Abstract—This research aims to describe the results of the needs analysis in the process of developing e-assessment media on the basic graphic design course. This research was a qualitative descriptive research by using survey methods in identifying the needs of students and teachers in learning assessment. In this research, the needs analysis related to the achievement of the student learning outcomes, the problems faced by the students and the media needed by students in the learning assessment process. This research used a questionnaire given to 32 students of grade X and 2 teachers of the basic graphic design subject. The results showed that: 1) there was still lack of assessment media that can be used as an independent assessment for students; 2) android-based interactive assessment media was needed on the basic graphic design subject. Based on these findings, it can be concluded that students need an interactive assessment media that can be used as an independent assessment media. In addition, these findings will be used in designing interactive e-assessments in basic graphic design subject.

Keywords: Needs Analysis, E-assessment, Interactive, Android

I. INTRODUCTION

The industrial revolution 4.0 is characterized by the use of technology in various aspects. One of which is smartphone technology. In education, all parts of education including teachers and students should be expected to be able to use Android technology in learning. Android is a very popular operating system because it is an open-source [1]. The use of android devices is in high demand including vocational students. Besides the price is quite affordable by the lower middle class, everyone from all ages competing to use it. This shows the possibility of using Android devices in the world of education. One form of education is vocational education.

Vocational school is a school that organizes vocational education. The learning process that occurs in the schools in the teaching process which is an activity of conveying information to students either directly by the teacher or through intermediary media, namely learning media. Another process is an evaluation that evaluates the results of the teaching process that has been given. Assessment is an ongoing process that includes planning, discussion, reflection, measurement, analysis and level of improvement based on data relating to learning objectives [2]. Student learning outcomes are known through assessment, but the function of the assessment can also monitor student progress.

One assessment is a test. The test takes the form of a series of tasks performed by one or a group of students, so as to produce the value of the student's behaviour or achievement [3]. Behaviour or achievement of students can be used as a basis for providing feedback throughout the learning process. The assessment shows the process of obtaining information, then it is used as a basis for making decisions related to the students, such as the composition of the curriculum, policies and programs that support education including the methods and instruments of education determined by certain institutions or official bodies related to education [4]. Assessment is an important part of learning activities related to student development and as feedback in improving institutional effectiveness [5].
Problems that occur in the field of basic graphic design subjects are assessments conducted by the teacher in a conventional way. The assessment uses paper and stationery to support the learning process. Paper that used for the assessment cannot be reused, so this method is considered a waste. In addition, greater funding is also needed in doubling the exam questions and answer sheets. The conventional assessment process has the position of students in the recipient of knowledge, this learning is measured at the lowest level of Bloom's taxonomy as knowledge and understanding [6].

The results of the analysis of observations and interviews conducted on the students of grade 10th majoring in Multimedia at SMK 4 Payakumbuh are: 1) the assessment process is still conventional with using paper and stationery so that the papers are wasted after completing the assessment; 2) the appraisal process requires more costs in multiplying questions and answer sheets; 3) the assessment process requires more time, so students needs more time to find out the results of the evaluation of learning; 4) manual appraisal has a higher probability of subjectivity in processing the valuation data; 5) the use of smartphone devices is not optimal by the teacher and students in the learning assessment process. These reasons can cause the students to be less effective and efficient in evaluating learning.

The results of the observations that cause an analysis of students’ needs are important to be done. The needs analysis according to Richard & Renandya is everything that is prioritized so it must be done in order to adjust the needs of the users [7]. Needs analysis is an initial process in developing the assessment media needed by teachers and students. E-assessment is a form of assessment using current technology. Online assessment makes the assessment process more efficient in terms of time, funding, and achievement of learning goals [8]. Online e-assessment will reduce the level of student’s cheating. Students can make an independent assessment of mastery learning in accordance with learning objectives anywhere and anytime by using e-assessment. Media interactivity can affect the use of e-assessment in independent assessments conducted by students.

Needs analysis is the process of collecting systematic and ongoing data about student information, needs, and preferences, interpreting information and then making decisions based on interpretations to meet needs [9]. A fast assessment process is important because students are able to evaluate the understanding of learning in real-time based on feedback obtained previously. Media interactivity makes media more motivating for students through their interest. The use of interactive e-assessment through an android device can make the students active in evaluating. In addition, the evaluation does not have to be in the classroom. A curriculum based on improving the character and competency quality is the 2013 curriculum. Brown states that need analysis is an activity involved in gathering information so that it can serve as a basis for developing a curriculum that will meet the learning needs of certain groups of students [10].

The use of smartphone devices among vocational school students is more considered, but the use of these devices in learning has not been maximized. Students only use it as a device for communication, game, and social media. The solution to the various problems that have been outlined above is the development of interactive e-assessments as a medium assessment that can facilitate teachers in conducting assessments. It also can motivate students in evaluating learning on the Basic Graphic Design subject. One of the research is about the prospective teacher's perception of the e-assessment model in learning physics, this model has received positive responses from both teachers and students. An effective and efficient assessment process can be carried out with an e-assessment model in learning activities [11]. However, there are three types of needs that must be considered in conducting a needs analysis in research development according to Nation and Mcalister [12]. The three types of needs are: 1) Need refers to skills or competencies students must have; 2) lack refers to problems or difficulties students face in learning, and 3) desire refers to reference that students need to learn in existing teaching material. The interactive e-assessment needed has a concept that combines the concept of assessment delivered through interactive electronic media as supporting media in the learning process.

II. METHODOLOGY

As research was an initial stage in research and development (R&D), this research was limited to the needs analysis by conducting observations. This study involved the students of grade 10th majoring in Multimedia at SMKN 4 Payakumbuh. There were 32 students who participated in giving opinions about what they needed in the assessment of basic graphic design learning. In addition, there were 2 teachers of basic graphic design subjects.

This research used a descriptive research method. Qualitative research methods are research methods based on the philosophy of positivism, which is used to examine populations or specific samples; data collection was by using research instruments, analysis of quantitative or statistical data, with the
aim of testing established hypotheses [13]. The data were collected through survey techniques with instruments in the form of questionnaires. Questionnaires were used to find out student’s opinion related to the learning assessment needs that were developed. The data obtained from the questionnaire were analyzed and then summarized in a table.

The data were obtained from the questionnaire analysis of teacher needs and student needs. The data obtained were processed in four stages: 1) collecting data from the questionnaire distribution; 2) tabulating data to see the class, nature, type, and frequency of data; 3) qualitative analysis, where the data were divided to link information related to the focus of the research and; 4) making an interpretation of the results of the problem analysis and the researcher's questions so that they can draw conclusions.

III. RESULTS AND DISCUSSION

The needs analysis of interactive e-assessment on basic graphic design course obtained through observation. Observations were done by 32 students from the students of grade 10th majoring in Multimedia and 2 teachers basic graphic design course in July-December 2019 semester. The research observations obtained the results presented in table 1.

| No | Question Analysis                                                                 | Identification of Problems                                      | Conclusion                                      |

| 8  | 100% of teachers answered that assessment media was needed so that it could      | The quality of learning basic graphic design lessons related to | There is a need to improve the quality of the  |
|    | improve the quality of learning basic graphic design lessons.                     | media assessment needs to be improved                           | assessment                                     |

Based on the results of the analysis of the teacher's need for interactive online-based media assessment for basic graphic design course it showed that there were no media that supported the assessment process. The assessment conducted was still a paper-based test. The teachers need to improve the quality of learning by using media as a tool in the learning process. In this case, it is in the assessment process. Interactive e-assessment is expected to be able to assist teachers in conducting the assessment. Teachers as one of the important actors in learning are expected to have the skills and creativity that bring learning to be effective, for example by selecting models, media and learning instruments [14]. This assessment did not support an independent assessment for students in real-time. Therefore, observations were done on students about the problems and expectations of the media assessment of basic graphic design lessons needed. The results of research on students in the form of data obtained were shown in table 2.

Need Analysis: An ....(Sari Azhariyah et al.)
The results of the analysis of students’ needs showed that 73% of students had difficulties in conducting independent assessments in basic graphic design lessons. Hence, 95% of students already had and were able to use smartphone technology, and it could be used in the assessment process. Utilization of information and communication technology could be done in the assessment process as a form of evaluation of the progress of students in learning. The use of e-assessment in learning is important because along with the development of technology will affect the development of the assessment process [15].

The assessment was still conventional by using a paper-based test. This form of assessment causes the assessment process carried out until the assessment results obtained require quite a long time. The assessment media desired by students was an interactive assessment media that is able to provide direct feedback in conducting assessments. The direct feedback desired by students could be in the form of assessment results and discussion of assessment questions. The learning process with e-assessment based on mobile technology is more effective and efficient because it is able to attract attention and improves motivation related to the fast feedback obtained [16]. This assessment media was in the form of assessment media using technology such as smartphones and can be accessed online. Online assessment media will connect directly between students and teachers in accessing assessment results. Assessment is considered as part of the learning process that provides ongoing feedback for students and educational institutions [17]. This is needed to develop interactive e-assessments that can be accessed online using smartphones for basic graphic design lessons based on needs analysis. This needs analysis showed 100% needs of teachers in improving the quality of learning media and 94% of students of needs for media assessments were mobile, interactive and support independent assessment in real-time.

**IV. CONCLUSION**

This research aims to describe the results of the needs analysis in the process of developing e-assessment media on a basic graphic design course. Based on the results and discussion of this research, it shows that the development of interactive e-assessment is needed. The needs analysis shows that there are 100% of teachers that need to improve the quality of assessment and learning assessment media. In addition, 94% of students need an assessment media that is interactive, mobile and utilizes technology so that they can make an independent assessment in evaluating understanding of learning. Therefore, there is a need to develop interactive e-assessments that support student self-assessment, interactive-based and can improve the quality of assessments conducted by teachers.
