Received 11 October 2011; Accepted 23 November 2011

Abstract: One rare tetracyclic macroline-type indole alkaloid, named rauvoyunine A (1), and two new picraline-type alkaloids rauvoyunines B and C (2 and 3) were isolated from the aerial parts of Rauvolfia yunnanensis. Their structures were elucidated on the basis of extensive spectroscopic analysis. Compounds 2 and 3 were evaluated for their in vitro cytotoxicity against five human tumor cell lines.

Keywords: Rauvolfia yunnanensis, indole alkaloid, rauvoyunine

Introduction

The plants of genus Rauvolfia, widely distributed in America, Africa, Asia, and Oceania, are well-known rich sources of unique heterocyclic alkaloids with monoterpene indole skeletons. These alkaloids have attracted great interests from biological and therapeutic aspects, due to their anticancer, antimalarial, antihypertensive, and sedative properties.

Rauvolfia yunnanensis Tsang, belonging to the Apocynaceae, is indigenous to southwestern China, and its roots are utilized locally for the remedy of scab. Recently, several structurally interesting indole alkaloids were isolated from this plant. As one part of our research program exploring bioactive monoterpene indole alkaloids from Chinese species of Rauvolfia, phytochemical analysis from the methanol extract of aerial parts of R. yunnanensis led to the isolation of three new alkaloids, rauvoyunines A–C (1–3). This paper reports the isolation and structure elucidation of new compounds and cytotoxic evaluation of selected compounds.

Results and Discussion

Compound 1, obtained as amorphous powder, has a molecular formula of C19H25N2O3 based on HRESIMS (pos.), showing a quasi-molecular ion peak at m/z 357.2185 (calc. for C19H25N2O3, 357.2178). The UV spectrum showed absorptions at λmax 228, 282, and 303 nm typical of a substituted indole chromophore. The IR spectrum showed absorptions at 3432 and 1628 cm⁻¹, attributed to hydroxy and olefin groups, respectively. The 1H NMR spectrum (Table 1) showed signals for an aromatic AMX spin system at δH 6.73 (dd, J = 8.7 and 2.3 Hz), 6.85 (d, J = 2.3 Hz), and 7.17 (d, J = 8.7 Hz), typical of an indole moiety substituted by a hydroxy group at 10 or 11 position, signals characteristic of an ethylidene group at δH 1.44 (d, J = 6.8 Hz) and 5.58 (q, J = 6.8 Hz), singlets for N-methyl groups at δH 2.55 and 3.59, and resonances of two hydroxymethyl groups, one at δH 3.75 (dd, J = 10.5 and 3.7 Hz) and 3.91 (dd, J = 10.5 and 5.5 Hz), and another at δH 4.02 (2H, s). The 13C NMR (DEPT) spectrum (Table 1) exhibited six sp² quaternary carbons (δC 151.8, 140.3, 134.0, 132.3, 127.8, and 106.2), four sp³ methines (δC 124.8, 112.2, 110.6, and 103.4), four sp³ methines (δC 58.7, 55.5, 47.7, and 30.2), four sp³ methylenes (δC 66.0, 64.1, 30.5, and 23.7), and three methyl groups (δC 41.5, 29.3, and 13.1). The above-mentioned data, together with the presence of nine degrees of unsaturation suggested that 1 was an indole alkaloid with tetracyclic macroline skeleton. This conclusion is supported by the HMBC (Figure 1) three-bond correlations of H-5 to C-3, C-15, and C-17, H-16 to C-4, and H-15 to C-3, C-15, and C-19. In addition, the m-coupling doublet at δH 6.85 (J = 2.3 Hz) showed an HMBC correlation with H-6β and a ROESY correlation with H-6β, indicating the hydroxyl at C-10. HMBC cross-peaks of H-18 to C-19 and C-20, and H-19 to C-15 and C-20 located the ethylidene side chain at C-20, and cross-peaks of H-17 to C-5, C-15, and C-16, and H-21 to C-15, C-19, and C-20 revealed that the two hydroxymethyl group was adjacent to C-16 and C-20, respectively. The position of each methyl group was confirmed by HMBC correlations from N(1)-Me to C-2 and C-13, and N(4)-Me to C-3 and C-5.

The relative stereochemistry of 1 was elucidated by ROESY experiments (Figure 1). The ROESY spectrum exhibited correlations of H-16 ↔ H-6β and H-3 ↔ N(4)-Me ↔ H-5, fixing the two bridgehead hydrogen atoms as α orientation, revealing

*To whom correspondence should be addressed. E-mail: jkliu@mail.kib.ac.cn
the stereochemistry of H-16 as β-oriented. The ROESY correlation between H-14α and the hydroxymethyl proton at C-20 indicated that C-20 was α-oriented and H-15 was β-oriented. The ROESY correlations of Me-18⇔H-15 and H-19⇔H-21 confirmed that the ethylidene side chain had an E-configuration. Consequently, the structure of compound 1 was determined as shown, named rauvoyunine A.

![Key HMBC and ROESY correlations of 1.](image)

Compound 2 was obtained as amorphous powder. Its molecular formula was determined to be C_{13}H_{27}N_{2}O_{5}, on the basis of HRESIMS (pos.), showing a quasi-molecular ion peak at m/z 427.1868 (calc. for C_{13}H_{27}N_{2}O_{5} 427.1869). The UV spectrum showed maximum absorption at 292 nm, and the IR spectrum implied the presence of a carbonyl (1738 cm⁻¹) functionality. The ¹H NMR spectra (Table 1) showed the presence of three aromatic protons, an ethylidene side chain, a methyl ether, and an acetyl. The ¹³C NMR spectra (Table 1) revealed 23 carbon signals due to six sp³ quaternary carbons, four sp² methines, three sp³ quaternary carbons, three sp² methylenes, four sp² methoxy groups, and three methyl groups. These spectroscopic features suggested that 2 had a picraline-type skeleton.³⁴ The three observed aromatic resonances at δ_H 7.11 (d, J = 8.8 Hz), 6.20 (dd, J = 8.8, 2.2 Hz), and 6.19 (d, J = 2.2 Hz) combined with the fact that a hydroxylated carbon signal was detected at δ_C 158.6 (s) suggested that an OH group located at C-10 or C-11. Finding HMBC correlation from the α-coupling doublet at δ_H 7.11 (J = 8.8 Hz) to C-7 at δ_C 153.2 (s) and ROESY correlation between the doublet and H-6α further confirmed placement of hydroxyl at C-11. Two geminally coupled proton signals at δ_H 3.85 and 4.52 (each d, J = 11.1 Hz) showed correlations with an O-acetyl carbonyl carbon at δ_C 171.9, indicating that an acetoxy group was located at C-17. An methoxy singlet at δ_H 3.66 showed correlation to C-22 at δ_C 173.7, allowing assignment of methyl ether at C-22 position. The ROESY cross-peak between H-17a and H-14β indicated that C-17 was β-oriented, which was further supported by the presence of an NMR signal of the acetyl methyl group at δ_H 1.62 (the noticeable upfield shift being due to the shielding by the aromatic ring current).³⁵ ROESY cross-peaks of H-14α⇔H-21⇔H-15 and H-21⇔H-5 revealed that the configuration of H-3 and H-5 were α and β, respectively. The ethylidene moiety was assigned to be E-type since the correlations of H-18⇔H-15 and H-19⇔H-21 were observed. Therefore, the structure of 2 was unambiguously elucidated as 11-hydroxypicraline, named rauvoyunine B.

Compound 3, obtained as amorphous powder, possessed a molecular formula of C_{13}H_{27}N_{2}O_{6}, as evidenced by HRESIMS (pos.) at m/z 593.2499 (calc. for C_{13}H_{27}N_{2}O_{6} 593.2499), in combination with ¹H and ¹³C NMR (DEPT) spectra (Table 1), and appropriate for 16 degrees of unsaturation. The UV spectrum showed maximum absorption at 269 nm. Its IR spectrum revealed absorption bands of carbonyl (1722 cm⁻¹). The ¹H NMR data showed signals of three aromatic protons at δ_H 6.04 (br. d, J = 8.3 Hz), 6.26 (br. s), and 7.29 (d, J = 8.3 Hz), an ethylidene group at δ_H 1.62 (d, J = 6.7 Hz) and 5.48 (q, J = 6.7 Hz), two methoxy groups at δ_H 3.45 (s) and 3.64 (s), and a 3′,4′,5′-trimethoxybenzyloxy unit, based on the presence of two aromatic protons at δ_H 6.94 (2H, s) and three overlapped methoxy groups at δ_H 3.87 (9H, s). The ¹³C NMR (DEPT) data exhibited ten sp³ quaternary carbons, three sp² methines, three sp² quaternary carbons, three sp³ methylenes, four sp² methylenes, and six methylenes. These spectroscopic features were closely related to those of 2, but it was evident that 3 had a trimethoxybenzyloxy unit instead of the acetoxy moiety at C-17 and a methoxyl group instead of the hydroxy group at C-11. This was also supported by HMBC correlations from H-17 to C-7′ and correlation from methoxy protons at δ_H 3.45 (s) to C-11 at δ_C 160.1. The ROESY cross-peaks of Me-18⇔H-15 and H-19⇔H-21 confirmed that the ethylidene possessed an E-configuration. The cross-peak of 17α⇔H-14β indicated that the stereochemistry of C-16 was identical to that of 2. Since the J₃₁₄, J₂₁₅, and J₁₆ values were essentially unchanged compared to 2, it is safe to deduce that the ring junction stereochemistry remain intact. Thus, the structure of 3 was established to be 11-methoxyburnamidine-17-O-3′,4′,5′-trimethoxybenzoate and named rauvoyunine C.

Compounds 2 and 3 were evaluated for their cytotoxicities against five human cancer cell lines (HL-60, SMMC-7721, A-549, MCF-7, and SW-480) using the MTT method as...
reported previously, however, all tested compounds were inactive, and they showed IC\textsubscript{50} values \(> 40 \mu M\).

**Experimental Section**

**General Experimental Procedures.** Optical rotations were measured on a Jasco P-1020 automatic digital polarimeter. IR spectra were obtained using a Bruker Tensor 27 FT-IR spectrometer with KBr pellets. NMR spectra were acquired with a Bruker DRX-500 instrument at room temperature. ESI-MS (including HRESIMS) were measured on API QSTAR Pulsar i mass spectrometers. Silica gel (200–300 mesh, Qingdao Marine Chemical Inc., China) and Sephadex LH-20 (Amersham Biosciences, Sweden) were used for column chromatography. Fractions were monitored by TLC (Qingdao Marine Chemical Inc., China) in combination with reversed-phase HPLC (Agilent 1200, Extend-C18 column, 5 μm, 4.6 × 150 mm).

**Plant Material.** The aerial parts of *R. yunnanensis* were collected in Xishuangbanna of Yunnan Province, China, in May 2008 and were identified by Prof. Yu Chen of Kunming Institute of Botany, Chinese Academy of Sciences. The voucher specimen was deposited at BioBioPha Co., Ltd.

**Extraction and Isolation.** The air-dried and powdered aerial parts of *R. yunnanensis* (6.5 kg) were extracted three times with methanol (3 × 50 L, each 3 days) at room temperature and filtered. The filtrate was evaporated under reduced pressure to get a residue (≈480 g), which was fractionized by silica gel (200–300 mesh) CC, eluted with a gradient solvent system of petroleum ether-acetone and then MeOH to yield five fractions A–E. Fraction D, eluted by 100% acetone, was separated on silica gel (CHCl\textsubscript{3}-MeOH, 100:1→30:1) to give two subfractions D1 and D2, Fr. D2 was further isolated and purified by Sephadex LH-20, silica gel (CHCl\textsubscript{3}-MeOH-ammonia, 100:1:0.1) to afford 3 (28 mg). Fraction E, eluted by 100% methanol, was separated on silica gel (CHCl\textsubscript{3}-MeOH, 30:1→10:1) to give four subfractions E1–E4. Fr. E4 was further isolated and purified by Sephadex LH-20, and then silica gel (CHCl\textsubscript{3}-MeOH-ammonia, 30:1:0.1) to afford 1 (40 mg) and 2 (11 mg). The retention times (t\textsubscript{R}) of 1–3 from analysis-type HPLC (50%−100% MeOH in H\textsubscript{2}O over 6.0 min followed by 100% MeOH to 10 min, 1.0 ml/min, 20°C) were 5.8, 4.7, and 6.6 min, respectively.

**Rauvouynne A (1):** yellowish, amorphous powder; [\(\alpha\)]\textsubscript{D}\textsuperscript{25} + 5.5 (c 0.10, MeOH); UV (MeOH) \(\lambda_{\text{max}}: 216 (sh), 228, 282, 303, 316 (sh) nm); IR (KBr) \(\nu_{\text{max}}: 3432, 2923, 1628, 1467, 1380, 1158, 1134 cm\textsuperscript{-1}; ^{1}H\) and \(^{13}C\) NMR data see Table 1; ESI-MS (pos.): \(m/z\) 357 [M + H]\(^+\); HRESIMS (pos.): \(m/z\) 357.2185 (calc. for C\textsubscript{21}H\textsubscript{25}N\textsubscript{2}O\textsubscript{3}, 357.2178).

![Springer](https://example.com/springer.png)
Rauvoyunine B (2): yellowish, amorphous powder; [α]_D^25 = 92.0 (c 0.19, MeOH); UV (MeOH) λ_{max}: 231 (sh), 292 nm; IR (KBr) ν_{max} 3440, 2951, 1738, 1622, 1385, 1236, 1146, 1114, 1048 cm^{-1}; ¹H and ¹³C NMR data see Table 1; ESIMS (pos.): m/z 427 [M + H]^+; HRESIMS (pos.): m/z 427.1868 (calc. for C_{23}H_{27}N_2O_6, 427.1869).

Rauvoyunine C (3): yellowish, amorphous powder; [α]_D^25 = -116.8 (c 0.18, MeOH); UV (MeOH) λ_{max}: 269, 293 (sh) nm; IR (KBr) ν_{max} 3433, 2945, 1722, 1625, 1590, 1503, 1384, 1416, 1335, 1226, 1127 cm^{-1}; ¹H and ¹³C NMR data see Table 1; ESIMS (pos.): m/z 593 [M + H]^+; HRESIMS (pos.): m/z 593.2496 (calc. for C_{32}H_{37}N_2O_9, 593.2499).

Cytotoxicity Assay. The cytotoxicity assay was performed according to the MTT [3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide] method,¹⁶ by use of the following five human cancer cell lines: human myeloid leukemia HL-60, hepatocellular carcinoma SMMC-7721, lung cancer A-549, breast cancer MCF-7, and colon cancer SW-480. The IC₅₀ values were calculated by Reed and Muench’s method.¹⁷
