Abstract

An overview of unconventional therapies for vitiligo is presented. Some herbal compounds may be considered as valid therapeutic tools for the treatment of vitiligo.

Introduction

Since ancient time, herbal products of different nature and effects had been used for the treatment of vitiligo. The Authors provide a brief overview of the herbal products available for the treatment of the pigmentary disease.

Ginkgo biloba

Ginkgo biloba (also known as “maidenhair tree”), is one of the oldest trees on Earth and its leaves and seeds had been largely used in medicine for a very long time. Ginkgo extracts have been shown to be effective for the treatment of different diseases, such as allergies, varicose vein, premenstrual syndrome, headache, vertigo and others [1]. In the last few years, gingko extracts have also been used for the treatment of vitiligo. The drug is formulated into a tablet of different dosage, which must be taken orally once to three times daily, for more than three months.

The exact mechanism of action of Ginkgo biloba in vitiligo is still unknown, but it seems to be related to the anti-inflammatory, immunomodulatory and antioxidant properties of the drug [2].

Many data support the efficacy of the herbal compound in controlling the activity of vitiligo and in inducing repigmentation of the white macules, especially if administrated with other conventional...
therapies (e.g. corticosteroids, phototherapies) [3][4]. Moreover, recent studies underline how the drug is also effective when administrated alone [2][5].

Unfortunately, the results in term of repigmentation are not uniform. This fact may be explained by different factors: the genetic differences of the analysed populations, the different type of Ginkgo biloba extracts, the treatment duration, the number of administrated doses per day [5]. The drug is safe and well-tolerated at therapeutic dosages (normal value: 120 mg/day). Only daily dosage > 240 mg may result in restlessness and gastrointestinal disorders. Patients on anticoagulants should only take ginkgo under medical supervision for a correct prescription, to avoid over-thinning of their blood and haemorrhaging.

Cucumis melo

Cucumis melo (also known as “Muskmelon”) is a species of Cucumis, plants of the Cucurbitaceae family. Cucumis melo extract is rich in antioxidants that naturally contain a high superoxide dismutase (SOD) (Table 1) activity, which has been proposed to be important in stopping the melanocytes death construction by the oxidative stress in the first step of vitiligo. Recently, preliminary studies were conducted to evaluate the efficacy of a topical preparation, containing Cucumis melo superoxide dismutase (SOD) and catalase, in the treatment of vitiligo [6][7]. In each study, the gel preparation was applied to the skin lesions followed by irradiation with natural UV or artificial narrow band UVB. Even though the drug has been shown to be safe, there was no difference in repigmentation rate recorded compared to the patients treated only with the phototherapy. More interesting and promising is the use of a different topical formulation, containing phenylalanine, Cucumis melo extract, and acetyl cysteine. The association of the gel with nb - UVB target phototherapy has been observed to be safe and effective, leading to a better repigmentation of cutaneous lesions [8].

Khellin

Khellin is a naturally occurring furanochromone, derived from the plant Amni visnaga. The plant has been used as a herbal medicine for different purposes (e.g. kidney diseases, asthma and others), since ancient Egyptian times. Because of khellin side effects, including liver dysfunction and allergic reactions, analogues of khellin, with safer profiles and better efficacy, have been developed and introduced in medicine in the last decades for the treatment of vitiligo, where they provide good results in combination with UVA phototherapy. Even if the exact mechanism of action is unclear, khellin acts by stimulating melanocytes proliferation and melanogenesis [9]. Khellin may be administrated both systemically (oral administration) or topically. The association of oral Khellin to UVA is better known as KUVA therapy [10]. The treatment consists in the oral intake of khellin gelatin capsules and, after about 2.5 hours, in the patient’s irradiation with UVA. The therapeutic session is repeated 2 - 3 times a week. The treatment is quite safe and provides clinical results similar to PUVA therapy. Unlike psoralens, Khellins have less phototoxic, and DNA mutagenic effects but the long-term risk of carcinogenesis has to be determinate [11]. Like topical - PUVA, khellin may be applied topically and associated with UVA radiation (topical KUVA therapy) or natural UVR (sol - KUVA therapy). Even in this case, the risk of carcinogenesis has to be yet determinate [12]. More recently, topical khellin 4% has been successfully used in association to monochromatic excimer light 308 nm [13]. The clinical results regarding repigmentation rate and safe profile suggest how this combination may be useful for vitiligo treatment.

Ayurvedic medicine: Picrorhiza kurroa

Also, Ayurvedic medicine had tried to treat vitiligo with herbal products, such as Picrorhiza kurroa. Picrorhiza kurroa (also known as “Kutki” or “Kutaki”) is another khellin extract, with well - known hepatoprotective properties. More recently, researchers have proposed how the herbal extract has antioxidant and immune-modulating properties too (Table 1).

Table 1: Some of the most common herbal products used for vitiligo treatments, and their main components

| Herbs          | Active components                                      |
|----------------|--------------------------------------------------------|
| Cucumis melo   | Cucumis melo superoxide dismutase                      |
| Green Tea      | Epicatechin, epicatechin-3-gallate, epigallocatechin    |
| Picrorhiza kurroa | Picroside I and picroside II                           |
| Polypodium leucotomos | p-coumaric, ferulic, caffeic, vanillic, 3,4 -  |
|                 | dihydroxybenzonic, 4 - Hydroxybenzoic, 4 - hydroxycinnamic, 4 - hydroxycinnamoyl - quinic, chlorogenic acids |

Recently, a study investigated Picrorhiza Kurroda’s potential use in association with phototherapy, in the treatment of vitiligo. The drug was administrated twice a day orally for three months. At the same time, patients were treated with methoxsalen photochemotherapy. The association of the two therapies has seen to provide a better result regarding repigmentation [14]. Another Ayurvedic herbal product which had been used for the treatment of vitiligo is the anarchic [15].
Anacardiaceae family. The drug seems to act as a photosensitizing agent. Unfortunately, more data and research are needed.

**Polypodium leucotomos**

Polypodium leucotomos (also known as “Calaguuala”) is a species of tropical fern in the family Polypodiaceae. Its extracts, famous for their antioxidant and photoprotective properties (Table 1) [16], are used for the treatment of various skin diseases, such as psoriasis, atopic dermatitis and others [17][18]. In the last few years, Polypodium leucotomos has been used as adjuvant therapy for vitiligo patients who were being treated with phototherapy. An interesting study underlines how PUVA therapy plus oral Polypodium leucotomos led to a higher repigmentation than the photochemotherapy alone. A different study showed similar results with the combination of nb - UVB/oral Polypodium leucotomos in comparison to the single phototherapy [18][19].

**Traditional Chinese Medicine (TCM)**

Since ancient time, TCM had tried to treat vitiligo with different herbal products, used alone or, more often, in combination. Among the traditional Chinese products, psoralein plus UVA (PUVA therapy) had been considered as the first vitiligo treatment for several decades. Psoralein is a photosensitising compound, derived from Psoralea Corydalia, a Chinese herb, and other plants. TCM used to treat vitiligo by combining topical or systemic Psoralea seed extract, in association to UVA exposure for a long time. The mechanism of action of therapeutic protocols, such as the beneficial effects and the collaterals are well - known. Another well - known and characterized treatment option is the topical PUVA, based on the topical application of Psoralea extract or derived products, and in the successive exposure to a UVA source [20]. Among the other herbal products, many are the formulations available for the treatment of the pigmentary disorders (Table 2) (Table 3) [21][22][23][24].

Table 2: The most commonly prescribed Chinese herbs for vitiligo

| Angelica Sinensis, Ligusticum wallichii, Tribulus Terrestris, Polygonum multiflorum, Fructus psoraleae, Radix Paonzieae Rubra, Rehmannia glutinosa, Glossy Privet Fruit, Eclipta Alba, Salvia miltiorrhiza, Liqueur, Angelica dahurica |

They can be administered alone or in association with phototherapy. Unfortunately, for most of them, clinical trials are of poor quality or missing [25]. A particular mention is due to the “Barresi complex prescription”, one of the most used for vitiligo treatment in the Uyghur medicine, which is an important part of TCM [26]. The formulation is composed of the hot water extract of five herbs (Psoralea corylifolia, Plumbago zeylanica, Brassica juncea, Nigella glandulifera, Vernonnia anthemintic). The efficacy of the drugs has been evaluated both in vivo and in vitro. In both studies, a good repigmentation has been observed, as the result of melanogenesis stimulation [27].

**Green Tea Polyphenols**

Green Tea polyphenols are extracts of green tea leaves, which are used in medicine since ancient time. They act as anti - inflammatory, anti - oxidant, and immunomodulatory agents, mainly because of their composition in Epigallocatechin – 3 - gallate (EGCG) (Table 1) [28]. The drug can be administered both systemically and topically [29]. Recent data suggest how Green Tea polyphenols may be useful for vitiligo treatment, in stopping the oxidative stress of the melanocyte-unit [30].

**Capsaicin**

Capsaicin is one of the active component of chili peppers, plants of the genus Capsicum. Because its antiinflammatory and antioxidant properties, the drug has been proposed as a therapeutic tool for
vitiligo treatments. An experimental study recently confirmed how the incubation of keratinocytes, taken by the perilesional skin of a vitiligious patient, with capsaicin stopped the cellular damage by ROS [31].

Curcumin

Curcumin is a polyphenol derived from the golden spice turmeric (“Curcuma longa”).

Because of its numerous properties (e.g. antioxidant, anti - proliferative, anti - inflammatory, antiviral, antibacterial and antifungal properties), curcumin has been used for the treatment of different diseases [32].

Recently, a tetrahydrocurcuminide cream has been used in association with nb - UVB for vitiligo treatments. The phototherapy was performed twice a week for 12 weeks. At the end of the therapeutic protocol, patients showed a slightly better repigmentation compared to the ones treated only with nb-UVB [33]. Finally, as with other antioxidants, curcumin may be orally administered as adjuvant therapy in vitiligo patients.

Pyrostegia venusta

Pyrostegia venusta (also known as “cipó – de – são – joão”) is a herb of the family Bignoniaceae, widely distributed in southern Brazil, where topical formulations are commonly used for the treatment of vitiligo. Even if its mechanisms of action are still under investigations, the herb seems to be effective for its antioxidant, anti-inflammatory and melanogenic properties [34].

Conclusions

Some herbal compounds may be considered as valid therapeutic tools for the treatment of vitiligo.
