A MEAN VALUE THEOREM FOR THE SQUARE OF CLASS NUMBER TIMES REGULATOR OF QUADRATIC EXTENSIONS

TAKASHI TANIGUCHI

Abstract. Let \( k \) be a number field. In this paper, we give a formula for the mean value of the square of class number times regulator for certain families of quadratic extensions of \( k \) characterized by finitely many local conditions. We approach this by using the theory of the zeta function associated with the space of pairs of quaternion algebras. We also prove an asymptotic formula of the correlation coefficient for class number times regulator of certain families of quadratic extensions.

1. Introduction

We fix an algebraic number field \( k \). Let \( \mathcal{M}, \mathcal{M}_\infty, \text{and} \mathcal{M}_f \) denote respectively the set of all places of \( k \), all infinite places and all finite places. For \( v \in \mathcal{M} \) let \( k_v \) denote the completion of \( k \) at \( v \) and if \( v \in \mathcal{M}_f \) then let \( q_v \) denote the order of the residue field of \( k_v \). We let \( \Delta_k, r_1, r_2, \text{and} e_k \) be respectively the absolute discriminant, the number of real places, the number of complex places, and the number of roots of unity contained in \( k \). We denote by \( \zeta_k(s) \) the Dedekind zeta function of \( k \).

Let \( S \supset \mathcal{M}_\infty \) be a finite set of places. We fix an \( S \)-tuple \( L_S = (L_v)_{v \in S} \) where each \( L_v \) is a separable quadratic algebra of \( k_v \), i.e., either \( k_v \times k_v \) or a quadratic extension of \( k_v \).

Let \( Q(L_S) \) be the following family of quadratic extensions of \( k \):

\[
Q(L_S) := \{ F \mid [F : k] = 2, F \otimes k_v \cong L_v \text{ for all } v \in S \}.
\]

Let \( h_F \) and \( R_F \) be the class number and the regulator of \( F \), respectively. We would like to understand the value \( h_F^2 R_F^2 \) for \( F \in Q(L_S) \) in average. For \( F \in Q(L_S) \) we denote by \( \Delta_{F/k} \) the relative discriminant of \( F/k \) and by \( N(\Delta_{F/k}) \) its absolute norm. Let

\[
Q(L_S, X) := \{ F \in Q(L_S) \mid N(\Delta_{F/k}) \leq X \}.
\]

The following is one of the main results of this paper.

Theorem 1.1 (Theorem 10.12). Let \( L_S = (L_v)_{v \in S} \) be an \( S \)-tuple such that \( L_v \) is a field for at least two places of \( S \). Then the limit

\[
\lim_{X \to \infty} \frac{1}{X^2} \sum_{F \in Q(L_S, X)} h_F^2 R_F^2
\]

exists, and the value is equal to

\[
\frac{(\text{Res}_{s=1} \zeta_k(s))^2 \Delta_k^2 e_k^2(2)}{2^{r_1+r_2+1}2^{r_1(L_S)}(2\pi)^{2r_2(L_S)}} \prod_{v \in S \cap \mathcal{M}_f} e_v(L_v) \prod_{v \in \mathcal{M}_f} (1 - 3q_v^{-3} + 2q_v^{-4} + q_v^{-5} - q_v^{-6}).
\]

Date: June 28, 2018.

Key words and phrases. density theorem, prehomogeneous vector space, quaternion algebra, local zeta function.
Here we denote by \( r_1(L_S) \) and \( r_2(L_S) \) be respectively the number of real and complex places of \( F \in \mathcal{O}(L_S, X) \) (which does not depend on the choice of \( F \),) and also for \( v \in \mathcal{M}_r \) we put

\[
e_v(L_v) = \begin{cases} 
2^{-1}(1 + q_v^{-1})(1 - q_v^{-2}) & L_v \cong k_v \times k_v, \\
2^{-1}(1 - q_v^{-1})^3 & L_v \text{ is quadratic unramified}, \\
2^{-1}N(\Delta_{L_v/k_v})^{-1}(1 - q_v^{-1})(1 - q_v^{-2})^2 & L_v \text{ is quadratic ramified}.
\end{cases}
\]

We discuss on the condition of \( L_S \) in Remark 10.16.

We note that there is a good deal of works on moments of quadratic fields \( F \over Q \). For example, Granville and Soundararajan [GS] recently obtained the mean value of a general complex power of \( h_F R_F \) of quadratic fields \( F \). On the other side little is known explicitly over a general number field \( k \) to the present except for the result of Datskovsky [D] and Kable-Yukie [KY1]. Datskovsky [D] has obtained the mean value of \( h_F R_F \) of quadratic extensions.

We explain one more theorem we prove in this paper. As we determine every constants in Theorem 1.1 explicitly, combined with the result of Kable-Yukie [KY1], we can obtain an interesting formula of the asymptotic behavior of the correlation coefficients for class number times regulator of certain families of quadratic extensions.

We fix a quadratic extension \( \tilde{k} \) of \( k \). Let \( \mathcal{M}_{\text{ram}}, \mathcal{M}_{\text{in}} \) and \( \mathcal{M}_{\text{sp}} \) be the sets of finite places of \( k \) which are respectively ramified, inert and split on extension to \( \tilde{k} \). We assume \( \mathcal{M}_{\text{ram}} \) does not contain places those dividing 2. For any quadratic extension \( F \) of \( k \) other than \( \tilde{k} \), the compositum \( F \) and \( \tilde{k} \) contains exactly three quadratic extensions of \( k \). Let \( F^* \) denote the quadratic extension other than \( F \) and \( \tilde{k} \). Take any \( F \in \mathcal{O}(L_S) \) and put \( L_v^* = F^* \otimes k_v \), which does not depend on the choice of \( F \).

**Theorem 1.2** (Theorem 11.2). Assume \( S \supset \mathcal{M}_{\text{ram}} \cup \mathcal{M}_{\infty} \). Let \( L_S = (L_v)_{v \in S} \) be an \( S \)-tuple. Assume two of \( L_v \)'s and two of \( L_v^* \)'s are fields. Then the limit

\[
\lim_{X \to \infty} \frac{\sum_{F \in \mathcal{O}(L_S, X)} h_F R_F h_F^* R_{F^*}}{\left( \sum_{F \in \mathcal{O}(L_S, X)} h_F^2 R_F^2 \right)^{1/2} \left( \sum_{F \in \mathcal{O}(L_S, X)} h_F^2 R_{F^*}^2 \right)^{1/2}}
\]

exists, and the value is equal to

\[
\prod_{v \in \mathcal{M}_{\text{in}} \setminus S} \left( 1 - \frac{2q_v^{-2}}{1 + q_v^{-1} + q_v^{-2} - 2q_v^{-3} + q_v^{-5}} \right).
\]

It is an interesting phenomenon that the value is purely of product form with the index set \( \mathcal{M}_{\text{in}} \). For example, if we take \( \tilde{k} \) such that \( \tilde{k} \) splits at all the small places of \( k \), then \( h_F R_F \) and \( h_F^* R_{F^*} \) are strongly related.

We prove these density theorems using the theory of zeta functions associated with prehomogeneous vector spaces. This method has been developed by Sato-Shintani [SS], Shintani [S2], Datskovsky-Wright [DW2], Datskovsky [D] and also by Kable, Yukie and the author. In the beautiful work of Wright-Yukie [WY], they showed that 8 types of prehomogeneous vector space possess significant interest in arithmetic, and laid out a program to prove a series of density theorems. There are some advantages to using this theory. For example, at the moment this approach is the only possible way that allows the ground field to be a general number field rather than just \( \mathbb{Q} \), as is done in [DW2], [D, T2], [KY1] or [T1].
This paper is concerned with the representation
\[ G' = \text{GL}(2) \times \text{GL}(2) \times \text{GL}(2), \quad V' = k^2 \otimes k^2 \otimes k^2, \]
which is referred to as the $D_4$ case in [WY]. It was found in [WY] that the principal parts of the zeta function of this type are closely related to the asymptotic behavior of the mean value of $h_F^2 R_F^2$ of quadratic extensions $F/k$. However, the global theory of prehomogeneous vector spaces is difficult in general and more than ten meaningful cases including the case $(G', V')$ are left open.

Our approach to work on this topic is to consider inner forms. Let $B$ be a quaternion algebra of $k$ and $B^{\text{opp}}$ the opposite algebra. We regard $B \times$ and $(B^{\text{opp}}) \times$ as algebraic groups over $k$. In this paper, we consider the representation
\[ G = B \times \times (B^{\text{opp}}) \times \times \text{GL}(2), \quad V = B \otimes k^2, \]
which is an inner form of $(G, V)$. Note that if $B$ splits then $(G, V)$ is equivalent to $(G', V')$. We call $(G, V)$ the space of pairs of quaternion algebras. As we saw in [T3], the orbit space of $V$ also carries a rich structure. We recall the fundamental properties of this space in Section 3. One advantage of non-split cases is that the global theory becomes much easier. In this paper we consider $(G, V)$ when $B$ is a division algebra over a number field $k$. For this case, we determined the principal parts of the global zeta function in [T3].

On the other hand, as we will see in Proposition 10.3, the global zeta function is only an approximation of the counting function of $h_F^2 R_F^2$ of quadratic extensions. Hence we could not directly deduce Theorem 1.1 from the global theory [T3], and what the aim of this paper is to fill out this gap by carrying out what is called the filtering process originally developed by Datskovsky-Wright [DW1, DW2] and Datskovsky [D]. This process requires a local theory in some detail. We consider the localizations of $(G, V)$ at each place of $k$. Except for a finite set of places of $k$ the quaternion $B$ splits, and the localizations of $(G, V)$ at those places are equivalent to $(G', V')$.

There also exists an outer form of the representation $(G', V')$, namely the space of pairs of binary Hermitian forms. The necessary local theory and the filtering process for that case was constructed by Kable-Yukie [KY1, KY2, KY3], and certain new density theorems were obtained using the Yukie’s global theory [Y]. Some results obtained in [KY1, KY2] are useful for us, because they also consider the split form $(G', V')$ in local situations. We quote from [KY1, KY2] a uniform estimate of the standard local zeta functions and some evaluated constants.

After we prove Theorem 10.12, we consider on the correlation coefficient in the final section combined with the results of [KY1]. It is an interesting phenomenon that the density is purely of the Euler product form as is stated in Theorem 1.2.

In [T3] we handled one more prehomogeneous vector space which is a non-split form of so called $E_6$-type. The density theorem for that case, should be the mean value of $h_F R_F$ of certain families of cubic extensions $F$ of $k$, will be treated in a separate paper. Also in [T3] we develop the global theory with general quasi-characters but in this paper we only treat the principal quasi-character case. The study with non-principal characters will enrich arithmetic results as is done in [DW1], [KW], or [T1]. We hope this to be developed in the future.

For the remainder of this section, we will give the contents of the paper. In Section 2, we introduce the notations used throughout the paper. More specialized notations are introduced when required. In Section 3, we define the space of pairs of quaternion
algebras, and recall from [T3] its basic properties. In Section 4, we first define various invariant measures on the groups and the representation spaces. After that we introduce the global zeta function and review its analytic properties.

From Section 5 to Section 9, we consider the local theory. We establish the necessary local theory to obtain the density theorem in these sections. In Section 5, we define a measure on the stabilizer for semi-stable points, which is in some sense canonical. In Section 6, we define the local zeta function and the local density. Also we quote from [KY1] an estimate of the standard local zeta function, which we need in order to apply the filtering process in the proof of the mean value theorem in Section 10. In Sections 7, 8 and 9, we compute the local densities. Section 7 is for finite unramified places (the places $B$ splits), Section 8 for finite ramified places, and Section 9 for infinite places. The unramified cases were almost done in [KY1, KY2] and we essentially quote their result, but we will give a refinement for dyadic places by applying the method developed in [T2]. After that we study the ramified cases.

In Section 10 we go back to the adelic situation. We first define some invariant measures and show that our zeta function is more or less the counting function of the unnormalized Tamagawa numbers of the stabilizers. After that we apply the filtering process to our case and find the mean value of the Tamagawa numbers. Then with an explicit computation, we give a formula for the mean value of the square of class numbers times regulators for certain family of quadratic extensions, which is a main theorem of this paper. In Section 11, we define the correlation coefficient of class number times regulator of quadratic fields. Then we explicitly compute the value in some cases by combining the results of [KY1] and this paper.

Acknowledgments. There are many tremendous help for the creation of this work. The author express his gratitude to his advisor T. Terasoma for the constant discussions and suggestions. The author also would like to thank to Professor A. Yukie who suggested to consider the topic in Section 11, and to A. C. Kable who taught me several references including [GS] with useful comments. The author was also inspired by their series of work [KY1, KY2, KY3]. Special thanks goes to the author’s colleague Uuye Otogonbayar, who read the manuscript and gave many comments.

2. Notation

In this section we collect basic notations used throughout in this paper.

If $X$ is a finite set then $\#X$ will denote its cardinality. The standard symbols $\mathbb{Q}$, $\mathbb{R}$, $\mathbb{C}$ and $\mathbb{Z}$ will denote respectively the rational, real and complex numbers and the rational integers. The set of positive real numbers is denoted $\mathbb{R}_+$. For a complex number $z$, let $\Re(z)$, $\Im(z)$ and $\bar{z}$ be the real part, the imaginary part, and the complex conjugate of $z$. If $R$ is any ring then $R^\times$ is the set of invertible elements of $R$, and if $V$ is a scheme defined over $R$ and $S$ is an $R$-algebra then $V_S$ denotes its $S$-rational points. Let us denote by $M(2,2)$ the set of $2 \times 2$ matrices.

We fix an algebraic number field $k$. Let $\mathcal{M}$, $\mathcal{M}_\infty$, $\mathcal{M}_f$, $\mathcal{M}_{dy}$, $\mathcal{M}_{\mathbb{R}}$ and $\mathcal{M}_{\mathbb{C}}$ denote respectively the set of all places of $k$, all infinite places, all finite places, all dyadic places (those dividing the place of $\mathbb{Q}$ at 2), all real places and all complex places. Let $\mathcal{O}$ be the ring of integers of $k$. If $v \in \mathcal{M}$ then $k_v$ denotes the completion of $k$ at $v$ and $| |_v$ or $| |_{k_v}$ denotes the normalized absolute value on $k_v$. If $v \in \mathcal{M}_f$ then $\mathcal{O}_v$ denotes the ring of integers of $k_v$, $\mathfrak{p}_v$ the maximal ideal of $\mathcal{O}_v$ and $q_v$ the cardinality of $\mathcal{O}_v/\mathfrak{p}_v$. For $t \in k_v^\times$,
we define \( \text{ord}_v(t) \) so that \( |t|_v = q_0^{-\text{ord}_v(t)} \). For a practical purpose in Sections 7 and 8, we do not fix a uniformizer in \( \mathcal{O}_v \) here. For any separable quadratic algebra \( L_v \) of \( k_v \), let \( \mathcal{O}_{L_v} \) denote the ring of integral elements of \( L_v \). That is, if \( L_v \) is a quadratic extension then \( \mathcal{O}_{L_v} \) is the integer ring of \( L_v \) and if \( L_v = k_v \times k_v \) then \( \mathcal{O}_{L_v} = \mathcal{O}_e \times \mathcal{O}_v \).

If \( k_1/k_2 \) is a finite extension of either local fields or number fields then we shall write \( \Delta_{k_1/k_2} \) for the relative discriminant of the extension; it is an ideal in the ring of integers of \( k_2 \). For conventions, we let \( \Delta = \Delta_{k_1/k_2} \) and if \( v \) is imaginary. We choose a Haar measure \( d\lambda \) on \( \mathcal{O} \). We do not consider \( L/k \) as \( (d\lambda^0) \) a map to \( L \).

Returning to \( k \), we let \( r_1, r_2, h_k, R_k \) and \( e_k \) be respectively the number of real places, the number of complex places, the class number, the regulator and the number of roots of unity contained in \( k \). It will be convenient to set

\[
\zeta_k = 2^{r_1}(2\pi)^{r_2}h_kR_k\epsilon_k^{-1}.
\]

We refer to [W] as the basic reference for fundamental properties on adeles. The ring of adeles and the group of ideles are denoted by \( \mathbb{A} \) and \( \mathbb{A}^\times \), respectively. The adelic absolute value \( | | \) on \( \mathbb{A}^\times \) is normalized so that, for \( t \in \mathbb{A}^\times \), \( |t| \) is the module of multiplication by \( t \) with respect to any Haar measure \( dx \) on \( \mathbb{A} \), i.e. \( |t| = d(tx)/dx \). Let \( \mathbb{A}^0 = \{ t \in \mathbb{A}^\times \mid |t| = 1 \} \). Suppose \( [k : \mathbb{Q}] = n \). For \( \lambda \in \mathbb{R}^+ \), \( \lambda \in \mathbb{A}^\times \) is the idele whose component at any infinite place is \( \lambda^{1/n} \) and whose component at any finite place is 1. Then we have \( |\lambda| = \lambda \).

For a finite extension \( L/k \), let \( \mathbb{A}_L \) denote the adele ring of \( L \). We define \( \mathbb{A}_L^\times, \mathbb{A}_L^0, \zeta_L \) etc., similarly. The adelic absolute value of \( L \) is denoted by \( | |_L \). There is a natural inclusion \( \mathbb{A} \rightarrow \mathbb{A}_L \), under which an adele \( (a_v)_v \) corresponds to the adele \( (b_w)_w \) with \( b_w = a_v \) if \( w \mid v \). Using the identification \( L \otimes_k \mathbb{A} \cong \mathbb{A}_L \), the norm map \( N_{L/k} \) can be extended to a map from \( \mathbb{A}_L \) to \( \mathbb{A} \). It is known (see p. 139 in [W]) that \( |N_L(t)| = |t|_L \) for \( t \in \mathbb{A} \). Suppose \( [L : k] = m \). For \( \lambda \in \mathbb{R}^+ \), we denote by \( \lambda \in \mathbb{A}_L^\times \) the ideles whose component at any infinite place is \( \lambda^{1/mn} \) and whose component at any finite place is 1, so that \( |\lambda|_L = \lambda \).

Clearly \( \lambda = \lambda^n \) and hence \( |\lambda|_L = \lambda^m \). When we have to show the number field on which we consider \( \lambda \), we use the notation such as \( \lambda \).

If \( V \) is a vector space over \( k \) we write \( V_k \) for its adelization. Let \( S(V_k) \) and \( S(V_{k_v}) \) be the spaces of Schwartz–Bruhat functions on each of the indicated domains.

For any \( v \in \mathbb{M}_t \), we choose a Haar measure \( dx_v \) on \( k_v \) to satisfy \( \int_{\mathcal{O}_v} dx_v = 1 \). We write \( dx_v \) for the ordinary Lebesgue measure if \( v \) is real, and for twice the Lebesgue measure if \( v \) is imaginary. We choose a Haar measure \( dx \) on \( \mathbb{A} \) to satisfy \( dx = \prod_{v \in \mathbb{M}_t} dx_v \). Then \( \int_{k/k_v} dx = |\Delta_k|^{1/2} \) (see [W], p. 91).

For any \( v \in \mathbb{M}_t \), we normalize the Haar measure \( d^x v \) on \( k_v^\times \) such that \( \int_{\mathcal{O}_v} d^x v = 1 \). Let \( d^x v(x) = |x|_v^{s/2} dx_v \) if \( v \in \mathbb{M}_\infty \). We choose a Haar measure \( d^x \) on \( \mathbb{A}^\times \) so that \( d^x = \prod_{v \in \mathbb{M}_t} d^x v \). Using this measure, we choose a Haar measure \( d^x \) on \( \mathbb{A}^0 \) by

\[
\int_{\mathbb{A}^\times} f(t) d^x t = \int_0^\infty \int_{\mathbb{A}^0} f(\lambda \cdot \lambda^0) d^x \lambda d^x \lambda^0,
\]

where \( d^x \lambda = \lambda^{-1} d\lambda \). Then \( \int_{\mathbb{H}^0/k} d^x \lambda = \zeta_k \) (see [W], p. 95).

Let \( \zeta_k(s) \) be the Dedekind zeta function of \( k \). We define

\[
Z_k(s) = |\Delta_k|^{s/2} \left( \pi^{-s/2} \Gamma \left( \frac{s}{2} \right) \right)^r_1 \left( (2\pi)^{1-s} \Gamma(s) \right)^{s/2} \zeta_k(s).
\]
This definition differs from that in [W], p.129 by the inclusion of the \(|\Delta_k|^{s/2}\) factor. It is adopted here as the most convenient for our purposes. It is known ([W], p.129) that
\[
\text{Res}_{s=1} \zeta_k(s) = |\Delta_k|^{-1/2}\mathbf{c}_k \quad \text{and so} \quad \text{Res}_{s=1} Z_k(s) = \mathbf{c}_k.
\]

Let \(\mathbb{H}\) denote the quaternion algebra of Hamiltonians over \(\mathbb{R}\). We choose and fix an element \(j \in \mathbb{H}\) so that \(\mathbb{H} = \mathbb{C} \oplus \mathbb{C}j\) as a left vector space over \(\mathbb{C}\) and the multiplication law is given by \(j^2 = -1\) and \(j\alpha = \bar{\alpha}j\) for \(\alpha \in \mathbb{C}\). Let us express elements of \(\mathbb{H}\) as \(x = x_1 + x_2 j\) where \(x_1, x_2 \in \mathbb{C}\). We choose a Haar measure on \(\mathbb{H}\) so that \(dx = dx_1 dx_2\), where \(dx_1\) and \(dx_2\) are twice the Lebesgue measure on \(\mathbb{C}\) as above. If we let \(|x|_\mathbb{H} = |x_1|_\mathbb{C} + |x_2|_\mathbb{C}\), then \(|x|_\mathbb{H}^{-2} dx\) defines a Haar measure on \(\mathbb{H}^\times\). For practical purposes, we choose \(d\xi(t(x)) = \pi^{-1} |x|_\mathbb{H}^{-2} dx\) as the normalized measure on \(\mathbb{H}^\times\). We put \(\mathbb{H}^0 = \{t \in \mathbb{H}^\times \mid |t|_\mathbb{H} = 1\}\).

3. Review of the space of pairs of quaternion algebras

In this section, we define the prehomogeneous vector space of pairs of quaternion algebras which are at the heart of this work and reviewing their fundamental properties. Arithmetic plays no role here, so in this section we consider the representation over an arbitrary field \(K\). We later use the result in this section both local and global situations.

Let \(\mathcal{B}\) be a quaternion algebra over \(K\). This algebra is either isomorphic to the algebra \((2,2)\) consisting of \(2 \times 2\) matrices or a division algebra of dimension 4. Let \(\mathcal{T}\) and \(\mathcal{N}\) be the reduced trace and the reduced norm, respectively. We denote by \(\mathcal{B}^{\text{op}}\) the opposite algebra of \(\mathcal{B}\). We introduce a group \(G_1\) and its linear representation on \(\mathcal{B}\) as follows. Let
\[
G_{11} = \mathcal{B}^\times, \quad G_{12} = (\mathcal{B}^{\text{op}})^\times, \quad \text{and} \quad G_1 = G_{11} \times G_{12}.
\]
That is, \(G_1\) is equal to \(\mathcal{B}^\times \times \mathcal{B}^\times\) set theoretically and the multiplication law is given by \((g_{11}, g_{12})(h_{11}, h_{12}) = (g_{11}h_{11}, h_{12}g_{12})\). If there is no confusion, we drop \`\text{op}' and simply write such as \(G_{12} = \mathcal{B}^\times\) instead. We regard \(G_1\) as an algebraic group over \(K\). The quaternion algebra \(\mathcal{B}\) can be considered as a vector space over \(K\). We define the action of \(G_1\) on \(\mathcal{B}\) as follows:
\[
(g_1, w) \mapsto g_1w g_{12}, \quad g_1 = (g_{11}, g_{12}) \in G_1, \quad w \in \mathcal{B}.
\]
This defines a representation \(\mathcal{B}\) of \(G_1\). We consider the standard representation of \(G_2 = \text{GL}(2)\) on \(K^2\). The group \(G = G_1 \times G_2\) acts naturally on \(V = \mathcal{B} \otimes K^2\). The representation \((G, V)\) is the main object of this paper. This is a \(K\)-form of
\[
(\text{GL}(2) \times \text{GL}(2) \times \text{GL}(2), K^2 \otimes K^2 \otimes K^2),
\]
and if \(\mathcal{B}\) is split, \((G, V)\) is equivalent to the above representation over \(K\). The representation \((3.1)\) was studied in [WY] in some detail, and our review is a slight generalization [T3] of that.

We describe the action more explicitly. Throughout this paper, we express elements of \(V \cong \mathcal{B} \oplus \mathcal{B}\) as \(x = (x_1, x_2)\). We identify \(x = (x_1, x_2) \in V\) with \(x(v) = v_1x_1 + v_2x_2\) which is an element of the quaternion algebra with coordinates in linear forms in two variables \(v = (v_1, v_2)\). Then the action of \(g = (g_{11}, g_{12}, g_2) \in G\) on \(x \in V\) is defined by
\[
(gx)(v) = g_1x(v)g_{12}g_2.
\]
We put \(F_x(v) = N(x(v))\). This is a binary quadratic form in variables \(v = (v_1, v_2)\). We let \(P(x) (x \in V)\) be the discriminant of \(F_x(v)\), which is a polynomial in \(V\). That
GL(1)

is semi-stable if and only if

respectively. We define

Definition 3.2. For

V

K(x)

gives a bijection between

G_K \setminus V_K^{ss}

and

A_2(B_K).

For

x

∈

V_K^{ss},

let

G_x

be the stabilizer of

x

and

G_x^0

its identity component, both are algebraic groups defined over

K.

We have shown in [T3] that

G_x^0

is isomorphic to

(GL(1)\tilde{K(x)})^2

as
an algebraic group over $K$. We close this section with a detailed description of the $K$-rational points of the stabilizer $G_{w_u}$.

We first recall the isomorphism $G_{w_u}^o \cong (K[u]^\times)^2$. Since $\{1, u\}$ is a basis of $K[u]$ as a $K$-vector space, for any $s_1, s_2 \in K[u]^\times$, $\{s_1 s_2, s_1 s_2 u\}$ is also a $K$-basis of $K[u]$. Hence there exists a unique element $g_{s_1 s_2} \in \text{GL}(2)_K$ such that $g_{s_1 s_2} \tau(s_1 s_2, s_1 s_2 u) = \tau(1, u)$. Since $K[u]$ is a commutative algebra, $s_1 s_2 u = s_1 u s_2$. Therefore we have $(s_1, s_2, g_{s_1 s_2}) \in G_{w_u}^o K$. The following proposition is proved in [T3, Lemma 3.4].

**Proposition 3.6.** The map

$$\psi_u : (K[u]^\times)^2 \to G_{w_u}^o K, \quad (s_1, s_2) \mapsto (s_1, s_2, g_{s_1 s_2})$$

gives an isomorphism of the two groups.

Finally we consider the structure of $G_{w_u} K/G_{w_u}^o K$. Let $\sigma$ be the non-trivial $K$-automorphism of $K[u]$. Then there exists $\nu \in \mathcal{B}_K \setminus K[u]$ such that $\nu^2 \in K$, $\mathcal{B}_K = K[u] \oplus K[u] \nu$ as a $K[u]$-vector space, and the multiplication law is given by $\nu \alpha = \alpha^\sigma \nu$ for $\alpha \in K[u]$. Let $u = a + bu^\sigma$ where $a \in K, b \in K^\times$.

**Proposition 3.7.** We have $[G_{w_u} K : G_{w_u}^o K] = 2$ and $G_{w_u} K/G_{w_u}^o K$ is generated by the class of $\tau = \left(\begin{smallmatrix} \nu^{-1} & \nu & (1 & 0) \\ a & b & \end{smallmatrix}\right)$.

**Proof.** A simple computation shows $\tau w_u = w_u$. On the other hand, by [WY] we have $[G_{w_u} K : G_{w_u}^o K] = 2$ because $(G, V)$ is a $K$-form of (3.1). Since $[G_{w_u} K : G_{w_u}^o K] \leq [G_{w_u} K : G_{w_u}^o K]$, the proposition follows.

By Lemma 3.3, we have $[G_{x K} : G_{x K}^o] = 2$ for any $x \in V_K^{ss}$.

4. IN Variant measures AND THE GLOBAL ZETA FUNCTION

For the rest of this paper, we assume $k$ a fixed number field and $\mathcal{B}$ a non-split quaternion algebra over $k$. In this section, we define various invariant measures in both local and adelic situations and summarize the necessary results. For the proof, see [V] for example. In this paper, we always choose the adelic measure as the product of local measures, for the conventions of connection between global and local theory. After that we introduce the global zeta function of the prehomogeneous vector space $(G, V)$ and recall from [T3] its most basic analytic properties.

We define $\mathcal{M}_{\mathcal{B}}$ to be the set of places $v$ of $k$ such that $\mathcal{B}$ is ramified at $v$. For $v \in \mathcal{M}$, let $\mathcal{B}_v$ denote $\mathcal{B} \otimes_k k_v$. Then, by definition, $v \in \mathcal{M}_{\mathcal{B}}$ if and only if $\mathcal{B}_v$ is a division algebra. It is well known that $\mathcal{M}_{\mathcal{B}}$ is a finite set.

We give a normalization of invariant measure on $G_{k_v}$ and $V_{k_v}$. First we consider the places $v \notin \mathcal{M}_{\mathcal{B}}$. For each of these $v$, we fix once and for all a $k_v$-isomorphism $\mathcal{B}_v \cong M(2, 2)_{k_v}$ and identify these algebras. Then

$$G_{k_v} = \text{GL}(2)_{k_v} \times \text{GL}(2)_{k_v} \times \text{GL}(2)_{k_v}, \quad V_{k_v} = M(2, 2)_{k_v} \oplus M(2, 2)_{k_v}.$$ 

We choose a Haar measure $dx_v$ on $V_{k_v}$ so that

$$dx_v = dx_{1v} dx_{2v}, \quad dx_{iv} = dx_{i1v} dx_{i2v}, \quad (i = 1, 2)$$

for

$$x_v = (x_{1v}, x_{2v}), \quad x_{iv} = \begin{pmatrix} x_{i1v} & x_{i2v} \\ x_{i2v} & x_{i2v} \end{pmatrix} \quad (i = 1, 2).$$
For \( v \in \mathfrak{M}_f \), we put \( V_{O_v} = M(2,2)_{O_v} \oplus M(2,2)_{O_v} \), which is a maximal compact subgroup of \( V_{k_v} \). We note that \( \int_{V_{O_v}} dg_v = 1 \) for \( v \in \mathfrak{M}_f \). We consider \( G_{k_v} \) for \( v \notin \mathfrak{M}_B \). If \( v \in \mathfrak{M}_f \), we put a maximal compact subgroup \( K_v \) of \( G_{k_v} \) as
\[
K_v = \text{GL}(2)_{O_v} \times \text{GL}(2)_{O_v} \times \text{GL}(2)_{O_v},
\]
and normalize the measure \( dg_v \) on \( G_{k_v} \) so that the total volume of \( K_v \) is 1. For \( v \in \mathfrak{M}_\infty \), we first give a measure for \( \text{GL}(2)_F \) where \( F = \mathbb{R} \) or \( \mathbb{C} \). As in Section 2, we shall take Lebesgue measure to be the standard measure on the real numbers and twice the Lebesgue measure to be the standard measure on the complex numbers. If \( h_v = (h_{ijv})_{1 \leq i,j \leq 2} \), then \( dh_v = dh_{11v}dh_{12v}dh_{21v}dh_{22v} / | \det(h_v)|_F \) defines a Haar measure on \( \text{GL}(2)_F \). We put \( dh_v = p_F dh_v \) where \( p_\mathbb{R} = \pi^{-1} \) and \( p_\mathbb{C} = (2\pi)^{-1} \). Using this measure, we define \( dg_v \) for \( v \in \mathfrak{M}_\infty \) as \( dg_v = dg_{11v}dg_{12v}dg_{2v} \) where \( g = (g_{11}, g_{12}, g_2) \in G_{k_v} = \text{GL}(2)_{k_v} \).

Next we consider the case \( v \in \mathfrak{M}_B \). For \( v \in \mathfrak{M}_f \), let \( O_{B_v} \) be the ring consisting of integral elements of \( B_v \). We put \( V_{O_v} = O_{B_v} \oplus O_{B_v} \), which is a maximal compact subgroup of \( V_{k_v} \). We choose a Haar measure \( dx_v \) on \( V_{k_v} = B_v \oplus B_v \) so that the volume of \( O_{B_v} \oplus O_{B_v} \) is 1. Also we we put a maximal compact subgroup \( K_v \) of \( G_{k_v} \) as
\[
K_v = O_{B_v}^x \times O_{B_v}^x \times \text{GL}(2)_{O_v},
\]
and normalize the measure \( dg_v \) on \( G_{k_v} \) so that the total volume of \( K_v \) is 1.

Now the remaining case is for \( v \in \mathfrak{M}_\infty \cap \mathfrak{M}_B \), which is an element of \( \mathfrak{M}_\mathbb{R} \). We fix an isomorphism \( B_v \cong \mathbb{H} \). Then
\[
G_{k_v} = \mathbb{H}^x \times \mathbb{H}^x \times \text{GL}(2)_{\mathbb{R}}, \quad V_{k_v} = \mathbb{H} \oplus \mathbb{H}.
\]
We set measures \( dg_v \) and \( dx_v \) on \( G_{k_v} \) and \( V_{k_v} \) as the product measures, where we consider the measures on \( \mathbb{H}^x, \mathbb{H} \) as in Section 2 and \( \text{GL}(2)_{\mathbb{R}} \) as above. For \( v \in \mathfrak{M}_\infty \), we put
\[
\mathcal{K}_v = \begin{cases} O(2, \mathbb{R})^3 & v \in \mathfrak{M}_\mathbb{R} \setminus \mathfrak{M}_B, \\ U(2, \mathbb{C})^3 & v \in \mathfrak{M}_\mathbb{C} \setminus \mathfrak{M}_B, \\ \mathbb{H}^0 \times \mathbb{H}^0 \times O(2, \mathbb{R}) & v \in \mathfrak{M}_B, \end{cases}
\]
which is a maximal compact subgroup of \( G_{k_v} \).

Using these local measures, we define the measures \( dg \) and \( dx \) on \( G_\mathbb{A} \) and \( V_\mathbb{A} \) by
\[
dg = \prod_{v \in \mathfrak{M}_\mathbb{R}} dg_v, \quad \text{and} \quad dx = \prod_{v \in \mathfrak{M}_\mathbb{R}} dx_v.
\]
If we put
\[
\Delta_\mathbb{B} = \Delta_\mathbb{K}^4 \prod_{v \in \mathfrak{M}_\mathbb{R} \cap \mathfrak{M}_\mathbb{Q}} \zeta_v^2 \quad \text{and} \quad \Delta_\mathbb{V} = \Delta_\mathbb{B}^2,
\]
then it is well known that the volume of \( V_\mathbb{A} / V_\mathbb{B} \) with respect to the measure \( dx \) is \( \Delta_\mathbb{V}^{1/2} \). Hence our choice of measure \( dx \) on \( V_\mathbb{A} \) in this paper is \( \Delta_\mathbb{V}^{1/2} \) times that of \([T3]\), in which we defined so that the volume of \( V_\mathbb{A} / V_\mathbb{B} \) is equal to 1.

Our definition of measure \( dg_v \) on \( G_{k_v} \) can naturally be considered as the product measure \( dg_v = dg_{11v}dg_{12v}dg_{2v} \) for \( g_v = (g_{11v}, g_{22v}, g_{2v}) \) and we shall do so below. For example, if \( v \in \mathfrak{M}_f \cap \mathfrak{M}_B \), we will regard \( dg_{11v}, dg_{12v} \) and \( dg_{2v} \) on \( G_{1k_v}, G_{12k_v} \) and \( G_{2k_v} \) as
\[
\int_{O_{B_v}^x} dg_{11v} = \int_{O_{B_v}^x} dg_{12v} = \int_{\text{GL}(2)_{O_v}} dg_{2v} = 1.
\]
We define the measure $dg_{11}, dg_{12}$ and $dg_2$ on $G_{11A}, G_{12A}$ and $G_{2A}$ by

$$dg_{11} = \prod_{\nu \in \mathfrak{m}_R} dg_{11\nu}, \quad dg_{12} = \prod_{\nu \in \mathfrak{m}_R} dg_{12\nu}, \quad \text{and} \quad dg_2 = \prod_{\nu \in \mathfrak{m}_R} dg_{2\nu}.$$  

Clearly, we have $dg = dg_{11}dg_{12}dg_2$.

Since $\tilde{T} \cong \text{GL}(1) \times \text{GL}(1)$ is a split torus, the first Galois cohomology set $H^1(k' , \tilde{T})$ is trivial for any field $k'$ containing $k$. This implies that the set of $k'$-rational point of $\tilde{G}$ coincides with $G_{k'}/\tilde{T}_{k'}$. Therefore $(G/T)_{\tilde{A}} = G_{\tilde{A}}/\tilde{T}_{\tilde{A}}$ and $(G/T)_{k'}/(G/T)_{k} = G_{k'}/\tilde{T}_{k'}/G_{k}$.

We put the measures $d^\nu t_v$ and $d^\nu \tilde{t}_v$ on $T_v$ and $\tilde{T}_v$ respectively to satisfy $d^\nu \tilde{t}_v = d^\nu t_{1v}d^\nu t_{2v}$, $d^\nu \tilde{t} = d^\nu t_1d^\nu t_2$ for $\tilde{t}_v = (t_1v, t_2v, (t_1v t_2v)^{-1})$, $\tilde{t} = (t_1, t_2, (t_1t_2)^{-1})$. Using these, we normalize the invariant measure $dg_v$ on $G_{k'}/T_{k'}$ and $G_{\tilde{A}}/\tilde{T}_{\tilde{A}}$ so that $dg_v = dg_v d^\nu \tilde{t}_v, dg = d^\nu \tilde{t} = \prod_{\nu \in \mathfrak{m}_R} d^\nu \tilde{t}_v$.

We put

$$G^0_{11A} = \{ g_{1i} \in G_{11A} \mid |N(g_{1i})| = 1 \} \ (i = 1, 2),$$

$$G^0_{2A} = \{ g_2 \in G_{2A} \mid |\det(g_2)| = 1 \}.$$  

Then the maps

$$\mathbb{R}_+ \times G^0_{11A} \longrightarrow G_{11A}, \quad (\lambda_{1i}, g^0_{1i}) \longmapsto \lambda_{1i}g^0_{1i} \ (i = 1, 2),$$

$$\mathbb{R}_+ \times G^0_{2A} \longrightarrow G_{2A}, \quad (\lambda_{2}, g^0_2) \longmapsto \lambda_{2}g^0_2,$$  

give isomorphisms of these groups. We choose Haar measures $dg^0_{1i}$ and $dg^0_2$ on $G^0_{11A}$ and $G^0_{2A}$ so that $dg_{1i} = 2d^\nu \lambda_{1i}dg^0_{1i}, dg_2 = 2d^\nu \lambda_2dg^0_2$. Then it is known that

$$\int_{G^0_{11A}/G_{11k}} dg^0_{1i} = \Delta^1_{k} c_{k} Z_k(2) \prod_{\nu \in \mathfrak{m}_R \cap \mathfrak{m}_\mathbb{Q}} (q_v - 1),$$

$$\int_{G^0_{2A}/G_{2k}} dg^0_2 = \Delta^1_{k} c_{k} Z_k(2).$$

We now define the global zeta function.

**Definition 4.1.** For $\Phi \in \mathcal{S}(V_k)$ and a complex variable $s$, we define

$$Z(\Phi, s) = \int_{G_{\tilde{A}}/\tilde{T}_{k}G_k} |\lambda(\tilde{g})|^s \sum_{x \in V^\text{ss}_k} \Phi(\tilde{g}x) \, d\tilde{g},$$

and call it the **global zeta function**.

It is known that the integral converges if $\Re(s)$ is sufficiently large and can be continued meromorphically to the whole complex plane. In [T3], we described the principal parts of $Z(\Phi, s)$ by means of certain distributions. However, we used a slightly different formulation in [T3], and we need some arguments to translate the results from that paper. Also, in this paper we only consider the rightmost pole of $Z(\Phi, s)$ because this is enough to deduce the density theorems.

We put $G^0_{1A} = G^0_{11A} \times G^0_{12A}$. The domain of integration used in [T3] is $\mathbb{R}_+ \times G^0_{A}/G_k$, where $G^0_A = G^0_{1A} \times G^0_{2A}$. Let $\tilde{T}^0_A = G^0_{A} \cap \tilde{T}_{\tilde{A}}$. Then we have

$$\left( \mathbb{R}_+ \times G^0_{A} \right) / \tilde{T}^0_A \cong G^0_{A} / \tilde{T}_{\tilde{A}}$$

via the map which sends the class of $(\lambda, g^0_{11}, g^0_{12}, g^0_2)$ to class of $(g^0_{11}, g^0_{12}, \lambda g^0_2)$. In [T3] $\mathbb{R}_+ \times G^0_A$ is made to act on $V_k$ by assuming that $(\lambda, 1)$ acts by multiplication by $\lambda$, and
the above isomorphism is compatible with their actions on \( V_k \). We will compare the measure \( d\tilde{g} \) on \( G_k/\tilde{T}_k \) with the measure \( d^*\lambda dg^0 \) on \( \mathbb{R} \times G_k^0 \) used in [T3]. The argument in [T3] is valid for any choice of measure on \( G_{1A}^0 \) and we consider \( dg_{11}dg_{12} \) for this. We note that the measure \( dg_k^0 \) on \( G_k^0 \) in the present situation is \( \Delta_k^{1/2} \mathcal{C}_k^2 \) times that of used in [T3].

We have \( G_k/\tilde{T}_k \cong (\mathbb{R}_+^3 \times G_k^0)/(\mathbb{R}_+^2 \times \tilde{T}_k^0) \) where \( \mathbb{R}_+^3 \times \tilde{T}_k^0 \) is included in \( \mathbb{R}_+^3 \times G_k^0 \) via \((\lambda_1, \lambda_2, \tilde{t}) \mapsto (\lambda_1, \lambda_2, \lambda_1^{-1} \lambda_2^{-1}, \tilde{t}^0)\) and \( \mathbb{R}_+^3 \times G_k^0 \) maps onto \( G_k/\tilde{T}_k \) via \((\lambda_1, \lambda_2, \lambda_3, g^0) \mapsto (\lambda_1, \lambda_2, \lambda_3)g^0\). With this identification we have chosen the measure \( d\tilde{g} \) to be compatible with the measure \( 8d^*\lambda_1 d^*\lambda_2 d^*\lambda_3 dg^0 \) on \( \mathbb{R}_+^3 \times G_k^0 \) and \( d^*\lambda_1 d^*\lambda_2 d^*\tilde{t}^0 \) on \( \mathbb{R}_+^2 \times \tilde{T}_k^0 \), where the volume of \( \tilde{T}_k/\tilde{T}_k \) under \( d^*\tilde{t}^0 \) is \( \mathcal{C}_k^2 \). Moreover, \( |\lambda(1, \Delta)| = \lambda^4 \), and so if \( Z^*(\Phi, s) \) denotes the zeta function studied in [T3], then we have \( Z(\Phi, s) = 8\Delta_k^{1/2} Z^*(\Phi, 4s) \). In [T3], it is shown that \( Z^*(\Phi, s) \) has a meromorphic continuation to the region \( \text{Re}(s) > 3/2 \) only with a possible simple pole at \( s = 2 \) with residue

\[
Z_k(2) \mathcal{C}_k^{-1} \int_{G_k^0/G_{1k}} dg_{11}^0 dg_{12}^0 \cdot \int_{V_k} \Phi(x) dx.
\]

where the measure \( dx \) on \( V_k \) is \( \Delta_V^{-1/2} \) times that of in this paper. Thus we arrive at:

**Theorem 4.2.** Assume that the Schwartz-Bruhat function \( \Phi \in \mathcal{S}(V_k) \) has a product form \( \Phi = \otimes_{v \in \mathcal{M}} \Phi_v \) and each \( \Phi_v \in \mathcal{S}(V_{k_v}) \) is \( K_v \)-invariant. The zeta function \( Z(\Phi, s) \) has a meromorphic continuation to the region \( \text{Re}(s) > 3/2 \) only with a possible simple pole at \( s = 2 \) with residue

\[
\mathcal{R}_1 \prod_{v \in \mathcal{M}} \int_{V_{k_v}} \Phi_v(x_v) dx_v,
\]

where we put

\[
\mathcal{R}_1 = 2\Delta_k^{-5/2} \mathcal{C}_k Z_k(2)^3 \prod_{v \in \mathcal{M}_k \cap \mathcal{M}_B} \left(1 - q_v^{-1}\right)^2.
\]

This completes our review of the analytic properties of the global zeta function. To arrive at the density theorem from this, we need various preparations from local theory. We do it in the next five sections.

### 5. The canonical measure on the stabilizer

In this section we shall define a measure on \( G_{x, k_v}^0 \) for \( x \in V_{k_v}^{ss} \) which is canonical in the sense made precise by Proposition 5.1. Recall that there exists a unique division quaternion algebra \( \mathcal{B} \) up to isomorphism over a local field \( F \) other than \( \mathbb{C} \), and that for any separable quadratic extension \( L/F \), there exists a injective homomorphism \( L \rightarrow \mathcal{B} \) of \( F \)-algebras. Hence by Proposition 3.5, the set of rational orbits \( G_k \backslash V_{k_v}^{ss} \) corresponds to the set of all separable quadratic algebras of \( k_v \) if \( v \notin \mathcal{M}_B \) and to the set of all separable quadratic extensions of \( k_v \) if \( v \in \mathcal{M}_B \).

Following [KY1], we attach to each orbit in \( V_{k_v}^{ss} \) where \( v \in \mathcal{M}_B \), an index or type which records the arithmetic properties of \( v \) and the extension of \( k_v \) corresponding to the orbit. The orbit corresponding to \( k_v \times k_v \) will have the index (ur sp). (This case does not occur when \( v \in \mathcal{M}_B \).) The orbit corresponding to the unique unramified quadratic extension of \( k_v \) will have the index (rm ur) or (ur ur) according as \( v \) is in \( \mathcal{M}_B \) or not. An orbit corresponding to a ramified quadratic extension of \( k_v \) will have the index (rm rm) if \( v \in \mathcal{M}_B \) and (ur rm) if \( v \notin \mathcal{M}_B \).
We first give a normalization of the measure on the stabilizer $G_{\mathcal{t}_u}^{\circ}$ for elements of $V_{k_u}^{ss}$ of the form $w_u = (1, u)$. We recall that $k_u[u]$ is isomorphic to either $k_v \times k_v$ or a quadratic extension of $k_v$ as a $k_v$-algebra. By using this isomorphism, we can construct an isomorphism of multiplicative group

$$k_u[u]^\times \cong \begin{cases} k_v \times k_v^\times & w_u \text{ has type (ur sp)}, \\ \hat{L}_{v,u}^\times & \text{otherwise}, \end{cases}$$

where $L_{v,u}$ is the splitting field of $F_{w_u}(v)$ if this quadratic form is irreducible. Using the normalized measure of $k_v^\times$ and $L_{v,u}^\times$ in Section 2 (we consider the product measure on $k_v^\times \times k_v^\times$), we induce a measure $d\hat{u}_x$ on $k_u[u]^\times$ as the pullback measure via the above isomorphism. We note that this normalization does not depend on the choice of the isomorphism.

For an element of the form $w_u = (1, u)$, we constructed an isomorphism

$$\psi_u : k_v[u]^\times \times k_v[u]^\times \to G_{w_u,k_v}^{\circ}, \quad (s_1, s_2) \mapsto g_{w_u,v}'' = (s_1, s_2, g_{s_1 s_2}),$$

in Section 3. Using this isomorphism and the product measure $d\hat{u}_x s_1 d\hat{u}_x s_2$ on $k_v[u]^\times \times k_v[u]^\times$, we define a Haar measure $dg_{w_u,v}''$ on $G_{w_u,k_v}^{\circ}$ by

$$dg_{w_u,v}'' = (\varphi_u)_*(d\hat{u}_x s_1 d\hat{u}_x s_2),$$

the pushout measure. For a general element $x \in V_{k_v}^{ss}$ we choose an element $g \in G_{k_v}$ so that $x = gw_u$ for some $w_u \in V_{k_v}^{ss}$, which is possible by Lemma 3.3. Then

$$i_g : G_{w_u,k_v}^{\circ} \to G_{x,k_v}^{\circ}, \quad g_{w_u,v}'' \mapsto g_{x,v}'' = gg_{w_u,v}'' g^{-1}$$

gives an isomorphism of groups. We define the measure $dg_{x,v}''$ on $G_{x,k_v}^{\circ}$ by

$$dg_{x,v}'' = (i_g)_*(dg_{w_u,v}'').$$

We let $dg_{x,v}''$ on $G_{x,k_v}^{\circ}/\tilde{T}_{k_v}$ such that $dg_{x,v}'' = d\tilde{g}_{x,v}'' d\tilde{T}_{x,v}$. Note that we defined the measure $d\tilde{t}_v$ on $\tilde{T}_{k_v}$ in Section 3.

We have to check that these normalizations are well-defined.

**Proposition 5.1.** (1) The above definition of $dg_{x,v}''$ does not depend on the choice of $u$ and $g$.

(2) Moreover, suppose that $x, y \in V_{k_v}^{ss}$ and that $y = g_{xy}x$ for some $g_{xy} \in G_{k_v}$. Let $i_{g_{xy}} : G_{g_{xy}k_v}^{\circ} \to G_{x,k_v}^{\circ}$ be the isomorphism $i_{g_{xy}}(g) = g_{xy}^{-1}gg_{xy}$. Then

$$dg_{y,v}'' = i_{g_{xy}}^*(dg_{x,v}'') \quad \text{and} \quad d\tilde{g}_{y,v}'' = i_{g_{xy}}^*(d\tilde{g}_{x,v}'').$$

**Proof.** By the construction of the measures, a formal consideration shows that it is enough to prove (2) for $x = (1, u_1), y = (1, u_2)$ where $u_1, u_2 \in B_{k_v}$. We write

$$g_{xy} = (\alpha, \beta, g_2), \quad g_2 = \begin{pmatrix} p & q \\ r & s \end{pmatrix}.$$  

Then since $y = g_{xy}x$, we have

$$\beta = (p + qu_1)^{-1} \cdot \alpha^{-1}, \quad u_2 = \alpha \cdot \frac{r + su_1}{p + qu_1} \cdot \alpha^{-1}.$$  

Therefore if we let

$$\eta : B_v \to B_v, \quad \eta(\theta) = \alpha^{-1} \cdot \theta \cdot \alpha,$$
we have $\eta(u_2) = (r + su_1)/(p + qu_1)^{-1} \in k_v[u_1]$ and hence $\eta$ induces an isomorphism of $k_v$-algebras

$$\eta: k_v[u_2] \longrightarrow k_v[u_1]$$

and an isomorphism of groups

$$\eta: k_v[u_2]^\times \longrightarrow k_v[u_1]^\times.$$  

Since (5.3) is an isomorphism of $k_v$-algebras, (5.4) is a measure preserving map.

Now we show that the diagram

$$\begin{array}{ccc}
(k_v[u_2]^\times)^2 & \xrightarrow{\psi_{u_2}} & G_y^o
\\
(\eta,\eta) & \Downarrow & i_{g_{xy}}
\\
(k_v[u_1]^\times)^2 & \xrightarrow{\psi_{u_1}} & G_x^o
\end{array}$$

is commutative. Let $s_1, s_2 \in k_v[u_2]^\times$. We compare

$$\psi_{u_1} \circ (\eta,\eta)(s_1, s_2) \quad \text{and} \quad i_{g_{xy}} \circ \psi_{u_2}(s_1, s_2).$$

Note that by Proposition 3.6, the $G_2$-part of an element of $G_y^o$ is uniquely determined by its $G_1$-part and hence to prove the above elements are same, it is enough to verify that their $G_1$-parts coincide. By the definition of the maps, we immediately see

$$\psi_{u_1} \circ (\eta,\eta)(s_1, s_2) = (\alpha^{-1}s_1\alpha, \alpha^{-1}s_2\alpha, *),$$

$$i_{g_{xy}} \circ \psi_{u_2}(s_1, s_2) = (\alpha, \beta, g_2)^{-1}(s_1, s_2, *)(\alpha, \beta, g_2) = (\alpha^{-1}s_1\alpha, \beta s_2\beta^{-1}, *).$$

Note that we defined $G_{12}$ to be the multiplicative group of the opposite algebra of $B$. We consider the $G_{12}$-part of the latter element. By (5.2), we have

$$\alpha \beta = \alpha(p + qu_1)^{-1}\alpha^{-1} = \eta^{-1}((p + qu_1)^{-1}) \in k_v[u_2]$$

and hence commutative with $s_2 \in k_v[u_2]$. Therefore $\alpha s_2 = s_2\alpha$ and hence $\beta s_2 \beta^{-1} = \alpha^{-1}s_2\alpha$. This shows that the $G_1$-parts of (5.6) coincide and hence the diagram (5.5) is commutative. Since $(\eta,\eta): (k_v[u_2]^\times)^2 \rightarrow (k_v[u_1]^\times)^2$ is measure preserving, the commutativity of the above diagram establishes the first claim of (2) and the second claim follows from the observation that $i_{g_{xy}}|_{\tilde{T}_y}$ is the identity map.

6. The local zeta function and the local density

In this section, we make a canonical choice of a measure on the stabilizer quotient $G_{k_v}/G^o_{x_kv}$ and define the local zeta function. We also choose a standard orbital representative for each $G_{k_v}$-orbit in $V_{k_v}$, and define the the local density $E_v$ for $v \in \mathfrak{M}$ which will show up later in the Euler factor in the density theorem.

We choose a left invariant measure $dg_{x,v}$ on $G_{k_v}/G^o_{x_k_v}$ such that $dg_v = dg'_{x,v}dg''_{x,v}$. Recall that we defined invariant measures $dg_v$ and $dg''_{x,v}$ on $G_{k_v}$ and $G^o_{x_k_v}$ in Sections 4 and 5, respectively. If $g_{xy} \in G_{k_v}$ satisfies $y = g_{xy}x$ and $i_{g_{xy}}$ is the inner automorphism $g \mapsto g_{xy}^{-1}gg_{xy}$ of $G_{k_v}$, then $i_{g_{xy}}(G^o_{y_{k_v}}) = G^o_{x_k_v}$ and so $i_{g_{xy}}$ induces a homeomorphism $G_{k_v}/G^o_{y_{k_v}} \rightarrow G_{k_v}/G^o_{x_{k_v}}$, which we also express by $i_{g_{xy}}$.

**Proposition 6.1.** We have $i_{g_{xy}}^*(dg'_{x,v}) = dg''_{y,v}$. 
Proof. Since the group $G_{k_v}$ is unimodular, $i_{g_{xy}}^* (dg_v) = dg_v$. On the other hand, we have $i_{g_{xy}}^* (dg_{x,v}'') = dg_{y,v}'$ by Proposition 5.1. Hence,
\[\int \frac{dg_{x,v}'}{dg_{y,v}'} = \int \frac{dg_v}{dg_v} = i_{g_{xy}}^* (dg_v)\]
\[= i_{g_{xy}}^* (dg_{x,v}'dg_{x,v}'') = i_{g_{xy}}^* (dg_{x,v}'i_{g_{xy}}^* (dg_{x,v}''))\]
\[= i_{g_{xy}}^* (dg_{x,v}')dg_{y,v}'.\]
Therefore $i_{g_{xy}}^* (dg_{x,v}') = dg_{y,v}'. \square$

**Definition 6.2.** For $v \in \mathfrak{M}$ and $x \in V_{k_v}^{ss}$ we let $b_{x,v} > 0$ be the constant satisfying the following equation
\[\int_{G_{k_v}/G_{x,v}^0} f(g_{x,v}'x) dg_{x,v}' = b_{x,v} \int_{G_{k_v}x} f(y)|P(y)|_v^{-2} dy\]
for any function $f$ on $G_{k_v}x \subset V_{k_v}$ integrable with respect to $dy/|P(y)|_v^2$.

This is possible because $dy/|P(y)|_v^2$ is a $G_{k_v}$-invariant measure on $V_{k_v}^{ss}$ and each of the orbits $G_{k_v}x$ is an open set in $V_{k_v}^{ss}$.

**Proposition 6.3.** If $x, y \in V_{k_v}^{ss}$ and $G_{k_v}x = G_{k_v}y$ then $b_{x,v} = b_{y,v}$.

**Proof.** Let $f(y)$ be as in Definition 6.2 and $y = g_{xy}x$ for $g_{xy} \in G_{k_v}$. Then
\[\int_{G_{k_v}x} f(y)|P(y)|_v^{-2} dy = b_{x,v}^{-1} \int_{G_{k_v}/G_{x,v}^0} f(g_{x,v}'x) dg_{x,v}'\]
\[= b_{x,v}^{-1} \int_{G_{k_v}/G_{x,v}^0} f(g_{x,v}'g_{y,v}y) dg_{y,v}' \quad \text{by Proposition 6.1}\]
\[= b_{x,v}^{-1}b_{y,v} \int_{G_{k_v}x} f(y)|P(y)|_v^{-2} dy.\]
Note that the last step is justified because $dg_{y,v}'$ is left $G_{k_v}$-invariant. Therefore $b_{x,v} = b_{y,v}. \square$

**Definition 6.4.** For $\Phi \in \mathcal{S}(V_{k_v})$ and $s \in \mathbb{C}$ we define
\[Z_{x,v}(\Phi_v, s) = \int_{G_{k_v}/G_{x,v}^0} |\chi(g_{x,v}')|^s \Phi_v(g_{x,v}'x) dg_{x,v}'\]
and call it the local zeta function.

By the definition of $b_{x,v}$ and the equation $P(g_{x,v}'x) = \chi(g_{x,v}')P(x)$, we have
\[Z_{x,v}(\Phi, s) = b_{x,v} \int_{G_{k_v}x} |P(y)|_v^{-2s} \Phi(y) dy.\]
This integral converges absolutely at least when $\text{Re}(s) > 2$. For $x, y \in V_{k_v}^{ss}$ lying in the same orbit, by the above equation and Proposition 6.3, we obtain the following.

**Proposition 6.5.** If $x, y \in V_{k_v}^{ss}$ and $G_{k_v}x = G_{k_v}y$ then
\[Z_{x,v}(\Phi_v, s) = \frac{|P(y)|_v^s}{|P(x)|_v^s} Z_{y,v}(\Phi_v, s).\]
By this proposition, we see that the local zeta functions for the same $G_{k_v}$-orbit are related by a simple equation. In section 10, we define and consider certain Dirichlet series arising from the global zeta function. Here, collecting the orbital zeta functions lying in the same $G_{k_v}$-orbit will be fundamental. For this purpose, we fix a representative element for each $G_{k_v}$-orbit in $V_{k_v}^{ss}$, which also has some good arithmetic properties if $v \in \mathcal{M}_t$.

**Definition 6.6.** For each of $G_{k_v}$-orbits in $V_{k_v}^{ss}$, we choose and fix an element $x$ which satisfies the following condition.

1. If $v \in \mathcal{M}_f$, then $x$ is of the form $(1, u)$ and $u$ generates $\mathcal{O}_{k_v}(x)$ over $\mathcal{O}_v$ via the identification $k_v[u] \cong \tilde{k}_v(x)$.
2. If $v \in \mathcal{M}_{\infty}$, then $|P(x)|_v = 1$.

We call such fixed orbital representatives as the *standard orbital representatives*.

If $v \in \mathcal{M}_f$, for any standard representative $x = (1, u) \in V_{k_v}^{ss}$, $u$ is a root of $F_x(v_1, -1)$ and so the discriminant $P(x)$ of $F_x(v)$ generates the ideal $\Delta_{k_v}(x)/k_v$.

**Definition 6.7.** For any $v \in \mathcal{M}_f$, let $\Phi_{v,0}$ be the characteristic function of $V_{\mathcal{O}_v}$. Also we put

$$Z_{x,v}(s) = Z_{x,v}(\Phi_{v,0}, s).$$

We call $Z_{x,v}(s)$ for any standard orbital representative $x$ a *standard local zeta function* of $x$.

To describe estimates of Dirichlet series, we introduce the following notation.

**Definition 6.8.** Suppose that we have Dirichlet series $L_i(s) = \sum_{m=1}^{\infty} \ell_{i,m} m^{-s}$ for $i = 1, 2$. If $\ell_{1,m} \leq \ell_{2,m}$ for all $m \geq 1$ then we shall write $L_1(s) \lesssim L_2(s)$.

We set $S_0 = \mathcal{M}_{\infty} \cup \mathcal{M}_{dy} \cup \mathcal{M}_{B}$. To carry out the filtering process, we need a uniform estimate of the standard local zeta functions. The following proposition concerning the standard local zeta functions for $v \notin S_0$ is proved in [KY1, Corollary 8.24, Proposition 9.25]. Since $S_0$ is a finite set, the result is enough for our purposes.

**Proposition 6.9.** Let $v \notin S_0$ and $x \in V_{k_v}^{ss}$ be one of the standard representatives. Then $Z_{x,v}(s)$ can be expressed as

$$Z_{x,v}(s) = \sum_{n \geq 0} \frac{a_{x,v,n}}{q_v^{ns}}$$

with $a_{x,v,0} = 1$ and $a_{x,v,n} \geq 0$ for all $n$. Also let us define

$$L_v(s) = \frac{1 + 29q_v^{-2(s-1)} - 21q_v^{-4(s-1)} + 7q_v^{-6(s-1)}}{(1 - q_v^{-(2s-1)})(1 - q_v^{-2(s-1)})^4}.$$

Then $Z_{x,v}(s) \lesssim L_v(s)$.

Now we define the local density.

**Definition 6.10.** Assume $x \in V_{k_v}^{ss}$ is a standard orbital representative. We define

$$\varepsilon_v(x) = \frac{|P(x)|_v^2}{b_{x,v}}.$$
Also we define the local density at $v$ by

$$E_v = \sum_{x} \varepsilon_v(x)$$

where the sum is over all standard representatives for orbits in $G_{k_v} \backslash V_{k_v}^{ss}$.

These values play an essential role in the density theorem. The purpose in the next three sections are to compute the local densities. To make the density theorem more precise, it is better to evaluate $\varepsilon_v(x)$ separately rather than the sum $E_v$. We compute for $v \in M_f$ in Sections 7, 8 and for $v \in M_{\infty}$ in Section 9. For $v \notin M_B$, those were already almost carried out in [KY1, KY2] and except for a refinement for dyadic places in Proposition 7.4, we quote their result.

**Remark 6.11.** We briefly compare the definition of standard orbital representatives and the value $\varepsilon_v(x)$ in [KY1] and in this paper for $v \notin M_B$, to confirm that we can directly use their result. Let $G'_{k_v}$ denote the group of the representation $V_{k_v}$ used in [KY1]. Then one can easily see that the isomorphism $G'_{k_v} \to G_{k_v}$ given by $(g_1, g_2, g_3) \mapsto (g_1, g_2, g_3)$ is compatible with their actions on $V_{k_v}$. If we identify these groups using the isomorphism, we immediately see that our choice of measure on $G_{k_v}$ coincides to that of in [KY1], and moreover, measures on $G_{x,v}$ also. The latter claim holds because both papers used the isomorphism in Proposition 3.6 to normalize the measures on $G_{x,k_v}$. The normalization of the measures on $G_{k_v}/G_{x,k_v}$ are slightly different, but from the definitions we can easily see that the constants $b_{x,v}$'s coincide. Although our choice of the standard orbital representatives $x$ for $v \in M_f$ is also slightly different, the values of $|P(x)|_v$ coincide since the standard orbital representative $x$ in [KY1] are also chosen so that $P(x)$ generate $\Delta_{k_v(x)}/k_v$. Since $\varepsilon_v(x)$ is determined only by $|P(x)|_v$ and $b_{x,v}$, this observation shows that our $\varepsilon_v(x)$'s coincide to those of [KY1].

7. Computation of the local densities at finite unramified places

In this and next sections, we assume $v \in M_f$. We first introduce some notations for these sections. For any $v \in M_f$ we shall put $2O_v = p_m^{2m_v}$. Of course $m_v = 0$ unless $v \in M_{dy}$. If $x \in V_{k_v}^{ss}$ then let $\Delta_{k_v(x)}/k_v = p_{\delta_{x,v}}^{\delta_{x,v}}$. It is well-known that if $k_v(x)/k_v$ is ramified then $\delta_{x,v}$ takes one of the values 2, 4, …, $2m_v, 2m_v + 1$. (In the case $v \notin M_{dy}$ and hence $m_v = 0$, this should be counted as $\delta_{x,v}$ only takes the value 1.)

We now assume $v \notin M_B$. The following propositions are proved in [KY1, Lemma 7.3] and [KY2, Propositions 4.14, 4.15, 4.25].

**Proposition 7.1.** Assume $v \notin M_B$. Let $x \in V_{k_v}^{ss}$ be one of the standard representative.

1. If $x$ has type (ur sp) then $\varepsilon_v(x) = 2^{-1}(1 + q_v^{-1})(1 - q_v^{-2})^2$.
2. If $x$ has type (ur ur) then $\varepsilon_v(x) = 2^{-1}(1 - q_v^{-1})^3(1 - q_v^{-2})$.

**Proposition 7.2.** Assume $v \notin M_B$. Let $x \in V_{k_v}^{ss}$ be one of the standard representative.

1. If $v \notin M_{dy}$ and $x$ has type (ur rm) then $\varepsilon_v(x) = 2^{-1}q_v^{-1}(1 - q_v^{-1})(1 - q_v^{-2})^3$.
2. If $v \in M_{dy}$ then

$$\sum_{2 \leq \delta_{x,v} = 2\ell \leq 2m_v} \varepsilon_v(x) = (1 - q_v^{-1})^2(1 - q_v^{-2})^3 q_v^{-\ell},$$

$$\sum_{\delta_{x,v} = 2m_v + 1} \varepsilon_v(x) = (1 - q_v^{-1})(1 - q_v^{-2})^3 q_v^{-(m_v + 1)}.$$
where $x$ runs through all the standard representative with the given condition of discriminants.

**Proposition 7.3.** Let $v \notin \mathcal{M}_B$. Then

$$E_v = (1 - q_v^{-2})(1 - 3q_v^{-3} + 2q_v^{-4} + q_v^{-5} - q_v^{-6}).$$

These results are already enough to prove our density theorems. However, if we could know the value $\varepsilon_v(x)$ for $v \in \mathcal{M}_{dy}$ in the Proposition 7.2 solely, then the density theorems become finer. In this section we refine Proposition 7.2 to the following.

**Proposition 7.4.** Assume $v \notin \mathcal{M}_B$. Let $x \in V_{k_v}^{ss}$ be a standard representative with the type (ur rm). Then

$$\varepsilon_v(x) = 2^{-1}\Delta_{k_v(x)/k_v}^{-1}(1 - q_v^{-1})(1 - q_v^{-2})^3.$$

It is well known that there are $2q_v^{-1}(q_v - 1)$ numbers of quadratic extensions of $k_v$ with the absolute value of the relative discriminant $q_v^2$ if $1 \leq l \leq m_v$ and $2q_v^{m_v}$ numbers of quadratic extensions of $k_v$ with the absolute value of the relative discriminant $q_v^{2m_v+1}$. Hence this is in fact a refinement of Proposition 7.2. We give the proof of this proposition after we prove Lemma 7.10.

Let $L/k_v$ be a quadratic ramified extension, $\varpi$ a uniformizer of $L$, and $\varpi^\tau$ the conjugate of $\varpi$ with respect to $L/k_v$, henceforth fixed. We put $a_1 = \varpi + \varpi^\tau, a_2 = \varpi \varpi^\tau$. Following [KY1], we let

$$x = (x_1, x_2), \quad x_1 = \begin{pmatrix} 0 & 1 \\ 1 & a_1 \end{pmatrix} \quad \text{and} \quad x_2 = \begin{pmatrix} 1 & a_1 \\ a_1 & a_1^2 - a_2 \end{pmatrix}.$$  

Then $F_x(v) = -(v_1^2 + a_1v_1v_2 + a_2v_2^2) = -(v_1 + \varpi v_2)(v_1 + \varpi^\tau v_2)$ and hence $L \cong k_v(x)$ and $P(x)$ generates the ideal $\Delta_{k_v(x)/k_v}$. Therefore we can replace the standard representative for the orbit corresponding to $L$ to this $x$ to compute $\varepsilon_v(x) = |P(x)|_v^{2\Delta_{k_v(x)/k_v}^{-1}}$.

The following lemma is a consequence of [KY1, Lemma 7.3] and [KY2, Proposition 3.2].

**Lemma 7.6.** We have $\varepsilon_v(x) = \text{vol}(\mathcal{K}_v x)$.

We compute $\text{vol}(\mathcal{K}_v x)$ with a slight modification of the method in [KY2], along the line of [T2]. To begin with we introduce some notations, which we also use to consider similar problems in Section 8. We regard $\mathcal{K}_v$ as the set of $\mathcal{O}_v$-rational points $G_{\mathcal{O}_v}$ of a group scheme $G = \text{GL}(2) \times \text{GL}(2) \times \text{GL}(2)$ defined over $\mathcal{O}_v$, acting on a module scheme $V = \text{M}(2, 2) \oplus \text{M}(2, 2)$ also defined over $\mathcal{O}_v$. Then since $x$ is an $\mathcal{O}_v$-rational point of $V$, we can consider the stabilizer of $x$ as a group scheme also defined over $\mathcal{O}_v$, in the sense of [MF]. Let $G_x$ denote this group scheme. Note that this definition of $G_x$ differs from [KY2, KY3]. Let $i$ be a positive integer. For an $\mathcal{O}_v$-scheme $X$, let $r_{X, i}$ denote the reduction map $X_{\mathcal{O}_v} \to X_{\mathcal{O}_v/p_v^i}$. If the situation is obvious we drop $X$ and write $r_i$ instead.

For rational points $y_1, y_2 \in X_{\mathcal{O}_v}$, we use the notation $y_1 \equiv y_2 (p_v^i)$ if $r_i(y_1) = r_i(y_2)$. We also use the notation “$y \mod p_v^i$” for $r_i(y)$.

For the element $x$ of the form (7.5), let

$$A_x(c, d) = \begin{pmatrix} c & d \\ -a_2d & c + a_1d \end{pmatrix}.$$  

Then if $A_x(c_i, d_i) \in \text{GL}(2)_{\mathcal{O}_v}$ for $i = 1, 2$, by computation we could see that the element

$$(A_x(c_1, d_1), A_x(c_2, d_2), A_x(c_1, d_1)^{-1}A_x(c_2, d_2)^{-1}) \in \mathcal{K}_v$$
Definition 7.8. We define \( \varepsilon \) compute modulo a certain high power of prime ideal is already presented in [KY2] and used to is in the form above and \( g_x \).

Hence we will consider when such an element actually lies in \( N_{x} \), defined over \( O_v \).

Proposition 7.7. We have \( N_{x} \cong (O_{k_{v}(x)}^{\times})^2 \) as a group scheme over \( O_v \).

Proof. Let \( R \) be any \( O_v \)-algebra. Then we could see that the map

\[
(A_x(c_1, d_1), A_x(c_2, d_2), A_x(c_1, d_1)^{-1}A_x(c_2, d_2)^{-1}) \mapsto (c_1 + \varpi d_1, c_2 + \varpi d_2)
\]

gives an isomorphism between \( N_xR \) and \( \{(O_{k_{v}(x)} \otimes O_v R)^{\times}\}^2 \), and this map, denoted by \( \psi_{x, R} \), satisfies the usual functorial property with respect to homomorphism of \( O_v \)-algebras. This shows that there exists an isomorphism \( \psi_x : N_x \to (O_{k_{v}(x)}^{\times})^2 \) as groups schemes over \( O_v \) such that \( \psi_{x, R} \) is the induced isomorphism for all \( R \). \( \square \)

We now consider the orbit \( K_v x \). The approach in [KY2] is to consider modulo \( p_v \) congruence condition on \( V_{O_v} \) to compute the sum \( \sum_{x} \text{vol}(K_v x) \) where \( x \) runs through all the standard representatives with the given relative discriminant. Let \( n = \delta_{x,v} + 2m_v + 1 \) as in [T2]. Then, as we demonstrate below, deliberation of the congruence relation of modulo \( p_v^2 \) allows us to treat the orbit \( K_v x \) solely. We note that the idea of considering modulo a certain high power of prime ideal is already presented in [KY2] and used to compute \( \varepsilon_v(x) \) in some other cases.

Definition 7.8. We define \( D = \{ y \in V_{O_v} \mid y \equiv x (p_v^h) \} \).

Lemma 7.9. We have \( D \subset K_v x \).

Proof. Let \( y \in D \). First we show \( y \in G_k, x \). Since \( P(y) \equiv P(x) (p_v^h) \) and \( \text{ord}_v(P(x)) = \delta_{x,v} \), we have \( P(y)/P(x) \equiv 1 (p_v^{2m_v+1}) \). Then by Hensel’s lemma, we have \( P(y)/P(x) \in (k_v^{\times})^2 \). Therefore the splitting fields of \( F_x(v) \) and \( F_y(v) \) coincide and hence by Lemma 3.5, we have \( y \in G_{k_v} x \). The rest of argument is exactly the same as that of [KY1, KY2] and we omit it. \( \square \)

Lemma 7.10. We have \( [G_{x, O_v/p_v^h} : N_{x, O_v/p_v^h}] = 2q_v^{\delta_{x,v}} \).

Proof. The same argument as in the proof of [KY2, Proposition 4.15] shows that each right coset space of \( N_{x, O_v/p_v^h} \backslash G_{x, O_v/p_v^h} \) contains exactly one element of the form \( g = (g_1, g_2), g_1 = (g_{11}, g_{12}) \) with

\[
g_{11} = \begin{pmatrix} 1 & 0 \\ u & s \end{pmatrix}, \quad g_{22} = \begin{pmatrix} 1 & v \\ 0 & t \end{pmatrix}, \quad g_2 = \begin{pmatrix} \alpha & \beta \\ \gamma & \delta \end{pmatrix}.
\]

Hence we will consider when such an element actually lies in \( G_{x, O_v/p_v^h} \). Suppose that \( g \) is in the form above and \( gx = x \) in \( V_{O_v/p_v^h} \). We put \( y = (y_1, y_2) = (g_1, 1)x \). Then by computation we have

\[
y_1 = \begin{pmatrix} 0 & t \\ s & * \end{pmatrix}, \quad y_2 = \begin{pmatrix} 1 & v + a_1 t \\ u + a_1 s & * \end{pmatrix}.
\]

Therefore, by comparing the \((1, 1), (1, 2)\) and \((2, 1)\)-entries of \( x_1 \) and \( \alpha y_1 + \beta y_2 \), we have \( \beta = 0 \) and \( s = t = \alpha^{-1} \). Also under the condition \( s = t \), from \( x_1 = \gamma y_1 + \delta y_2 \) we have
δ = 1, u = v and γ = s^{−1}(a_1 − u − a_1s). Under these equations, we have

\[
\begin{pmatrix}
\alpha y_1 + \beta y_2
\end{pmatrix} = \begin{pmatrix}
0 & 1 \\
1 & 2u + a_1s
\end{pmatrix}
\]

\[
\begin{pmatrix}
\gamma y_1 + \delta y_2
\end{pmatrix} = \begin{pmatrix}
1 & a_1 \\
-1 & -u^2 + (2u + a_1s)a_1 - a_1su - a_2s^2
\end{pmatrix}
\]

and therefore we could see that \( gx = x \) if and only if

\[
2u + a_1s = a_1 \quad \text{and} \quad u^2 + a_1su + a_2s^2 = a_2 \quad \text{in} \quad \mathcal{O}_v / p_n^2.
\]

This system is exactly the same as that we considered in [T2, Lemma 4.7] and it has 2\( q_v^{δ_1,v} \) solutions in all.

We are now ready to prove Proposition 7.4. Let \( r_n \) be the reduction map \( \mathcal{G}_{O_v} \to \mathcal{G}_{O_v / p_n^2} \). Then by Lemma 7.9, the set \( \mathcal{K}_v x = \mathcal{G}_{O_v,x} \) is equal to \#(\( G_{O_v / r_n^{-1}(G_{x O_v/p_n^2})} \)) number of disjoint copies of \( D \).

In this section we assume \( v \in \mathfrak{M}_{\kappa} \) and so \( B_v \) is a non-split quaternion algebra of \( k_v \). We briefly recall the algebraic structure of \( B_v \) and prepare the notations to begin with. We take a commutative subalgebra \( F_v \) of \( B_v \) so that \( F_v \) is a quadratic unramified extension of \( k_v \) and henceforth fixed in this section. Let \( \sigma \) denote the non-trivial element of \( \text{Gal}(F_v/k_v) \).

Then for any prime element \( \pi_v \in k_v \), \( B_v \) can be identified with \( F_v \oplus F_v \sqrt{\pi_v} \) as a left vector space of \( F_v \) and the multiplication law is given by \( \sqrt{\pi_v} \alpha = \alpha^\sigma \sqrt{\pi_v} \) for \( \alpha \in F_v \). For \( a \in B_v \), let \( a^\sigma \) be its involution. Then for \( \alpha, \beta \in F_v \), \( (\alpha + \beta \sqrt{\pi_v})^\sigma = \alpha^\sigma - \beta \sqrt{\pi_v} \).

Hence the reduced trace \( T \) and the reduced norm \( N \) of \( B_v \) is given by

\[
T(\alpha + \beta \sqrt{\pi_v}) = \alpha + \alpha^\sigma, \quad N(\alpha + \beta \sqrt{\pi_v}) = \alpha \alpha^\sigma - \pi_v \beta \beta^\sigma,
\]

for \( \alpha, \beta \in F_v \). The map \( u \mapsto \text{ord}_v(N(u)) \) defines a discrete valuation of \( B_v \), and it is well known that \( \mathcal{O}_{B_v} = \{ u \mid |N(u)|_v \leq 1 \}, \mathcal{O}^{x}_{B_v} = \{ u \mid |N(u)|_v = 1 \} \). If we restrict the reduced norm to any quadratic subfield \( L_v \), it coincides with the norm map \( N_{L_v/k_v} \) of the extension \( L_v \). Hence \( \mathcal{O}_{B_v} \cap L_v = \mathcal{O}_{L_v} \) and \( \mathcal{O}^{x}_{B_v} \cap L_v = \mathcal{O}_{L_v}^{x} \). We fix an element \( \theta \in \mathcal{O}_{F_v} \) so that \( \mathcal{O}_{F_v} = \mathcal{O}_v[\theta] \). By computation we have the following.

**Lemma 8.1.** We have

\[
\mathcal{O}_{B_v} = \{ \alpha + \beta \sqrt{\pi_v} \mid \alpha, \beta \in \mathcal{O}_{F_v} \}, \quad \mathcal{O}^{x}_{B_v} = \{ \alpha + \beta \sqrt{\pi_v} \mid \alpha \in \mathcal{O}_{F_v}^{\times}, \beta \in \mathcal{O}_{F_v} \}.
\]

For any quadratic ramified extension \( L_v \) of \( k_v \) contained in \( B_v \), we can also write

\[
\mathcal{O}_{B_v} = \{ \alpha + \beta \theta \mid \alpha, \beta \in \mathcal{O}_{L_v} \}, \quad \mathcal{O}^{x}_{B_v} = \{ \alpha + \beta \theta \mid \alpha, \beta \in \mathcal{O}_{L_v}, \alpha \in \mathcal{O}_{L_v}^{\times} \text{ or } \beta \in \mathcal{O}_{L_v}^{\times} \},
\]

and moreover, by changing \( \theta \) if necessary, the multiplication law is given by \( \theta \alpha = \alpha^\sigma \theta \) for \( \alpha \in L_v \) where \( \tau \) denote the non-trivial element of \( \text{Gal}(L_v/k_v) \).
As in Section 7, we can and shall regard \( K_v \) as the set of \( \mathcal{O}_v \)-rational points \( G_{\mathcal{O}_v} \) of a group scheme \( G \) defined over \( \mathcal{O}_v \) acting on a module scheme \( V \) also defined over \( \mathcal{O}_v \). For example, the group \( G_{\mathcal{O}_v} = \mathcal{O}_{B_v}^* \times (\mathcal{O}_{B_v})^* \times \text{GL}(2)_{\mathcal{O}_v} \) acts on the module \( V_{\mathcal{O}_v} = \mathcal{O}_{B_v} \oplus \mathcal{O}_{B_v}^* \). Then any standard orbital representative \( x \) is an element of \( V_{\mathcal{O}_v} \) and as in Section 7, we regard the stabilizer \( G_x \) as a group scheme defined over \( \mathcal{O}_v \). If \( x \in V_{\mathcal{O}_v} \), then \( F_x(v) \in \text{Sym}^2 \mathcal{O}_v^2 \). We also regard \( \text{Sym}^2 \mathcal{O}_v^2 \) as a module scheme over \( \mathcal{O}_v \) and the map \( x \mapsto F_x(v) \) as a morphism of schemes. We continue to use the notation \( r_i \) defined in Section 7. Further, for any quadratic extension \( L_v \) of \( k_v \), we use the abbreviation \( \mathcal{O}_{L_v}/p^i_v \) for \( r_i(\mathcal{O}_{L_v}) \), where we regard \( \mathcal{O}_{L_v} \) as a scheme over \( \mathcal{O}_v \). For example, 

\[
\mathcal{O}_{L_v}/p^i_v = (\mathcal{O}_v/p^i_v)[\theta] = \{ \alpha + \beta \theta \mid \alpha, \beta \in \mathcal{O}_v/p^i_v \}.
\]

In this section, we will express \( g \in G_{k_v} \) as

\[
g = (g_{11}, g_{12}, g_{22}), \quad g_2 = \begin{pmatrix} p & q \\ r & s \end{pmatrix}.
\]

**Proposition 8.2.** Let \( x \) be one of the standard representative. Then there exist an injective homomorphism \( (\mathcal{O}_{k_v(x)}^*)^2 \to G_x \) as a group scheme over \( \mathcal{O}_v \).

**Proof.** Let \( x = (1, u) \). We construct the injective homomorphism

\[
\psi_{u,R} : \{(\mathcal{O}_{k_v(x)} \otimes R)^*\}^2 \longrightarrow G_x R
\]

for any commutative \( \mathcal{O}_v \)-algebra \( R \).

We put \( \tilde{R}(x) = \mathcal{O}_{k_v(x)} \otimes R \). Note that \( \tilde{R}(x) = R[u] \) is a subalgebra of \( \mathcal{O}_{B_v} \otimes R \) and is commutative. Since \( \{1, u\} \) is a \( \mathcal{O}_v \)-basis of \( \mathcal{O}_v[u] \), this is also an \( R \)-basis of \( \tilde{R}(x) \). Let \( s_1, s_2 \in \tilde{R}(x)^* \). Then \( \{s_1s_2, s_1s_2u\} \) is also an \( R \)-basis of \( \tilde{R}(x) \), and so there exists a unique element \( g = g_{s_1s_2} \in \text{GL}(2)_R \) such that \( g^t(s_1s_2, s_1s_2u) = ^t(1, u) \). Hence

\[
\psi_{u,R} : (s_1, s_2) \longrightarrow (s_1, s_2, g_{s_1s_2})
\]

gives an injective homomorphism from \( (\tilde{R}(x)^*)^2 \) to \( G_x R \), and as in the proof of Proposition 7.7, we can regard this map as the induced one from the morphism of schemes. \( \square \)

Let \( N_x \) denote the image of this homomorphism, which is a subgroup of \( G_x \).

**Proposition 8.3.** Let \( x \in V_{k_v}^{ss} \) be one of the standard representatives. Then

\[
\int_{K_v \cap G_{k_v}^0} dq_x'' = 1.
\]

**Proof.** Let \( x = (1, u) \) be a standard representative. We claim that \( \psi_u^{-1}(K_v \cap G_{k_v}^0) = (\mathcal{O}_v[u]^*)^2 \) where \( \psi_u \) is defined in Section 5. The inclusion \( \psi_u^{-1}(K_v \cap G_{k_v}^0) \subset (\mathcal{O}_{k_v[u]}^*)^2 \) follows from \( \mathcal{O}_{B_v}^* \cap k_v(x) = \mathcal{O}_{k_v(x)}^* \). Let \( s_1, s_2 \) be elements of \( \mathcal{O}_{k_v[u]}^* \). Then since \( \{s_1s_2, s_1s_2u\} \) also forms a \( \mathcal{O}_v \)-basis of \( \mathcal{O}_{k_v[u]}^* \), we have \( g_{s_1s_2} \in \text{GL}(2)_{\mathcal{O}_v} \). This shows the reverse inclusion. Now the proposition follows from the definition of \( dq_x'' \). \( \square \)

The following simple observation will be sometimes useful in the concrete calculations below. This easily follows from Proposition 3.6 and the properties of the norm map of the quadratic extension of local fields.
Lemma 8.4. We define 
\[ \zeta : G_{k_v} \rightarrow \mathbb{Z}^2, \quad \text{as} \quad g \mapsto (\text{ord}_v(N(g_{11})), \text{ord}_v(N(g_{12}))). \]
Then the image \( \zeta(G_{x, k_v}) \) is \( (2\mathbb{Z})^2 \) if \( x \) corresponds to the quadratic unramified extension and \( \mathbb{Z}^2 \) if \( x \) corresponds to a quadratic ramified extension.

From now on we consider the case \( k_v(x) \) is unramified and ramified separately. We first consider the former case. Till Proposition 8.10, we assume \( x \) has type \((\text{rm ur})\). We note that in this case the polynomial \( (F_x(v) \mod p_v) \in \text{Sym}^2(\mathcal{O}_v/p_v)^2 \) is irreducible and especially \( F_x(0, 1) \in \mathcal{O}_v^x \). By changing the choice of the included unramified extension \( F_v \) and the generator of the integer ring \( \theta \) if necessary, we may assume \( x = (1, \theta) \). Let us write \( \theta = a + b\theta^\sigma, a \in \mathcal{O}_v, b \in \mathcal{O}_v^x \) and set \( \tau_\theta = \left( \begin{array}{cc} 1 & 0 \\ a & b \end{array} \right) \in \text{GL}(2)\mathcal{O}_v \). We fix a prime element \( \pi_v \in k_v \) and put \( \tau_v = (\sqrt{\pi_v^{-1}}, \sqrt{\pi_v}, \tau_\theta) \), which then generates the non-trivial class of \( G_{x, k_v}/G_{x, k_v}^0 \).

Lemma 8.5. Let \( x \) have type \((\text{rm ur})\). Then \( K_v G_{x, k_v} = K_v G_{x, k_v}^0 \Pi \tau_v K_v G_{x, k_v}^0 \).

Proof. Since \( \text{ord}_v(N(\sqrt{\pi_v^{-1}})) = \text{ord}_v(\pi_v^{-1}) = -1 \), we have \( \tau_v \notin K_v G_{x, k_v}^0 \) as a consequence of Lemma 8.4. Now the lemma follows since \( \tau_x \) is a normalizer of the group \( K_v \).

Lemma 8.6. Let \( x \) have type \((\text{rm ur})\). Then \( \varepsilon_v(x) = 2^{-1}\text{vol}(K_v x) \).

Proof. By the definition of \( dg_{x,v}' \), Proposition 8.3 and Lemma 8.5,
\[
1 = \int_{K_v} dg_v = \int_{K_v G_{x, k_v}} dg'_{x,v} \int_{K_v \cap G_{x, k_v}} dg''_{x,v} = \int_{K_v G_{x, k_v}} dg'_{x,v} = \frac{1}{2} \int_{K_v G_{x, k_v}} dg'_{x,v}.
\]
Hence, if we let \( \Phi_v \) be the characteristic function of \( K_v x \), by Definition 6.2 we have
\[
2 = \int_{K_v G_{x, k_v}} dg'_{x,v} = \int_{G_{k_v}/G_{x, k_v}} \Phi_v(g'_{x,v} x) dg'_{x,v} = b_{x,v} \int_{G_{k_v}/G_{x, k_v}} \Phi_v(y)|P(y)|_{v}^{-2} dy = b_{x,v} \int_{K_v x} |P(y)|_{v}^{-2} dy.
\]
Since \( |P(y)|_{v} = |P(x)|_{v} \) for all \( y \in K_v x \), we have \( \varepsilon_v(x) = |P(x)|_{v}^2 b_{x,v}^{-1} = 2^{-1}\text{vol}(K_v x) \). \( \square \)

We will compute \( \text{vol}(K_v x) \). In the case \( k_v(x) \) is unramified extension, it is enough to consider the congruence relation of modulo \( p_v \).

Definition 8.7. We define \( \mathcal{D} = \{ y \in V_{O_v} \mid y \equiv x (p_v) \} \).

Lemma 8.8. We have \( \mathcal{D} \subset K_v x \).

Proof. Let \( y \in \mathcal{D} \). Since \( (F_y(v) \mod p_v) = (F_x(v) \mod p_v) \in \text{Sym}^2(\mathcal{O}_v/p_v)^2 \), the splitting field of \( F_y(v) \) is the quadratic unramified extension. Hence, \( y \in G_{k_v} x \). Let \( y = gx, g = (g_{11}, g_{12}, g_2) \in G_{k_v} \). Note that
\[
|\chi(g)|_{v} = |N(g_{11})N(g_{12})\det(g_2)|_{v}^2 = 1
\]
since \(|P(y)|_v = |P(x)|_v\). We will show that \(g \in K_v G_{x(k)}\). By Lemma 8.4, multiplying an element of \(G_{x(k)}^\ast\) and \(\tau_x\) if necessary, we may assume that \(g\) satisfies either one of the following conditions.

(A) \(|N(g_{11})|_v = |N(g_{12})|_v = 1\), (hence \(|\det(g_2)|_v = 1\).

(B) \(|N(g_{11})|_v = q_v, |N(g_{12})|_v = 1\), (hence \(|\det(g_2)|_v = q_v^{-1}\)).

From the definition of the representation we have

\[ F_y(v) = N(g_{11})N(g_{12})F_x(vg_2) \]

and hence

\[ F_y(1, 0) = N(g_{11})N(g_{12})N_{F_v/k_v}(p + q\theta), \]
\[ F_y(0, 1) = N(g_{11})N(g_{12})N_{F_v/k_v}(r + s\theta). \]

On the other side, since \(F_x(v) \equiv F_y(v) (p_v)\), both \(F_y(1, 0)\) and \(F_y(0, 1)\) are units of \(O_v\). If \(g\) satisfies the condition (B), then \(\text{ord}_v(N_{F_v/k_v}(p + q\theta))\) must be 1. But this is a contradiction since \(F_{v}/k_v\) is the quadratic unramified extension. Hence we assume \(g\) satisfies the condition (A). Then both \(N_{F_v/k_v}(p + q\theta)\) and \(N_{F_v/k_v}(r + s\theta)\) are elements of \(O_v\) and so \(p, q, r, s \in O_v\). Since \(|\det(g_2)|_v = 1\), we conclude \(g_2 \in \text{GL}(2)_{O_v}\). Thus \(g \in K_v\) and the lemma follows.

**Lemma 8.9.** We have \(G_{x O_v/p_v} = N_{x O_v/p_v}\).

**Proof.** In the proof of this lemma, if we have \(y \equiv y' (p_v)\) for any two \(O_v\)-rational points of an \(O_v\)-scheme, we drop \(p_v\) and simply write \(y \equiv y'\) instead. Clearly \(G_{x O_v/p_v} \supset N_{x O_v/p_v}\) and hence we prove the reverse inclusion. Let \(g = (g_{11}, g_{12}, g_2) \in G_{x O_v/p_v}\). We choose representatives of \(g_{11}, g_{12}, g_2\) in \(G_{11k_v}, G_{12k_v}, G_{2k_v}\) and use the same notation for them. By Lemma 8.1 and Proposition 8.2, multiplying an element of \(N_{x O_v/p_v}\) if necessary, we assume that

\[ g_{11} = 1 + \alpha\sqrt{\pi_v}, \quad g_{12} = 1 + \beta\sqrt{\pi_v}, \]

where \(\alpha, \beta \in O_{F_v}\). Put \(y = (y_1, y_2) = (g_{11}, g_{12}, 1)x\). Then by computation we have

\[ y_1 \equiv 1 + (\alpha + \beta)\sqrt{\pi_v}, \quad y_2 \equiv \theta + (\alpha\theta^2 + \beta\theta)\sqrt{\pi_v}. \]

Since \(\iota(y_1, y_2) \equiv g_2^{-1} \iota(1, \theta)\) and \(1, \theta \in O_{F_v}\), we have \(\iota_1(y_1), \iota_1(y_2) \in O_{F_v}/p_v\). Hence \(\alpha + \beta \equiv 0, \alpha\theta^2 + \beta\theta \equiv 0\). Then since \(\theta - \theta^2 \in O_{F_v}^\ast\), we have \(\alpha \equiv \beta \equiv 0\) and hence \(g_{11} \equiv g_{12} \equiv 1\). Then \(g_2 \equiv I_2\) and this shows \(G_{x O_v/p_v} \subset N_{x O_v/p_v}\). \(\square\)

**Proposition 8.10.** Let \(x\) has type \((\text{rm ur})\). Then \(\varepsilon_v(x) = 2^{-1}(1 - q_v^{-2})(1 - q_v^{-1})\).

**Proof.** By Lemma 8.8, the set \(K_v x = G_{O_v} x\) is equal to \(#(G_{O_v}/\tau_1^{-1}(G_{x O_v/p_v}))\) number of disjoint copies of \(D\). Since

\[ G_{O_v}/\tau_1^{-1}(G_{x O_v/p_v}) \equiv G_{O_v/p_v}/G_{x O_v/p_v}, \]

by Lemma 8.9 we have

\[ \text{vol}(K_v x) = \text{vol}(D) \cdot \frac{\#(G_{O_v/p_v})}{\#(N_{x O_v/p_v})} = q_v^{-8} \cdot \frac{(q_v^2(q_v^2 - 1))^2 \cdot (q_v^2 - 1)(q_v^2 - q_v)}{(q_v^2 - 1)^2} = (1 - q_v^{-2})(1 - q_v^{-1}). \]

Now the proposition follows from Lemma 8.6. \(\square\)
Next we consider orbits corresponding to quadratic ramified extensions. From now on
to Proposition 8.15, we assume \( x \) has type (rm rm). Let \( x = (1, \varpi) \).
Then \( \varpi \) is a prime
element of \( L_v = k_v(\varpi) \cong k_v(x) \). Let \( \tau \) denote the non-trivial element of \( \text{Gal}(L_v/k_v) \).
Then \( F_x(v_1, v_2) = (v_1 + \varpi v_2)(v_1 + \varpi^\tau v_2) \) is an Eisenstein polynomial
and \( (\varpi - \varpi^\tau)^2 \in O_v \)
generates the relative discriminant \( \Delta_{k_v(x)/k_v} = p_v^\delta_{x,v} \).

**Lemma 8.11.** Let \( x \) have type (rm rm). Then \( \varepsilon_v(x) = \text{vol}(\mathcal{K}_v,x) \).

**Proof.** We can prove this lemma exactly the same as Lemma 8.6. Only the difference is
that we can take the generator \( \tau \) of \( G_{x,k_v}/G_{x,k_v}^\circ \) in Proposition 3.7 from \( \mathcal{K}_v \)
and hence \( \mathcal{K}_v G_{x,k_v} = \mathcal{K}_v G_{x,k_v}^\circ \). \( \square \)

We put \( n = \delta_{x,v} + 2m_v + 1 \). As in the case \( x \) has type (ur rm) in Section 7, we consider
the congruence relation of modulo \( p_v^n \) to compute \( \text{vol}(\mathcal{K}_v,x) \).

**Definition 8.12.** We define \( \mathcal{D} = \{ y \in V_{O_v} \mid y \equiv x(p_v^n) \} \).

**Lemma 8.13.** We have \( \mathcal{D} \subset \mathcal{K}_v x \).

**Proof.** Let \( y \in \mathcal{D} \). Then as in the proof of Lemma 7.9, we have \( y \in G_{k_v,x} \).
The rest of argument is similar to that of Lemma 8.8 and we shall be brief. Let \( y = gx, g \in G_{k_v} \).
By Lemma 8.4, multiplying an element of \( G_{x,k_v}^\circ \) if necessary, we may assume that
\[ |N(g_{11})|_v = |N(g_{12})|_v = 1, \quad \text{and hence} \quad |\text{det}(g_2)|_v = 1. \]
Since \( F_y(v) \in \text{Sym}^2 O_v^2 \), we have
\[
\begin{align*}
F_y(1, 0) &= N(g_{11})N(g_{12})N_{k_v(x)/k_v}(p + q\varpi) \in O_v, \\
F_y(0, 1) &= N(g_{11})N(g_{12})N_{k_v(x)/k_v}(r + s\varpi) \in O_v.
\end{align*}
\]
Hence both \( N_{k_v(x)/k_v}(p + q\varpi) \) and \( N_{k_v(x)/k_v}(r + s\varpi) \) are elements of \( O_v \) and so \( p, q, r, s \in O_v \). Since \( |\text{det}(g_2)|_v = 1 \),
we conclude \( g_2 \in \text{GL}(2)_{O_v} \). Hence \( g \in \mathcal{K}_v \) and the lemma follows. \( \square \)

**Lemma 8.14.** We have \( |G_{x,O_v/p_v^n} : N_x O_v/p_v^n_\mathcal{K}_v| = 2q_v^\delta_{x,v} \).

**Proof.** We shall count the number of elements of the right coset space \( N_x O_v/p_v^n \backslash G_{x,O_v/p_v^n_\mathcal{K}_v} \).
Let \( g' \in G_{x,O_v/p_v^n_\mathcal{K}_v} \). By Lemma 8.1 and Proposition 8.2, the right coset
\( N_x O_v/p_v^n \backslash g' \) contains an element \( g = (g_1, g_2) \) with \( g_1 = \langle g_{11}, g_{12} \rangle \)
of one of the following forms
\[
\begin{align*}
(A) \quad g_{11} &= 1 + \alpha \theta, g_{12} = 1 + \beta \theta, \\
(B) \quad g_{11} &= 1 + \alpha \theta, g_{12} = \beta + \theta, \\
(C) \quad g_{11} &= \alpha + \theta, g_{12} = 1 + \beta \theta, \\
(D) \quad g_{11} &= \alpha + \theta, g_{12} = \beta + \theta,
\end{align*}
\]
where \( \alpha, \beta \in O_{k_v}/p_v^n_\mathcal{K}_v \), and also they are determined by the coset \( N_x O_v/p_v^n_\mathcal{K}_v \).
We will count the possibilities for \( g \) for each of the above cases. We choose representatives
of \( \alpha, \beta \) in \( O_{k_v}/p_v^n_\mathcal{K}_v \) and use the same notation.

From now on we consider the case \( v \notin \mathcal{M}_{dy} \) and \( v \in \mathcal{M}_{dy} \) separately. We first consider
the case \( v \notin \mathcal{M}_{dy} \). In this case \( \delta_{x,v} = 1 \) and \( n = 2 \). Also since \( 2 \in O_v^\times \),
by changing \( \theta \) and \( x = (1, \varpi) \) if necessary, we may assume that \( \theta^2 \in O_v^\times \) and \( \varpi^\tau = -\varpi \). Let
\( y = (y_1, y_2) = (g_1, 1)x \).

First consider the case of (A). By computation we have
\[
y_1 = 1 + \alpha \beta^\tau\theta^2 + (\alpha + \beta)\theta, \quad y_2 = \varpi(1 - \alpha \beta \theta^2) + \varpi(\beta - \alpha)\theta.
\]
Since \( t(y_1, y_2) \equiv g_2^{-1}t(1, \varpi)(p_v^2) \), we have \( v_2(y_1), v_2(y_2) \in \mathcal{O}_{L_v}/p_v^2 \). Hence
\[
\alpha + \beta \equiv 0 \pmod{p_v^2} \quad \text{and} \quad \varpi(\beta - \alpha) \equiv 0 \pmod{p_v^2}.
\]
It is easy to see that there are \( q_v \) possibilities for pairs of \((\alpha, \beta)\) modulo \( p_v^2 \) satisfying the above condition. On the other hand, for each of these pairs, we have \( y_1 \equiv 1 \pmod{p_v^2} \) and \( y_2 \equiv \varpi \pmod{p_v^2} \), and hence \((1, g_2)y \equiv x \pmod{p_v^2}\) if and only if \( g_2 \equiv I_2(p_v^2) \).

Next we consider the case \((B)\). In this case, we have
\[
y_1 = \beta + \alpha \theta^2 + (1 + \alpha \beta^\tau)\theta, \quad y_2 = \varpi(\beta - \alpha \theta^2 + \varpi(1 - \alpha \beta^\tau)\theta).
\]
Again since \( t(y_1, y_2) \equiv g_2^{-1}t(1, \varpi) \pmod{p_v^2} \), we have \( v_2(y_1), v_2(y_2) \in \mathcal{O}_{L_v}/p_v^2 \). Hence
\[
1 + \alpha \beta^\tau \equiv 0 \pmod{p_v^2} \quad \text{and} \quad \varpi(1 - \alpha \beta^\tau) \equiv 0 \pmod{p_v^2},
\]
but this is impossible since \( 2 \in \mathcal{O}_v^\times \). Hence any right coset of \( G_x \mathcal{O}_v/p_v^n \) does not contain elements of the form \((B)\).

The remaining two cases are similar. We can see that there are no possibilities for \( g \) of the form \((C)\) and \( q_v \) possibilities for \( g \) of the form \((D)\). These give the desired description for \( v \notin \mathfrak{M}_{dy} \).

We next consider the case \( v \in \mathfrak{M}_{dy} \). In this case we may choose \( \theta \) so that \( \theta^2 = \theta + c \) for some \( c \in \mathcal{O}_v^\times \). Again we let \( y = (y_1, y_2) = (g_1, 1)x \).

Let us consider the case \( g \) is of the form \((A)\). By computation we have
\[
y_1 = 1 + c\alpha \beta^\tau + (\alpha + \beta + \alpha \beta^\tau)\theta, \quad y_2 = (\varpi + c\alpha \beta^\tau \varpi^\tau) + (\alpha \varpi^\tau + \beta \varpi + \alpha \beta^\tau \varpi^\tau)\theta.
\]
Hence as before, we need
\[
\beta + \alpha + \alpha \beta^\tau \equiv 0 \pmod{p_v^n} \quad \text{and} \quad \beta \varpi + \varpi^\tau(\alpha + \alpha \beta^\tau) \equiv 0 \pmod{p_v^n}.
\]
Under the first equation, the second equation is equivalent to \( \beta(\varpi - \varpi^\tau) \equiv 0 \pmod{p_v^n} \). If we write \( \beta = \beta_1 + \beta_2 \varpi \) where \( \beta_1, \beta_2 \in \mathcal{O}_v/p_v^n \), this equation holds if and only if
\[
\begin{cases}
\beta_1, \beta_2 \in p_v^{n-\delta_{x,v}/2}/p_v^n, \\
\beta_1 \in p_v^{n-m_v}/p_v^n, \quad \beta_2 \in p_v^{n-m_v-1}/p_v^n, \quad 2 \leq \delta_{x,v} \leq 2m_v.
\end{cases}
\]
Hence there are \( q_v^{\delta_{x,v}} \) possibilities for \( \beta \). Also for each of these \( \beta, 1 + \beta^\tau \) is invertible and so \( \alpha \) is uniquely determined by the first equation.

Then for each of these pairs \((\alpha, \beta)\), we have \( y_1 \equiv 1 \pmod{p_v^n} \) and \( y_2 \equiv \varpi \pmod{p_v^n} \), and hence \((1, g_2)y \equiv x \pmod{p_v^n}\) is equivalent to \( g_2 \equiv I_2(p_v^n) \). Hence there are \( q_v^{\delta_{x,v}} \) choice of \( g \) of the form \((A)\) in all.

The remaining three cases are similar. There are no possibilities for \( g \) of the form \((B)\) and \((C)\), and \( q_v^{\delta_{x,v}} \) choice of \( g \) of the form \((D)\). We have thus proved the lemma.

**Proposition 8.15.** Suppose the standard representative \( x \) has type \((rm \ ur)\). Then \( \varepsilon_v(x) = 2^{-1}|\Delta_{k_v(x)/k_v}|-1(1 + q_v^{-1})(1 - q_v^{-2})^2 \).

**Proof.** By Lemma 8.13, the set \( \mathcal{K}_v x = G_{\mathcal{O}_v}x \) is equal to \( \#(G_{\mathcal{O}_v}/v_n^{-1}(G_{x \mathcal{O}_v}/p_v^n)) \) number of disjoint copies of \( \mathcal{D} \). Since
\[
G_{\mathcal{O}_v}/v_n^{-1}(G_{x \mathcal{O}_v}/p_v^n) \cong G_{\mathcal{O}_v}/p_v^n / G_{x \mathcal{O}_v}/p_v^n,
\]
by Lemma 8.14 we have
\[
\text{vol}(\mathcal{K}_v x) = \text{vol}(\mathcal{D}) \cdot \frac{\#(G_{\mathcal{O}_v/p_v})}{2q_v^{s_{x,v}} \cdot \#(N_{x_0\mathcal{O}_v/p_v})} = q_v^{-sn} \cdot \left\{ q_v^{4n}(1 - q_v^{-2})^2 \cdot q_v^{4n}(1 - q_v^{-2})(1 - q_v^{-2}) \right\}
\]
\[
= 2^{-1}q_v^{-|x'_{v}(1 + q_v^{-1})(1 - q_v^{-2})^2}.
\]
Now the proposition follows from Lemma 8.11. \qed

9. Computation of the local densities at infinite places

In this section, we compute \( \varepsilon_v(x) \) at infinite places. We assume \( v \in \mathcal{M}_\infty \) in this section. For the unramified places, the values were already computed in [KY2], and the remaining case is for places \( v \in \mathcal{M}_\mathbb{B} \cap \mathcal{M}_\infty \). Note that this case does not occur if \( v \in \mathcal{M}_\mathbb{C} \) and that for these places \( V_s \) is the single \( G_{k_v} \) orbit. In the computation we need to know the \( 8 \times 8 \) Jacobian determinant associated with the map \( g \mapsto gx \) in some coordinate system. This calculation was carried out using the MAPLE computer algebra package [M].

Proposition 9.1. Let \( v \in \mathcal{M}_\mathbb{B} \cap \mathcal{M}_\infty \). Then \( \varepsilon_v(x) = \pi^3/2 \).

Proof. Since \( |P(x)|_v = 1 \) if \( x \) is a standard representative, \( \varepsilon_v(x) = b_{x,v}^{-1} \). We proved in Proposition 6.3 that if \( y \in \mathcal{G}_{k_v} \) then \( b_{y,v} = b_{x,v} \). Therefore we will compute \( b_{x,v} \) for \( x = (1, \sqrt{-1}) \) instead of the standard representative.

We define
\[
\iota: \mathbb{C}^\times \rightarrow \text{GL}(2)_\mathbb{R} \quad \text{as} \quad t \mapsto \begin{pmatrix} \Re(t) & \Im(t) \\ -\Im(t) & \Re(t) \end{pmatrix},
\]
which is an injective homomorphism. Then the isomorphism in Proposition 3.6 can be expressed as
\[
\psi_{\sqrt{-1}}: (\mathbb{C}^\times)^2 \rightarrow \mathcal{G}^o_{x,\mathbb{R}}, \quad (s_1, s_2) \mapsto (s_1, s_2, \iota(s_1s_2)^{-1}).
\]
Recall that the measure \( dq''_{x,v} \) on \( \mathcal{G}^o_{x,\mathbb{R}} \) was defined as the pushout measure of \( d^o s_1d^o s_2 \).

Let \( \mathbb{H}' = \{(u + j)s \mid u \in \mathbb{C}, s \in \mathbb{C}^\times \} \) and \( \mathcal{D} = \mathbb{H}' \times \mathbb{H}' \times \text{GL}(2)_\mathbb{R} \). Then \( \mathcal{D} \) is an open dense subset of \( \mathcal{G}_{k_v} \) and we will compare the measures on this set. Any element \( g \) of \( \mathcal{D} \) can be written uniquely as \( g = g'_{x,v}g''_{x,v} \) where
\[
g'_{x,v} = (u_1 + j, u_2 + j, g_3), \quad g''_{x,v} = (s_1, s_2, \iota(s_1s_2)^{-1})
\]
with
\[
u_1, u_2 \in \mathbb{C}, \quad g_3 = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \in \text{GL}(2)_\mathbb{R}, \quad \text{and} \quad s_1, s_2 \in \mathbb{C},
\]
and when \( g_{x,v} \) is written in this form, \( \Re(x_1), \Im(x_1) \) and \( a_{ij} \) for \( i, j = 1, 2 \) may be regarded as coordinates on \( \mathcal{G}_{x,\mathbb{R}}/\mathcal{G}^o_{x,\mathbb{R}} \). An easy computation shows that
\[
dg'_{x,v} = \frac{1}{\pi^3} \cdot \frac{du_1}{(|u_1|_\mathbb{C} + 1)^2} \cdot \frac{du_2}{(|u_2|_\mathbb{C} + 1)^2} \cdot d\mu(g_3)
\]
with respect to these coordinates. Note that we are setting \( du_i \) twice the Lebesgue measure on \( \mathbb{C} \) as usual and that we defined \( d\mu(g_3) \) to be \( da_{11}da_{12}da_{21}da_{22}/|\det(g_3)|^2_{\mathbb{R}} \).

We consider the Jacobian determinant of the map
\[
\mathcal{G}_{x,\mathbb{R}}/\mathcal{G}^o_{x,\mathbb{R}} \rightarrow \mathcal{G}_{x,\mathbb{R}}, \quad g'_{x,v} \mapsto g'_{x,v}x.
\]
To do this, we choose there respective $\mathbb{R}$-coordinates. For $G_{x,R}/G_{x,R}^o$, we regarded $\Re(x_i)$, $\Im(x_i)$ and $a_{ij}$ for $i, j = 1, 2$ as its $\mathbb{R}$-coordinates. For $G_{x,R}$, which is an open subset of $V_{R} = \mathbb{H} \oplus \mathbb{H}$, by expressing elements of $G_{x,R}$ as

$$y = (y_1 + y_2j, y_2 + y_2j), \quad y_{ij} \in \mathbb{C} \ (i, j = 1, 2),$$

we regard $\Re(y_{ij}), \Im(y_{ij})$ for $i, j = 1, 2$ as $\mathbb{R}$-coordinates of $G_{x,R}$. Then with respect to the coordinate systems above, the Jacobian determinant of the map is found to be

$$4(|u_1|c + 1)^2(|u_2|c + 1)^2 \det(g_3)\frac{1}{2}_R$$

by using MAPLE [M]. Note that this map is a double cover since $[G_{x,R} : G_{x,R}^o] = 2$. As $P(g'_{x,v}) = \chi(g'_{x,v})P(x)$ and

$$|\chi(g'_{x,v})|_R = (|u_1|c + 1)^2(|u_2|c + 1)^2 \det(g_3)\frac{1}{2}_R, \quad |P(x)|_R = 4,$$

it follows that the pullback measure of $dy/|P(y)|_R^2$ to $G_{x,R}/G_{x,R}^o$ is

$$\frac{1}{2} \frac{du_1}{(|u_1|c + 1)^2} \frac{du_2}{(|u_2|c + 1)^2} \cdot d\mu(g_3).$$

We note that we chose the measure $dy$ on $V_{R}$ to be $2^4$ times to that of product of Lebesgue measures $\prod_{i,j} |d\{\Re(y_{ij})\}d\{\Im(y_{ij})\}|$. Comparing this measure and $dg'_{x,v}$, we have $b_{x,v} = 2/\pi^3$ and hence the proposition follows. \hfill $\square$

Combining [KY2, Propositions 5.2, 5.4] and the above proposition, we obtain the following.

**Proposition 9.2.** Assume $v \in \mathfrak{M}_\infty$. Let $x \in V_{k_v}$ be one of the standard representatives.

1. If $v \in \mathfrak{M}_R$ then $\varepsilon_v(x) = \pi^3/2$ for any type of the standard representative.
2. If $v \in \mathfrak{M}_C$ then $\varepsilon_v(x) = 4\pi^3$.

All of these finish the necessary preparations from local theory and we are now ready to go back to the adelic situation.

10. **The mean value theorem**

In this section, we will deduce our mean value theorem by putting together the results we have obtained before. We will see in Proposition 10.3 that the global zeta function is approximately the Dirichlet generating series for the sequence $\mathcal{C}_L^o$ for quadratic extensions $L$ of $k$ which are embeddable into $\mathcal{B}$. If it were exactly this generating series, the Tauberian theorem would allow us to extract the mean value of the coefficients from the analytic behavior of this series. However, our global zeta function contains an additional factor in each term. We will surmount this difficulty by using the technique called the filtering process, which was originally formulated by Datskovsky-Wright [DW2].

Let $x \in V_{k_v}$. We define measures $dg'_{x}$ and $dg''_{x}$ on $G_{x,k}^o$ and $G_{x,k}/T_A$ to be $dg''_{x} = \prod_{v \in \mathfrak{R}}dg''_{x,v}$ and $dg'_{x} = \prod_{v \in \mathfrak{R}}dg'_{x,v}$, where we defined $dg''_{x,v}$ and $dg''_{x,v}$ in Section 5. We choose a left invariant measure on $G_{k}/G_{x,k}^o$. Since $G_{x}$ is isomorphic to $(\text{GL}(1)_{k(x)})^2$ as an algebraic group over $k$, the first Galois cohomology set $H^1(k', G_{x})_{\text{et}}$ is trivial for any field $k'$ containing $k$. This implies that the set of $k'$-rational point of $G_{k}/G_{x,k}^o$ coincides with $(G/G_{x,k}^o)_{k'}$. Therefore $G_{k}/G_{x,k} = (G/G_{x,k}^o)_{k}$. Hence if we let $dg''_{x} = \prod_{v}dg''_{x,v}$ (we defined $dg''_{x,v}$ in Section 6), then this defines an invariant measure on $G_{k}/G_{x,k}^o$. We have $dg = dg'_{x}dg''_{x}$ since $dg_v = dg'_{x,v}dg''_{x,v}$, for all $v$, and hence $\widetilde{\mu} = \widetilde{\mu}' \widetilde{\mu''}$.

We first determine the volume of $G_{x,k}/T_A G_{x,k}^o$ under $d\bar{g}'_{x}$, which is the weighting factor of the Dirichlet series arising from our global zeta function.
Proposition 10.1. Suppose $x \in V_{k}^{ss}$. Then the volume of $G_{x,k}^{o}/\tilde{T}_{\chi}G_{x,k}^{o}$ with respect to the measure $dg''_{x}$ is $(2\mathcal{C}_{k(x)}/\mathcal{C}_{k})^{2}$.

Proof. Identifying $\tilde{T}$ with $(\text{GL}(1)_{k})^{2}$ and $G_{x}^{o}$ with $(\text{GL}(1)_{k(x)})^{2}$, we define $\tilde{T}_{\chi}^{0} = (\mathbb{A}_{k(x)})^{2}$ and $G_{x,k}^{o} = (\mathbb{A}_{k(x)})^{2}$. Let $d^{x}T_{\chi}$ and $dg''_{x}$ be the measures on $\tilde{T}_{\chi}$ and $G_{x,k}^{o}$, such that $dg''_{x} = d^{x}\lambda_{1}d^{x}\lambda_{2}dg''_{x}$, $d^{x}T_{\chi} = d^{x}\lambda_{1}d^{x}\lambda_{2}d^{x}T_{\chi}^{0}$ for

$$g''_{x} = (\lambda_{1}(x),\lambda_{2}(x))g''_{x}, \quad \tilde{t} = (\lambda_{1}(x),\lambda_{2}(x))\tilde{t}^{0}.$$ 

Note that if $\lambda \in \mathbb{R}_{+}$ then the absolute value of $\Delta_{k}$ as an idele of $k(x)$ is $\lambda^{2}$. Therefore, $dg''_{x} = 2^{2}d^{x}\lambda_{1}d^{x}\lambda_{2}dg''_{x}$ for $g''_{x} = (\lambda_{1}(x),\lambda_{2}(x))g''_{x}$. Since $dg''_{x} = d^{x}T_{\chi}dg''_{x}$ this implies that $2^{2}dg''_{x} = d^{x}T_{\chi}dg''_{x}$. Therefore

$$2^{2}\int_{G_{x,k}^{o}/G_{x,k}^{o}}dg''_{x} = \int_{G_{x,k}^{o}/G_{x,k}^{o}}d^{x}T_{\chi}^{0}\int_{\tilde{T}_{\chi}^{0}/\tilde{T}_{\chi}}d^{x}T_{\chi}^{0}$$

$$= \text{vol}(G_{x,k}^{o}/\tilde{T}_{\chi}^{0}G_{x,k}^{o})\int_{\tilde{T}_{\chi}^{0}/\tilde{T}_{\chi}}d^{x}T_{\chi}^{0}.$$ 

Since

$$\int_{G_{x,k}^{o}/G_{x,k}^{o}}dg''_{x} = \mathcal{C}_{k(x)}^{2} \quad \text{and} \quad \int_{\tilde{T}_{\chi}^{0}/\tilde{T}_{\chi}}d^{x}T_{\chi}^{0} = \mathcal{C}_{k}^{2},$$ 

this proves the proposition. \qed

For $x \in V_{k}^{ss}$ and $\Phi = \bigotimes \Phi_{v} \in \mathcal{S}(V_{k})$ we define the orbital zeta function of $x$ to be $Z_{x}(\Phi, s) = \prod_{v \in \mathfrak{m}} Z_{x,v}(\Phi_{v}, s)$. Note that we defined $Z_{x,v}(\Phi_{v}, s)$ in Section 6. If $x$ lies in the orbit of the standard representative $\omega_{v,x}$ in $V_{k}^{ss}$ then we shall write $\Xi_{x,v}(\Phi_{v}, s) = Z_{\omega_{v,x},\Phi_{v}}(\Phi_{v}, s)$ and $\Xi_{x}(\Phi, s) = \prod_{v \in \mathfrak{m}} \Xi_{x,v}(\Phi_{v}, s)$. We call $\Xi_{x}(\Phi, s)$ the standard orbital zeta function.

Proposition 10.2. For $x \in V_{k}^{ss}$ and $\Phi = \bigotimes \Phi_{v} \in \mathcal{S}(V_{k})$ we have

$$Z_{x}(\Phi, s) = \mathcal{N}(\Delta_{k(x)}/k)^{-s}\Xi_{x}(\Phi, s).$$ 

Proof. By Proposition 6.5, we have

$$Z_{x}(\Phi, s) = \left(\prod_{v \in \mathfrak{m}} \frac{|P(\omega_{v,x})|_{v}}{|P(x)|_{v}}\right)^{s} \Xi_{x}(\Phi, s).$$ 

Since $P(x) \in k^{x}$, we have $\prod_{v \in \mathfrak{m}} |P(x)|_{v} = 1$ by the Artin product formula. Also since $P(\omega_{v,x})$ generate the local discriminant $\Delta_{k_{v}(x)/k_{v}}$ of $k_{v}(x)$ if $v \in \mathfrak{m}$ and $|P(\omega_{v,x})|_{v} = 1$ if $v \in \mathfrak{m}_{\infty}$, we have

$$\prod_{v \in \mathfrak{m}} |P(\omega_{v,x})|_{v} = \prod_{v \in \mathfrak{m}_{\infty}} |P(\omega_{v,x})|_{v} = \prod_{v \in \mathfrak{m}_{\infty}} |\Delta_{k_{v}(x)/k_{v}}|_{v} = \mathcal{N}(\Delta_{k(x)/k})^{-1}.$$ 

Thus we have the proposition. \qed

Proposition 10.3. If $\Phi = \bigotimes \Phi_{v} \in \mathcal{S}(V_{k})$ then we have

$$Z(\Phi, s) = \frac{2}{\mathcal{C}_{k}^{2}} \sum_{x \in G_{k} \setminus V_{k}^{ss}} \frac{\mathcal{C}_{k(x)}^{2}}{\mathcal{N}(\Delta_{k(x)/k})^{s}} \Xi_{x}(\Phi, s).$$
Lemma 10.7.

Proof. By the usual modification, we have

$$Z(\Phi, s) = \sum_{x \in G_k \setminus V_{k}^{ss}} [G_{x.k} : G_{x.k}^0]^{-1} \int_{G_{x,k}^0 \setminus \bar{T}_k G_{x,k}^0} \frac{dg'}{g'} \int_{G_k / G_{x,k}} |\chi(g'_x)|^s \Phi(g'_x x) dg'_x.$$ 

For each $x \in G_k \setminus V_{k}^{ss}$, the last integral in the above equation is equal to $Z_x(\Phi, s)$ since $\Phi = \bigotimes_v \Phi_v$ and $dg' = \prod_v dg'_{x,v}$. Now the proposition follows from $[G_{x.k} : G_{x.k}^0] = 2$ and Propositions 10.1, 10.2. $\square$

Propositions 10.1, 10.2.

For each finite subset

Definition 10.4.

We define

$$\Xi_{x,T}(s) = \prod_{v \notin T} \Xi_{x,v}(s) \quad \text{and} \quad L_T(s) = \prod_{v \notin T} L_v(s),$$

where $L_v(s)$ is as in Proposition 6.9.

By Proposition 6.9, we have the following.

Proposition 10.5. Both $\Xi_{x,T}(s)$ and $L_T(s)$ are Dirichlet series. We let

$$\Xi_{x,T}(s) = \sum_{m=1}^{\infty} \frac{a_{x,T,m}^*}{m^s} \quad \text{and} \quad L_T(s) = \sum_{m=1}^{\infty} \frac{l_{T,m}^*}{m^s}.$$

Then $0 \leq a_{x,T,m}^* \leq l_{T,m}^*$ for all $m$ and $a_{x,T,1}^* = 1$. Also $L_T(s)$ converges absolutely and locally uniformly in the region $\Re(s) > 3/2$.

We consider $T$-tuples $\omega_T = (\omega_v)_{v \in T}$ where each $\omega_v$ is one of the standard orbital representatives for the orbits in $V_{k_v}^{ss}$. If $x \in V_{k}^{ss}$ and $x \in G_{k_v}, \omega_v$ then we write $x \approx \omega_v$ and if $x \approx \omega_v$ for all $v \in T$ then we write $x \approx \omega_T$.

Definition 10.6. We define

$$\xi_{\omega_T}(s) = \sum_{x \in G_k \setminus V_{k}^{ss}, x \approx \omega_T} \frac{\mathfrak{c}_k^2(x)}{N(\Delta_k(x)/k)^s} \Xi_{x,T}(s)$$

and

$$\xi_{\omega_S,T}(s) = \sum_{x \in G_k \setminus V_{k}^{ss}, x \approx \omega_S} \frac{\mathfrak{c}_k^2(x)}{N(\Delta_k(x)/k)^s} \Xi_{x,T}(s),$$

which is the sum of $\xi_{\omega_T}(s)$ over all $\omega_T = (\omega_v)_{v \in T}$ which extend the fixed $S$-tuple $\omega_S$.

The following lemma is exactly the same as [KY1, Lemma 6.17] and we omit the proof.

Lemma 10.7. Let $v \in \mathcal{M}$, $x \in V_{k_v}^{ss}$ and $r \in \mathbb{C}$. Then there exists a $K_v$-invariant Schwartz-Bruhat function $\Phi_v$ such that the support of $\Phi_v$ is contained in $G_{k_v}, x$, $Z_{x,v}(\Phi_v, s)$ is an entire function and $Z_{x,v}(\Phi_v, r) \neq 0$. 

Proposition 10.8. Let \( T \supseteq S \) be a finite set of places of \( k \) and \( \omega_T \) be a \( T \)-tuple, as above. The Dirichlet series \( \xi_{\omega_T}(s) \) has a meromorphic continuation to the region \( \text{Re}(s) > 3/2 \). Its only possible singularity in this region is a simple pole at \( s = 2 \) with residue

\[
\mathcal{R}_2 \prod_{v \in \mathfrak{M}_S \cap \mathfrak{M}_T} (1 - q_v^{-1})^2 \prod_{v \in T} \varepsilon_v(\omega_v),
\]

where

\[
\mathcal{R}_2 = \Delta_k^{-5/2} C_k^3 Z_k(2)^3.
\]

*Proof.* For each \( v \in T \) we choose \( K_v \)-invariant Schwartz-Bruhat function \( \Phi_v \) such that \( \text{supp}(\Phi_v) \subseteq G_{k_v, \omega_v} \). Let \( \Phi = \prod_{v \in T} \Phi_v \otimes \prod_{v \notin T} \Phi_v, 0 \in \mathcal{S}(V_k) \). For \( v \in T \) we have \( \Xi_{x,v}(\Phi_v, s) = 0 \) unless \( x \appropto \omega_v \) and hence by Proposition 10.3 we have

\[
Z(\Phi, s) = \frac{2 C_k^2}{\Delta_k} \sum_{x \in G_k \backslash V_k^{\nu^2}} \frac{c_k^2(x)}{N(\Delta_k(x)/k)^s} \left( \prod_{v \in T} \Xi_{x,v}(\Phi_v, s) \right) \Xi_{x,T}(s)
\]

Using Lemma 10.7 and Theorem 4.2, this formula implies the first statement. Also by the equation just before Proposition 6.5, we have

\[
\int_{V_{k_v}} \Phi_{v,0}(x) dx = 1 \quad \text{for} \quad v \notin T,
\]

by Theorem 4.2 we have the residue of \( \xi_{\omega_T}(s) \). \( \square \)

As a corollary to this proposition, we obtain the following.

Corollary 10.9. The Dirichlet series \( \xi_{\omega_S,T}(s) \) has a meromorphic continuation to the region \( \text{Re}(s) > 3/2 \). Its only possible singularity in this region is a simple pole at \( s = 2 \) with residue

\[
\mathcal{R}_2 \prod_{v \in \mathfrak{M}_S \cap \mathfrak{M}_T} (1 - q_v^{-1})^2 \prod_{v \in S} \varepsilon_v(\omega_v) \cdot \prod_{v \notin S} E_v.
\]

We are now ready to prove a preliminary version of the density theorem. Since the proof is exactly same as that of [KY1, Theorem 6.22], we omit it. Note that by Proposition 7.3, the product \( \prod_{v \in \mathfrak{M}_E} E_v \) converges to a positive number.

Theorem 10.10. Let \( S \supset S_0 \) be a finite set of places of \( k \) and \( \omega_S \) be an \( S \)-tuple of standard orbital representatives. Then

\[
\lim_{X \to \infty} \frac{1}{X^2} \sum_{x \in G_k \backslash V_k^{\nu^2}, x \omega_S \leq X} C_k^2(x) = \frac{1}{2} \mathcal{R}_2 \prod_{v \in \mathfrak{M}_S \cap \mathfrak{M}_T} (1 - q_v^{-1})^2 \prod_{v \in S} \varepsilon_v(\omega_v) \cdot \prod_{v \notin S} E_v.
\]

We will rewrite Theorem 10.10 as a mean value theorem for the square of class number times regulator of quadratic extensions. Let \( S \supset \mathfrak{M}_\infty \) be a finite set of places. As in Section 1, we let \( L_S = (L_v)_{v \in S} \) be an \( S \)-tuple where each \( L_v \) is a separable quadratic algebra of \( k_v \), and put

\[
\mathcal{Q}(L_S) = \{ F \mid [F : k] = 2, F \otimes k_v \cong L_v \text{ for all } v \in S \},
\]

\[
\mathcal{Q}(L_S, X) = \{ F \in \mathcal{Q}(L_S) \mid N(\Delta_F/k) \leq X \}.\]
where $X$ is a positive number. To state our main theorem, we define the constants as follows.

**Definition 10.11.** (1) Let $v \in \mathcal{M}_f$ and $L_v$ a separable quadratic algebra over $k_v$. We put

$$
e_v(L_v) = \begin{cases} 2^{-1}(1 + q_v^{-1})(1 - q_v^{-2}) & L_v \cong k_v \times k_v, \\ 2^{-1}(1 - q_v^{-1})^3 & L_v \text{ is quadratic unramified}, \\ 2^{-1}\Delta_{L_v/k_v}^{-1}(1 - q_v^{-1})(1 - q_v^{-2})^2 & L_v \text{ is quadratic ramified}. \end{cases}$$

(2) Let $S \supset \mathcal{M}_\infty$. For a $S$-tuple $L_S = (L_v)_{v \in S}$ of separable quadratic algebras, we define

$$e_{\infty}(L_S) = 2^{-r_1(L_S)}(2\pi)^{-r_2(L_S)}$$

by assuming that

$$r_1(L_S) = \# \{ v \in \mathcal{M}_R \mid L_v \cong \mathbb{R} \times \mathbb{R} \} \times 2,$$

$$r_2(L_S) = \# \{ v \in \mathcal{M}_R \mid L_v \not\cong \mathbb{R} \times \mathbb{R} \} + 2r_2.$$

(3) For $v \in \mathcal{M}_f$, we put

$$e_v = 1 - 3q_v^{-3} + 2q_v^{-4} + q_v^{-5} - q_v^{-6}.$$

Also we define

$$R_k = 2^{-(r_1+r_2+1)}\epsilon_k^2\epsilon_k^3.$$

Note that the constants $e_v(L_v)$ are $(1 - q_v^{-2})^{-1}$ times those of we have listed in Propositions 7.1, 7.4 and $(1 - q_v^{-1})^2(1 - q_v^{-2})^{-1}$ times those of we have evaluated in Propositions 8.10, 8.15.

The following theorem is a main result of this paper.

**Theorem 10.12.** Let $S \supset \mathcal{M}_\infty$ and $L_S = (L_v)_{v \in S}$ an $S$-tuple. Assume there are at least 2 places $v$ such that $L_v$ are fields. Then we have

$$\lim_{X \to \infty} \frac{1}{X^2} \sum_{F \in Q(L_S, X)} h_F^2 R_F^2 = R_k \Delta_{K/k}^{1/2} \zeta_k(2)^2 e_{\infty}(L_S)^2 \prod_{v \in S \cap \mathcal{M}_f} e_v(L_v) \prod_{v \not\in S} e_v.$$

**Proof.** We choose $v_1, v_2 \in S$ so that $L_{v_1}, L_{v_2}$ are fields. We take the quaternion algebra $B$ of $k$ so that $\mathcal{M}_B = \{ v_1, v_2 \}$, which is possible by the Hasse principle. We consider the prehomogeneous vector space $(G, V)$ for this $B$. Since the set of $k_v$-rational orbits $G_{k_v}/V_{k_v}$ corresponds to the set of all quadratic extensions of $k_v$ if $v \in \mathcal{M}_B$ and to the set of all separable quadratic algebras of $k_v$ if $v \not\in \mathcal{M}_B$, we can take a $S$-tuple $\omega_S = (\omega_v)_{v \in S}$ of standard orbital representatives so that each $\omega_v$ corresponds to $L_v$. We claim that if a quadratic extension $F$ of $k$ satisfies $F \in Q(L_S)$ then there exists $x \in V_{k_v}$ so that $F \cong k(x)$. In fact, if $F \in Q(L_S)$ then $F \otimes k_{v_i} \cong L_{v_i}$ is embeddable into $B_{v_i}$ for $i = 1, 2$. Since $B_v \cong M(2, 2)_{k_v}$ for $v \not\in \mathcal{M}_B$, this shows that $F \otimes B_v \cong M(2, 2)_{F \otimes k_v}$ for all $v$ and by the Hasse principle we have $F \otimes B \cong M(2, 2)_F$. Hence $F$ is embeddable into $B$ and so by Proposition 3.5, there exists $x \in V_{k_v}$ such that $F \cong k(x)$.

Therefore, applying Theorem 10.10 for $\omega_S$, we obtain

$$\lim_{X \to \infty} \frac{1}{X^2} \sum_{F \in Q(L_S, X)} e_F^2 = \frac{1}{2} R_2 \prod_{v \in \mathcal{M}_B \cap \mathcal{M}_f} (1 - q_v^{-1})^2 \prod_{v \in S} \varepsilon_v(\omega_v) \cdot \prod_{v \not\in S} E_v.$$

We consider the value $\mathcal{E}_F^2$. Let $r_1(F)$ and $r_2(F)$ be the number of set of real places and complex places, respectively. Then if $F \in Q(L_S)$ we immediately see $r_1(F) = r_1(L_S)$ for
for almost all \( F \in \mathcal{Q}(L_S) \). Let us consider the right hand side of (10.13). By Proposition 9.2 and the definition of \( Z_k(s) \), we have

\[
\frac{1}{2} \mathcal{R}_2 \prod_{v \in \mathfrak{M}_\infty} \varepsilon_v(\omega_v) = \frac{\mathcal{C}_k^3}{2 \Delta_k^{5/2}} \left( \frac{\Delta_k}{\pi \cdot (2\pi)^2} \zeta_k(2) \right)^3 \left( \frac{\pi}{2} \right)^r (4\pi^3)^2
\]

\[
= \frac{1}{2 r_1 + r_2 + r} \Delta_k^{1/2} \mathcal{C}_k^3 \zeta_k(2)^3 = e_k^{-2} \mathcal{R}_k \Delta_k^{1/2} \zeta_k(2)^3.
\]

Since \( \zeta_k(2) = \prod_{v \in \mathfrak{M}_k} (1 - q_v^{-2})^{-1} \) and \( \varepsilon_v = (1 - q_v^{-2}) \mathfrak{C}_v \), (10.13) turns out that

\[
\lim_{X \to \infty} \frac{1}{X^2} \sum_{F \in \mathcal{Q}(L_S, X)} h_F^2 R_F^2 = \Delta_k^{1/2} \zeta_k(2)^2 \mathcal{R}_k \mathcal{C}_k \zeta_k(2)^3
\]

As in the observation after Definition 10.11, one can see that \( \varepsilon_v(\omega_v)/(1 - q_v^{-2}) = \varepsilon_v(L_v) \) for \( v \in \mathfrak{M}_f \setminus \mathfrak{M}_L \) and \( (1 - q_v^{-2})^2 \varepsilon_v(\omega_v)/(1 - q_v^{-2}) = \varepsilon_v(L_v) \) for \( v \in \mathfrak{M}_f \cap \mathfrak{M}_L \). Hence we obtain the desired description.

**Remark 10.15.** Let \( S \supseteq \mathfrak{M}_\infty \) and \( L_S = (L_v)_{v \in S} \) any \( S \)-tuple of separable quadratic algebras. For a finite set \( T \) of places \( L \) of \( k \), let \( \mathcal{O}_T \) be the set of quadratic extensions \( L \) of \( k \) so that \( L \) does not split at least two places of \( T \). Then by Theorem 10.12, for any \( T \) so that \( T \cap S = \emptyset \), we could see that

\[
\lim_{X \to \infty} \frac{1}{X^2} \sum_{F \in \mathcal{O}_T \setminus \mathcal{O}(L_S, X)} h_F^2 R_F^2 = \mathcal{R}_k \Delta_k^{1/2} \zeta_k(2)^2 \mathcal{C}_k \zeta_k(2)^3 \left( \prod_{v \in T} \varepsilon_v(L_v) \right) \prod_{v \in S \setminus \mathfrak{M}_L} \varepsilon_v(L_v) \prod_{v \in (S \setminus T)} \mathfrak{C}_v
\]

and hence

\[
\lim_{T \not\supseteq \mathfrak{M}(S)} \lim_{X \to \infty} \frac{1}{X^2} \sum_{F \in \mathcal{O}_T \setminus \mathcal{O}(L_S, X)} h_F^2 R_F^2 = \mathcal{R}_k \Delta_k^{1/2} \zeta_k(2)^2 \mathcal{C}_k \zeta_k(2)^3 \prod_{v \in S \setminus \mathfrak{M}_L} \varepsilon_v(L_v) \prod_{v \in S \setminus \mathfrak{M}_L} \mathfrak{C}_v.
\]

If we could change the order of limits in the right hand side of the above formula, we can obtain the statement of Theorem 10.12 for unconditional \( S \)-tuples also. But to assert the statement is true, we probably have to know the principal part at the rightmost pole of the global zeta function for \( \mathcal{B} = M(2, 2) \), which is an open problem. We conclude this section with this conjecture.

**Conjecture 10.16.** The statement of Theorem 10.12 also holds for any unconditional \( S \)-tuple \( L_S \).
11. The correlation coefficient

In this section, we define the correlation coefficient of class number times regulator of certain families of quadratic extensions, and give the value in some cases. The author would like to thank A. Yukie, who suggested to consider on this topic.

We fix a quadratic extension \( \tilde{k} \) of \( k \). For any quadratic extension \( F \) of \( k \) other than \( \tilde{k} \), the compositum \( F \) and \( \tilde{k} \) contains exactly three quadratic extensions of \( k \). Let \( F^* \) denote the quadratic extension other than \( F \) and \( \tilde{k} \). Note that if we write \( \tilde{k} = k[x]/(x^2 - \alpha) \) and \( F = k[x]/(x^2 - \beta) \) where \( \alpha, \beta \in k \) then \( F^* = k[x]/(x^2 - \alpha \beta) \). As in Section 10, let \( S \) always denote the finite set of places of \( k \) containing \( \mathcal{M}_\infty \) and \( L_S = (L_v)_{v \in S} \) an \( S \)-tuple of separable quadratic algebra \( L_v \) of \( k_v \).

**Definition 11.1.** We define
\[
\text{Cor}(L_S) = \lim_{X \to \infty} \frac{\sum_{F \in \mathcal{Q}(L_S, X)} h_F R_F h_{F^*} R_{F^*}}{\left( \sum_{F \in \mathcal{Q}(L_S, X)} h_F^2 R_F^2 \right)^{1/2} \left( \sum_{F \in \mathcal{Q}(L_S, X)} h_{F^*}^2 R_{F^*}^2 \right)^{1/2}}
\]
if the limit of the right hand side exists and call it the correlation coefficient.

The asymptotic behavior of the numerator as \( X \to \infty \) was investigated by [KY1, KY2, KY3], while the denominator is considered in this paper. Hence we could find the correlation coefficients for certain types of \( \tilde{k} \) and \( L_S \). Let \( \mathcal{M}_{rm}, \mathcal{M}_{in} \) and \( \mathcal{M}_{sp} \) be the sets of finite places of \( k \) which are respectively ramified, inert and split on extension to \( \tilde{k} \). Take any \( F \in \mathcal{Q}(L_S) \) to put \( L_v^* = F^* \otimes k_v \) and \( L_v^S = (L_v^*)_{v \in S} \), which does not depend on the choice of \( F \). In this section we prove the following theorem.

**Theorem 11.2.** Assume \( \mathcal{M}_{rm} \cap \mathcal{M}_{dy} = \emptyset \) and \( S \supset \mathcal{M}_{rm} \). Let \( L_S = (L_v)_{v \in S} \) is an \( S \)-tuple of separable quadratic algebras such that there are at least two places \( v \) with \( L_v \) are fields. Further assume that there are at least two places \( v \) with \( L_v^* \) are fields. Then we have
\[
\text{Cor}(L_S) = \prod_{v \in \mathcal{M}_{in} \setminus S} \left( 1 - \frac{2q_v^{-2}}{1 + q_v^{-1} + q_v^{-2} - 2q_v^{-3} + q_v^{-5}} \right).
\]

We first recall from [KY1] the asymptotic behavior of \( \sum_{F \in \mathcal{Q}(L_S, X)} h_F R_F h_{F^*} R_{F^*} \) as \( X \to \infty \). We define the constants as follows.

**Definition 11.3.** (1) Let \( v \in \mathcal{M}_v \setminus \mathcal{M}_{rm} \) and \( L_v \) a separable quadratic algebra over \( k_v \).

We define \( f_v(L_v) \) as follows.

(i) If \( v \in \mathcal{M}_{sp} \), then we put \( f_v(L_v) = c_v(L_v) \).

(ii) If \( v \in \mathcal{M}_{in} \), then we define
\[
f_v(L_v) = \begin{cases} 2^{-1}(1 - q_v^{-1}) (1 + q_v^{-2}) & L_v \cong k_v \times k_v \text{ or quadratic unramified}, \\ 2^{-1} |\Delta_{L_v/k_v}| q_v^{-1} (1 - q_v^{-1})(1 - q_v^{-4}) & L_v \text{ is quadratic ramified}. \end{cases}
\]

(iii) If \( v \in \mathcal{M}_{rm} \setminus \mathcal{M}_{dy} \), then we define
\[
f_v(L_v) = \begin{cases} 2^{-1}(1 - q_v^{-2}) & L_v \cong k_v \times k_v, \\ 2^{-1}(1 - q_v^{-1})^2 & L_v \text{ is quadratic unramified}, \\ 2^{-1}q_v^{-2}(1 - q_v^{-2}) & L_v \cong k_v, \\ 2^{-1}q_v^{-2}(1 - q_v^{-1})^2 & L_v \text{ is quadratic ramified and } L_v \not\cong \tilde{k}_v. \end{cases}
\]

(2) For an \( S \)-tuple \( L_S = (L_v)_{v \in S} \) we define \( f_\infty(L_S) = c_\infty(L_S) \).
(3) For $v \in \mathcal{M}_l \setminus \mathcal{M}_\text{rm}$, we put

$$\ell_v = \begin{cases} 
\mathcal{E}_v & v \in \mathcal{M}_\text{sp}, \\
(1 + q_v^{-2})(1 - q_v^{-2} - q_v^{-3} + q_v^{-4}) & v \in \mathcal{M}_\text{in}.
\end{cases}$$

Then the following is a refinement of [KY1, Corollary 7.17] in case of $\mathcal{M}_\text{dy} \cap \mathcal{M}_\text{rm} = \emptyset$.

**Proposition 11.4.** Assume $\mathcal{M}_\text{dy} \cap \mathcal{M}_\text{rm} = \emptyset$ and $S \supset \mathcal{M}_\text{rm}$. Then the limit

$$\lim_{X \to \infty} \frac{1}{X^2} \sum_{F \in \mathbb{Q}(L_S, X)} h_F R_F h_F^* R_{F^*}$$

exists and the value is equal to

$$\mathcal{R}_k \zeta_k(2) \Delta_k^{1/2} \Delta_k^{-1/2} \mathcal{f}_\infty(L_S) \mathcal{f}_\infty(L_S^*) \prod_{v \in S \cap \mathcal{M}_l} f_v(L_v) \prod_{v \notin S} \ell_v.$$

**Proof.** The only new part is that we determine the constant $f_v(L_v)$ for $v \in \mathcal{M}_\text{dy}$ and $L_v$ a quadratic ramified extension solely, whereas in [KY1], the sum of $f_v(L_v)$ for $L_v$'s with the same relative discriminants were given. We consider the constants $f_v(L_v)$ for these cases. For $v \in \mathcal{M}_\text{sp}$, we could see from [KY1] that Proposition 7.4 gives not only $\mathcal{E}_v(L_v)$ but also the value $f_v(L_v)$. Let $v \in \mathcal{M}_\text{in}$. Then a similar argument from Lemma 7.6 to Lemma 7.10 again leads us to the problem to count the number of the system of congruence equations considered in [T2, Lemma 4.7], and the result follows. Since the argument is much the same as the case of $v \in \mathcal{M}_\text{sp}$, we choose not to include the details here. \(\square\)

We next consider the second term in the denominator. We compare $\Delta_{L_v^*/k_v}$ and $\Delta_{L_v/k_v}$. For $v \in \mathcal{M}_\text{rm}$, we put $\text{sgn}(L_v) = -1$ if $L_v$ is a quadratic ramified extension and $\text{sgn}(L_v) = 1$ otherwise. Then in the case $v \notin \mathcal{M}_\text{rm} \cap \mathcal{M}_\text{dy}$, the results are described as follows.

**Lemma 11.5.** We have $\Delta_{L_v^*/k_v} = p_v^{\text{sgn}(L_v)} \Delta_{L_v/k_v}$ if $v \in \mathcal{M}_\text{rm} \setminus \mathcal{M}_\text{dy}$, while $\Delta_{L_v^*/k_v} = \Delta_{L_v/k_v}$ if $v \in \mathcal{M}_\text{sp} \cup \mathcal{M}_\text{in}$.

**Proof.** For $v \in \mathcal{M}_\text{sp}$ these are obviously coincide since $L_v^* = L_v$. If $v \in \mathcal{M}_\text{rm} \setminus \mathcal{M}_\text{dy}$, then $L_v$ is quadratic ramified if and only if $L_v^*$ is not. Also $\Delta_{L_v/k_v}$ is $p_v$ if $L_v$ quadratic ramified and is $\mathcal{O}_v$ otherwise, and the result follows. We consider the case $v \in \mathcal{M}_\text{in}$. If $L_v$ is not quadratic ramified, then one of $L_v$ and $L_v^*$ is the quadratic unramified extension and the other is $k_v \times k_v$. Hence their relative discriminants are concurrent. Assume $L_v$ is quadratic ramified. If $v \notin \mathcal{M}_\text{dy}$ then $L_v$ and $L_v^*$ are the distinct quadratic ramified extensions of $k_v$ with relative discriminants $p_v$, and therefore the result follows. If $v \in \mathcal{M}_\text{dy}$ then $\Delta_{L_v^*/k_v} = \Delta_{L_v/k_v}$ is a corollary of [KY3, Proposition 3.10]. Thus we obtained the desired description. \(\square\)

For an $S$-tuple $L_S$, we define

$$\Delta_{L_S} = \prod_{v \in \mathcal{M}_\text{rm}} q_v^{\text{sgn}(L_v)}.$$

**Proposition 11.6.** Assume $\mathcal{M}_\text{rm} \cap \mathcal{M}_\text{dy} = \emptyset$ and $S \supset \mathcal{M}_\text{rm}$. Let $L_S = (L_v)_{v \in S}$ is a $S$-tuple such that there are at least two places $v$ with $L_v^*$ fields. Then we have

$$\lim_{X \to \infty} \frac{1}{X^2} \sum_{F \in \mathbb{Q}(L_S, X)} h_F R_F^2 = \Delta_{L_S}^2 \mathcal{R}_k \Delta_k^{1/2} \zeta_k(2)^2 \mathcal{f}_\infty(L_S^*)^2 \prod_{v \in S \cap \mathcal{M}_l} \epsilon_v(L_v^*) \prod_{v \notin S} \ell_v.$$
Proof. By Lemma 11.5 we have $N(\Delta_{F^*/k}) = \Delta_{L_S} N(\Delta_{F/k})$. Also by definition, $F \in \mathcal{Q}(L_S)$ if and only if $F^* \in \mathcal{Q}(L_S^*)$. Hence, $F \in \mathcal{Q}(L_S, X)$ if and only if $F^* \in \mathcal{Q}(L_S^*, \Delta_{L_S} X)$. Therefore by applying $L_S$ to Theorem 10.12, we have the proposition. □

All of these establish the necessary preparations and now we go back to the proof of Theorem 11.2. By Theorem 10.12 and Propositions 11.4, 11.6, we have

$$\text{Cor}(L_S) = N(\Delta_{\tilde{k}/k})^{1/2} \Delta_{L_S}^{-1} \frac{\zeta_{\tilde{k}}(2)}{\zeta_k(2)} \prod_{v \in S \cap \mathfrak{m}_q} \frac{\zeta_v(L_v)}{\zeta_v(L_v^*)} \prod_{v \in S} \frac{\mathfrak{e}_v}{\mathfrak{e}_v}.$$ 

Note that we used the relation $N(\Delta_{\tilde{k}/k}) = \Delta_{\tilde{k}}/\Delta_k^2$. We naturally regard the right hand side of the equation above as the Euler product of finite places $\prod_{v \in \mathfrak{m}_q} \alpha_v$. Then we immediately see $\alpha_v = 1$ for $v \in \mathfrak{m}_{sp}$ and

$$\alpha_v = \frac{(1-q_v^{-2})^2}{1-q_v^{-4}} \cdot \frac{\mathfrak{e}_v}{\mathfrak{e}_v} = 1 - \frac{2q_v^{-2}}{1 + q_v^{-1} + q_v^{-2} - 2q_v^{-3} + q_v^{-5}}$$

for $v \in \mathfrak{m}_{in} \setminus S$. Now the remaining task is to verify $\alpha_v = 1$ for $v \in S \setminus \mathfrak{m}_{sp}$ and this could be easily carried out by one by one calculation. For example, if $v \in S \cap \mathfrak{m}_{in}$ and $L_v$ is quadratic ramified, then we have

$$\alpha_v = \frac{(1-q_v^{-2})^2}{1-q_v^{-4}} \cdot \frac{2^{-1/2} |\Delta_{L_v/k_v}|_v^{-1} (1-q_v^{-1})(1-q_v^{-4})}{2^{-1} |\Delta_{L_v/k_v}|_v^{-1} (1-q_v^{-1})(1-q_v^{-2})^2} = 1,$$

and if $v \in S \cap \mathfrak{m}_{sp}$ (note that by the assumption $\mathfrak{m}_{sp} \cap \mathfrak{m}_{dy} = \emptyset$, we have $v \not\in \mathfrak{m}_{dy}$ in this case) and $L_v$ is quadratic unramified, then we have

$$\alpha_v = q_v^{(1/2)-1} (1-q_v^{-2}) \cdot \frac{2^{-1} (1-q_v^{-1})^2}{2^{-1} q_v^{-1/2} (1-q_v^{-1})^2 (1-q_v^{-2})} = 1.$$ 

The other cases are similar and we omit the routine figuring here.

Remark 11.7. The conditions on $S$-tuple $L_S$ in Theorem 11.2 is to use Theorem 10.12 for $L_S$ and $L_S^*$. If Conjecture 10.16 is true, then we could obtain Theorem 11.2 for unconditional $L_S$ also.
