Abstract: The aim of this article is to use von-Mises coordinates to find a class of new exact solutions of the equations governing the plane steady motion with moderate Peclet number of incompressible fluid of variable viscosity in presence of body force. An equation relating a differentiable function and a stream function characterizes the class under consideration. When the differentiable function is parabolic and when it is not, in both the cases, it finds exact solutions for given one component of the body force. This discourse shows an infinite set of streamlines and the velocity components, viscosity function, generalized energy function and temperature distribution for moderate Peclet number in presence of body force. Moreover, for parabolic case, it obtains viscosity as a function of temperature distribution for moderate Peclet number.

Keywords: Martin’s System, Von-Mises Coordinates, Variable Viscosity, Navier-Stokes Equations with Body Force, Exact Solutions with Body Force

1. Introduction

In general, a moving fluid element experiences both the surface and body forces. The momentum of moving fluid element is given by the Navier-Stokes equations (NSE). The non-linear terms in NSE offers a great difficulty for its exact solution show ever, some transformation techniques and dimension analysis methods are workable. A variety of techniques/methods and references given there are practical for some exact solutions of NSE without body force [1-6]. Moreover recently Mushtaq A. et al., applied a new technique for exact solution of variable viscosity fluids without body force term [7, 10]. Body force term like coriolis force is considered by Giga, Y. et al. in [8] and Gerbeau, J. et al. gives a fundamental remark on NSE with body force in [9] where as Mushtaq A. et. al. has applied successive transformation technique for exact solution for flow of incompressible variable viscosity fluids in presence of body force in [11-14].

To achieve the aim of this letter successive transformation technique is applied. According to this method the basic non-dimensional flows equations with body force in Cartesian space \((x, y)\) are transformed into Martin’s coordinates \((\phi, \psi)\) then to von-Mises coordinates \((x, \psi)\). In Martin’s coordinates, the curvilinear coordinates \((\phi, \psi)\) are such that the coordinate lines \(\psi = \text{const}\) are streamlines and the coordinate lines \(\phi = \text{constant}\) are arbitrary [15]. Whereas in the von-Mises coordinates, the arbitrary coordinate lines of Martin’s system is taken along the \(x-\text{axis}\). Thus, the function \(\phi = x\) and stream function \(\psi\) of Martin’s coordinates as independent variables instead of \(y\) and \(x\) [16]. Further, the characteristic equation for streamlines of the class of flows under consideration is:

\[
\frac{y-g(x)-n}{m} = \text{const.} \quad (1)
\]

Where \(m \neq 0\), \(n\) are constants and a differentiable function is \(g(x)\). Without loss of generality the equation (1) implies
\[ y = g(x) + v(y') \]  
(2)

where \( v(y') = m y' + n \).

Paper’s organization is follow: Section (2) gives central flow equations in non-dimensional form and transforms them into Martin system \((\phi, \psi)\). Section (3) retransforms the basic equations to von-Mises coordinates. The exact solutions to the problem in presence of body force are given in section 4. Conclusions are given at the end.

2. Basic Non-dimensional Equations in Martin’s Coordinates

The equation of continuity, NSE and energy equation, for the steady plane motion of incompressible fluid of variable viscosity with constant thermal conductivity in the presence of unknown external force, in non-dimensional form are respectively following

\[ u_x + v_y = 0 \]  
(3)

\[ \begin{align*}
    u u_x + v u_y &= F_1 - p_x \\
    &+ \frac{1}{R_c} \left[ (2 \mu u_x)_x + (\mu u_x + v_x)_y \right] \\
    v u_x + v v_y &= F_2 - p_y \\
    &+ \frac{1}{R_c} \left[ (2 \mu v_y)_y + (\mu u_y + v_y)_x \right] \\
    u T_x + v T_y &= \frac{1}{P_r} \left( T_{xx} + T_{yy} \right) \\
    &+ \frac{E_v}{R_c} \left[ (2 \mu u_x^2 + v_y^2) + (\mu u_y + v_x)^2 \right]
\end{align*} \]  
(4-6)

Where \( u(x, y) \), \( v(x, y) \) are the components of velocity vector, \( F_1(x, y) \), \( F_2(x, y) \) are the components of the body force, \( p(x, y) \) pressure, \( \mu(x, y) \) the viscosity, and \( T(x, y) \) is temperature. The numbers \( E_v \), \( P_r \) and \( R_c \) are the Ecart number, the Prandtl number and the Reynolds number respectively. The product of \( R_c \) and \( P_r \) is Peclet number \( P_c \). The solution of the basic fluid dynamics equations is found for very large and very small \( P_c \) where as the solution for moderate \( P_c \) is challenging. Please refer to [17-22] and reference therein.

The solution of the equation (3) is a stream function \( \psi(x, y) \) such that \( \frac{\partial^2 \psi}{\partial x \partial y} = \frac{\partial^2 \psi}{\partial y \partial x} \) and

\[ u = \frac{\partial \psi}{\partial y}, \quad v = -\frac{\partial \psi}{\partial x} \]  
(7)

The solution of the remaining system of equations (4-6), as experience teaches, offers a great difficulty because of the presence of the non-linear term. These equations are managed by introducing the total energy function \( T_e \) and the vorticity function \( \Omega \) defined by:

\[ T_e = p + \frac{1}{2} (u^2 + v^2) - \frac{2 \mu u_x}{R_c} \]  
(8)

\[ \Omega = v_x - u_y \]  
(9)

Utilizing equation (8-9) in equations (4-6), we have

\[ -v \Omega = F_1 - L_x + \frac{1}{R_c} A_y \]  
(10)

\[ u \Omega = F_2 - L_y - \frac{1}{R_c} B_y + \frac{1}{R_c} A_x \]  
(11)

\[ u T_x + v T_y = \frac{1}{P_r} (T_{xx} + T_{yy}) \]  
\[ + \frac{E_v}{R_c} \left( \frac{1}{4 \mu} \left( B^2 + 4 A^2 \right) \right) \]  
(12)

where

\[ A = \mu u_y + v_x \]  
(13)

Consider the allowable change of coordinates:

\[ x = x(\phi, \psi), \quad y = y(\phi, \psi) \]  
(14)

where the system \((\phi, \psi)\) are curvilinear coordinates in the \((x, y) - plane \) such that the Jacobian \( J = \frac{\partial(x, y)}{\partial(\phi, \psi)} \neq 0 \) is finite.

Let curvilinear coordinate \( \psi \) is stream function as defined in Martin [15]. Let \( \lambda \) be the angle between the tangent to the streamlines \( \psi = \text{const.} \) and the curves \( \phi = \text{const.} \) as arbitrary at a point \( P(x, y) \), then

\[ \tan(\lambda) = \frac{y_\phi}{x_\phi} \]  
(15)

The first fundamental form is

\[ ds^2 = E(\phi, \psi) \, d\phi^2 + 2 \, F(\phi, \psi) \, d\phi \, d\psi + G(\phi, \psi) \, d\psi^2 \]  
(16)

wherein:

\[ E = x_\phi^2 + y_\phi^2 \]

\[ F = x_\phi \, x_\psi + y_\phi \, y_\psi \]

\[ G = (x_\psi)^2 + (y_\psi)^2 \]  
(17)

Differentiating equation (14) with respect to \( x \) and \( y \),
and solving the resulting equations, one finds:

\[
\begin{align*}
\phi_x &= -J \psi_y, \quad \psi_x = J \phi_y \\
\phi_y &= J \psi_x, \quad \psi_y = -J \phi_x
\end{align*}
\]

(18)

where

\[
J = \pm \sqrt{EG-F^2} = \pm (\phi_y \psi_x - \phi_x \psi_y) = \pm W
\]

(19)

Applying trigonometric identities on equation (15) and equation (18) provides

\[
\begin{align*}
\phi_x &= E \cos \lambda \\
\psi_x &= \frac{1}{E} [F \cos \lambda - J \sin \lambda] \\
\phi_y &= \frac{1}{E} [F \sin \lambda + J \cos \lambda] \\
\psi_y &= E \sin \lambda
\end{align*}
\]

(20)

The integrability conditions:

\[
\begin{align*}
x_y \phi_x &= x_x \psi_y \\
y_y \phi_x &= y_x \psi_y
\end{align*}
\]

(21)

The integrability conditions:

\[
\begin{align*}
\lambda_x &= J \Gamma^2_{11} / E \\
\lambda_y &= J \Gamma^2_{12} / E
\end{align*}
\]

(22)

where

\[
\begin{align*}
\Gamma^2_{11} &= \frac{1}{2W^2} (-FF_x + 2E F_x - E E_y) \\
\Gamma^2_{12} &= \frac{1}{2W^2} [EG_x - F E_y]
\end{align*}
\]

(23)

Equation (21), applying the integrability condition \(\lambda_y = \lambda_y\), for \(\lambda(x, y)\), yields

\[
K = \frac{1}{W} \left[ \left( \Gamma^2_{11} / E \right)_y - \left( \Gamma^2_{12} / E \right)_x \right]
\]

(24)

where \(K\) is called the Gaussian curvature.

Now equations (10-11), on substituting equation (15), equation (18), equation (20) and equations (22-23) simplifies to following

\[
\begin{align*}
-R_e \Omega \Delta E &= -F \sqrt{E} \left( F_1 \cos \lambda + F_2 \sin \lambda \right) \\
+J \sqrt{E} \left( F_1 \sin \lambda - F_2 \cos \lambda \right) + R_e J E L_y \\
+ A_\psi \left( F^2 - J^2 \right) \cos 2\lambda + 2FJ \sin 2\lambda
\end{align*}
\]

(25)

According to differential geometry [23], the expression \(u T_x + v T_y\) in equation (12) simplifies to \(T_x + T_y\)

\[
\begin{align*}
&= R_e J \sqrt{E} \left[ F_1 \cos \lambda + F_2 \sin \lambda \right] \\
&- R_e J L_y + E A_{\lambda} \cos 2\lambda \\
&- A_{\lambda} \left[ F \cos 2\lambda - J \sin 2\lambda \right] \\
&+ B_{\lambda} \left( \frac{1}{2} J \sin \lambda \cos \lambda \right) - \frac{E B_{\lambda}}{2} \sin 2\lambda
\end{align*}
\]

(26)

The magnitude of velocity vector \(u, v\) is

\[
q = \sqrt{u^2 + v^2}
\]

and it simplifies to:

\[
q = \sqrt{E}
\]

(27)

The equation (13) on substitute values from equations (18-23), provides

\[
B(\phi, \psi) = \frac{4 \mu}{E J^3} \left[ E_\phi (F \sin \lambda + J \cos \lambda)^2 \\
- 2E (F \sin \lambda + J \cos \lambda) (F_\psi \sin \lambda + J_\psi \cos \lambda) \\
+ E^2 (J_\psi \sin 2\lambda + G_\psi \sin^2 \lambda) \right]
\]

(30)

\[
A(\phi, \psi) = \mu \left[ \left( F \sin \lambda - J \sin \lambda \right) \right] \frac{4 E^2 J^5}{E J^3}
\]
\begin{align*}
\{ E_\phi (2EJ^3 \cos \lambda + F\sqrt{E} \sin \lambda) \\
-4E^2J^2J_\phi \cos \lambda - 2E\sqrt{E}F_\phi \sin \lambda \\
+ E\sqrt{E}E_\psi \sin \lambda \} \\
+ \frac{\cos \lambda}{2J^3} \{ E_\psi (F \sin \lambda + J \cos \lambda) \\
- 2EJ_\psi \cos \lambda - E G_\phi \sin \lambda \} \\
+ \frac{\sin \lambda}{2J} \{ (E_\psi J \sin \lambda - F \cos \lambda) \\
+ 2E J_\psi \sin \lambda + E G_\phi \cos \lambda \} \}
\end{align*}

\begin{equation}
\phi = x
\end{equation}

\section*{3. Basic Equations in Von-Mises Coordinates}

Since the purpose of this communication is to determine a class of exact solutions to flow equations in von-Mises coordinates therefore the definition of von-Mises coordinates in [16] demands to set

\begin{equation}
\cos \lambda = \frac{1}{\sqrt{E}}
\end{equation}

\begin{equation}
E = 1 + (x g'(x))^2
\end{equation}

\begin{equation}
J = m x
\end{equation}

\begin{equation}
B = \frac{-4\mu}{m^2}
\end{equation}

\begin{equation}
A = \frac{\mu}{m x} \left( x (x g'(x))' - 2x g'(x) \right)
\end{equation}

\begin{equation}
\frac{d \Omega}{d x} = \left( \frac{x g'(x)}{m x} \right) \frac{d}{d x}
\end{equation}

The equations (25-26) and equation (28) on utilizing equations (34-40), give

\begin{align*}
-\gamma E \frac{\partial \Omega}{\partial x} &= -\gamma E \left( m x F_2 + R_\psi L \right) - m x A_x \\
&+ x g' A_\psi + B_\psi \\
&0 = R_\gamma \left( F_1 + x g' F_2 \right)
\end{align*}

\begin{align*}
-\gamma E \frac{\partial L_x}{\partial x} + \gamma A_\psi \left( 1 - (x g')^2 \right) + x g' A_\psi - \frac{x g' B_\psi}{m x} \\
&0 = R_\gamma \left( F_1 + x g' F_2 \right)
\end{align*}

\begin{equation}
\frac{m x T_x}{x} - 2x g' T_{x'} + \frac{1 + (x g')^2}{m x} T_{x''} \\
+ (m - P_x) T_x + (x g') T_{x'}
\end{equation}

\begin{equation}
= -\frac{m x E_\psi P_\psi}{4\mu} \left( B^2 + 4A^2 \right)
\end{equation}

The fundamental system of equations transformed to Martin’s system as momentum equations (25-26), the energy equation (28) for moderate Peclet number together with equations (30-31) and equation (33).
In equation (48) the coefficients of the derivative $B_{xx}$, $B_{xy}$, $B_{yy}$, $B_x$, $B_y$, and $B$ are all functions of $x$ only, this suggests to seek a solution of equation(48) of the form

$$B(x,y) = R(x) + S(y)$$

(49)

Equation (48), on substituting equation (49), becomes

$$\left[ x(XR) \right]' + \frac{S''}{mX} \left\{ N - X(1 - N^2) \right\}$$

$$- S'(2NX' + N'X) + m (xX')' S$$

$$= R_x \left( \frac{N'}{mX} \right)' + R_x \left( F_1 + NF_2 \right)_y - R_x \left( mxF_2 \right)_x$$

(50)

The equation (50) involves the components of unknown body force $F_1(x,y)$, $F_2(x,y)$ the functions $R(x)$ and $S(y)$ therefore the solution of equation (50) will depend upon the form of $F_1$ and $F_2$. One select many possible forms of $F_1$ and $F_2$ leading to the solution of equation (50) for $R(x)$ and $S(y)$, however they are required to satisfy (41-42) and (43). The search for the appropriate form of $F_1$ or $F_2$ reveals

$$R_x \left( mxF_2 \right)_x = R_x \left( \frac{N'}{mX} \right)' - [x(XR)']'$$

(51)

or

$$R_x F_2 = R_x \left( \frac{N'}{mX^2} \right)' - (XR)' + \frac{Q_1(y)}{mX}$$

(52)

where $Q_1(y)$ is function of integration.

Insertion of equation (52) in equation (50) keeps $R(x)$ and $S(y)$ arbitrary and provides

$$R_x F_1 = \frac{S'}{mX} \left\{ N - X(1 - N^2) \right\}$$

$$- S'(2NX' + N'X) + m (xX')' \int S \, dy$$

$$+ P_1(x) - N \left[ R_x \left( \frac{N'}{mX^2} \right)' - (XR)' + \frac{Q_1(y)}{mX} \right]$$

(53)

where $P_1(x)$ is function of integration. Solution of equations (41-42) for $L$, on substituting equations (52–53), is following

$$R_x L = \int Q_1(y) \, dy + m(xX') \int S(y) \, dy$$

$$- (N X + 1) S(y) + e^x \int e^{-x} N(XR) \, dx + e^x c_1$$

(54)
provided
\[ m = 1 \] (55)

\( c_i \) is constant of integration.

Thus from equation (38) or equation (39) viscosity is
\[ \mu = -\frac{x^2}{4} \left[ R(x) + S(\psi) \right] \] (56)

The energy equation (43), on utilizing equation (46), equation (49) and equations (55–56) becomes
\[ x T'_{xx} - 2 NT'_{yx} + \left( \frac{1 + N^2}{x^2} \right) T'_{yy} + (1 - P_e) T_y = \]
\[ E_c P_r \left( 1 + 4X^2 \right) \frac{1}{x} \left[ R(x) + S(\psi) \right] \] (57)

The right-hand side of equation (57) suggests seeking solution of the form
\[ T(x, \psi) = T_1(x) + T_2(x) H(\psi) \] (58)

Equation (57) for equation (58) becomes
\[ x T''_{xx} + (1 - P_e) T''_y + H \left( x T''_{yy} + (1 - P_e) T''_x \right) = \]
\[ + H' \left( -2 NT'_{y} - N' T_2 \right) + \left( \frac{1 + N^2}{x^2} \right) T''_{y} \]
\[ = E_c P_r \left( 1 + 4X^2 \right) \frac{1}{x} \left[ R(x) + S(\psi) \right] \] (59)

Let us differentiate equation (59) with respect to \( \psi \).
\[ H' \left( x T''_{yy} + (1 - P_e) T''_x \right) + H'' \left( -2 NT'_{y} - N' T_2 \right) = \]
\[ + \left( \frac{1 + N^2}{x^2} \right) T''_{y} \]
\[ = E_c P_r \left( 1 + 4X^2 \right) \frac{1}{x} S'(\psi) \] (60)

Since \( x \) and \( \psi \) are independent variables therefore the right-hand side of equation (60) demands
\[ S(\psi) = s_1 \psi + s_2 \] (61)

and
\[ H(\psi) = s_3 \psi + s_4 \] (62)

where \( s_1, s_2, s_3 \) and \( s_4 \) are constants of integration.

Substitution of equations (61–62) in equation (60) provides
\[ x T''_{yy} + (1 - P_e) T''_x = E_c P_r \frac{1}{s_3} \left( 1 + 4X^2 \right) \] (63)

Utilization of equations (61–62) in equation (59), gives
\[ x T''_{xx} + (1 - P_e) T''_y = s_3 \left\{ 2 NT'_{y} + N' T_2 \right\} \]
\[ - s_4 \left\{ x T'_{xx} + (1 - P_e) T''_x \right\} \]
\[ + E_c P_r \left( 1 + 4X^2 \right) \frac{1}{x} \left[ R(x) + s_2 \right] \] (64)

when \( (1 - P_e) \neq 0 \) the solution of equations (63–64) are
\[ T_2(x) = \int \left\{ x^{-1-p_e} \int x^{1-p_e} Z_2(x) dx \right\} dx \]
\[ + c_2 \int x^{-1-p_e} dx + c_3 \] (65)

\[ T_1(x) = \int \left\{ x^{-1-p_e} \int x^{1-p_e} Z_1(x) dx \right\} dx \]
\[ + c_4 \int x^{-1-p_e} dx + c_5 \] (66)

where \( c_2, c_3, c_4 \) and \( c_5 \) are constant of integration and
\[ Z_2(x) = \frac{E_c P_r s_1}{s_3 x^2} \] (67)

\[ Z_1(x) = s_3 \left\{ 2 NT'_{y} + N' T_2 \right\} \]
\[ - s_4 \left\{ x T'_{xx} + (1 - P_e) T''_x \right\} \]
\[ + E_c P_r \left( 1 + 4X^2 \right) \frac{1}{x} \left[ R(x) + s_2 \right] \] (68)

Utilization of equations (65–68) in equation (58) provides the temperature \( T \) for moderate \( P_e \) and the back substitution gives the viscosity \( \mu \) from equation (56), the velocity components from equation (7), the pressure \( P \) from equation (9) using equation (55), and streamlines from equation (2) for non-parabolic function \( g(x) \).

Now when \( (1 - P_e) = 0 \) the equations (65–66) give
\[ T_2(x) = \int \left\{ \int Z_2(x) dx \right\} dx + c_6 x + c_7 \] (69)

and
\[ T_1(x) = \int \left\{ \int Z_1(x) dx \right\} dx + c_8 x + c_9 \] (70)

where
\[ Z_3(x) = s_3 \left\{ 2 NT'_{y} + N' T_2 \right\} - s_4 \left\{ x T'_{xx} + (1 - P_e) T''_x \right\} \]
\[ + E_c P_r \left( 1 + 4X^2 \right) \frac{1}{x} \left[ R(x) + s_2 \right] \] (71)
and \(c_6\), \(c_7\), \(c_8\) and \(c_9\) are constants of integration. Insertion of equations (69-71) in equation (58) gives \(T\) for \((1-P_e) = 0\) and by back substitution \(\mu\) from equation (56), the velocity components from equation (7), \(P\) from equation (9) using equation (56), and streamlines from equation (2) for non-parabolic function \(g(x)\).

The case \((x N - 2 N) = 0\), on supplying \(N(x)\) from equation (35), shows that the function \(g(x)\) is a parabolic function

\[
g(x) = \frac{1}{2} c_{10} x^2 + c_{11}
\]

where \(c_{10}\) and \(c_{11}\) are constants. In view of equation (72), the equation (48) reduces to

\[
-B_x y' + \frac{N B_y y'}{m x} = R_e (F_1 + N F_2) y' - R_e (m x F_2) x
\]

Here equation (73) is to provide the function \(B(x,y')\) but it involves the components of unknown body force \(F_1(x,y')\) and \(F_2(x,y')\) therefore its solution will depend upon the form of \(F_1\) and \(F_2\). It is easy to see that the arbitrary selection of the forms for \(F_1\) and \(F_2\) to the solution of equation (73) for \(B(x,y')\) does not lead to the solution of the momentum equations (41-42) for the function \(L\) and the energy equation (43) for \(T\). However, it is found that the solution of the equations (41-42) is obtainable if the function \(F_2\) is a solution of the following differential equation

\[
R_e (m x F_2)_x = 0
\]

or

\[
R_e F_2 = \frac{Q_2(y)}{m x}
\]

where a function of integration is \(Q_2(y)\). Substitution of equation (75) in equation (73), provides

\[
R_e F_1 = -\frac{c_{10}}{m} x Q_2(y) - B_x + \frac{c_{10}}{a} B_y y' + P_2(x)
\]

where the function of integration is \(P_2(x)\). Utilizing equations (75-76), in equations (41-42) and solving for the function \(L\) one have

\[
R_e L = -R_e \left(\frac{2c_{10}}{m}\right) y' + \int Q_2(y) dy - B(x,y')
\]

\[
+ \int P_2(x) dx
\]

In view of equation (72), the energy equation (43), becomes

\[
m x^2 T_{xx} - 2 c_{10} x^3 T_{xx} + \frac{1}{m} (1 + c_{10} x^4) T_{yy}
\]

\[
+ x \left( m - P_e \right) T_r + 2 c_{10} x^2 T_{yy} = E_e P_e B(x,y')
\]

(78)

On substituting value from equation (43) in equation (78), the viscosity \(\mu\) is obtained as a function of temperature \(T\)

\[
\mu = \left( \frac{-m x^2}{4 E_e P_e} \right) \left[ m x^2 T_{xx} - 2 c_{10} x^3 T_{xx} + x \left( m - P_e \right) T_r + 2 c_{10} x^2 T_{yy} \right]
\]

(79)

for moderate \(P_e\). It is now easy to find the velocity components from equation (7), the pressure \(P\) from equation (9) using equation (77), and streamlines from equation (2) for \(g(x)\) given by equation (72).

5. Conclusion

The following dimensionless parameters are used to obtain the non-dimensional form of the basic equations for the two-dimensional steady motion of incompressible fluid of variable viscosity in the presence of body force

\[
x^* = \frac{x}{L_0}, \quad y^* = \frac{y}{L_0}, \quad \mu^* = \frac{\mu}{U_0}, \quad v^* = \frac{v}{U_0}
\]

\[
\mu^* = \frac{\mu}{\rho_0}, \quad p^* = \frac{p}{p_0}, \quad F_1^* = \frac{F_1}{F_0}, \quad F_2^* = \frac{F_2}{F_0}
\]

where \(c_v = c_p = \text{Const.}\) where \(c_v\) is specific heat at constant volume and \(c_p\) is specific heat at constant pressure, the thermal conductivity \(k = k_0 = \text{Const.}\) and density \(\rho = \rho_0 = \text{Const.}\).

This paper finds a class of new exact solutions of the equations governing the two-dimensional steady motion with moderate Peclet number of incompressible fluid of variable viscosity in presence of body force in von-Mises coordinates. The characteristic equation for the streamlines \(y = g(x) + \phi + n\) where a differentiable function is \(g(x)\), \(\phi\) is stream function and \(n\) is constant. The exact solutions for moderate Peclet number in the presence of body force is determined for given one component of the body force, for both the cases when \(g(x)\) is non-parabolic function and when it is a parabolic function of \(x\). For non-parabolic \(g(x)\) the streamlines are \(y = g(x) - n = \phi = \text{Const.}\) and for parabolic
case \( g(x) = \frac{1}{2} c_{10} x^2 + c_{11} \) and the streamlines are
\[
\left[ y - \frac{1}{2} c_{10} x^2 + c_{11} - n \right] = \psi = \text{Const.} \quad \text{where} \quad c_{10} \text{ and } c_{11} \text{ are constants.}
\]
In both cases, an infinite set of velocity components, viscosity function, generalized energy function, temperature distribution for moderate Peclet number in components, viscosity function, generalized energy function, constants. In both the cases, an infinite set of velocity components, viscosity function, generalized energy function, temperature distribution for moderate Peclet number.
