in parentheses.
Due to concerns about post-treatment bias, we omit controls for party identification from the models reported in the main text. However, Figure A7 (Table A5) reports quasipoisson results mirroring those in Figure 4 (Table A2) and Figure A6 (Table A4) but which additionally control for Democratic and Republican self-identification (including leaners).

Figure A7: Correlates of YouTube video exposure by channel type (with party controls)

| A: View counts |
|----------------|
| Hostile sexism | Republican |
| Racial resentment | Democrat |
| Feeling Jews | Post-grad |
| Bachelors |  |
| Views/week to alternative channel videos | Views/week to extremist channel videos | Views/week to mainstream media channel videos |
| Quasipoisson coefficient | Quasipoisson coefficient | Quasipoisson coefficient |

| B: Time elapsed |
|----------------|
| Hostile sexism | Republican |
| Racial resentment | Democrat |
| Feeling Jews | Post-grad |
| Bachelors |  |
| Minutes/week on alternative channel videos | Minutes/week on extremist channel videos | Minutes/week on mainstream media channel videos |
| Quasipoisson coefficient | Quasipoisson coefficient | Quasipoisson coefficient |

Quasipoisson regression coefficients for correlates of the number of respondent video views per week (panel A) and time spent (panel B) per week on videos from alternative, extremist, and mainstream media channels. Figure includes 95% confidence intervals calculated from robust, survey-weighted standard errors. See Table A5 for the regression table.
Table A5: Correlates of YouTube video exposure by channel type (with party controls)

|                        | Dependent variable: Views | Dependent variable: Time elapsed |

∗∗∗p < 0.001; ∗∗p < 0.01; ∗p < 0.05

Quasipoisson models for correlates of views and time per week spent on videos from alternative, extremist, and mainstream media channels. Robust standard errors are in parentheses.
Table A6 reports quasipoisson estimates in which racial resentment and hostile sexism are entered into separate models rather than jointly as presented above.

Table A6: Correlates of time spent on YouTube videos by channel type

|                          | Alternative channel videos | Extremist channel videos | Mainstream channel videos |
|--------------------------|----------------------------|-------------------------|---------------------------|

*** p < 0.001; ** p < 0.01; * p < 0.05

Quasipoisson coefficients for correlates of time per week spent on videos from alternative, extremist, and mainstream media channels. Robust standard errors are in parentheses.
Finally, we provide results in Figure A8 and Table A7 below in which we use survey respondents’ prior responses to two questions measuring denial of institutional racism (27) in the 2018 Cooperative Congressional Survey as an alternate measure of racial attitudes. Our findings are similar to those reported above using prior levels of racial resentment instead.

Figure A8: Correlates of exposure to YouTube videos by channel type (alternate racial attitude measure)

Quasipoisson regression coefficients for correlates of the number of respondent views and time spent per week on videos from alternative, extremist, and mainstream media channels. Figure includes 95% confidence intervals calculated from robust, survey-weighted standard errors. See Table A7 for regression table.
Table A7: Correlates of exposure to YouTube videos by channel type (with alternative racial resentment)

N: 851 851 851 851 851 851

Quasipoisson coefficients for correlates of of views and time per week spent on videos from alternative, extremist, and mainstream media channels. Robust standard errors are in parentheses.
Browser extension validation

Browser activity statistics are reported throughout the paper. Below, we evaluate the validity of browser activity by comparing it to browser history data. The browser extension also recorded participants’ browser history (URLs with timestamps that are recorded each time a participant loads a new webpage). For comparability, we limit browser history data to the period for which both browser history and activity data are available.

Figure A9 shows the Pearson correlation coefficients between browser history and activity data across five variables for alternative, extremist, mainstream media, and other YouTube channels: a binary measure of viewing any video from that type of channel, the total number of views of videos from that type of channel, the total number of views of videos from subscribed channels of that type, the number of seconds elapsed on all YouTube videos from channels of that type, and the number of seconds elapsed on all YouTube videos from channels of that type. Correlations range from $r = 0.60$ to $0.99$ and are consistently high for alternative videos ($0.79 \leq r \leq 0.90$) and extremist videos ($0.83 \leq r \leq 0.95$).

Figure A9: Correlation between browser history and activity data

Any views of YouTube videos from channel

| Alternative channel | Extremist channel | Mainstream media channel | Other channel |
|---------------------|-------------------|--------------------------|--------------|
| 0.79                | 0.83              | 0.79                     | 0.60         |

Total number of views of YouTube videos from channel

| Alternative channel | Extremist channel | Mainstream media channel | Other channel |
|---------------------|-------------------|--------------------------|--------------|
| 0.83                | 0.95              | 0.90                     | 0.75         |

Total number of views of subscribed channel

| Alternative channel | Extremist channel | Mainstream media channel | Other channel |
|---------------------|-------------------|--------------------------|--------------|
| 0.88                | 0.94              | 0.89                     | 0.71         |

Seconds elapsed on YouTube videos from channel (capped)

| Alternative channel | Extremist channel | Mainstream media channel | Other channel |
|---------------------|-------------------|--------------------------|--------------|
| 0.87                | 0.83              | 0.99                     | 0.69         |

Seconds elapsed on videos from subscribed channel (capped)

| Alternative channel | Extremist channel | Mainstream media channel | Other channel |
|---------------------|-------------------|--------------------------|--------------|
| 0.90                | 0.85              | 0.99                     | 0.82         |
Differential browsing behavior after install

As shown in Table A8 below, we find no discernible change in the proportion of time that participants spent on alternative or extremist channels after installing the extension. We performed this analysis to verify that participants did not modify their web browsing behavior after installation, an important consideration in validating our measurement approach. Leveraging browser history data, which captures three months of web activity prior to the installation of the extension, we test if the proportion of time participants spend on alternative and extremist channels changes after installation in levels or slopes. Using OLS with robust standard errors clustered by participant, we estimate the two-way fixed effects model in Equation 1 where  is a participant-level fixed effect (for each ),  is a day-level fixed effect (for ), and  is a binary variable testing whether the mean proportion of time participants spend on alternative and extremist channels changes after installation. We also estimate the model in Equation 2 which adds the term  to test for a linear time trend in alternative and extremist channel viewership after installation. The dependent variable in both models is the proportion of seconds spent on either alternative or extremist channel videos per day.

\[
Y_{i,t} = \alpha_i + \gamma_t + \beta_1 \text{Installed}_{i,t} + \epsilon_{i,t} \\
Y_{i,t} = \alpha_i + \gamma_t + \beta_1 \text{Installed}_{i,t} + \beta_2 \text{Days after install}_{i,t} + \epsilon_{i,t}
\]

Table A8: Predictors of proportion of time spent on alternative/extremist videos by day

|                | (1)       | (2)       |
|----------------|-----------|-----------|
| Installed      | 0.00660   | 0.00627   |
|                | (0.00778) | (0.00789) |
| Days after install | -0.00013 |           |
|                |           | (0.00210) |
| Day fixed effects | ✓        | ✓        |
| User fixed effects | ✓        | ✓        |
| N              | 63,216    | 63,216    |

Full sample  Extension sample
Session trajectories

We provide three examples of participant viewing paths that led to extremist channel videos in a manner consistent with the rabbit hole narrative below:

- A participant conducted a search for an alternative channel’s name (Dinesh D’Souza), viewed a video from that channel, and then followed a recommendation to an extremist channel video (PragerU).

- In another session, a participant visited the YouTube homepage, viewed a video from an “other” channel (English Heritage), then viewed a video from the alternative channel Carpe Donktum titled “Stop The Steal.us,” and then followed a recommendation to a video from the extremist channel Styxhexenhammer666 titled “MSM Hopes You’ll Just Accept the Election Despite Outstanding Evidence of Fraud.” Following that, the participant viewed a video from an “other” channel that is now private titled “Target Smart Early Voting Data Gives President Trump the Eventual Victory After Recounts.”

- A participant viewed an other channel video (WIRED; “Every Race In Middle-Earth Explained”) and then followed a recommendation to an extremist channel video (Survive the Jive, “Ancient History of Ireland, Newgrange, Celts, Vikings”).

To test for “rabbit hole”-style patterns of exposure, we also consider whether YouTube users are more likely to encounter potentially harmful content in longer sessions (24). We construct sessions by separating a sorted timeline of respondents’ YouTube activity at each point at which they (1) dwell on a non-video URL (e.g., the YouTube homepage) for greater than 10 minutes, (2) spend longer than the duration of the video in question plus 30 minutes before interacting with the page, or (3) spend longer than four hours on a video. We call the number of YouTube videos between these breakpoints a session and define each session by its length (number of videos viewed).

First, we note several descriptive findings about YouTube sessions. They are relatively numerous—the median number of sessions for a participant is 29 during the study period—and frequently short. In total, 18.3% of sessions on YouTube do not include a video view, 16.6% are singletons in which respondents view just one video, and 41.9% include 2–10 videos. Just 23.2% of sessions have length 11 or longer. However, due to skewness in the distribution of YouTube consumption by session length, 77.5% of videos are watched in these sessions of length eleven or greater.

Figure A11 considers how the probability of viewing an alternative or extremist channel video varies by the point in a session over sessions of length 1–319 (the range of lengths that capture 99% of the sessions in our data). Each point in the graph represents the estimated probability of viewing a particular type of video at a particular session length. We find no clear evidence that the probability of viewing an alternative or extremist channel video increases as sessions lengthen; the probabilities are generally stable. The equivalent probability for mainstream media channel videos, which we provide for comparison, is also relatively stable.

Figure A12 instead examines whether the total proportion of videos watched from alternative and extremist channels by session is greater in longer sessions. A point represents the percentage of videos of a particular type that were watched in sessions of a given total length. We find no evidence that longer sessions have higher proportions of alternative or extremist channel videos.
Figure A11: Percentage of views to each channel type by video number within session

Each point represents the average percentage of videos from a channel type at a given session length. Lines are loess curves fit with a linear function and a 0.5 span.

Figure A12: Percentage of views to each channel type by total session length

Each point represents the average percentage of videos from a channel type of all videos viewed in sessions of a fixed session length. Lines are loess curves fit with a linear function and a 0.5 span.
## External referrers

Table A9: External referrers to alternative and extremist channel videos

| Referrer type    | Preceding domain | % extremist channel external referrers | % alternative channel external referrers |
|------------------|------------------|---------------------------------------|-----------------------------------------|
| Alternative social | 4chan.org        | 0.09                                  | 0.00                                    |

Exposure concentration by views

Figure A13: Concentration of exposure to alternative and extremist channels (view counts)

Weighted empirical cumulative distribution function showing the percentage of participants responsible for a given level of total observed video viewership of alternative and extremist channels on YouTube (by view count).
Online Appendix B: Ethics and consent language

Survey informed consent

This research project is being conducted by REDACTED FOR PEER REVIEW. It is a study to learn more about public opinion on issues in the news. Your participation is voluntary. Participation involves completion of a short survey as well as the option to participate in additional components of the study that would collect confidential data on your online behavior. This would entail confidential tracking data of your online website visits which you have already agreed to as part of your YouGov Pulse participation, and could include up to 1 year of data already collected prior to this survey. You may choose to not answer any or all questions and to not participate in any portion of the study that you choose. The researchers will not store information that could identify you with your survey responses. Identifying information will not be used in any presentation or publication written about this project. You must be age 18 or older to participate. Questions about this project may be directed to REDACTED FOR PEER REVIEW.

If you agree to participate in this survey, click “I agree” below.
-I agree to participate
-I do not agree to participate

Browser extension informed consent (invitation)

This extension implements a user study being conducted by researchers at REDACTED FOR PEER REVIEW. If you choose to participate, this browser extension will confidentially collect four types of data from your browser.

1. Metadata for web browsing (e.g. URL visited with time of visit), exposure to embedded URLs on websites (e.g. YouTube videos), and interactions with websites (e.g. clicks and video viewing time). This data is collected until the study is completed.

2. Copies of the HTML seen on specific sites: Google Search, Google News, YouTube, Facebook Newsfeed, and Twitter Feed. We remove all identifying information before it leaves the browser. This confidential data is collected until the study is completed.

3. Browsing history, Google and YouTube account histories (e.g. searches, comments, clicks), and online advertising preferences (Google, Bluekai, Facebook). This data is initially collected for the year prior to the installation of our browser extension, and we then check these sources once every two weeks to collect updates until the study is completed.

4. Snapshots of selected URLs from your browser. For each URL, the extension saves a copy of the HTML that renders, effectively capturing what you would have seen had you visited that website yourself. Once per week we conduct searches on Google Search, Google News, Youtube, and Twitter, and collect the current frontpage of Google News, YouTube, and Twitter. These web page
visits will occur in the background and will not affect the normal functioning of your browser.

Additionally, if you choose to participate, you will be asked to take a survey in which we ask you several questions about your demographics, web usage, and media preferences. These data, as well as those mentioned above, will be used to analyze the correlations between your online behavior and your interest profiles.

After the study is complete on December 31, 2020, the extension will uninstall itself. All data collected will be kept strictly confidential and used for research purposes only. We will not share your responses with anyone who is not involved in this research.

Minimizing risks: None of the raw data collected through our browser extension during this study will be publicly released, and the survey data will not be given or sold to a third party without the panelist’s consent. All raw data will be stored on a secure server at Northeastern University, and access to that server will be limited to members of the research group. Only aggregated data will be released, which minimizes the possibility of reidentification. All data that is collected from our survey and from participants’ browsers will be stripped of personally identifiable information to the best of our ability.

The decision to participate in this research project is voluntary. You do not have to participate, and there is no penalty if you choose not to participate in this research or if you choose to stop participating. You may choose to stop participating at any time, and you may request that we delete all data collected from your browser.

Browser extension informed consent (installation page)

Welcome to the study!

This extension implements a user study being conducted by researchers at REDACTED FOR PEER REVIEW. If you choose to participate, this browser extension will confidentially collect four types of data from your browser.

1. Metadata for web browsing (e.g. URL visited with time of visit), exposure to embedded URLs on websites (e.g. YouTube videos), and interactions with websites (e.g. clicks and video viewing time). This data is collected until the study is completed.

2. Copies of the HTML seen on specific sites: Google Search, Google News, YouTube, Facebook Newsfeed, and Twitter Feed. We remove all identifying information before it leaves the browser. This confidential data is collected until the study is completed.

3. Browsing history, Google and YouTube account histories (e.g. searches, comments, clicks), and online advertising preferences (Google, Bluekai, Facebook). This data is initially collected for the year prior to the installation of our browser extension, and we then check these sources once every
two weeks to collect updates until the study is completed.

4. Snapshots of selected URLs from your browser. For each URL, the extension saves a copy of the HTML that renders, effectively capturing what you would have seen had you visited that website yourself. Once per week we conduct searches on Google Search, Google News, YouTube, and Twitter, and collect the current frontpage of Google News, YouTube, and Twitter. These web page visits will occur in the background and will not affect the normal functioning of your browser. There is a theoretical risk of “profile pollution” – that this extension will impact your online profiles, i.e., “pollute” them with actions that you did not take. To mitigate this risk, the extension will only visit content that is benign and will only execute searches for general terms. Our previous work has found that historical information of this kind has minimal impact on online services.

Additionally, if you choose to participate, you will be asked to take a survey in which we ask you several questions about your demographics, web usage, and media preferences. These data, as well as those mentioned above, will be used to analyze the correlations between your online behavior and your interest profiles.

After the study is complete on December 31, 2020, the extension will uninstall itself. All data collected will be kept strictly confidential and used for research purposes only. We will not share your responses with anyone who is not involved in this research.

You must be at least 18 years old to take part in this study. The decision to participate in this research project is voluntary. You do not have to participate and you can refuse to participate. Even if you begin our experiment, you can stop at any time. You may request that we delete all data collected from your web browser at any time.

We have minimized the risks. We are collecting basic demographic information, information about your internet habits, and copies of web pages that you visit. To the greatest extent possible, information that identifies you will be removed from all collected web data.

Your role in this study is confidential. However, because of the nature of electronic systems, it is possible, though unlikely, that respondents could be identified by some electronic record associated with the response. Neither the researchers nor anyone involved with this study will be collecting those data. Any reports or publications based on this research will use only aggregate data and will not identify you or any individual as being affiliated with this project.

Whether agree with the statement (racial resentment) -- Irish, Italians, Jewish and many other minorities overcame prejudice and worked their way up. Blacks should do the same without any special favors.

Whether agree with the statement (racial resentment) -- Generations of slavery and discrimination have created conditions that make it difficult for blacks to work their way out of the lower class.

Whether agree with the statement (racial resentment) -- Over the past few years, blacks have gotten less than they deserve.

Whether agree with the statement (racial resentment) -- It’s really a matter of some people not trying hard enough, if blacks would only try harder they could be just as well off as whites.

Whether agree with the statement (racial resentment) -- White people in the U.S. have certain advantages because of the color of their skin.

Whether agree with the statement (racial resentment) -- Racial problems in the U.S. are rare, isolated situations.

Whether agree with the statement (feminists) -- When women lose to men in a fair competition, they typically complain about being discriminated against.

Whether agree with the statement (feminists) -- Feminists are making entirely reasonable demands of men.

How often do you feel that you lack companionship?

How often do you feel left out?

How often do you feel isolated from others?

Whether the statement is True -- Given enough provocation, I may hit a person

Whether the statement is True -- I often find myself disagreeing with people

Whether the statement is True -- I can’t help getting into arguments when people disagree with me

Whether the statement is True -- I have trouble controlling my temper

Whether the statement is True -- I flare up
quickly but get over it quickly

q6_10 Whether the statement is True -- At times I feel I have gotten a raw deal out of life

q6_1 Whether the statement is True -- There are people who have pushed me so far that we have come to blows

q6_3 Whether the statement is True -- I have threatened people I know

q6_6 Whether the statement is True -- My friends say I’m somewhat argumentative

q6_8 Whether the statement is True -- Sometimes I fly off the handle for no good reason

q6_11 Whether the statement is True -- Other people always seem to get the breaks

q6_12 Whether the statement is True -- I wonder why sometimes I feel so bitter about things

q7_1 Whether agree with the statement (conspiracy predispositions) -- Much of our lives are being controlled by plots hatched in secret places.

q7_2 Whether agree with the statement (conspiracy predispositions) -- Even though we live in a democracy, a few people will always run things anyway.

q7_3 Whether agree with the statement (conspiracy predispositions) -- The people who really "run" the country are not known to the voter.

q7_4 Whether agree with the statement (conspiracy predispositions) -- Big events like wars, recessions, and the outcomes of elections are controlled by small groups of people who are working in secret against the rest of us.

q8 How much trust you have in the mass media

q9 How accurate is the news posted online

q11_4 How much you trust you have in this news source -- The Washington Post

q11_5 How much you trust you have in this news source -- MSNBC

q11_6 How much you trust you have in this news source
q11_7
How much you trust you have in this news source

q12_1
How much trust you have in information from the following source -- Organizations you follow on YouTube or social media platforms (Twitter, Facebook, Instagram, Snapchat, etc.)

q12_2
How much trust you have in information from the following source -- Celebrities you follow on YouTube or social media platforms (Twitter, Facebook, Instagram, Snapchat, etc.)

q12_3
How much trust you have in information from the following source -- People you follow but do not personally know on YouTube or social media platforms (Twitter, Facebook, Instagram, Snapchat, etc.)

q12_4
How much trust you have in information from the following source -- People you follow and personally know on YouTube or social media platforms (Twitter, Facebook, Instagram, Snapchat, etc.)

q12_5
How much trust you have in information from the following source -- People you personally know and talk to offline

q12_6
How much trust you have in information from the following source -- The mass media (such as newspapers, TV and radio)

q13
How frequently you use Google

q14
How much of the information you find using Google is accurate

q15
Google personalizes the search results

q17
How much of the information you find using YouTube is accurate

q18
YouTube personalizes the videos

q28
How satisfied you are with the search result quality on Google

q29
How much trust you have in information on Google

q30
What Google search results favor -- Liberals or conservatives

q31
How satisfied you are with the video quality on YouTube

q32
How much trust you have in YouTube videos

q33
What YouTube videos favor -- Liberals or conservatives

q34_1
How concerned you feel about the following -- Getting coronavirus yourself

q34_2
How concerned you feel about the following -- Family members getting coronavirus

q35
How much of a threat is the coronavirus for US people

q36_2
Believe the following or not -- Avoiding larger
gatherings of people can help prevent the spread of the coronavirus

q36_3 Believe the following or not -- Masks are an effective way to prevent the spread of the coronavirus

q36_4 Believe the following or not -- Coronavirus can be spread by people who do not show symptoms

q36_6 Believe the following or not -- The medication hydroxychloroquine is proven to cure or prevent COVID-19, the illness caused by the novel coronavirus

q36_8 Believe the following or not -- The Chinese government created the coronavirus that causes COVID-19 as a bioweapon

q36_10 Believe the following or not -- A group funded by Bill Gates patented the coronavirus that causes COVID-19

q36_1 Believe the following or not -- Frequent handwashing is a way to protect against the coronavirus

q36_5 Believe the following or not -- A new loss of taste or smell is a symptom of the coronavirus

q36_7 Believe the following or not -- The coronavirus is being spread by 5G cell phone technology

q36_9 Believe the following or not -- The media is exaggerating the threat from the coronavirus to damage President Trump

q37_1 Agree with the following or not -- Getting vaccines is a good way to protect children from disease

q37_2 Agree with the following or not -- Generally I do what my doctor recommends about vaccines

q37_3 Agree with the following or not -- New vaccines are recommended only if they are safe

q37_4 Agree with the following or not -- Children do not need vaccines for diseases that are not common anymore

q37_5 Agree with the following or not -- I am concerned about serious side effects of vaccines

q37_6 Agree with the following or not -- Some vaccines cause autism in healthy children

q37_7 Agree with the following or not -- Vaccinations are one of the most significant achievements in improving public health

q38 How often you don't take surveys seriously

q39 Did you make an effort to look up information
