Reviewer 1 v1

The study is a review on pathogenesis and various therapies for smoke inhalation-induced acute lung injury. It is interesting and well summarized. I have only minor suggestions:

1. Table 2 is less informative. Authors should indicate the number of patients, outcome, etc.
2. Authors had better give specific recommendation in conclusion.

Reviewer 1 v2

The authors have addressed all my comments and in my opinion, the manuscript is now acceptable for publication.

Reviewer 2 v1

This is a well-organized and succinct review article on the research and treatments of smoke inhalation-induced acute lung injury (SI-ALI). This flow of this review is easy to follow and the structure is very logic. This review should be a valuable reference for investigators in the field.

I have a minor suggestion:

The authors can elaborate more on why certain therapies have inconsistent efficacies among SI-ALI patients.
