ABSTRACT

Various substituted benzimidazoles have been successfully synthesized in aqueous medium by developing VO(acac)$_2$–Cu(OTf)$_2$ catalytic system. A green synthetic protocol has been created in presence of water and cetyltrimethyl ammonium bromide (CTAB) system in an organic solvent free condition. This chemoselective cyclocondensation cumoxidation process occurred in aqueous media. In this suitable method easily synthesized 2-Substituted benzimidazoles with good yields and no 1,2-disubstituted by-products were noticed. Excellent yields, environmentally benign and mild reaction condition, easy purification of the desired products are the main attractive features of this newly devised method.

Keywords: Aqueous medium, Benzimidazoles, Cyclocondensation, Catalysis and NMR Spectroscopy, VO(acac)$_2$–Cu(OTf)$_2$.

INTRODUCTION

Benzimidazoles and their analogues are tremendous useful organic compounds, which shows an important function in organic, bioorganic and medicinal chemistry. Benzimidazoles and many of its analogues are widely known as their antimicrobial, antitumor, antifungal, antiparasitic, antiviral, anti-inflammatory, and antihistaminic activities. On the other hand, at present environment friendly synthetic processes have been extremely encouraging for organic synthesis. Consequently toxic, hazardous, volatile, carcinogenic and flammable organic solvents are being replaced by water or phase-transfer catalysts. Therefore, synthetic methodologies for the generation of biologically relevant 2-substituted benzimidazoles scaffolds in water media are very much desired and this is the major challenge for synthetic organic chemists.
The literature reports two general synthetic routes for the production of benzimidazoles. One method is the condensation of carboxylic acid with \( \text{o-phenylenediamines} \).\textsuperscript{12-15} A rapid synthetic protocol was developed by Du and Wang using Phl(OAc)\(_2\) as the oxidant.\textsuperscript{28} Maleki and co-workers have synthesized tri- and tetra-substituted imidazole derivatives using silica-coated NiFe\(_2\)O\(_{4}\) nanoparticles.\textsuperscript{29} Maleki has introduced an one-pot Synthesis of Polysubstituted Imidazoles Catalyzed by an Ionic liquid.\textsuperscript{30} Erfaninia and co-worker have reported a novel and effective solid nanoporous basic catalyst, ED-UIO-66 for the synthesis of 2-aminophenol.\textsuperscript{31} Taybee has demonstrated a one-pot four-component condensation of an aromatic aldehyde with an enolisable ketone and acetyl chloride in the presence of H\(_2\)SiV\(_4\)O\(_{12}\) in acetonitrile for the synthesis of \( \beta\)-acetamido ketones.\textsuperscript{32} Taybee and co-workers have synthesis 3-substituted indoles using silica-supported H\(_2\)PW\(_{12}\)O\(_{40}\) (HPW) solid acid catalysts in solvent less condition.\textsuperscript{33} Taybee has shown synthesis of 3,4-dihydropyrimidin-2-(1H)-ones by condensation of different substituted benzaldehydes with ethyl acetoacetate and urea using an effective heterogeneous nano catalyst under solvent-free conditions.\textsuperscript{34}

Herein, I have developed a suitable pathway for synthesis of substituted benzimidazoles by applying metal catalysts VO(acac), and Cu(OTf)\(_2\) in water as a reaction media to the development of sustainable chemistry.\textsuperscript{25} I have used common phase transfer catalyst, cetyltrimethyl ammonium bromide (CTAB) for carry forward this reaction in water.

RESULT AND DISCUSSION

For standardize the reaction \( p\)-bromobenzaldehyde (1 mmol) and 1,2-phenylenediamine (1.1 mmol) were taken as a model reaction. Initially, I have studied the reaction in different condition using \( \text{o-phenylenediamines} \) (1a) with 4-bromobenzaldehyde (2a) for the synthesis of 2-(4’-bromophenyl)-1H-benzimidazole (3a, Scheme 1) in organic solvent and water and the results were summarized in Table 1. After extensive study I have found VO(acac)\(_2\), as an useful catalyst which convert aryl aldehyde and \( \text{o-phenylenediamines} \) to corresponding 2-substituted benzimidazoles in organic media (entry 1, Table 1). However, in presence of 20 mol\% Cu(OTf)\(_2\) as a cocatalyst improves the reaction rate and yield and catalytic load. (entry 6, Table 1). The reaction is progress in presence of stoichiometric amount of VO(acac)\(_2\) with long reaction time and low yield. However, due to improvement of the reaction rate and yield I have used Cu(OTf)\(_2\) as a cocatalyst along with VO(acac)\(_2\). I am very surprised to see that, introduction of 20 mol\% of the cocatalyst reduces drastically the catalytic load of VO(acac)\(_2\), from the stoichiometric amount to 20 mol\%. Cu(OTf)\(_2\) plays an important role to increase the electrophilicity of aldehyde group by coordination with aldehydic oxygen atom and consequently imine formation takes place very fast. Therefore, VO(acac)\(_2\)-Cu(OTf)\(_2\) are used to examine the synthesis of 2-substituted benzimidazole derivatives in water media. It was observed that in protic solvent like water the catalyst was unable to work (entry 7, Table 1). Then I have study this reaction in with commercially available materials like CTAB cationic nature, SDS anionic nature and neutral amphiphilic surfactant Tween 80 (entries 8-10, Table 1). All the results reveal that CTAB is one of the most superior phase transfer catalyst for this method (entry 8, Table 1). Then different amount of CTAB was used to investigate the optimization of the reaction condition in water. (entries 8,11 and 12, Table 1). When I have added 30 mol\% of CTAB best result was found. Therefore, 30 mol\% CTAB was sufficient for this benign synthetic method. Furthermore, without using any catalyst the reaction does not possible in CTAB water (entry 13, Table 1). The main envisioned of my work is to synthesis the 2-substituted-1H- benzimidazole by using environment benign synthetic protocol.
With this result, I have studied the catalytic system VO(acac)$_2$-Cu(OTf)$_2$ with various o-aromaticdiamines (1) and aromatic aldehyde (2) in CTAB water media forming the desired substituted benzimidazole derivatives (3, Scheme 2) and the results were depicted in Table 2. Electron donating and withdrawing both groups attached to aromatic aldehyde were investigated. Six different o-aromaticdiamines having donating and withdrawing groups attached to aromatic ring were also examined of this new synthetic protocol. Surprisingly I have found that all of the substrates are reacted smoothly under the reaction conditions with excellent yields (71%–88%).

Benzimidazoles bearing either electron-donating (entries 5, 7-10, 15, 21, 22, 24 and 25, Table 2) or electron-withdrawing substituents (entries 1-4, 11-14 and 16-20, Table 2) were successfully produced in this benign synthetic procedure. A series of aromatic aldehydes bearing either electron-donating or electron-withdrawing groups on aromatic ring were investigated. There are no clear effect on the yield and reaction time with different substitution group attached on the aromatic ring. However, aldehydes containing strong electron withdrawing groups in the aromatic ring such as 4-nitrobenzaldehyde and 3-nitrobenzaldehyde gave the products with excellent yield (entries 3 and 16, Table 2). In case of aldehydes containing strong electron donating methoxy group in the aromatic ring (entries 15, 21 and 22-25, Table 2) gave the desired benzimidazoles with good yield. Aldehydes containing strong electron withdrawing groups in the aromatic ring such as 4-cyano benzaldehyde, 4-bromo benzaldehyde, 4-chloro benzaldehyde and 3-bromo benzaldehyde gave the products with excellent yield and compared to take lower time than 3-nitrobenzaldehyde and 4-nitrobenzaldehyde (entries 14 and 17-20, Table 2) to complete the reaction. In reaction with heteroaromaticaldehyde such as furfural, with o-phenylenediamines and the corresponding product 3z was obtained with excellent yields (entry 26, Table 2). The o-aromaticdiamines with electron rich substituents like methyl and dimethyl (1b and 1c, entries 14-25, Table 2) and electron-deficient substituents like dichloro, acid and benzoyl (1d, 1e and 1f, entries 27, 28 and 29-30, Table 2) also consider and they are consistent to follow the cyclocondensation cum oxidation protocol for the synthesis of benzimidazole derivatives with good yield.

### Proposed mechanism for synthesis of 2-aryl-1H-benzimidazoles by VO(acac)$_2$-Cu(OTf)$_2$ (3)

The plausible mechanistic pathway of this chemoselective cyclocondensation cum oxidation of aldehydes with $\sigma$-phenylenediamines to the corresponding 2-substituted benzimidazoles is depicted in Scheme 3. First, Cu(OTf)$_2$ coordinates with aldehydic oxygen atom to increase the electrophilicity of aldehyde group then condensation product imine intermediate (A) was obtained by the reaction with $\sigma$-aromaticdiamines shown in the mechanism. A yellow colour spot appeared in TLC within an hour from start of the reaction in lieu of the substrates. Then cyclisation took place with continuous stirring of the reaction mixture to produce another intermediate benzimidazoline (B) and it was readily oxidised to generate desired benzimidazole derivative catalysed by VO(acac)$_2$. VO(acac)$_2$ is a mild oxidant and probably the Vanadium(V) as the active species for this oxidation process and its generation is highly accelerated in the presences of oxygen.

\end{align*}
\]

Scheme 3. Proposed mechanism for synthesis of 2-aryl-1H-benzimidazoles

### EXPERIMENTAL

All materials and solvents were purchased from Marck and sigma Aldrich Chemical. VO(acac)$_2$ was synthesised from literature. Perkin-Elmer spectrometer was used to record IR spectra. Bruker 300 MHz instrument was used to record $^1$H and $^{13}$C NMR spectra and used TMS as an internal standard. CDCl$_3$ and DMSO-$d_6$ were used as NMR solvents. Chemical shifts were recorded with respect to internal standard TMS. Melting point of the synthesized compound was detected with HRS Ambula Electrothermal apparatus. Reactions were monitored on glass sheets pre-coated thin layer chromatography with silica gel.

#### Experimental procedure

Aromatic aldehyde (2, 1 mmol), ortho-phenylenediamines (1, 1.1 mmol) and CTAB (30 mol%) were mixed and taken in a round bottomed flask. Then added 5 mL water in to it and stirred at room temperature. 20 mol% VO(acac)$_2$ and similar amount Cu(OTf)$_2$ were added in to it. After 16-22 h the reaction was completed, examined by silica coated TLC. A brown spot appeared in an iodine chamber. 25 mL ethyl acetate three times was used to extract the residue from reaction mixture. Then 30 mL brine solution was used to wash two times the organic portion. It was dried over Na$_2$SO$_4$ and rotary evaporator was used to concentrate. Crude product was crystallized directly from hot ethanol to prepare
pure compound (3a-z and 3a'-d') in the yield of 71-88%. Thus the reaction of ortho-phenylenediamine (1a, 118 mg, 1.1 mmol) and 4-bromobenzaldehyde (2a, 186 mg, 1 mmol) afforded 2-(4-bromophenyl)-1H-benzimidazole (3a) with 88% yield (240 mg, 0.88 mmol). Benzimidazole derivative 3a and other derivatives were prepared by using the above methods easily. All known compounds (3a-z and 3a'-d') were characterized by comparing the literature melting point values and also by FT-IR, 1H and 13C NMR data with the authentic known samples.

Selected Characterization Data for Synthesized Compounds
2-(4-bromo-phenyl)-1H-benzimidazole (3a)
Yellow solid, m.p: 296°C [Lit16 299-300°C], FT-IR (KBr, cm⁻¹): 962, 1013, 1114, 1275, 1321, 1428, 1592, 2785, 2856, 2935, 3051, 1H NMR (300 MHz, DMSO-d₆): δ 7.20(2H, d), 7.49 (1H, d), 7.64 (1H, d), 7.73 (2H, d), 8.10 (2H, d), 12.97 (1H, s), 13.27, 131.1, 150.4 Elemental analysis calculated for C₁₉H₁₄N₂Br: C: 57.17, H: 3.32, N: 10.26; Found: C: 57.23, H: 3.23, N: 10.37%.

2-(4-methoxyphenyl)-1H-benzimidazole-5-carboxylic acid (3b)
Grey solid, m.p: 120°C [Lit17 118°C], FT-IR (KBr, cm⁻¹): 830, 1018, 1184, 1264, 1396, 1507, 1610, 1687, 1901, 2372, 2575, 2932, 3392, 1H NMR (300 MHz, DMSO-d₆): δ 3.78 (3H, s), 6.96 (2H, d), 7.54 (1H, d), 7.83 (1H, d), 8.09 (2H, d), 8.19 (1H, s), 13C NMR (75 MHz, DMSO-d₆): δ 54.0, 112.8, 113.0, 115.5, 120.2, 122.6, 123.6, 127.3, 137.1, 140.7, 152.4, 160.1, 167.0, 171.2, Elemental analysis calculated for C₁₉H₁₃NO₄: C: 57.17, H: 3.32, N: 10.26; Found: C: 57.23, H: 3.23, N: 10.37%.

CONCLUSION
The work reported in this paper is an environmentally benign synthetic protocol for the synthesis of substituted benzimidazoles. Herein I report VO(acac)₂-Cu(OTf)₂ catalyzed a green chemical approach for the synthesis of above derivatives using various o-phenylenediamines and different aromatic aldehydes in presence of CTAB water system. Different kinds of derivatives of 2-substituted benzimidazoles are easily synthesized in this eco friendly reaction condition with good yield and easy purification process.

ACKNOWLEDGEMENT
I am very much grateful to Dr. Hari Sadhan Ghosh, Department of Chemistry, Surendranath College for his valuable suggestions. I am also thankful to Professor Dilip K. Maiti, Department of Chemistry, Calcutta University for providing me laboratory facilities.

Conflicts of Interest
The authors declare no conflict of interest.
