A COMPOSITION FORMULA FOR MANIFOLD STRUCTURES

ANDREW RANICKI

ABSTRACT. The structure set $\mathcal{S}_{\text{TOP}}(M)$ of an $n$-dimensional topological manifold $M$ for $n \geq 5$ has a homotopy invariant functorial abelian group structure, by the algebraic version of the Browder-Novikov-Sullivan-Wall surgery theory. An element $(N, f) \in \mathcal{S}_{\text{TOP}}(M)$ is an equivalence class of $n$-dimensional manifolds $N$ with a homotopy equivalence $f : N \to M$. The composition formula is that $(P, fg) = (N, f) + f^*(P, g) \in \mathcal{S}_{\text{TOP}}(M)$ for homotopy equivalences $g : P \to N$, $f : N \to M$. The formula is required for a paper of Kreck and Lück.

For Prof. F. Hirzebruch

INTRODUCTION

The structure set $\mathcal{S}_{\text{TOP}}(M)$ of an $n$-dimensional topological manifold $M$ is the pointed set of equivalence classes of pairs $(N, f)$ with $N$ an $n$-dimensional manifold and $f : N \to M$ a homotopy equivalence, with $(N_1, f_1) = (N_2, f_2) \in \mathcal{S}_{\text{TOP}}(M)$ if and only if $(f_1)^{-1}f_2 : N_2 \to N_1$ is homotopic to a homeomorphism, and $(M, 1) \in \mathcal{S}_{\text{TOP}}(M)$ the base point. The equivalence class $(N, f) \in \mathcal{S}_{\text{TOP}}(M)$ is called the structure invariant of $(N, f)$. For $n \geq 5 \mathcal{S}_{\text{TOP}}(M)$ is determined by the fundamental exact sequence of pointed sets of the Browder-Novikov-Sullivan-Wall surgery theory

$$
\cdots \rightarrow L_{n+1} (\mathbb{Z}[\pi_1(M)]) \rightarrow \mathcal{S}_{\text{TOP}}(M) \rightarrow T_{\text{TOP}}(M) \rightarrow \mathcal{S}_{\text{TOP}}(M) \rightarrow L_n (\mathbb{Z}[\pi_1(M)]) \rightarrow \cdots
$$

with $T_{\text{TOP}}(M) = [M, G/TOP]$ the normal bordism set, $G/TOP$ the classifying space for fibre homotopy trivialized topological bundles, $\eta$ sending a structure invariant to its bordism class when regarded as a normal map, and $\theta$ the surgery obstruction function.

This paper will only consider homotopy equivalences of manifolds which are simple, i.e. have zero Whitehead torsion, in order to take advantage of the $s$-cobordism theorem. However, all the results have analogues for homotopy equivalences which are not necessarily simple.

Key words and phrases. Topological manifold, structure set, surgery theory.
The algebraic surgery sequence of abelian groups

$$\cdots \longrightarrow L_{n+1}(\mathbb{Z}[\pi_1(M)]) \longrightarrow S_{n+1}(M) \longrightarrow H_n(M; \mathbb{L}_*) \xrightarrow{A} L_n(\mathbb{Z}[\pi_1(M)])$$

was constructed in Ranicki [16 §16] for any space $M$, with $\mathbb{L}_*$ the 1-connective quadratic $L$-theory spectrum of $\mathbb{Z}$ such that $\mathbb{L}_0 \cong G/TOP$, and with $A$ the assembly map. The algebraic and topological surgery sequences are isomorphic, with bijections

$$\mathcal{S}^{TOP}(M) \rightarrow S_{n+1}(M) ; (N, f) \mapsto \s(f) ,$$

$$\mathcal{T}^{TOP}(M) = [M, G/TOP] \rightarrow H_n(M; \mathbb{L}_*) .$$

§1 recalls the algebraic and topological surgery exact sequences.

§2 uses the algebraic surgery exact sequence to prove the composition formula

$$(P, fg) = (N, f) + f_*(P, g) \in \mathcal{S}^{TOP}(M)$$

for homotopy equivalences $f : N \rightarrow M$, $g : P \rightarrow N$ of $n$-dimensional topological manifolds (Theorem 2.3). The addition in the structure set is thus given by

$$(N, f) + (N', f') = (P, fg) \in \mathcal{S}^{TOP}(M)$$

with $(P, g) = (f_*)^{-1}(N', f') \in \mathcal{S}^{TOP}(N)$.

A homotopy equivalence of $n$-dimensional manifolds $f : N \rightarrow M$ is automatically a normal map $(f, b)$, with

$$b : \nu_N \rightarrow (f^{-1})^*\nu_N = \nu_M \oplus \nu_f .$$

Use the normal invariant $(f, b) \in [M, G/TOP]$ to define a function

$$\eta : \mathcal{S}^{TOP}(M) = S_{n+1}(M) \rightarrow \mathcal{T}^{TOP}(M) ; (N, f) = \s(f) \mapsto \eta(N, f) = (f, b) .$$

The composite of homotopy equivalences $f : N \rightarrow M$, $g : P \rightarrow N$ is a homotopy equivalence $fg : P \rightarrow M$ with normal invariant

$$\eta(P, fg) = \eta(N, f) \oplus (f^{-1})^*\eta(P, g) \in \mathcal{T}^{TOP}(M)$$

by the sum formula of Brumfiel [11] and Madsen-Taylor-Williams [9].

At first sight, there is a disparity between the sum formulae (*) and (**), since it is well-known that the disjoint union addition $+$ and the Whitney sum addition $\oplus$ on the surgery classifying space $G/TOP \simeq \mathbb{L}_0$ are different, and the normal bordism set $\mathcal{T}^{TOP}(M) = [M, G/TOP]$ has two abelian group structures. A map $f : N \rightarrow M$ of $n$-dimensional manifolds induces a function $f_* : \mathcal{T}^{TOP}(N) \rightarrow \mathcal{T}^{TOP}(M)$ which is a morphism of abelian groups with respect to $+$, and a function $f^* : \mathcal{T}^{TOP}(M) \rightarrow \mathcal{T}^{TOP}(N)$ which is a morphism of abelian groups with respect to $\oplus$. If $f$ is a homotopy equivalence then both $f_*$ and $f^*$ are isomorphisms, but in general they are not inverse bijections. The diagram

$$\begin{array}{ccc}
\mathcal{S}^{TOP}(N) & \xrightarrow{f_*} & \mathcal{S}^{TOP}(M) \\
\eta \downarrow & & \downarrow \eta \\
\mathcal{T}^{TOP}(N) & \xrightarrow{(f^{-1})^*} & \mathcal{T}^{TOP}(M)
\end{array}$$
is not commutative, essentially since \( f \) does not preserve the Hirzebruch \( \mathcal{L} \)-genus \( \mathcal{L}(M) \in H_{n-4*}(M; \mathbb{Q}) \)
\[
f_*\mathcal{L}(N) \neq \mathcal{L}(M) \in H_{n-4*}(M; \mathbb{Q}) .
\]

An \( n \)-dimensional manifold \( M \) has a canonical \( \mathbb{L}^* \)-theory fundamental class \([M]_L \in H_n(M; \mathbb{L}^*)\) with \( \mathbb{L}^* \) the symmetric \( L \)-theory spectrum of \( \mathbb{Z} \) (Ranicki [16 §16]), such that
\[
[M]_L \otimes \mathbb{Q} = \mathcal{L}(M) \in H_n(M; \mathbb{L}^* \otimes \mathbb{Q}) = H_{n-4*}(M; \mathbb{Q}) .
\]

The failure of commutativity in the diagram is traced in §3 to the failure (in general) of \( f \) to preserve the symmetric \( L \)-theory fundamental classes, with
\[
f_*[N]_L - [M]_L = (1 + T)\eta(N, f) \in \text{im}(1 + T : H_n(M; \mathbb{L}_*) \to H_n(M; \mathbb{L}^*)) .
\]

The normal invariant function \( \eta: S^{TOP}(M) \to T^{TOP}(M) \) is a morphism of abelian groups with respect to +, so (*) gives
\[
\eta(P,fg) = \eta(N,f) + \eta(f_*(P,g)) \in T^{TOP}(M) .
\]

The symmetric \( L \)-theory orientation of manifolds is used in Corollary 3.4 to prove that
\[
\eta(N,f) + \eta(f_*(P,g)) = \eta(N,f) \oplus (f^{-1})^*\eta(P,g) \in T^{TOP}(M)
\]
reconciling (*) and (**).

This paper is a substantial expansion of the paper posted on the arXiv in November 2006 (math.AT/0608705). I am grateful to Larry Taylor for asking me about the relationship between the manifold structure composition formula (*') and the normal invariant composition formula (**') which stimulated me to expand the original version of the paper.

1. THE ALGEBRAIC AND TOPOLOGICAL SURGERY EXACT SEQUENCES

We refer to Wall [19] for the basic properties of geometric Poincaré complexes and pairs. A Spivak normal structure \((\nu_M, \rho_M)\) on an \( n \)-dimensional geometric Poincaré complex \( M \) is a \((k-1)\)-spherical fibration \( \nu_M: M \to BG(k) \) together with a map \( \rho_M: S^{n+k} \to T(\nu_M) \) to the Thom space with Hurewicz-Thom image the fundamental class
\[
h(\rho_M) = [M] \in \tilde{H}_{n+k}(T(\nu_M)) = H_n(M) .
\]

Again, we refer to [19] for the existence and uniqueness properties of Spivak normal structures. An \( n \)-dimensional manifold \( M \) is an \( n \)-dimensional geometric Poincaré complex. An embedding \( M \subset S^{n+k} \) (\( k \) large) has a topological normal bundle \( \nu_M: M \to BTOP(k) \) and the Pontrjagin-Thom construction gives a map \( \rho_M: S^{n+k} \to T(\nu_M) \) such that \((J\nu_M, \rho_M)\) is a Spivak normal structure, with \( J: BTOP(k) \to BG(k) \) the forgetful map. Similarly for geometric Poincaré pairs and manifolds with boundary.

A normal map \((f,b): N \to M\) of \( n \)-dimensional geometric Poincaré complexes with Spivak normal structures \((\nu_N, \rho_N), (\nu_M, \rho_M)\) is a degree 1 map \( f: N \to M \) together with a map \( b: \nu_N \to \nu_M \) of Spivak normal fibrations such that
\[
T(b)\rho_N \simeq \rho_M : S^{n+k} \to T(\nu_M) .
\]
A topological normal map \((f, b) : N \to M\) from an \(n\)-dimensional manifold \(N\) to an \(n\)-dimensional geometric Poincaré complex \(M\) is a degree 1 map \(f : N \to M\) together with a bundle map \(b : \nu_N \to \nu_M + \nu_b\) for some topological bundle \(\nu_b : M \to B\text{TOP}(k)\) with a fibre homotopy trivialization \(J\nu_b \simeq \ast : M \to BG(k)\), in which case \((f, Jb) : N \to M\) is a normal map of the underlying geometric Poincaré complexes with \(Jb : J\nu_N \to J\nu_M\). In particular, a homotopy equivalence \(f : N \to M\) of manifolds determines a topological normal map \((f, b)\) with \(b : \nu_N \to (f^{-1})^*\nu_N\).

As usual, let
\[
G/\text{TOP} = \text{homotopy fibre of } J : B\text{TOP} \to BG,
\]
the classifying space for fibre homotopy trivialized stable topological bundles. A topological normal map \((f, b) : N \to M\) has a topological normal invariant \(\eta(f, b) \in [M, G/\text{TOP}]\) such that \(b : \nu_M \to \nu_N + \nu_b\) with
\[
\nu_b : M \xrightarrow{\eta(f, b)} G/\text{TOP} \to B\text{TOP}.
\]
The normal map set \(\mathcal{T}^{\text{TOP}}(M)\) of a manifold \(M\) is the pointed set of bordism classes of topological normal maps \((f, b) : N \to M\). The function
\[
\mathcal{T}^{\text{TOP}}(M) \to [M, G/\text{TOP}] : (f, b) \mapsto \eta(f, b)
\]
is a bijection. The inverse is given by the Browder-Novikov transversality construction: given a map \(\eta : M \to G/\text{TOP}\) let \(\nu_b : M \to B\text{TOP}\) be the corresponding fibre homotopy trivial topological bundle, let \(h_\eta : T(\nu_M) \simeq T(\nu_M + \nu_b)\) be the corresponding homotopy equivalence of Thom spaces, and make the map
\[
h_\eta \rho_M : S^{n+k} \to T(\nu_M) \simeq T(\nu_M + \nu_b)
\]
topologically transverse regular at the zero section \(M \subset T(\nu_M + \nu_b)\), to obtain a topological normal map
\[
(f, b) = h_\eta \rho_M| : (N, \nu_N) = ((h_\eta \rho_M)^{-1}(M), \nu_N \subset S^{n+k}) \to (M, \nu_M + \nu_b)
\]
with topological normal invariant \(\eta\). For a manifold with boundary \((M, \partial M)\) there is a relative normal map set \(\mathcal{T}(M, \partial M)\) of topological normal maps \((f, b) : (N, \partial N) \to (M, \partial M)\) with a bijection
\[
\mathcal{T}^{\text{TOP}}(M, \partial M) \cong [M, G/\text{TOP}].
\]
There is also a rel \(\partial\) normal map set \(\mathcal{T}_{\partial}^{\text{TOP}}(M, \partial M)\) of topological normal maps \((f, b) : N \to M\) such that \(\partial f : \partial N \to \partial M\) is a homeomorphism, with a bijection
\[
\mathcal{T}_{\partial}^{\text{TOP}}(M, \partial M) \cong [M, \partial M; G/\text{TOP}, \ast].
\]

The Wall 20 surgery obstruction groups \(L_n(\Lambda)\) of a ring \(\Lambda\) with involution \(\lambda \mapsto \overline{\lambda}\) were expressed in Ranicki [14] as the cobordism groups of \(n\)-dimensional quadratic Poincaré complexes \((C, \psi)\) over \(\Lambda\), with \(C\) an \(n\)-dimensional based f.g. free \(\Lambda\)-module chain complex. The quadratic structure is an element
\[
\psi \in Q_n(C) = H_n(W \otimes_{\mathbb{Z}[\mathbb{Z}_2]} (C \otimes_\Lambda C))
\]
where
\[
W : \cdots \to \mathbb{Z}[\mathbb{Z}_2] \xrightarrow{1-T} \mathbb{Z}[\mathbb{Z}_2] \xrightarrow{1+T} \mathbb{Z}[\mathbb{Z}_2] \xrightarrow{1-T} \mathbb{Z}[\mathbb{Z}_2]
\]
is the standard free \(\mathbb{Z}[\mathbb{Z}_2]\)-module resolution of \(\mathbb{Z}\), and \(T \in \mathbb{Z}_2\) acts on
\[
C \otimes_\Lambda C = C \otimes_{\mathbb{Z}} C/(x \otimes \lambda y - \overline{\lambda} x \otimes y \mid x, y \in C, \lambda \in \Lambda)
\]
A COMPOSITION FORMULA FOR MANIFOLD STRUCTURES

\[ T : C_p \otimes_{\Lambda} C_q \to C_q \otimes_{\Lambda} C_p \; ; \; x \otimes y \mapsto (-)^p y \otimes x . \]

The \( \Lambda \)-module chain map

\[ (1 + T)\psi_0 : C^{n-*} = \text{Hom}_\Lambda(C, \Lambda)_{*-n} \to C \]

is required to be a simple chain equivalence. The quadratic \( L \)-groups are the homotopy groups of an \( \Omega \)-spectrum \( L\bullet(\Lambda) \) of quadratic Poincaré complexes over \( \Lambda \), with

\[ \pi_n(L\bullet(\Lambda)) = L_n(\Lambda) . \]

For the surgery exact sequence it is necessary to consider the 1-connective cover of \( L\bullet(Z) \), which is denoted by \( L\bullet \), and is such that

\[
\begin{align*}
\mathbb{L}_0 &\cong G/TOP , \\
\pi_n(\mathbb{L}_\bullet) &= \pi_n(G/TOP) = L_n(Z) = \\
&\begin{cases} 
Z & \text{if } n \equiv 0(\text{mod } 4) \\
0 & \text{if } n \equiv 1(\text{mod } 4) \\
\mathbb{Z}_2 & \text{if } n \equiv 2(\text{mod } 4) \\
0 & \text{if } n \equiv 3(\text{mod } 4).
\end{cases}
\end{align*}
\]

The \( H \)-space structure on \( L_0 \) given by the direct sum of quadratic Poincaré complexes corresponds to the disjoint union \( H \)-space structure on \( G/TOP \).

The \textit{symmetric} \( L \)-groups \( L^n(\Lambda) \) of a ring \( \Lambda \) with involution were defined in [14] (following Mishchenko) as the cobordism groups of \( n \)-dimensional symmetric Poincaré complexes \( (C, \phi) \) over \( \Lambda \), with \( C \) an \( n \)-dimensional based f.g. free \( \Lambda \)-module chain complex. The symmetric structure is an element \( \phi \in Q^n(C) = H_n(\text{Hom}_{\mathbb{Z}[\pi_1]}(W, C \otimes_{\Lambda} C)) \)

and the \( \Lambda \)-module chain map \( \phi_0 : C^{n-*} \to C \) is required to be a simple chain equivalence. The symmetrization maps

\[ 1 + T : L_n(\Lambda) \to L^n(\Lambda) ; \; (C, \psi) \mapsto (C, (1 + T)\psi) \]

are isomorphisms modulo 8-torsion ([13, Proposition 8.2]). For any rings with involution \( \Lambda, \Lambda' \) the tensor product over \( \mathbb{Z} \) defines \( L \)-theory products

\[
\begin{align*}
L^n(\Lambda) \otimes_{\mathbb{Z}} L^n(\Lambda') &\to L^{n+n'}(\Lambda \otimes_{\mathbb{Z}} \Lambda') , \\
L^n(\Lambda) \otimes_{\mathbb{Z}} L^{n'}(\Lambda') &\to L_{n+n'}(\Lambda \otimes_{\mathbb{Z}} \Lambda')
\end{align*}
\]

and also

\[
L_n(\Lambda) \otimes_{\mathbb{Z}} L_{n'}(\Lambda') \to L_{n+n'}(\Lambda \otimes_{\mathbb{Z}} \Lambda') : \; x \otimes x' \mapsto (1 + T)x \otimes x' = x \otimes (1 + T)x' .
\]

The \textit{symmetric signature} of an \( n \)-dimensional geometric Poincaré complex \( M \) was defined in Ranicki [15] (again, following Mishchenko) to be the cobordism class

\[ \sigma^*(M) = (C(\tilde{M}), \phi_M) \in L^n(\mathbb{Z}[\pi_1(M)]) \]

of the \( n \)-dimensional symmetric Poincaré complex \( (C(\tilde{M}), \phi_M) \) over \( \mathbb{Z}[\pi_1(M)] \) with \( \tilde{M} \) is the universal cover of \( M \). The symmetric \( L \)-groups are the homotopy groups of an \( \Omega \)-spectrum \( L\bullet(\Lambda) \) of symmetric Poincaré complexes over \( \Lambda \), with

\[ \pi_n(L\bullet(\Lambda)) = L^n(\Lambda) . \]
In particular, for \( \Lambda = \mathbb{Z} \) we write \( L^\bullet(\mathbb{Z}) = L^\bullet \), with

\[
\pi_n(L^\bullet) = L^n(\mathbb{Z}) = \begin{cases}
\mathbb{Z} & \text{if } n \equiv 0 \pmod{4} \\
\mathbb{Z}_2 & \text{if } n \equiv 1 \pmod{4} \\
0 & \text{if } n \equiv 2 \pmod{4} \\
0 & \text{if } n \equiv 3 \pmod{4}.
\end{cases}
\]

The tensor product of symmetric Poincaré complexes over \( \mathbb{Z} \) gives \( L^\bullet \) the structure of a ring spectrum (with a 1), \( L_\ast(\Lambda) \) is an \( L^\bullet \)-module spectrum, and \( L_n \) is also a ring spectrum (but only with an 8, not a 1). A topological bundle has an \( L^\bullet \)-orientation, and an \( n \)-dimensional manifold \( M \) has a symmetric \( L \)-theory fundamental class \( [M]_L \in H_n(M; L^\bullet) \) \([16]\) Proposition 16.16\) with assembly

\[
A([M]_L) = \sigma^s(M) \in L^n(\mathbb{Z}[\pi_1(M)]) .
\]

The quadratic signature of a normal map \((f, b) : N \to M \) of \( n \)-dimensional geometric Poincaré complexes was defined in Ranicki \([15]\) to be the cobordism class

\[
\sigma(f, b) = (C(f^1), \psi_b) \in L_n(\mathbb{Z}[\pi_1(M)])
\]

of the quadratic kernel \( n \)-dimensional quadratic Poincaré complex \((C(f^1), \psi_b)\) over \( \mathbb{Z}[\pi_1(M)] \), constructed as follows. The Umkehr \( \mathbb{Z}[\pi_1(M)] \)-module chain map is the composite

\[
f^1 : C(\tilde{M}) \simeq C(\tilde{M})^{n-\ast} \xrightarrow{\tilde{f}^s} C(\tilde{N})^{n-\ast} \simeq C(\tilde{N}) ,
\]

where \( \tilde{M} \) is the universal cover of \( M \), \( \tilde{N} = f^*\tilde{M} \) is the pullback cover of \( N \), and \( \tilde{f} : \tilde{N} \to \tilde{M} \) is a \( \pi_1(M) \)-equivariant lift of \( f \). The algebraic mapping cone \( C(f^1) \) fits into the chain homotopy direct sum system

\[
\begin{array}{c}
C(\tilde{M}) \xrightarrow{f^1} C(\tilde{N}) \xrightarrow{e} C(f^1)
\end{array}
\]

with \( e : C(\tilde{N}) \to C(f^1) \) the inclusion and \( \tilde{f}f^1 \simeq 1 : C(\tilde{M}) \to C(\tilde{M}) \). Thus there is defined a chain equivalence of symmetric Poincaré complexes

\[
(C(\tilde{N}), \phi_N) \simeq (C(f^1), (1 + T)\psi_b) \oplus (C(\tilde{M}), \phi_M) ,
\]

and

\[
\begin{align*}
H_\ast(C(f^1)) &= K_\ast(N) = \ker(\tilde{f}_\ast : H_\ast(\tilde{N}) \to H_\ast(\tilde{M})) , \\
H_\ast(\tilde{N}) &= H_\ast(C(f^1)) \oplus H_\ast(\tilde{M}) .
\end{align*}
\]

Let \( \nu_{\tilde{M}} \) be the pullback of \( \nu_M \) to the universal cover \( \tilde{M} \) of \( M \), and let \( \nu_{\tilde{N}} \) be the pullback of \( \nu_N \) to the pullback cover \( \tilde{N} = f^*\tilde{M} \) of \( N \), so that \( b \) lifts to a \( \pi_1(M) \)-equivariant map \( \tilde{b} : \nu_{\tilde{N}} \to \nu_{\tilde{M}} \). The \( \pi_1(M) \)-equivariant \( S \)-dual of \( T(\tilde{b}) : T(\nu_{\tilde{N}}) \to T(\nu_{\tilde{M}}) \) is a \( \pi_1(M) \)-equivariant stable map \( F : \Sigma^\infty\tilde{M}^+ \to \Sigma^\infty\tilde{N}^+ \) inducing \( f^1 \) on the chain level. The quadratic construction of \([15] \) \S1\] is a natural transformation

\[
\psi_F : C(M) \to W \otimes_{\mathbb{Z}[\pi_2]} (C(\tilde{N}) \otimes_{\mathbb{Z}[\pi_1(M)]} C(\tilde{N}))
\]

and the quadratic structure in \( \sigma_s(f, b) \) is defined by

\[
\psi_b = (e \otimes e)\psi_F [M] \in Q_n(C(f^1)) .
\]

There is also a version for a normal map of geometric Poincaré pairs.
The surgery obstruction \( \sigma_s(f, b) \in L_n(\mathbb{Z}[\pi_1(M)]) \) was defined by Wall \cite{20} for a topological \( n \)-dimensional normal map \((f, b) : N \to M\) of manifolds with boundary such that \( \partial f : \partial N \to \partial M \) is a homotopy equivalence. The surgery obstruction was identified in \cite{15} with the quadratic signature of the underlying normal map of geometric Poincaré pairs.

The algebraic normal invariant of a topological normal map \((f, b) : N \to M\) of \( n \)-dimensional manifolds is the cobordism class
\[
t(f, b) = (C, \psi) \in H_n(M; \mathbb{L}_\bullet)
\]
defined in \cite{16} Proposition 18.3 (as recalled in §2 below), with symmetrization
\[
(1 + T)t(f, b) = f_*[N]_L - [M]_L \in H_n(M; \mathbb{L}_\bullet)
\]
and assembly the surgery obstruction
\[
A(t(f, b)) = \sigma_s(f, b) \in L_n(\mathbb{Z}[\pi_1(M)])
\]

The structure set \( S_{T O P}(M) \) of an \( n \)-dimensional topological manifold \( M \) was already defined in the Introduction. For a manifold with boundary \((M, \partial M)\) there is a relative structure set \( S_{T O P}(M, \partial M) \) of equivalence classes of pairs \((N, f)\) with \( N \) an \( n \)-dimensional manifold with boundary and \( f : N \to M \) a homotopy equivalence. There is also a rel \( \partial \) structure set \( S^T_{\partial O P}(M, \partial M) \) of equivalence classes of pairs \((N, f)\) with \( N \) an \( n \)-dimensional manifold with boundary and \( f : N \to M \) a homotopy equivalence such that \( \partial f : \partial N \to \partial M \) is a homeomorphism.

For \( n \geq 5 \) and an \( n \)-dimensional manifold \( M \) the Browder-Novikov-Sullivan-Wall surgery theory (extended to the topological category by Kirby and Siebenmann \cite{6}) fits \( S^T_{\partial O P}(M \times D^k) \) \((k \geq 0)\) into an exact sequence of pointed sets
\[
\ldots \to S^T_{\partial O P}(M \times D^k) \overset{\eta}{\to} T^T_{\partial O P}(M \times D^k) \overset{\theta}{\to} L_{n+k}(\mathbb{Z}[\pi_1(M)]) \to \ldots
\]
\[
\ldots \to S^T_{\partial O P}(M \times D^1) \overset{\eta}{\to} T^T_{\partial O P}(M \times D^1) \overset{\theta}{\to} L_{n+1}(\mathbb{Z}[\pi_1(M)]) \to \ldots
\]
\[
\to S^{T O P}(M) \overset{\eta}{\to} T^{T O P}(M) \overset{\theta}{\to} L_n(\mathbb{Z}[\pi_1(M)])
\]
which is in fact an exact sequence of abelian groups until \( L_{n+1}(\mathbb{Z}[\pi_1(M)]) \), with \( T^T_{\partial O P}(M \times D^k) = [M \times D^k, \partial; G/T O P] \), using the disjoint union \( H \)-space structure on \( G/T O P \). For a manifold with boundary \((M, \partial M)\) there are also rel and rel \( \partial \) versions. See Wall \cite{20} Theorem 10.8, Quinn \cite{11} \cite{12}, Siebenmann \cite{6} Essay V, Appendix C, Ranicki \cite{14} \cite{15}, Nicas \cite{10}, Cappell and Weinberger \cite{2} and Kro \cite{8} for previous accounts of the topological structure set.

The quadratic \( S \)-groups \( S_\ast(X) \) of a space \( X \) were defined in \cite{10} §15, to fit into the algebraic surgery exact sequence
\[
\ldots \to H_n(X; \mathbb{L}_\bullet) \overset{A}{\to} L_n(\mathbb{Z}[\pi_1(X)]) \to S_\ast(X) \to H_{n-1}(X; \mathbb{L}_\bullet) \to \ldots
\]
with \( A \) the assembly map. The functor
\[
\{ \text{spaces} \} \to \{ \text{Z-graded abelian groups} \} \ ; \ X \mapsto S_\ast(X)
\]
is covariant and homotopy invariant: a map $f : X \to Y$ induces morphisms $f_* : S_*(X) \to S_*(Y)$ depending only on the homotopy class of $f$. A homotopy equivalence $f$ induces isomorphisms $f_*$. 

**Proposition 1.1.** (Ranicki [16, Theorem 18.5]) The algebraic and topological surgery exact sequences of an $n$-dimensional manifold $M$ with $n \geq 5$ are related by an isomorphism 

$$
\cdots \overset{\cdots}{\longrightarrow} L_{n+1}(\mathbb{Z}[\pi_1(M)]) \overset{S_*(M)}{\longrightarrow} S_{TOP}(M) \overset{\eta}{\longrightarrow} T_{TOP}(M) \overset{\theta}{\longrightarrow} L_n(\mathbb{Z}[\pi_1(M)])
$$

$$
\cdots \overset{\cdots}{\longrightarrow} L_{n+1}(\mathbb{Z}[\pi_1(M)]) \overset{S_n+1(M)}{\longrightarrow} S_{TOP}(M) \overset{\eta(f,b)}{\longrightarrow} H_n(M; L_*) \overset{A}{\longrightarrow} L_n(\mathbb{Z}[\pi_1(M)])
$$

Similarly for a manifold with boundary.

**Proof.** The isomorphism sending the topological normal invariant to the algebraic normal invariant 

$$
t = [M]_L \cap - : T_{TOP}(M) = [M, G/TOP] = H^0(M; \mathbb{L}_*) \overset{\sim}{\longrightarrow} H_n(M; \mathbb{L}_*) ; \eta(f,b) = t(f,b) = [M]_L \cap \eta(f,b)
$$

is the Poincaré duality isomorphism defined by cap product with the symmetric $L$-theory fundamental class $[M]_L \in H_n(M; L_*)$, sending the topological normal invariant of a normal map $(f,b) : N \to M$ to the algebraic normal invariant 

$$
t(f,b) = [M]_L \cap \eta(f,b) \in H_n(M; \mathbb{L}_*) .
$$

Here, we are using the disjoint union $H$-space structure on $G/TOP$ to define the abelian group structure, which corresponds to the direct sum of quadratic Poincaré complexes in $\mathbb{L}_*$. The composite of $t$ and the quadratic $L$-theory assembly map $A$

$$
At : T_{TOP}(M) \cong H_n(M; \mathbb{L}_*) \to L_n(\mathbb{Z}[\pi_1(M)])
$$

sends a topological normal map $(f,b) : N \to M$ to the surgery obstruction 

$$
At(f,b) = \sigma_*(f,b) \in L_n(\mathbb{Z}[\pi_1(M)]) .
$$

The isomorphism 

$$
s : S_{TOP}(M) \cong S_{n+1}(M) ; (N, f) \mapsto s(f)
$$

sends a homotopy equivalence $f : N \to M$ to the ‘manifold structure’ $s(f)$ measuring the failure of the point inverses $f^{-1}(x) \subset N$ $(x \in M)$ to be acyclic. (At this point it is worth recalling the CE approximation theorem of Siebenmann [18]: for $n \geq 5$ a map of $n$-dimensional topological manifolds $f : N \to M$ with contractible point inverses is a homotopy equivalence which is homotopic to a homeomorphism.)

**Remark 1.2.** Proposition 1.1 also applies in dimension $n = 4$ in the case of a fundamental group $\pi_1(M)$ which is good in the sense of Freedman and Quinn [4].
2. Composition Formulae

The composition formula for manifold structures is just a local version of the composition formula of Ranicki [15] for surgery obstructions, so we start with that:

**Proposition 2.1.** ([15, Proposition 4.3]) The composite of normal maps of \( n \)-dimensional geometric Poincaré complexes

\[
(g, c) : P \to N, \quad (f, b) : N \to M
\]
is a normal map \((fg, bc) : P \to M\) with surgery obstruction

\[
\sigma_*(fg, bc) = \sigma_*(f, b) + f_*\sigma_*(g, c) \in L_n(\mathbb{Z}[\pi_1(M)]).
\]

**Proof.** Homotopy equivalent quadratic Poincaré complexes are cobordant. The Umkehr chain maps are such that up to chain homotopy

\[
(fg)^! = g^!f^! : C(M) \xrightarrow{f^!} C(N) \xrightarrow{g^!} C(P)
\]
and the quadratic kernels are such that up homotopy equivalence

\[
(C((fg)^!), \psi_{bc}) = (C(f^!), \psi_b) \oplus f_*(C(g^!), \psi_c).
\]

\[\square\]

**Remark 2.2.** The surgery composition formula of Proposition 2.1 avoids the framing problems of the surgery composition formulae for topological normal maps of Wall [20, p.279] and Jones [5, 7.0], being purely homotopy theoretic in nature. See Proposition 2.7 below for the composition of topological normal maps. \[\square\]

The generalized \( L_* \)-homology groups \( H_n(X; \mathbb{L}_*) \) of a finite simplicial complex \( X \) were identified in Ranicki [16, §12] with the quadratic \( L \)-groups of an additive category \( \mathbb{A}(\mathbb{Z})_* (X) \) with chain duality in which a quadratic Poincaré complex is a sheaf of quadratic Poincaré complexes over \( X \), i.e. satisfies local Poincaré duality. As in Ranicki and Weiss [17] define a \((\mathbb{Z}, X)\)-module \( A \) to be a \( \mathbb{Z} \)-module with a direct sum decomposition

\[
A = \bigoplus_{\sigma \in X} A(\sigma),
\]
with each \( A(\sigma) \) based f.g. free. Let \( \mathbb{A}(\mathbb{Z})_* (X) \) be the additive category with objects \((\mathbb{Z}, X)\)-modules and morphisms \( f : A \to B \) the abelian group morphisms such that

\[
f(A(\sigma)) \subseteq \bigoplus_{\tau \geq \sigma} B(\tau).
\]
As in [16, §§5,13] there is defined a chain duality on \( \mathbb{A}(\mathbb{Z})_* (X) \) such that

\[
H_n(X; \mathbb{L}_*) = L_n(\mathbb{A}(\mathbb{Z})_* (X)).
\]
An element \((C, \psi) \in H_n(X; \mathbb{L}_*)\) is a cobordism class of \( n \)-dimensional quadratic Poincaré complexes \((C, \psi)\) in \( \mathbb{A}(\mathbb{Z})_* (X) \) with \( C(\sigma) \) an \((n - |\sigma|)\)-dimensional based f.g. free \( \mathbb{Z} \)-module chain complex, subject to the additional requirement (corresponding to the 1-connectivity of \( \mathbb{L}_* \)) that \( C(\sigma) \) be contractible for \( \sigma \in C \) with \(|\sigma| = n \). The quadratic structure is an element

\[
\psi \in Q^X_n(C) = H_n(W \otimes \mathbb{Z}[\Delta] (C \otimes (\mathbb{Z}, X) C)).
\]
with $C \otimes_{(\mathbb{Z},X)} C \subseteq C \otimes_{\mathbb{Z}} C$ the $\mathbb{Z}[\mathbb{Z}_2]$-module subcomplex defined by

$$C \otimes_{(\mathbb{Z},X)} C = \sum_{\sigma, \tau \in X, \sigma \cap \tau \neq \emptyset} C(\sigma) \otimes_{\mathbb{Z}} C(\tau).$$

Let $\mathcal{A}(\mathbb{Z}[\pi_1(X)])$ be the additive category of based f.g. free $\mathbb{Z}[\pi_1(X)]$-modules. The assembly functor ([17], [16, §9])

$$A : \mathcal{A}(\mathbb{Z})_n(X) \to \mathcal{A}(\mathbb{Z}[\pi_1(X)]); \quad B = \sum_{\sigma \in X} B(\sigma) \mapsto A(B) = \sum_{\sigma \in X} B(p\sigma)$$

was defined using the universal covering projection $p : \tilde{X} \to X$. An element $(C, \psi) \in H_n(X; \mathbb{L}_\bullet)$ is a cobordism class of $n$-dimensional quadratic Poincaré complexes $(C, \psi)$ in $\mathcal{A}(\mathbb{Z})_n(X)$. An element $(C, \psi) \in S_{n+1}(X)$ is a cobordism class of $n$-dimensional quadratic Poincaré complexes $(C, \psi)$ in $\mathcal{A}(\mathbb{Z})_n(X)$ such that the assembly based f.g. free $\mathbb{Z}[\pi_1(X)]$-module chain complex $A(C)$ is simple contractible.

We now recall from [16] the construction of the algebraic normal invariant $t(f, b) \in H_n(M; \mathbb{L}_\bullet)$ of a topological normal map $(f, b) : N \to M$ of $n$-dimensional manifolds. By [16 Corollary 17.6] there exists a finite simplicial complex $X$ with a homotopy equivalence $h : M \to X$ such that both $h$ and $hf : N \to X$ are topologically transverse across the dual cell decomposition $\{D(\sigma, X)|\sigma \in X\}$ of the barycentric subdivision $X'$. The $\mathbb{L}_\bullet$-homology groups are homotopy invariant, so $h_* : H_n(M; \mathbb{L}_\bullet) \to H_n(X; \mathbb{L}_\bullet)$ is an isomorphism. The restrictions

$$(f(\sigma), b(\sigma)) = (f, b) \mid D(\sigma, X) : (hf)^{-1}D(\sigma, X) \to h^{-1}D(\sigma, X) \quad (\sigma \in X)$$

are normal maps of $(n - |\sigma|)$-dimensional geometric Poincaré pairs (in fact manifolds) with boundaries the inverse images of the boundaries of the dual cells

$$\partial D(\sigma, X) = \bigcup_{\tau > \sigma} D(\tau, X) \subset D(\sigma, X),$$

such that the degree 1 map is the assembly

$$f = \bigcup_{\sigma \in X} f(\sigma) : N = \bigcup_{\sigma \in X} (hf)^{-1}D(\sigma, X) \to M = \bigcup_{\sigma \in X} h^{-1}D(\sigma, X).$$

The quadratic cycle $(C, \psi)$ has chain components

$$C(\sigma) = C(f(\sigma)^{-1} : C((hf)^{-1}D(\sigma, X)) \to C(h^{-1}D(\sigma, X))) \quad (\sigma \in X)$$

with assembly the based f.g. free $\mathbb{Z}[\pi_1(X)]$-module chain complex

$$A(C) = C(\tilde{f} : C(\tilde{N}) \to C(\tilde{M})).$$

The algebraic manifold structure of a homotopy equivalence $f : N \to M$ of $n$-dimensional manifolds is the cobordism class

$$s(f) = (C, \psi) \in S_{n+1}(X) = S_{n+1}(M)$$

with $(C, \psi)$ (constructed as above) simple $\mathbb{Z}[\pi_1(M)]$-contractible by virtue of $f$ being a homotopy equivalence. The bijection of Proposition [11]

$$S^{TOP}(M) \to S_{n+1}(M) : (N, f) \mapsto s(f) = (C, \psi)$$
The algebraic manifold structure is interpreted as an element of \( S \). Similarly:

\[
(fg)\, (bc)\, (\sigma) = (f, b)(\sigma) (g, c) : (hfg)^{-1}D(\sigma, X) \rightarrow (hf)^{-1}D(\sigma, X) \rightarrow h^{-1}D(\sigma, X) \quad (\sigma \in X)
\]

split (up to \( \mathbb{Z} \)-module chain equivalence) as direct sums

\[
C((fg)(\sigma)) = C(f(\sigma)) \oplus C(g(\sigma)),
\]

and similarly for the quadratic structures \( \psi \). It follows that

\[
s(fg) = s(f) + f_{*}s(g) \in S_{n+1}(M) = S_{n+1}(X)
\]

completing the proof. \( \square \)

Remark 2.4. (i) Theorem 2.3 also applies in dimension \( n = 4 \) in the case of a fundamental group \( \pi_1(M) \) which is good in the sense of Freedman and Quinn [4].

(ii) Theorem 2.3 is in fact true for all \( n \geq 0 \), provided that \( f_{*}(P, g) \in S_{n+1}(M) \) is interpreted as an element of \( S_{n+1}(M) \) rather than as a manifold structure. The algebraic manifold structure \( s(f) \in S_{n+1}(M) \) is defined for any homotopy equivalence \( f : N \rightarrow M \) of \( n \)-dimensional manifolds, and the proof of 2.3 gives \( s(fg) = s(f) + f_{*}s(g) \in S_{n+1}(M) \).

For any degree 1 map \( f : N \rightarrow M \) of \( n \)-dimensional geometric Poincaré complexes there is defined a commutative square

\[
H^{r}(N) \xleftarrow{f_{*}} H^{r}(M) \quad [N] \cap - \xrightarrow{\cong} \quad f_{*}[N] \cap - \quad H_{n-r}(N) \xrightarrow{f_{*}} H_{n-r}(M)
\]

with \( f_{*}[N] = [M] \in H_{n}(M) \), so that the induced morphisms \( f^{*} : H^{r}(N) \rightarrow H^{r}(M) \) are split injections. Similarly:

Lemma 2.5. For a topological normal map \( (f, b) : N \rightarrow M \) of \( n \)-dimensional manifolds there is defined a commutative square

\[
[N, G/TOP] = H^{0}(N; \mathbb{L}) \xleftarrow{f_{*}} [M, G/TOP] = H^{0}(M; \mathbb{L}) \quad [N]_{\mathbb{L}} \cap - \xrightarrow{\cong} \quad f_{*}[N]_{\mathbb{L}} \cap - \quad H_{n}(N; \mathbb{L}) \xrightarrow{f_{*}} H_{n}(M; \mathbb{L})
\]
so that 
\[ f^* : [M, G/TOP] \to [N, G/TOP] ; \eta \mapsto f^*\eta \]
is a split injection. □

Remark 2.6. (i) A degree 1 map of manifolds \( f : N \to M \) does not in general have degree 1 in \( L^\bullet \)-homology
\[ f_*[N]_L \neq [M]_L \in H_n(M; \mathbb{L}^\bullet) . \]
(ii) If \((f, b) : N \to M\) is a topological normal map then
\[ f_*[N]_L = [M]_L + (1 + T)t(f, b) \in H_n(M; \mathbb{L}_\bullet) \]
is an \( \mathbb{L}_\bullet \)-theory fundamental class. □

In general, it is not possible to compose topological normal maps. However:

Proposition 2.7. For topological normal maps \((f, b) : N \to M, (g, c) : P \to N\) such that
\[ \eta(g, c) \in \text{im}(f^* : [M, G/TOP] \to [N, G/TOP]) \]
it is possible to define the composite topological normal map \((fg, bc) : P \to M\) with
\[ bc : \nu_P \xrightarrow{c} \nu_N \oplus \nu_c \xrightarrow{b + 1} \nu_M \oplus \nu_b \oplus f\nu_c , \]
with normal invariant \( f_!\eta(g, c) \in [M, G/TOP] \) the unique element such that
\[ \eta(g, c) = f^*(f_!\eta(g, c)) \in [N, G/TOP] . \]

(i) The topological normal invariant of the composite is given by
\[ \eta(fg, bc) = \eta(f, b) \oplus f_!\eta(g, c) \in [M, G/TOP] . \]
(ii) The algebraic normal invariant of the composite is given by
\[ t(fg, bc) = t(f, b) + f_!t(g, c) \in H_n(M; \mathbb{L}_\bullet) . \]

Proof. (i) By construction.
(ii) Exactly as for the proof of Theorem 2.3. □

Remark 2.8. In particular, the hypothesis of Proposition 2.7 is satisfied in the special case when \( f : N \to M \) is a homotopy equivalence, with
\[ f_!\eta(g, c) = (f^{-1})^*\eta(g, c) \in [M, G/TOP] . \]
The composition formula in this case
\[ \eta(fg, bc) = \eta(f, b) \oplus (f^{-1})^*\eta(g, c) \in [M, G/TOP] \]
was first obtained by Brumfiel [11 Proposition 2.2] and Madsen, Taylor and Williams [9 Lemma 2.5]. □

In order to reconcile the composition formulae of Proposition 2.7 for the topological and algebraic normal invariants it is necessary deal with the bijection
\[ \eta : \mathcal{T}^{TOP}(M) = [M, G/TOP] \to H_n(M; \mathbb{L}_\bullet) : \eta(f, b) \mapsto t(f, b) . \]
and compare the Whitney sum addition on the left with the direct sum addition on the right, as will now be done in §3.
3. The Whitney sum and products

It has long been known that the surgery obstruction function
\[ \theta : \mathcal{T}_{\text{TOP}}(M) = [M,G/\text{TOP}] \to L_n(\mathbb{Z}[\pi_1(M)]) \]
is a function between abelian groups which is not a morphism. This was first observed for PL normal invariants in the simply-connected case by Cooke [3, p.182], and in general by Wall [20, p.114]:

We enter here a caveat to the reader. In the situation of (10.6), we have the map
\[ \theta : [X,G/\text{PL}] \to L_m(\pi_1(X)) \]
of abelian groups which satisfies, by definition, \( \theta(0) = 0 \). However, \( \theta \) is NOT in general a homomorphism. The result fails even in the closed, simply connected case with \( 4|\text{m} \), as one readily sees by computing with Pontrjagin classes (the simplest example is the quaternion projective plane).

The classifying space \( G/\text{TOP} \) has two distinct \( H \)-space structures, one given by the Whitney sum of bundles and one given by the disjoint union. The latter was originally defined by Sullivan using the characteristic variety theorem and by Quinn using the disjoint union of normal maps, and corresponds to the direct sum of quadratic Poincaré complexes in \( L_0 \simeq G/\text{TOP} \). The abelian group structure on \( [M,G/\text{TOP}] \) defined by + matches the abelian group structure on \( \text{H}^n(M;L_\bullet) \).

We shall now compare the composition formula for the structure invariant (Theorem 2.3) and the composition formula for the normal invariant (Proposition 2.7), using the expression of the Whitney sum \( \oplus \) on \( G/\text{TOP} \) as the addition
\[ \oplus : \mathbb{L}_0 \times \mathbb{L}_0 \to \mathbb{L}_0 ; (a,b) \mapsto a \oplus b = a + b + a \otimes b \]
(cf. Ranicki [13, p.295]).

Recall the definition of the Whitney sum of bundles \( \eta : M \to \text{BTOP}(k) \), \( \eta' : M \to \text{BTOP}(k') \), namely as the composite
\[ \eta \oplus \eta' : M \xrightarrow{\Delta} M \times M \xrightarrow{\eta \times \eta'} \text{BTOP}(k) \times \text{BTOP}(k') \xrightarrow{\oplus} \text{BTOP}(k+k') , \]
At this point, we need to recall the surgery product formula:

**Proposition 3.1.** (Ranicki [13, Proposition 8.1])
(i) The product \( M \times M' \) of an \( n \)-dimensional geometric Poincaré complex \( M \) and an \( n' \)-dimensional geometric Poincaré complex \( M' \) is an \( (n+n') \)-dimensional geometric Poincaré complex \( M \times M' \) with symmetric signature
\[ \sigma^*(M \times M') = \sigma^*(M) \otimes_{\mathbb{Z}} \sigma^*(M') \]
\[ \in L^{n+n'}(\mathbb{Z}[\pi_1(M \times M')]) = L^{n+n'}(\mathbb{Z}[\pi_1(M)] \otimes_{\mathbb{Z}} \mathbb{Z}[\pi_1(M')]) . \]
(ii) The product of a normal map \( (f,b) : N \to M \) of \( n \)-dimensional geometric Poincaré complexes and a normal map \( (f',b') : N' \to M' \) of \( n' \)-dimensional geometric Poincaré complexes is a normal map \( (f \times f',b \times b') : N \times N' \to M \times M' \) of
Corollary 3.2. The product of an $(n+n')$-dimensional geometric Poincaré complexes with quadratic signature
\[
\sigma_*(f \times f', b \times b') = \sigma_*(f, b) \otimes \sigma_*(M') + \sigma_*(M) \otimes \sigma_*(f', b') + \sigma_*(f, b) \otimes \sigma_*(f', b')
\]
\[
\in L_{n+n'}(\mathbb{Z}[\pi_1(M \times M')]) = L_{n+n'}(\mathbb{Z}[\pi_1(M)] \otimes \mathbb{Z}[\pi_1(M')]) .
\]

Proof. (i) The symmetric complex of $M \times M'$ is such that up homotopy equivalence
\[
(C(M \times M'), \phi_{M \times M'}) = (C(\tilde{M}), \phi_M) \otimes _{\mathbb{Z}} (C(\tilde{M}'), \phi_{M'})
\]
by the Eilenberg-Zilber theorem. Homotopy equivalent symmetric Poincaré complexes are cobordant.

(ii) The quadratic kernel of $(f \times f', b \times b')$ is such that up to homotopy equivalence
\[
(C((f \times f')^\natural), \psi_b) =

((C(f^\natural), \psi_b) \otimes _{\mathbb{Z}} (C(\tilde{M}'), \phi_{M'})) \oplus ((C(\tilde{M}), \phi_M) \otimes _{\mathbb{Z}} (C(f^\natural), \psi_b))
\]
\[
\oplus ((C(f^\natural), \psi_b) \otimes _{\mathbb{Z}} (C(f^\natural), \psi_b)).
\]
\[
\square
\]

Since $L^\bullet$ and $L_{\bullet}$ are ring spectra and $L_{\bullet}$ is an $L^\bullet$-module spectrum there are defined cup and cap products for any space $M$
\[
\cup : H^p(M; L^\bullet) \otimes _{\mathbb{Z}} H^q(M; L^\bullet) \rightarrow H^{p+q}(M; L^\bullet),
\]
\[
\cup : H^p(M; L_{\bullet}) \otimes _{\mathbb{Z}} H^q(M; L_{\bullet}) \rightarrow H^{p+q}(M; L_{\bullet}),
\]
\[
\cap : H_0(M; L^\bullet) \otimes _{\mathbb{Z}} H_0(M; L^\bullet) \rightarrow H_{0-q}(M; L_{\bullet}).
\]
The symmetric $L$-theory fundamental class $[M]_L \in H_n(M; L^\bullet)$ of an $n$-dimensional manifold $M$ determines Poincaré duality isomorphisms
\[
[M]_L \cap - : H^*(M; L_{\bullet}) \rightarrow H_{n-*}(M; L_{\bullet}) : x \mapsto x_* = [M]_L \cap x
\]
which can be used to define the intersection product
\[
H_{n-p}(M; L_{\bullet}) \otimes _{\mathbb{Z}} H_{n-q}(M; L_{\bullet}) \rightarrow H_{n-p-q}(M; L_{\bullet}) ; x_* \otimes y_* \mapsto x_* y_* = (x \cup y)_*,
\]
and similarly
\[
H_{n-p}(M; L^\bullet) \otimes _{\mathbb{Z}} H_{n-q}(M; L_{\bullet}) \rightarrow H_{n-p-q}(M; L_{\bullet}).
\]
We shall only be concerned with the intersection products in the special case $p = q = 0$
\[
H_n(M; L_{\bullet}) \otimes _{\mathbb{Z}} H_n(M; L_{\bullet}) \rightarrow H_n(M; L_{\bullet}),
\]
\[
H_n(M; L^\bullet) \otimes _{\mathbb{Z}} H_n(M; L_{\bullet}) \rightarrow H_n(M; L_{\bullet}).
\]

Corollary 3.2. The product of an $n$-dimensional topological normal map $(f, b) : N \rightarrow M$ and an $n'$-dimensional topological normal map $(f', b') : N' \rightarrow M'$ is an $(n+n')$-dimensional topological normal map
\[
(f \times f', b \times b') : N \times N' \rightarrow M \times M'
\]
with topological normal invariant
\[
\eta(f \times f', b \times b') = \eta(f, b) \times \eta(f', b') \in [M \times M', G/TOP]\]
and algebraic normal invariant
\[ t(f \times f', b \times b') = t(f, b) \otimes [M']_L + [M]_L \otimes t(f', b') + t(f, b) \otimes t(f', b') \]
\[ = t(f, b) \otimes [M']_L + f_*[N]_L \otimes t(f', b') \in H_{n+n'}(M \times M'; \mathbb{L}^*) \]
(using \((1 + T)t(f, b) = f_*[N]_L - [M]_L \in H_n(M; \mathbb{L}^*)\)).

The Whitney sum of normal invariants has the following topological and algebraic properties:

\textbf{Theorem 3.3.} Let \((f, b) : N \to M\), \((f', b') : N' \to M\) be normal maps of \(n\)-dimensional manifolds.
\begin{enumerate}[\textit{(i)}]
\item The Whitney sum of the topological normal invariants \(\eta(f, b), \eta(f', b') \in [M, G/\text{TOP}]\) is the topological normal invariant
\[ \eta(f, b) \oplus \eta(f', b') = \eta(f'', b'') = \Delta^*(\eta(f, b) \times \eta(f', b')) \in [M, G/\text{TOP}] \]
of the normal map \((f'', b'')\) obtained from the product
\[ (f \times f', b \times b') : N \times N' \to M \times M \]
by transversality at the diagonal submanifold \(\Delta : M \subset M \times M\)
\[ (f'', b'') = (f \times f', b \times b') \mid : N'' = (f \times f')^{-1}(M) \to M. \]
\item The algebraic normal invariant of \((f'', b'') : N'' \to M\) is
\[ t(f'', b'') = t(f, b) + t(f', b') + t(f, b)t(f', b') \in H_n(M; \mathbb{L}^*) \]
and surgery obstruction
\[ \sigma_*(f'', b'') = A(t(f'', b'')) \]
\[ = \sigma_*(f, b) + \sigma_*(f', b') + A(t(f, b)t(f', b')) \in L_n(\mathbb{Z}[\pi_1(M)]) . \]
\item Suppose that
\[ \eta(f', b') \in \text{im}(f^* : [N, G/\text{TOP}] \to [M, G/\text{TOP}]), \]
so up to normal bordism there is a unique topological normal map \((g, c) : P \to N\) with
\[ \eta(g, c) = f^*\eta(f', b') \in [N, G/\text{TOP}] , \]
\[ t(g, c) = [N]_L \cap \eta(g, c) \in H_n(N; \mathbb{L}^*) , \]
\[ f_*t(g, c) = f_*[N]_L \cap t(f', b') = t(f', b') + t(f, b)t(f', b') \in H_n(M; \mathbb{L}^*) , \]
\[ \sigma_*(g, c) = A(f_*t(g, c)) = \sigma_*(f', b') + A(t(f, b)t(f', b')) \in L_n(\mathbb{Z}[\pi_1(M)]) . \]
\end{enumerate}

Then
\[ \eta(f'', b'') = \eta(f, b) \oplus \eta(f', b') = \eta(fg, bc) \in [M, G/\text{TOP}] , \]
so \((f'', b'') : N'' \to M\) is normal bordant to \((fg, bc) : P \to M\), with
\[ t(f'', b'') = t(f, b) + t(f', b') + t(f, b)t(f', b') \]
\[ = t(f, b) + f_*t(g, c) = t(fg, bc) \in H_n(M; \mathbb{L}^*) , \]
\[ \sigma_*(f'', b'') = \sigma_*(f, b) + \sigma_*(f', b') + A(t(f, b)t(f', b')) \]
\[ = \sigma_*(f, b) + f_*\sigma_*(g, c) = \sigma_*(fg, bc) \in L_n(\mathbb{Z}[\pi_1(M)]) . \]
Proof. (i) By construction.
(ii) Pull back the product formulae of Corollary \[\ref{3.2}\] along \[\Delta : M \subset M \times M,\] use \[\nu_\Delta = \tau_M, \nu_\Delta \oplus \nu_M \simeq \ast\] and the commutative square

\[
\begin{array}{ccc}
H^0(M \times M; \mathbb{L}_\ast) & \xrightarrow{[M \times M]_L \cap -} & H_{2n}(M \times M; \mathbb{L}_\ast) \\
\Delta^* & \downarrow & \\
H^0(M; \mathbb{L}_\ast) & \xrightarrow{[M]_L \cap -} & H_n(M; \mathbb{L}_\ast) \simeq H_{2n}(M \times M, M \times M \setminus \Delta(M); \mathbb{L}_\ast)
\end{array}
\]

(iii) Immediate from (ii).

We now reconcile the manifold structure composition formula of Theorem \[\ref{2.3}\] with the normal map composition formula (Proposition \[\ref{2.7}\]) of Brumfiel \[\cite{1}\] and Madsen-Taylor-Williams \[\cite{9}\]:

**Corollary 3.4.** For homotopy equivalences of manifolds \(f : N \to M,\) \(g : P \to N\) of \(n\)-dimensional manifolds

\[
\eta(N, f) + \eta(f_*(P, g)) = \eta(N, f) \oplus (f^{-1})^* \eta(P, g) \in T^{TOP}(M) = H_n(M; \mathbb{L}_\ast).
\]

**Proof.** Let \((f, b) : N \to M, (g, c) : P \to N\) be the corresponding topological normal maps, with topological normal invariants

\[
\eta(N, f) = \eta(f, b) \in T^{TOP}(M), \quad \eta(P, g) = \eta(g, c) \in T^{TOP}(N).
\]

If \((f', b') : N' \to M\) is a topological normal map with

\[
\eta(f', b') = (f^{-1})^* \eta(g, c) \in T^{TOP}(M),
\]

then by Proposition \[\ref{2.7}\] the Whitney sum topological normal map of Theorem \[\ref{3.3}\] is

\[
(f'', b'') = (fg, bc) : N'' \to M
\]

up to normal bordism. Now

\[
\sigma_*(f, b) = \sigma_*(g, c) = \sigma_*(fg, bc) = 0 \in L_n(\mathbb{Z}[\pi_1(M)]),
\]

and Theorem \[\ref{3.3}\] (iii) gives

\[
s(fg) = s(f) + f_*s(g) \in S_{n+1}(M),
\]

\[
t(fg, bc) = t(f, b) + t(f', b') + t(f, b)t(f', b')
\]

\[
= t(f, b) + f_*t(g, c) \in H_n(M; \mathbb{L}_\ast),
\]

\[
\sigma_*(f', b') = -A(t(f, b)t(f', b')) \in L_n(\mathbb{Z}[\pi_1(M)]).
\]

Let \(h : Q \to M\) be a homotopy equivalence of \(n\)-dimensional manifolds with manifold structure \(s(h) = f_*s(g) \in S_{n+1}(M)\). The corresponding normal map \((h, d) : Q \to M\) has algebraic normal invariant

\[
t(h, d) = f_*t(g, c) = t(fg, bc) - t(f, b) = t(f', b') + t(f, b)t(f', b')
\]

\[
\in \text{im}(S_{n+1}(M) \to H_n(M; \mathbb{L}_\ast)) = \ker(A : H_n(M; \mathbb{L}_\ast) \to L_n(\mathbb{Z}[\pi_1(M)])).
\]
The images of \((P, g) \in \mathcal{S}^{TOP}(N)\) in the noncommutative diagram

\[
\begin{array}{ccc}
\mathcal{S}^{TOP}(N) & \xrightarrow{f_*} & \mathcal{S}^{TOP}(M) \\
\eta & \cong & \eta \\
\mathcal{T}^{TOP}(N) & \xrightarrow{(f^{-1})^*} & \mathcal{T}^{TOP}(M)
\end{array}
\]

are given by

\[
\eta(f_*(P, g)) = \eta(Q, h) = t(h, d),
\]

\[
(f^{-1})^*\eta(P, g) = (f^{-1})^*\eta(g, c) = t(f', b') \in \mathcal{T}^{TOP}(M) = H_n(M; \mathbb{L}_\bullet),
\]
differing by

\[
t(h, d) - t(f', b') = t(f, b)t(f', b') \in \mathcal{T}^{TOP}(M) = H_n(M; \mathbb{L}_\bullet).
\]

Thus

\[
\eta(N, f) + \eta(f_*(P, g)) = t(f, b) + t(h, d)
\]

\[
= t(f, b) + t(f', b') + t(f, b)t(f', b')
\]

\[
= \eta(N, f) \oplus \eta(N', f')
\]

\[
= \eta(N, f) \oplus (f^{-1})^*\eta(P, g) \in \mathcal{T}^{TOP}(M) = H_n(M; \mathbb{L}_\bullet).
\]

We conclude with a specific example, \(M = S^p \times S^q\), one of the two cases for which the manifold structure composition formula \(s(fg) = s(f) + f_*s(g)\) of Theorem 2.3 is used by Kreck and Lück [7].

**Example 3.5.** (i) Let \(M = S^p \times S^q\) for \(p, q > 2\), so that \(\pi_1(M) = \{1\}\). The assembly map in quadratic \(L\)-theory is given by

\[
A : H_{p+q}(M; \mathbb{L}_\bullet) = L_p(\mathbb{Z}) \oplus L_q(\mathbb{Z}) \oplus L_{p+q}(\mathbb{Z}) \to L_{p+q}(\mathbb{Z}) ; \ (x, y, z) \mapsto z
\]

and

\[
S_{p+q+1}(M) = \ker(A) = L_p(\mathbb{Z}) \oplus L_q(\mathbb{Z}).
\]

The addition and intersection pairing in \(H_{p+q}(M; \mathbb{L}_\bullet)\) are given by

\[
(x, y, z) + (x', y', z') = (x + x', y + y', z + z'),
\]

\[
(x, y, z)(x', y', z') = (0, 0, xy' + x'y) \in H_{p+q}(M; \mathbb{L}_\bullet).
\]

The product \(L_p(\mathbb{Z}) \otimes L_q(\mathbb{Z}) \to L_{p+q}(\mathbb{Z})\) factors through \(L_p(\mathbb{Z}) \otimes L^q(\mathbb{Z})\) and the quadratic and symmetric \(L\)-groups of \(\mathbb{Z}\) are given by

\[
L_n(\mathbb{Z}) = \begin{cases} \mathbb{Z} & \text{for } n \equiv 0 \pmod{4} \\ 0 & \text{for } n \equiv 2 \pmod{4} \end{cases}
\]

so the intersection pairing is non-zero only in the case \(p \equiv q \equiv 0(\text{mod } 4)\). Given a topological normal map \((f, b) : N \to M\) make \(f\) transverse regular at \(S^p \times \{\ast\},\)
\[ \{\ast\} \times S^q \subset M \] to obtain topological normal maps
\[
(f_p, b_p) = (f, b)|_N = f^{-1}(S^p \times \{\ast\}) \to S^p, \\
(f_q, b_q) = (f, b)|_N = f^{-1}(\{\ast\} \times S^q) \to S^q.
\]
and write the surgery obstructions as
\[
(\sigma_s(f_p, b_p), \sigma_s(f_q, b_q), \sigma_s(f, b)) = (x_f, y_f, z_f) \in L_p(Z) \oplus L_q(Z) \oplus L_{p+q}(Z).
\]

The algebraic normal invariant defines a bijection
\[
T^{TOP}(M) \to L_p(Z) \oplus L_q(Z) \oplus L_{p+q}(Z); \quad \eta(f, b) \mapsto t(f, b) = (x_f, y_f, z_f).
\]
The Whitney sum addition in \(T^{TOP}(M)\) corresponds to the addition
\[
(x, y, z) \oplus (x', y', z') = (x + x', y + y', xy' + x'y + z + z') \in L_p(Z) \oplus L_q(Z) \oplus L_{p+q}(Z).
\]
Given a homotopy equivalence \(f : N \to M\) let \((f, b) : N \to M\) be the corresponding topological normal map. The function
\[
S^{TOP}(M) \to L_p(Z) \oplus L_q(Z); \quad s(f) \mapsto (x_f, y_f)
\]
is a bijection, and
\[
t(f, b) = (x_f, y_f, 0) \in T^{TOP}(M) = L_p(Z) \oplus L_q(Z) \oplus L_{p+q}(Z).
\]

Given also a homotopy equivalence \(g : P \to N\) with corresponding topological normal map \((g, c) : P \to N\) let
\[
f_s g = (x_g, y_g) \in S^{TOP}(M) = L_p(Z) \oplus L_q(Z),
\]
so that
\[
f_s t(g, c) = (x_g, y_g, 0) \in T^{TOP}(M) = L_p(Z) \oplus L_q(Z) \oplus L_{p+q}(Z).
\]
As in the proof of Corollary 3.3 let \((f', b') : N' \to M\) be a topological normal map with topological normal invariant
\[
\eta(f', b') = (f^{-1})^* \eta(g, c) \in T^{TOP}(M),
\]
let \(h : Q \to N\) be a homotopy equivalence with
\[
s(h) = f_s g = (x_g, y_g) \in S^{TOP}(M) = S_{p+q+1}(M) = L_p(Z) \oplus L_q(Z),
\]
and let \((h, d) : Q \to N\) be the corresponding topological normal map. Then
\[
\eta(f, b) \oplus \eta(f', b') = \eta(f g, b c) \in T^{TOP}(M),
\]
\[
t(f', b') = (x_g, y_g, -x_f y_g - x_g y_f), \quad t(h, d) = (x_g, y_g, 0),
\]
\[
t(f g, b c) = t(f, b) + f_s t(g, c) = t(f, b) + t(f', b') + t(f, b)t(f', b') = (x_f + x_g, y_f + y_g, 0) \in H_{p+q}(M; \mathbb{L}_\bullet) = L_p(Z) \oplus L_q(Z) \oplus L_{p+q}(Z),
\]
\[
s(f g) = s(f) + f_s(g) = (x_f + x_g, y_f + y_g) \in S^{TOP}(M) = L_p(Z) \oplus L_q(Z).
\]

(ii) For the simplest example of the non-additivity of the surgery obstruction function
\[
\theta : T^{TOP}(M) \to L_n(Z[\pi_1(M)])
\]
with respect to \( \oplus \) set \( p = q = 4 \) in (i), and let \( f : N \to M = S^4 \times S^4 \) be a homotopy equivalence with

\[
\begin{align*}
s(f) &= (x,y) \in S^{TOP}(M) = L_4(\mathbb{Z}) \oplus L_4(\mathbb{Z}) , \\
t(f,b) &= (x,y,0) \in T^{TOP}(M) = L_4(\mathbb{Z}) \oplus L_4(\mathbb{Z}) \oplus L_8(\mathbb{Z}) , \\
\theta(\eta(f,b)) &= \sigma_* (f,b) = A(t(f,b)) = 0 \in L_6(\mathbb{Z}) 
\end{align*}
\]

for any \( x, y \in \mathbb{Z}\setminus\{0\} \). By (i) a homotopy inverse \( g = f^{-1} : P = M \to N \) is then such that

\[
\begin{align*}
f_* s(g) &= -s(f) = (-x,-y) \in S^{TOP}(M) = L_4(\mathbb{Z}) \oplus L_4(\mathbb{Z}) , \\
f_* t(g,c) &= -t(f,b) = (-x,-y,0) \in T^{TOP}(M) = L_4(\mathbb{Z}) \oplus L_4(\mathbb{Z}) \oplus L_8(\mathbb{Z})
\end{align*}
\]

and a topological normal map \( (f',b') : N' \to M \) with topological normal invariant \( \eta(f',b') = (f^{-1})^* \eta(g,c) \) has

\[
\begin{align*}
t(f',b') &= (-x,-y,2xy) \in T^{TOP}(M) = L_4(\mathbb{Z}) \oplus L_4(\mathbb{Z}) \oplus L_8(\mathbb{Z}) , \\
\theta(\eta(f',b')) &= \sigma_* (f',b') = A(t(f',b')) = 2xy \neq 0 \in L_6(\mathbb{Z}) = \mathbb{Z} .
\end{align*}
\]

The Whitney sum

\[
\eta(f,b) \oplus \eta(f',b') = \eta(fg, bc) = \eta(1 : M \to M) = 0 \in T^{TOP}(M)
\]

has surgery obstruction

\[
\sigma_* (fg, bc) = \sigma_* (f,b) + \sigma_* (f',b') + A(t(f,b)t(f',b')) = 0 + 2xy - 2xy = 0 \in L_8(\mathbb{Z}) ,
\]

so

\[
\theta(\eta(f,b) \oplus \eta(f',b')) = 0 \neq \theta(\eta(f,b)) + \theta(\eta(f',b')) = 2xy \in L_6(\mathbb{Z}) = \mathbb{Z} .
\]

\[\square\]
