an_shchitov@rambler.ru

Keywords: best approximations, Jackson-type inequality, trigonometric polynomials, sharp constant, modulus of continuity, $S^p$ spaces, $L_2$ space.

Abstract. We find the sharp constant in the Jackson-type inequality between the value of the best approximation of functions by trigonometric polynomials and moduli of continuity of $m$-th order in the spaces $S^p$, $1 < p < \infty$. In the particular case we obtain one result which in a certain sense generalizes the result obtained by L.V. Taykov for $m = 1$ in the space $L_2$ for the arbitrary moduli of continuity of $m$-th order ($m \in \mathbb{N}$).

Introduction

Trigonometric polynomials are the object of the study for a long time. The significant results in the approximation theory were obtained by Jackson. He proved that for an arbitrary $2\pi$-periodic continuous function the following inequality holds

$$E_{n-1}(f)_C \leq K \omega(f; \frac{1}{n}),$$

where

$$E_{n-1}(f)_C = \inf \{ \| f - T_{n-1} \|_C : T_{n-1} \in T_{n-1} \}$$

is the value of the best approximation of function $f$ by the subspace $T_{n-1}$ of trigonometric polynomials of degree $n - 1$ in the continuous metric;

$$\omega(f; t) = \sup \{ \| f(\cdot + h) - f(\cdot) \|_C : |h| \leq t \}$$

is the modulus of continuity of function $f$, and $K$ is a constant which doesn’t depend on $n$ and $f$.

This inequality and analogous relations are known in the approximation theory as the Jackson-type inequalities. In approximation theory it is of importance to find the smallest constant from all possible ones in the Jackson-type inequalities. Such constants are called the sharp constants.

The questions of the obtaining the Jackson-type inequalities in case of approximation by trigonometric polynomials in the uniform and integral metrics were studied by many mathematicians, see for example the articles [1]-[25].

A.I. Stepanets in [26] introduced the normed spaces $S^p (1 \leq p < \infty)$ of the integrable functions $f(x)$ having the period $2\pi$ for which

$$\| f \|_{S^p} \overset{df}{=} \left\{ \sum_{k \in \mathbb{Z}} |\hat{f}(k)|^p \right\}^{1/p} < \infty,$$

where

$$\hat{f}(k) = (2\pi)^{-1/2} \int_{-\pi}^{\pi} f(x) e^{-ikx} \, dx \quad (1)$$

are the Fourier coefficients of the function $f(x)$ on the trigonometric system $(2\pi)^{-1/2} e^{ikx}, k \in \mathbb{Z}$. It was proved that the spaces $S^p (1 \leq p < \infty)$ have the substantial properties of the Hilbert spaces, i.e. the minimal property of the partial Fourier sums. If

$$E_{n-1}(f)_{S^p} \overset{df}{=} \inf \{ \| f - T_{n-1} \|_{S^p} : T_{n-1} \in T_{n-1} \}$$

is the value of the best approximation of function $f(x) \in S^p$ by the subspace $T_{n-1}$ of trigonometric polynomials of degree $n - 1$ in the metric of the space $S^p$ then

$$E_{n-1}(f)_{S^p} = \|f - s_{n-1}(f)\|_{S^p} = \left\{ \sum_{|k| \geq n} |\hat{f}(k)|^p \right\}^{1/p},$$  \hspace{1cm} (2)$$

where

$$s_{n-1}(f, x) = (2\pi)^{-1/2} \sum_{|k| \leq n-1} \hat{f}(k) e^{ikx}$$

is the partial sum of the Fourier series

$$s(f, x) = (2\pi)^{-1/2} \sum_{k \in \mathbb{Z}} \hat{f}(k) e^{ikx}$$

of function $f(x) \in S^p$.

A.I. Stepanets stated in [26] that for $p = 2$ it is hold the equality

$$\|f\|_{L_2} = \|f\|_{S^2}.$$  

Let

$$\omega_m(f, t)_{X} = \sup \left\{ \|\Delta_h^m f(\cdot)\|_X : 0 < h \leq t \right\},$$

is a modulus of continuity of order $m$ of the function $f(x) \in X$, where

$$\Delta_h^m f(x) = \sum_{j=0}^{m} (-1)^{m-j} \binom{m}{j} f(x + jh)$$

is a finite difference of order $m$ of the function $f(x)$ at the point $x$ with the step $h$. If $X = L_p$ ($1 \leq p < \infty$) then the value $\omega_m(f, t)_{L_p}$ is the known integral modulus of continuity [27]. In case of $X = S^p$ the modulus of continuity $\omega_m(f, t)_{S^p}$ was introduced in the article [28].

Let $\Psi(k)$ and $\beta(k) \overset{df}{=} \beta_k$ ($k \in \mathbb{N}$) are the constrictions on $\mathbb{N}$ of the arbitrary functions $\Psi(x)$ and $\beta(x)$ defined on the half-segment $[1, \infty)$. Let’s suppose that the series

$$\sum_{k=1}^{\infty} \frac{1}{\Psi(k)} \left( a_k(f) \cos \left( kx + \frac{\beta_k \pi}{2} \right) + b_k(f) \sin \left( kx + \frac{\beta_k \pi}{2} \right) \right)$$

is the Fourier series of some summable function which we denote by $f^{\Psi}_B(x)$ according to [29]. The function $f^{\Psi}_B(x)$ is called $(\Psi, \beta)$-derivative of the function $f(x)$. The concept of the $(\Psi, \beta)$-derivative is the generalization of the definition of the $r$-th derivative of function. When $\Psi(k) = k^{-r}$ ($0 < r < \infty$) and $\beta(k) = r$ then the $r$-th derivative of the function $f(x)$ differs from the $(k^{-r}, r)$-derivative only on the constant value.

Let $L^\Psi_B(S^p)$ is the set of integrable functions $f(x)$ having the period $2\pi$ which have the $(\Psi, \beta)$-derivatives. Also let $L^\Psi_B(S^p)$ is the set of the functions $f(x) \in L^\Psi_B$ such that their $(\Psi, \beta)$-derivatives belong to the space $S^p$. If $\Psi(k) = k^{-r}$ ($0 < r < \infty$) and $\beta(k) = r$ then we use notation $L^r(S^p); L^r_2 \equiv L^r(S^2)$.

A lot of articles are devoted to solving problems of approximation theory in the spaces $S^p$ ($1 \leq p < \infty$). For example, in the articles [30]-[36] were studied the approximation properties of trigonometric system and were solved several problems on obtaining the Jackson-type inequalities

$$E_{n-1}(f)_{S^p} \leq \chi(t) \cdot n^{-r} \omega_m(f^{(r)}, t/n)_{S^p} \quad (t > 0)$$

and finding the sharp constants for the fixed values of $m, n, t$ and $p$, that is the values
\[ \chi_{n,m}(t)_{S^p} = \sup \left\{ \frac{E_{n-1}(f)_{S^p}}{\omega_m(f, t)_{S^p}} : f \in L^r(S^p), f \neq \text{const} \right\} (t > 0). \]

We assume that the ratio 0/0 is equal to zero.

Let’s define the following notation

\[ \chi_{n,(\Psi, \overline{\Psi}),m,p,1}(\mathcal{F}, t; S^p) \overset{df}{=} \sup_{f(x) \neq \text{const}} \frac{n^{-1}E_{n-1}(f)_{S^p}}{\Psi(n) \left( \int_0^t \omega_m(f^{\Psi}_{\overline{\Psi}}, x)_{S^p} \mathcal{F}(x) dx \right)^{1/p}}. \] (4)

In the spaces \( S^p \) the values of the type (4) were studied by A.I. Stepanets, A.S. Serdud [28] \( \left( \chi_{n(1,0),m,p,1/p}(\mathcal{F}, \frac{n}{n}; S^p), \mathcal{F}(x) = \sin(nx) \right) \), A.S. Serdud [31] \( \left( \chi_{n,(\Psi, \overline{\Psi}),m,p,1/p}(\mathcal{F}, \frac{n}{n}; S^p), \mathcal{F}(x) = \sin(nx) \right) \); \( \chi_{n,(\Psi, \overline{\Psi}),m,1}(\mathcal{F}, t; S^p), \mathcal{F}(x) = \sin(nx) \); \( \chi_{n,(\Psi, \overline{\Psi}),m,0}(\mathcal{F}, t; S^p), \mathcal{F}(x) \equiv 1, 0 < t \leq \frac{3\pi}{4} \). S.B. Vakarchuk [33] \( \left( \chi_{n,(\Psi, \overline{\Psi}),m,p,0}(\mathcal{F}, t; S^p), \mathcal{F}(x) \equiv 1, 0 < t \leq \frac{\pi}{n} \right) \). The analogous to (4) values were considered by B.P. Voytchevishi [34], S.B.Vakarchuk and A.N.Shchitov [35].

In the article [36] were obtained the exact values of extremal characteristics of a special form between the values of best polynomial approximations of functions \( E_{n-1}(f)_{S^p} \) and moduli of continuity of \( m \)-th order \( \omega_m(f^{\Psi}_{\overline{\Psi}}, t)_{S^p} \). The asymptotically sharp inequalities of Jackson type between the values \( E_{n-1}(f)_{S^p} \) and moduli of continuity of functions \( f(x) \in S^p \) were found in the article [36].

The aim of the current study is the obtaining of the sharp constant in the Jackson-type inequality between the value of the best approximation of functions from the class \( L^p(\Psi^{\overline{\Psi}}(S^p)) \) by trigonometric polynomials \( E_{n-1}(f)_{S^p} \) and moduli of continuity of \( m \)-th order \( \omega_m(f^{\Psi}_{\overline{\Psi}}, t)_{S^p} \) in the spaces \( S^p, 1 \leq p < \infty \).

**Sharp constant in the Jackson-type inequality for the best approximation of functions** \( f(x) \in S^p \)

Further we suppose that the function \( \Psi(x) (1 \leq x < \infty) \) is the positive function which monotonically decreases to zero with increasing of \( x \).

Sharp constant in the Jackson-type inequality for the best \( S^p \)-approximation of functions by trigonometric polynomials is found in the next theorem.

**Theorem 1.** For the arbitrary numbers \( n, m \in \mathbb{N}, 0 < \tau \leq \frac{3\pi}{4n} \) and \( 1 \leq p < \infty \) the following equality holds

\[ \sup_{f(x) \neq \text{const}} \frac{E_{n-1}(f)_{S^p}}{\int_0^\pi \omega_m^{2/m}(f^{\Psi}_{\overline{\Psi}}, h)_{S^p} dh} = \Psi(n) \left\{ \frac{n}{2(n\tau - \sin n\tau)} \right\}^{m/2}. \] (5)

**Proof.** Using following

\[ a_k(f) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos kx dx; \]

\[ b_k(f) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin kx dx (k \in \mathbb{Z}_+), \]

we can write the Fourier coefficients (1) in the form

\[ \hat{f}(k) = \left( \frac{\pi}{2} \right)^{1/2} (a_k(f) - ib_k(f) \text{sgn} k) \quad (k \in \mathbb{Z}). \] (6)
Then the relation \((2)\) can be written in the next form

\[
E_{n-1}(f)_{S^p} = \left(\frac{\pi}{2}\right)^{1/2} \left\{2 \sum_{k=n}^{\infty} \rho_k^p(f)\right\}^{1/p},
\]

(7)

where

\[
\rho_k(f) \overset{\text{df}}{=} \sqrt{a_k^2(f) + b_k^2(f)}.
\]

It is known \([29]\) that Fourier coefficients of the functions \(f(x)\) and \(f^\Psi_{\pi}(x)\) are connected by the formula

\[
\begin{align*}
& a_k(f) = \Psi(k) \left( a_k(f^\Psi_{\pi}) \cos \frac{\beta_k \pi}{2} - b_k(f^\Psi_{\pi}) \sin \frac{\beta_k \pi}{2} \right), \\
& b_k(f) = \Psi(k) \left( a_k(f^\Psi_{\pi}) \sin \frac{\beta_k \pi}{2} + b_k(f^\Psi_{\pi}) \cos \frac{\beta_k \pi}{2} \right).
\end{align*}
\]

(8)

From (6) and (8) we have

\[
\hat{f}(k) = e^{-i\beta_k \pi \text{sgn}(k)/2} \Psi(|k|) \frac{f^\Psi_{\pi}}{\pi}(k) \quad (k \in \mathbb{Z}\backslash\{0\}).
\]

(9)

In the article \([28]\) it was shown that for an arbitrary function \(f(x) \in S^p\) \((1 \leq p < \infty)\)

\[
\|\triangle_h^m f(\cdot)\|_{S^p}^p = 2^{m/p} \sum_{k \in \mathbb{Z}} |\hat{f}(k)|^p (1 - \cos kh)^{mp/2}.
\]

(10)

Using (6) and (10) we write

\[
\left\|\triangle_h^m f^\Psi_{\pi}(\cdot)\right\|_{S^p}^p = \pi^{p/2} 2^{1+(m-1)p/2} \sum_{k=1}^{\infty} \rho_k^p(f^\Psi_{\pi})(1 - \cos kh)^{mp/2}.
\]

(11)

From the (9) it immediately follows the equation

\[
\rho_k(f) = \Psi(k) \rho_k(f^\Psi_{\pi}).
\]

Then using the last equation from the (11) we have

\[
\left\|\triangle_h^m f^\Psi_{\pi}(\cdot)\right\|_{S^p}^p = \pi^{p/2} 2^{1+(m-1)p/2} \sum_{k=1}^{\infty} \frac{1}{\Psi P(k)} \rho_k^p(f)(1 - \cos kh)^{mp/2}.
\]

(12)

Using (7) we can write

\[
E_{n-1}(f)_{S^p} - \left(\frac{\pi}{2}\right)^{p/2} 2 \sum_{k=n}^{\infty} \rho_k^p(f) \cos k h =
\]

\[
= \left(\frac{\pi}{2}\right)^{p/2} 2 \sum_{k=n}^{\infty} \rho_k^{p-2/m}(f) \rho_k^{2/m}(f)(1 - \cos kh).
\]

(13)

Applying the Holder’s inequality to the right part of the (13), using (2), (12), definition of the modulus of continuity of the \(m\)-th order and the decreasing character of the function \(\Psi(x)\), from the (13) we get
\[ E_{n-1}(f)_{Sp} - \left( \frac{\pi}{2} \right)^{p/2} 2 \sum_{k=n}^{\infty} \rho_k^p(f) \cos kh \]

\[ \leq \left( \frac{\pi}{2} \right)^{p/2} 2 \left\{ \sum_{k=n}^{\infty} \rho_k^p(f) \right\}^{1-2/mp} \left\{ \sum_{k=n}^{\infty} \rho_k^p(f)(1 - \cos kh)^{mp/2} \right\}^{2/(mp)} \]

\[ \leq \left( \frac{\pi}{2} \right)^{1/m} \Psi^{2/m}(n) E_{n-1}^{p-2/m}(f)_{Sp} \left\{ \sum_{k=n}^{\infty} \frac{1}{\Psi_k^p} \rho_k^p(f)(1 - \cos kh)^{mp/2} \right\}^{2/(mp)} \]

\[ \leq \frac{1}{2} \Psi^{2/m}(n) E_{n-1}^{p-2/m}(f)_{Sp} \omega_{2/m}^2(f^{\Psi^0}, h)_{Sp}. \]  

Integrating the relation (14) by the variable \( h \) over the limits from 0 to \( \tau \) we have

\[ \tau E_{n-1}^p(f)_{Sp} \leq \left( \frac{\pi}{2} \right)^{p/2} 2 \sum_{k=n}^{\infty} \frac{\rho_k^p(f) \sin \frac{k \tau}{h}}{k} \]

\[ + \frac{\Psi^{2/m}(n)}{2} E_{n-1}^{p-2/m}(f)_{Sp} \int_0^\tau \omega_{2/m}^2(f^{\Psi^0}, h)_{Sp} dh. \]  

In the [3] it was obtained the relation

\[ \max_{n \tau \leq u} \left| \sin \frac{u}{n \tau} \right| = \frac{\sin \frac{n \tau}{n \tau}}{n \tau} \quad (0 < n \tau \leq \frac{3 \pi}{4}). \]  

Dividing the inequality (15) by \( \tau \) and taking into account (7) and (16) we have

\[ E_{n-1}^p(f)_{Sp} \leq \frac{\sin \frac{n \tau}{n \tau}}{n \tau} E_{n-1}^p(f)_{Sp} \]

\[ + \frac{\Psi^{2/m}(n)}{2 \tau} E_{n-1}^{p-2/m}(f)_{Sp} \int_0^\tau \omega_{2/m}^2(f^{\Psi^0}, h)_{Sp} dh. \]  

Therefore from (17) we get

\[ E_{n-1}(f)_{Sp} \leq \Psi(n) \left\{ \frac{n}{2(\sin n \tau)} \right\}^{m/2} \left\{ \int_0^\tau \omega_{2/m}^2(f^{\Psi^0}, h)_{Sp} dh \right\}^{m/2}. \]  

From (18) for an arbitrary \( 0 < \tau \leq \frac{3 \pi}{4n} \) we have the upper bound

\[ \sup_{f(x) \in L_{Sp}^p} \frac{E_{n-1}(f)_{Sp}}{\int \omega_{2/m}^2(f^{\Psi^0}, h)_{Sp} dh} \leq \Psi(n) \left\{ \frac{n}{2(\sin n \tau)} \right\}^{m/2}. \]  

To obtain the lower bound we consider the function

\[ \tilde{f}(x) = \sqrt{2/\pi} \cos(n x), \]

which belongs to the class \( L_{Sp}^p \).

Based on the (7) we have

\[ E_{n-1}(\tilde{f})_{Sp} = 2^{1/p}. \]
For $(\Psi, \beta)$-derivative of the function $\tilde{f}$

$$\tilde{f}_\beta^\Psi (x) = \sqrt{2/\pi} \Psi^{-1}(n) \cos(nx + \beta_n \pi/2)$$

due to (11) and definition of the modulus of continuity of order $m$ for $0 < t \leq \frac{\pi}{n}$ we can write

$$\omega_m(\tilde{f}_\beta^\Psi, t)_{Sp} = 2^{1/p + m/2} \frac{1}{\Psi(n)} (1 - \cos nt)^{m/2}.$$  \hspace{1cm} (21)

From the (21) for $0 < t \leq \frac{\pi}{n}$ we obtain

$$\left\{ \int_0^\pi \omega_m^{2/m}(\tilde{f}_\beta^\Psi, h)_{Sp} dh \right\}^{m/2} = \frac{1}{\Psi(n)} 2^{1/p + m/2} \left\{ \tau - \frac{1}{n} \sin n\tau \right\}^{m/2}.$$  \hspace{1cm} (22)

Then taking into account (20) and (22) we get

$$\sup_{f(x) \in L_2^p(S^p)} \frac{E_{n-1}(f)_{Sp}}{\int_0^\pi \omega_m^{2/m}(\tilde{f}_\beta^\Psi, h)_{Sp} dh} \geq \frac{E_{n-1}(\tilde{f})_{Sp}}{\int_0^\pi \omega_m^{2/m}(\tilde{f}_\beta^\Psi, h)_{Sp} dh} \right\}^{m/2} = \Psi(n) \left\{ \frac{n}{2(n\tau - \sin n\tau)} \right\}^{m/2}.$$  \hspace{1cm} (23)

From the upper bound (19) and lower bound (23) it follows the equality (5). Theorem 1 is proved.

If $\Psi(n) = n^{-r}$, $r \in \mathbb{Z}_+$, then from the theorem it follows the next result.

**Theorem 2.** Let $r \in \mathbb{Z}_+$ and $n, m \in \mathbb{N}$. Then for an arbitrary $0 < \tau \leq \frac{3\pi}{4n}$ the following equality holds

$$\sup_{f(x) \in L_2^p(S^p)} \frac{n^r E_{n-1}(f)_{L_2}}{\int_0^\pi \omega_m^{2/m}(f^{(r)}, h)_{L_2} dh} \geq \left\{ \frac{n}{2(n\tau - \sin n\tau)} \right\}^{m/2}.$$  \hspace{1cm} (24)

The result of the theorem 2 in a certain sense generalizes for the arbitrary modulus of continuity of $m$-th order $(m \in \mathbb{N})$ one result obtained by L.V. Taykov for the case $m = 1$ in the article [3].

**Conclusions**

For the functions from the class $L_2^p(S^p)$ $(1 \leq p < \infty)$ the sharp constant in the Jackson-type inequality between the value of the best approximation $E_{n-1}(f)_{Sp}$ of functions by trigonometric polynomials and moduli of continuity of $m$-th order $\omega_m(f^{(r)}, t)_{Sp}$ in the spaces $S^p$ has been found.

From the obtained result it follows the statement which in a certain sense generalizes for the arbitrary modulus of continuity of $m$-th order $\omega_m(f^{(r)}, t)_{L_2}$ $(m \in \mathbb{N})$ the result obtained by L.V. Taykov for $m = 1$ in the space $L_2$.
