Abstract By 2016, Member States of the World Health Organization (WHO) had developed and implemented national action plans on noncommunicable diseases in line with the Global action plan for the prevention and control of noncommunicable diseases (2013–2020). In 2018, we assessed the implementation status of the recommended best-buy noncommunicable diseases interventions in seven Asian countries: Bhutan, Cambodia, Indonesia, Philippines, Sri Lanka, Thailand and Viet Nam. We gathered data from a range of published reports and directly from health ministries. We included interventions that addressed the use of tobacco and alcohol, inadequate physical activity and high salt intake, as well as health-systems responses, and we identified gaps and proposed solutions. In 2018, progress was uneven across countries. Implementation gaps were largely due to inadequate funding; limited institutional capacity (despite designated noncommunicable diseases units); inadequate action across different sectors within and outside the health system; and a lack of standardized monitoring and evaluation mechanisms to inform policies. To address implementation gaps, governments need to invest more in effective interventions such as the WHO-recommended best-buy interventions, improve action across different sectors, and enhance capacity in monitoring and evaluation and in research. Learning from the Framework Convention on Tobacco Control, the WHO and international partners should develop a standardized, comprehensive monitoring tool on alcohol, salt and unhealthy food consumption, physical activity and health-systems response.

Introduction

Noncommunicable diseases, such as cardiovascular diseases, cancers, chronic respiratory diseases and diabetes, claim a high proportion of overall mortality, pushing many people into poverty due to catastrophic spending on medical care. Yet noncommunicable diseases are mostly preventable. The United Nations (UN) General Assembly has adopted a series of resolutions which reflect the high-level commitment to prevention and control of noncommunicable diseases. In 2013, Member States of the World Health Organization (WHO) resolved to develop and implement national action plans, in line with the policy options proposed in the Global action plan for the prevention and control of noncommunicable diseases (2013–2020). Noncommunicable diseases are also embedded in sustainable development goal (SDG) target 3.4, that is, to reduce by one-third the premature mortality from noncommunicable diseases by 2030, and are linked to other SDGs, notably SDG 1 to end poverty. In 2017, the WHO Global Conference on Noncommunicable Diseases reaffirmed noncommunicable diseases as a sustainable development priority in the Montevideo roadmap 2018–2030.

The WHO estimates an economic return of 7 United States dollars (US$) per person for every dollar spent on so-called best buys – evidence-based, highly cost–effectiveness policy interventions which tackle noncommunicable diseases. There could also be a reduction of 8.1 million premature deaths by 2030 if these best-buy options were fully implemented, which represents 15% of the total premature deaths due to noncommunicable diseases. Despite the rising burden of these diseases in low- and middle-income countries, only an estimated 1% of health funding in these countries is dedicated to prevention and control. This level of spending is unlikely to have a significant impact.

Country-level gaps in legislative, regulatory, technical and financial capacities impede the translation of global com-
mitments into national action. Most low- and middle-income countries have weak health systems, with limited domestic and international funding for prevention and health promotion interventions. Between 2000 and 2015, only 1.3% (US$ 5.2 billion) of total global development assistance for health was contributed to noncommunicable disease programmes. The problems are compounded by a lack of coordinated action across the relevant sectors within and outside governments. WHO has recommended that innovative sources of domestic financing be explored. Yet in most low- and middle-income countries, inadequate government funding and high out-of-pocket payments often prevent poorer people from accessing treatment for noncommunicable diseases.

We assessed the implementation status of best-buy interventions in seven Asian countries, which have participated in collaborative studies of noncommunicable diseases: Bhutan, Cambodia, Indonesia, Philippines, Sri Lanka, Thailand and Viet Nam. We also assessed gaps in institutional capacity and provided suggestions for improving policy implementation. All countries in this analysis are currently classified by the World Bank as lower-middle income, except Thailand, which is classified as upper-middle income. Population size ranges from under 1 million in Bhutan to more than 250 million in Indonesia. There are large variations in the prevalence of risk factors for noncommunicable disease, its associated burden and measures to tackle them across these seven countries (Table 1).

Although these seven countries have a similar pace of socioeconomic development, they are diverse in terms of population size, health-system structure and decentralization of governance (fully devolved to local govern-

ments in Indonesia and the Philippines, and partially devolved in Sri Lanka). Lessons from their experiences can be shared with other countries striving to implement their national action plans on noncommunicable diseases.

**Approach**

We based our analysis on the policy options in the six objectives in the global action plan on noncommunicable diseases. These objectives form the guiding framework for WHO Member States to develop their national action plans (Fig. 1). National research capacities (objective 5) and monitoring and evaluation (objective 6) provide evidence which supports the application of best-buy interventions (objective 3) and monitors progress towards achieving targets. Health-systems strengthening (objective 4) supports the implementation of the action plan. All four objectives (3, 4, 5 and 6) should be enhanced by good governance (objective 2) and a heightened noncommunicable diseases priority that sustains the agenda across successive governments (objective 1).

Given the six objectives act in synergy to contribute to noncommunicable diseases prevention and control, we did not attempt to address all of them, but to focus on implementation of the best buys for four major noncommunicable diseases risk factors (tobacco, alcohol, unhealthy diet and physical activity) and for health-systems response.

In the first half of 2018, we gathered information from country profiles in a range of sources from the published literature: (i) the WHO report on the global tobacco epidemic 2017 which was compiled by the Framework Convention on Tobacco Control (FCTC) secretariat; (ii) the WHO Global status report on alcohol and health 2018; (iii) the WHO Global status report on noncommunicable diseases 2010; (iv) the Noncommunicable diseases progress monitor 2017; (v) national capacity survey data on physical activity, salt policy and health-systems response to developing treatment guidelines from the WHO Global Health Observatory data repository; and (vi) the Noncommunicable diseases country profiles 2018 report on availability of essential medicines for noncommunicable diseases. Additional published literature was retrieved from a search of PubMed and Scopus online databases. We used personal contacts with the health ministries in each respective country to obtain further information on the institutional capacity to address noncommunicable diseases.

**Implementation of best buys**

Table 2 provides a summary of the implementation status of best-buy interventions across the seven countries.

**Tobacco control**

All six countries that are State Parties to the WHO FCTC, and also Indonesia, which is not a State Party to the Convention, have implemented tobacco control interventions. There are five indicators to monitor progress as mandated by the Convention.

First, countries are required to introduce plain or standardized packaging or large graphic health warnings on all tobacco packages. Thailand and Sri Lanka were the two best-performing countries, as text and pictorial health warnings covered 85% and 80% of the front and back areas of cigarettes package, respectively. Health warnings covered only 40% of package areas in Indonesia.

Fourth, countries are required to enact and enforce comprehensive bans on tobacco advertising, promotion and sponsorship. Bhutan had the highest level of compliance with a score of 10 out of 10 each for direct and indirect bans, followed by Viet Nam with a compliance score of 10/10 for a direct ban and 6/10 for an indirect ban. Indonesia had the lowest score (1/10) on eliminating exposure to second-hand tobacco smoke; the
### Table 2. Implementation status of best-buy interventions for the prevention and control of noncommunicable diseases in seven Asian countries in July 2018

| Best-buy intervention | Indicator description | Bhutan | Cambodia | Indonesia | Philippines | Sri Lanka | Thailand | Viet Nam |
|------------------------|------------------------|--------|----------|-----------|-------------|-----------|----------|----------|
| Tobacco demand-reduction measures | Not applicable, as sale of tobacco was banned in Bhutan | Total tax as % of the price of the most sold brand of cigarettes was maximum 75% and above, minimum 51% | Not applicable | Total tax: 25.2% of retail price in 2016. Retail cigarette price affordable. No changes between 2008 and 2016 | Total tax: 57.4% of retail price in 2016. Retail cigarette price affordable. Cigarettes more affordable in 2016 than 2008 | Total tax: 62.6% of retail cigarette price in 2016. Cigarettes more affordable in 2016 than 2008 | Total tax: 62.1% of retail cigarette price in 2016. Tobacco price affordable. No changes between 2008 and 2016 | Total tax: 73.5% of retail cigarette price in 2016. Retail cigarette price affordable. No changes between 2008 and 2016 |
| 1. Increase excise taxes and prices on tobacco products | Compliance score: 10/10 in 2016. Not yet enforced compliance in restaurant and government facilities | Compliance score: 10/10 in 2016. Not yet enforced compliance in restaurant and government facilities | Compliance score: 10/10 in 2016. Not yet introduced smoke-free regulation in indoor offices, restaurants, cafes, pubs and bars | Compliance score: 10/10 in 2016. Not yet introduced smoke-free regulation in indoor offices, restaurants, cafes, pubs and bars | Compliance score: 10/10 in 2016. Not yet introduced smoke-free regulation in indoor offices, restaurants, cafes, pubs and bars | Compliance score: 10/10 in 2016. Not yet introduced smoke-free regulation in indoor offices, restaurants, cafes, pubs and bars | Compliance score: 10/10 in 2016. Not yet introduced smoke-free regulation in indoor offices, restaurants, cafes, pubs and bars |
| 2. Eliminate exposure to second-hand tobacco smoke in all indoor workplaces, public places and public transport | Mandates pictorial and/standardized packaging or large graphic health warnings on tobacco packages | Mandates pictorial and/standardized packaging or large graphic health warnings on all tobacco packages | Mandates pictorial and text health warnings on packaging of cigarettes, other smoked tobacco and smokeless tobacco, covering 40% of front and back areas. (Ban on second-hand tobacco smoke in all public places and public transport) | Mandates pictorial and text health warnings on packaging of cigarettes, other smoked tobacco and smokeless tobacco, covering 40% of front and back areas. (Ban on second-hand tobacco smoke in all public places and public transport) | Mandates pictorial and text health warnings on packaging of cigarette, other smoked tobacco and smokeless tobacco, covering 50% of front and back areas. (Ban on second-hand tobacco smoke in all public places and public transport) | Mandates pictorial and text health warnings on packaging of cigarettes, other smoked tobacco and smokeless tobacco, covering 40% of front and back areas. (Ban on second-hand tobacco smoke in all public places and public transport) | Mandates pictorial and text health warnings on packaging of cigarettes, other smoked tobacco and smokeless tobacco, covering 50% of front and back areas. (Ban on second-hand tobacco smoke in all public places and public transport) |
| 3. Implement plain or standardized packaging and/or large graphic health warnings on all tobacco packages | Compliance score as per WHO report. | Compliance score as per WHO report. | Compliance score as per WHO report. | Compliance score as per WHO report. | Compliance score as per WHO report. | Compliance score as per WHO report. | Compliance score as per WHO report. |
| 4. Enact and enforce comprehensive bans on tobacco advertising, promotion and sponsorship | Compliance score: 8/10. No ban on indirect promotions except on publicizing corporate social responsibility activities of tobacco companies | Compliance score: 8/10. No ban on indirect promotions except on publicizing corporate social responsibility activities of tobacco companies | Compliance score: 8/10. No ban on indirect promotions except on publicizing corporate social responsibility activities of tobacco companies | Compliance score: 8/10. Content and target audience guided by research, with post-campaign evaluation |

### Harmful use of alcohol reduction measures<sup>19</sup>

1. Enact and enforce restrictions on the physical availability of retailed alcohol (via reduced hours of sale)

   - National legal minimum age for on- and off-premise sales of alcoholic beverages<sup>19</sup>: 18 years
   - Restrictions for on- and off-premise sales of alcoholic beverages by hours, days, places of sale, density of outlets, for specific events, to intoxicated persons, at petrol stations<sup>19</sup>: No restrictions

2. Enact and enforce bans or comprehensive restrictions on exposure to alcohol advertising (across multiple types of media)

   - Legally binding regulations on alcohol advertising, product placement, sponsorship, sales promotion, health warning labels on advertisements and containers: Yes, except advertising on containers

3. Increase excise taxes on alcoholic beverages

   - Excise tax on beer, wine and spirits: Yes, except for spirits

### Unhealthy diet reduction measures<sup>22</sup>

1. Adopt national policies to reduce population salt/sodium consumption

   - Adopted national salt policies: No
   - Applies voluntary or mandatory salt cut-offs on selected foods: No

---

(continues...)
### Best-buy intervention

**Physical activity**

1. Implement community-wide public education and awareness campaign for physical activity, which includes a mass media campaign

   | Indicator description | Bhutan | Cambodia | Indonesia | Philippines | Sri Lanka | Thailand | Viet Nam |
   |-----------------------|--------|----------|-----------|-------------|-----------|----------|----------|
   | Country has implemented, within past 5 years, at least one recent national public awareness programme on physical activity | Yes | No | Yes | Yes | Yes | Yes | No |

**Health systems**

1. Member State has national management guidelines for four major noncommunicable diseases through a primary care approach

   | Availability of national guidelines for the management of cardiovascular diseases, diabetes, cancer and chronic respiratory diseases | Yes | Yes | Yes | Yes | Yes | Yes | Yes |

2. Drug therapy for diabetes mellitus and hypertension using total risk approach, and counselling to individuals who have had a heart attack or stroke and to persons with high risk (≥ 30%, or ≥ 20%) of a fatal and non-fatal cardiovascular event in the next 10 years

   | Proportion of primary health-care facilities offering cardiovascular risk stratification for the management of patients at high risk for heart attack and stroke | Less than 25% | Less than 25% | Less than 25% | More than 50% | More than 50% | More than 50% | Less than 25% |
   | Availability of selected noncommunicable diseases medicines at 50% or more of primary-health care facilities | 4/12 drugs | 3/12 drugs | 11/12 drugs | 4/12 drugs | 11/12 drugs | 9/12 drugs | 2/12 drugs |

---

**Note:** Affordability of cigarettes is defined by the percentage of per capita gross domestic product required to purchase 2000 cigarettes of the most sold brand.

---

WHO: World Health Organization.
country had no bans on direct advertising or sponsorship; and low compliance (score 3/10) on banning free tobacco distribution.

Fifth, countries are required to implement effective mass-media campaigns to educate the public about the harms of smoking and second-hand smoke. All countries except Bhutan and Sri Lanka had comprehensive campaigns in the media in 2014 and 2016.

**Alcohol control**

There are three indicators in the *Global status report on alcohol and health 2018*, that were used to monitor progress on reduction of harmful use of alcohol.19

First, countries need to enact and enforce restrictions on the physical availability of retailed alcohol. The legal minimum age for on- and off-premise sales of alcoholic beverages in 2018 was the highest in Indonesia and Sri Lanka (21 years), followed by Bhutan, Philippines and Viet Nam (18 years), while Cambodia did not have a defined legal age. All countries in this study except Cambodia had introduced restrictions on the on- and off-premise sales of alcoholic beverages by timing or place, although these was not yet comprehensive.19

Second, countries need to enact and enforce bans or comprehensive restrictions on exposure to alcohol advertising in all types of media, product placement, sponsorship and sales promotion, and implement health warning labels on alcohol advertisements and containers. We found that almost all countries had introduced regulations on advertising for all categories of media except on alcohol drinks containers.

Third, countries need to increase excise taxes on alcoholic beverages including beer, wine and spirits. The *Global status report on alcohol and health 2018* does not provide detailed information, such as tax rates, trends of tax rates and changes of affordability of alcoholic beverages. However, most countries had imposed excise taxes for all alcoholic beverages, except on spirits in Bhutan. The available information would not be helpful for monitoring progress on changes of affordability and specific policy interventions.

**Unhealthy diet**

The availability of a salt policy is currently the only indicator used by WHO to monitor progress on unhealthy diet.20 Salt policies cover four best buys interventions; (i) reformulating and setting target of salt in foods, (ii) promoting an enabling environment for lower sodium options, (iii) promoting behaviour change through media campaign, (iv) implementing front-of-pack labelling. Thailand had introduced a salt and sodium reduction policy for 2016–2025, focusing on labelling, legislation and product reformulation.24 In 2016, Thailand adopted national policies to reduce population salt and sodium consumption, in the form of a voluntary salt reduction in processed food and snacks. Manufacturers who comply with the salt reduction recommendation (including those on fat and sugar) receive a healthier choice logo by the food and drug administration of the health ministry. A regulation was introduced in 2016 in Thailand, for mandatory package labelling (of salt, fat, sugar, energy and other contents) through the guideline daily amount. Bhutan and Sri Lanka have drafted salt reduction strategies, although an explicit policy on salt reduction was not yet available. Average daily salt intake was 10.8 g (in 2010) and 8.0 g (in 2012) in Thailand and Sri Lanka, respectively,26 which is more than the 5 g recommended by the WHO.23 Population behaviour change actions, such as creating awareness on high salt intake and empowering people to change their behaviours, had been introduced in Bhutan and Sri Lanka.

**Physical activity**

Implementing public education and awareness campaigns is the indicator for monitoring progress of promoting physical activity.22 By 2016, Cambodia and Viet Nam had not implemented any programme activities that support behavioural change in the previous 5 years. The *Global action plan on physical activity* (2018–2030), adopted by World Health Assembly resolution WHA71.624 in May 2018, urged the WHO Member States to implement the promotion of physical activity and requested the WHO to develop global monitoring and reporting systems.

**Health-systems response**

Two indicators are proposed for monitoring health-systems response to noncommunicable diseases: availability of treatment guidelines and availability of essential medicines at primary level facilities.21 Access to essential medicines supports reduction of premature mortality in SDG target 3.4.

By 2016, all seven countries had developed evidence-based national guidelines for the management of four major conditions through a primary health-care approach, although there was no detail on the scope and contents of guidelines. Three countries, Philippines, Sri Lanka and Thailand, reported that more than 50% of their primary health-care facilities offered cardiovascular risk management of patients at risk of heart attack and stroke. The remaining four countries reported fewer than 25% of their primary care facilities offered these services.

Indonesia and Sri Lanka reported that 11 out of 12 priority noncommunicable diseases medicines were available in more than 50% of their primary care facilities. Viet Nam and Cambodia needed to scale-up availability of these medicines, as only 2/12 and 3/12 medicines for noncommunicable diseases were available, respectively.

In addition to the cross-country analysis in Table 2, Box 1 provides a synthesis of intra-country analysis of their noncommunicable diseases interventions, achievements and gaps.

**Institutional capacity**

Translating the UN General Assembly resolutions into interventions with good outcomes requires institutional capacity to deliver these political promises. We obtained information directly from health ministries on their institutional capacities for noncommunicable diseases (Table 3).

All seven countries had designated a unit or equivalent body in their health ministry with responsibility for noncommunicable diseases. The number of full-time equivalent professional staff in the unit ranged from four in Bhutan to 41 in Sri Lanka. As required by the WHO FCTC reporting, the number of full-time equivalent for tobacco control ranged from three in the Philippines to 41 in Thailand.

Funding for noncommunicable diseases interventions (including prevention, promotion, screening, treatment, surveillance, monitoring and evaluation, capacity-building, palliative care and research) were available in all seven countries, except for a research budget in Cambodia.

Data were not available on annual spending on noncommunicable diseases interventions.
Policy & practice
National action plans on noncommunicable diseases in Asia

Challenges

Implementation gaps

Institutional capacity assessment in the seven countries is constrained by several limitations. Disaggregated information on the skill-mix of technical staff in countries’ health ministry noncommunicable diseases units, and staff turnover rate, are not routinely recorded and reported. This evidence is critical for analysing gaps and strengthening the capacity of noncommunicable disease units. In the countries we analysed, information was also lacking on government spending on health promotion interventions. Using the WHO Health Accounts database, we estimate that the global average investment on health promotion and public health interventions worldwide in 2012 was 4.3% of

Box 1. Best-buy interventions for the prevention and control of noncommunicable diseases: summary of achievements and gaps in seven Asian countries in July 2018

Bhutan
Although smoking is illegal in Bhutan, the current prevalence of tobacco use among young people and adults is estimated to be 30.2% and 7.4%, respectively in 2016. The country has good performance in ensuring smoke-free public spaces (compliance score 10/10) and total bans on tobacco advertising, promotion and sponsorship. Although excise taxes and restrictions on the availability and advertising of alcohol are in place, the legal minimum age for sales of alcohol beverage (18 years old) is the lowest among the seven countries. Bhutan is developing strategies on reduction of daily salt consumption and promotion of physical activity. While clinical guidelines for the management of four major noncommunicable diseases are produced, only four out of 12 essential medicines for management of these diseases are available in more than 50% of primary care facilities.

Cambodia
Tobacco control policies need considerable improvement. The tobacco tax rate is the lowest among the seven countries, 25.2% of the retail price. No price changes between 2008 and 2016 means that cigarettes are affordable by the WHO definition. There is room to strengthen compliance on smoke-free public spaces, increase the health warning areas on cigarette packages (55%) and introduce a ban on indirect marketing promotions. Cambodia needs to introduce a legal minimum age for sale of alcoholic beverages and to restrict alcohol availability, limit daily salt consumption and promote physical activity. The country needs to scale-up the availability of essential medicines in primary care facilities.

Indonesia
A very high prevalence of tobacco use was reported in Indonesia; 12.7% of young people and 64.9% of men are current tobacco users. Though not a State Party to the WHO Framework Convention on Tobacco Control, the government needs to increase the low tobacco tax rate (57.4%) and make cigarettes less affordable to discourage new smokers, scale-up the current low level (score 1/10) of compliance on smoke-free public spaces, increase health warning areas on cigarette packages (currently 40% of front and back areas), and introduce a ban on advertising and market promotion. Alcohol consumption is religiously prohibited and legal measures to reduce alcohol consumption are well-implemented. The legal minimum age for purchase is 21 years and restrictions of the times and places of alcohol availability and advertising are in place. Indonesia has yet to introduce a salt reduction policy. Health systems are responding well as 11 out of 12 essential medicines for noncommunicable diseases are available in primary care facilities.

Philippines
Although cigarettes were less affordable in 2016 than in 2008, the Philippines needs to further increase the tax rate (62.6%), improve compliance on smoke-free environments and increase the size of health warnings (50% of cigarette package areas) and increase compliance on bans on advertising and promotion. The country also needs to review the current legal minimum age (18 years) for sales of alcoholic beverages, introduce policies to limit daily salt consumption and increase the availability of essential medicines for clinical management in primary health care.

Sri Lanka
Although the tobacco tax rate is 62.1%, the lack of regular tax increases means that cigarettes are still affordable. Sri Lanka needs to further strengthen compliance on smoke-free environments and bans on advertising and promotion. The country is on the right path towards implementing salt reduction strategies and promotion of physical activity. Due to the strong emphasis on primary health care in the country, the availability of essential medicines at the primary care level has been ensured.

Thailand
Tobacco control is well-implemented with a high tax rate in place (73.5%), health warnings on 85% of the back and front package areas (which ranks third globally) and comprehensive regulations on advertising, market promotion and sponsorship. However, Thailand needs to improve compliance on smoke-free environments. Due to Thailand’s policy of universal health coverage, nine essential medicines for noncommunicable diseases are available at primary care facilities.

Viet Nam
Lack of regular increase in tax has resulted in more affordable cigarettes in 2016 than in 2008. Viet Nam therefore needs to increase its tax rate (35.7%) improve compliance on smoke-free environments and increase health warnings from the current 50% of package areas. Increasing the current minimum legal age for sales of alcoholic beverage (18 years) may prevent youth drinking. The country needs to introduce policies to reduce daily salt intake (currently only dietary guidelines are available and there is no front-of-package labelling), promote physical activity, and ensure more essential noncommunicable diseases medicines are available in primary care facilities.

Note: See Table 2 for more details and data sources. Affordability of cigarettes is defined by the percentage of per capita gross domestic product required to purchase 2000 cigarettes of the most sold brand. 14
current per capita health spending (US$ 38.6 of US$ 989.2). Despite the well-established monitoring and evaluation system of the WHO FCTC, data on expenditure for tobacco control is not routinely updated for many countries. For example, the latest expenditure data on tobacco control in the Cambodia, Indonesia and Philippines were outdated, from 2008, 2008 and 2007, respectively.

Taxation on tobacco and alcohol has not reached the global targets in these seven countries, mainly due to the lack of multisectoral action to enforce legislative decisions on taxing these harmful products and counteracting industry interference. These concerns were highlighted by the UN Interagency Task Force on noncommunicable diseases conducted in these countries. Furthermore, primary prevention efforts in the seven countries are hampered by weak regulatory capacities, inadequate legal consequences for law violation and conflicts of interests among government officials. Regulatory gaps were illustrated by poor enforcement of smoke-free environments or of bans on tobacco advertising and promotion. Besides Sri Lanka and Thailand, integration of noncommunicable disease interventions at the primary care level need to be strengthened in the remaining five countries, to ensure essential medicines for clinical management, prevention of complications and premature mortality. Funding gaps for noncommunicable diseases, as reported by health ministries, remain an important national agenda in these countries and the governments need to invest more on effective interventions such as the recommended best buys, intersectoral actions and health-system responses for noncommunicable diseases.

Another possible explanation for insufficient progress of noncommunicable diseases prevention policy is industry interference. There is evidence from other countries that the tobacco, alcohol, food and beverage industries use tactics to interfere with policies aimed at reducing consumption of their unhealthy products.

The South East Asia Tobacco Control Alliance has pioneered the Tobacco Industry Interference Index to monitor tobacco industry actions. Viet Nam and Indonesia have demonstrated high levels of industry interference, with marginal improvement between 2015 and 2016, which may be linked to the lack of progress on tobacco control in both countries. The tobacco industry has been more effective in promoting their products than governments have been in implementing effective interventions, as reflected by the slow progress in tobacco control efforts in the countries we analysed. In Indonesia, a non-State Party to the WHO FCTC, the level of tobacco industry interference is the highest, although the health ministry is drafting guidelines for interaction with the tobacco industry. Article 5.3 of the WHO FCTC guides State Parties to protect their tobacco control policies from the vested interests of the tobacco industry. Global experience shows how the tobacco industry’s corporate social responsibility activities are a platform for government officials to participate directly in the industry’s activities. All countries in this study have yet

to establish procedures for disclosing interactions between governments and the industry.

Industry interference with government policies is further highlighted by Thailand’s experience in introducing an excise tax on beverages containing sugar in 2017,42 where the government faced resistance by the Thai Beverage Industry Association that challenged the links between obesity and drinking soda.43

To address the commercial determinants of noncommunicable diseases and policy interference by industries, countries require improved governance, political leadership and a whole-of-government approach to making legislative decisions on taxation and strengthening regulatory capacities.

Monitoring and evaluation gaps

The existing systems for surveillance of health risks, including the prevalence of smoking, alcohol per capita consumption, daily salt intake and levels of physical inactivity, need strengthening, standardization and integration for comprehensive noncommunicable diseases policies to be formulated. Integrated household surveys such as the STEPwise approach to surveillance44 or equivalent should cover all noncommunicable diseases risks in one survey.

The lack of global standardized detail reporting on alcohol control hampers countries from monitoring and advancing the alcohol control agenda; for example, monitoring tax rates against the preferred level of tax rate, similar to the FCTC MPower report.45 Estimations of daily salt intake requires laboratory testing to quantify 24-hour urinary sodium excretion,46 and only a few countries worldwide conduct such surveys.46,47 The burdensome 24-hour collection of urine can be replaced by urine spot testing,48 which is more practical and less costly. Salt intake using spot urine samples can provide countries with a good indication of mean population salt intake.49 The level of daily salt intake is a powerful message for policy advocacy in educating the public and benchmarking with international peers. Monitoring measures for unhealthy diet reduction need to be more comprehensive. Such monitoring needs to cover people’s consumption of trans-fat and sugar-sweetened beverages; policy interventions such as introduction of sugar-sweetened beverages taxes and bans on trans-fat in food; and the food industries’ responses and adherence to policy.

Learning from the FCTC global tobacco epidemic report,18 the WHO and international partners should develop a standardized, comprehensive monitoring tool on alcohol, salt, unhealthy food, physical activity and primary health-care readiness to provide noncommunicable diseases services. The indicators in the country capacity survey50 are inadequate to drive health-systems responses to noncommunicable diseases.

Conclusion

Our survey identified more challenges than achievements in these seven Asian countries, although some progress has been made since implementing their national action plans on noncommunicable diseases control. Key underlying barriers for insufficient progress of noncommunicable disease policy are the lack of institutional capacities of noncommunicable disease units in managing action across different sectors; inadequate investment on primary prevention; and inadequate health-systems responses on clinical management. The multifactorial nature of noncommunicable disease requires coordinated health action across sectors within and outside the health system, including tax policies, health policies, food policies, transport and urban design. To overcome implementation gaps, governments need to improve the coordination of noncommunicable diseases units with other sectors, invest more in effective interventions such as the WHO recommended best buys, and improve monitoring and evaluation capacities.

Acknowledgments

We acknowledge the contributions of technical staff in the noncommunicable diseases units in the health ministry in all seven countries.

Résumé
Mise en œuvre de plans d'action nationaux sur les maladies non transmissibles au Bhoutan, au Cambodge, aux Philippines, au Sri Lanka, en Thaïlande et au Viet Nam

En 2016, les États membres de l'Organisation mondiale de la Santé (OMS) avaient élaboré et mis en œuvre des plans d'action nationaux sur les maladies non transmissibles conformément au Plan d'action mondial pour la lutte contre les maladies non transmissibles (2013–2020). En 2018, nous avons évalué l'état de l'application des interventions les plus avantageuses recommandées en matière de maladies non transmissibles dans sept pays asiatiques : le Bhoutan, le Cambodge, l'Indonésie, les Philippines, le Sri Lanka, la Thaïlande et le Viet Nam. Nous avons recueilli des données à partir de toute une série de rapports publiés et directement auprès des ministères de la Santé. Nous avons inclus les interventions qui concernaient la consommation de tabac et d'alcool, une activité physique inadéquate et une consommation de sel élevée, ainsi que les réponses des systèmes de santé, et nous avons identifié les lacunes et proposé des solutions. En 2018, les progrès étaient variables en vue de la mise en œuvre des plans d'action nationaux visant à prévenir et à contrôler les maladies non transmissibles.

ملخص
تنفيذ خطط عمل وطنية بشأن الأمراض غير المعدية، إنذارانيا والفلبين وبوتان وتايلند وسري لانكا وفيتنام

في عام 2016، أنشأت الدول الأعضاء في منظمة الصحة العالمية (WHO) في إطار خطة العمل العالمية لمرضات غير المعدية أنشطة عامة للتدخل في الأمراض غير المعدية في السابع عشر من العام (2013-2020). في عام 2018، نظرًا إلى مستوى تنفيذ أفضل التدخلات الموصى في الأمراض غير المعدية، وتفاوت بين الدول. وكانت الفجوات في مستوى التنفيذ كبيرة إلى حد كبير، حيث تشير إلى عدم التمويل؛ والقدرات المؤسسية المحدودة (معتبرة من الدعم الحكومي غير كافيا). وكانت هناك أيضًا بعض النقص بين القطاعات، حيث أن التفاعلات بالصحة العامة، والنشاط البدني والاستهلاك غير الصحي، وتغيير الابتكار والを集مية، وتغذية النشاط البدني، ورغم ذلك، فقد تم تنفيذ خطط العمل في البلدان. وتمت دراسة الفجوات في مستوى التنفيذ توجيه نحوسد كبير إلى الأمر.
Resumen

Aplicación de planes de acción nacionales sobre las enfermedades no contagiosas, Bhután, Camboya, Filipinas, Indonesia, Sri Lanka, Tailandia y Vietnam

Para 2016, los Estados miembros de la Organización Mundial de la Salud (OMS) habían elaborado y aplicado planes de acción nacionales sobre las enfermedades no contagiosas de acuerdo con el Plan de acción mundial para la prevención y el control de las enfermedades no transmisibles (2013-2020). En 2018, se evaluó el estado de implementación de las intervenciones recomendadas en siete países asiáticos en materia de enfermedades no contagiosas: Bhután, Camboya, Filipinas, Indonesia, Sri Lanka, Tailandia y Vietnam. Se recopilaron datos de una serie de informes publicados y directamente de los ministerios de salud. Se incluyeron intervenciones que abordaron el uso del tabaco y el alcohol, la actividad física inadecuada y la ingesta elevada de sal, así como las respuestas de los sistemas de salud, se identificaron las deficiencias y se propusieron soluciones. En 2018, el progreso fue desigual entre los países. Las deficiencias en la aplicación se debieron en gran medida a la falta de financiación, a la limitada capacidad institucional (a pesar de las dependencias designadas para las enfermedades no contagiosas), a la inadecuación de las medidas adoptadas en los diferentes sectores dentro y fuera del sistema de salud y a la falta de mecanismos normalizados de supervisión y evaluación que sirvieran de base a las políticas. Para subsanar las deficiencias en materia de aplicación, los gobiernos deben invertir más en intervenciones eficaces, como las recomendadas por la OMS, mejorar las medidas adoptadas en los distintos sectores y aumentar la capacidad de seguimiento y evaluación y de investigación. A partir de las enseñanzas del Convenio Marco para el Control del Tabaco, la OMS y los asociados internacionales deberían elaborar un instrumento de seguimiento normalizado y completo para el consumo de alcohol, sal y alimentos no saludables, la actividad física y la respuesta de los sistemas de salud.
