Abstract

One proves the existence and uniqueness of a generalized (mild) solution for the nonlinear Fokker–Planck equation (FPE)

$$u_t - \Delta(\beta(u)) + \text{div}(D(x)b(u)u) = 0, \quad t \geq 0, \quad x \in \mathbb{R}^d, \quad d \neq 2,$$

$$u(0, \cdot) = u_0, \quad \text{in } \mathbb{R}^d,$$

where $u_0 \in L^1(\mathbb{R}^d)$, $\beta \in C^2(\mathbb{R})$ is a nondecreasing function, $b \in C^1$, bounded, $b \geq 0$, $D \in L_\infty(\mathbb{R}^d; \mathbb{R}^d)$, $\text{div} D \in L^2(\mathbb{R}^d) + L_\infty(\mathbb{R}^d)$, with $(\text{div} D)^{-} \in L_\infty(\mathbb{R}^d)$, $\beta$ strictly increasing, if $b$ is not constant. Moreover, $t \rightarrow u(t, u_0)$ is a semigroup of contractions in $L^1(\mathbb{R}^d)$, which leaves invariant the set of probability density functions in $\mathbb{R}^d$. If $\text{div} D \geq 0$, $\beta'(r) \geq a|r|^{\alpha-1}$, and $|\beta(r)| \leq Cr^\alpha$, $\alpha \geq 1$, $d \geq 3$, then $|u(t)|_{L^\infty} \leq Ct^{-\frac{d(\alpha-1)}{2(d-1)}} |u_0|^{\frac{2}{(d-1)}}$, $t > 0$, and, if $D \in L^2(\mathbb{R}^d; \mathbb{R}^d)$, the existence extends to initial data $u_0$ in the space $\mathcal{M}_b$ of bounded measures in $\mathbb{R}^d$. As a consequence for arbitrary initial laws, we obtain weak solutions to a class of McKean-Vlasov SDEs with coefficients which have singular dependence on the time marginal laws.

Keywords: Fokker–Planck equation, $m$-accretive, measure as initial data, McKean-Vlasov stochastic differential equation

1. Introduction

Here, we consider the nonlinear parabolic equation (FPE)
\[
\begin{aligned}
&u_t - \Delta(\beta(u)) + \text{div}(Db(u)u) = 0, \quad \forall(t,x) \in [0, \infty) \times \mathbb{R}^d, \\
&u(0, \cdot) = \mu, \quad \text{in } \mathbb{R}^d,
\end{aligned}
\]  
(1.1)

where \(\mu\) is a bounded measure on \(\mathbb{R}^d\) and the functions \(\beta : \mathbb{R} \to \mathbb{R}, D : \mathbb{R}^d \to \mathbb{R}^d, b : \mathbb{R} \to \mathbb{R}\), are assumed to satisfy the following hypotheses

(i) \(\beta : \mathbb{R} \to \mathbb{R}\) is a monotonically nondecreasing \(C^1\)-function, \(\beta(0) = 0\).

(ii) \(D \in L^\infty(\mathbb{R}^d; \mathbb{R}^d), \text{div } D \in L^1_{\text{loc}}(\mathbb{R}^d), (\text{div } D)^- \in L^\infty(\mathbb{R}^d)\).

(iii) \(b \in C^1(\mathbb{R}), b\) bounded, nonnegative, and \(b \equiv \text{const.}, \text{ if } \beta \text{ is not strictly increasing}\).

In statistical physics, the nonlinear Fokker–Planck equation (NFPE) (1.1) models anomalous diffusion processes. As a matter of fact, (1.1) is an extension of the classical Smoluchowski equation.

It should be also mentioned that, as in the classical linear theory, NFPE (1.1) is related to the McKean-Vlasov stochastic differential equation
\[
\begin{aligned}
&dX(t) = D(X(t))b(u(t, X(t)))dt + \frac{1}{\sqrt{2}} \left(\frac{\beta(u(t, X(t)))}{u(t, X(t))}\right)^{\frac{3}{2}} dW(t), \quad t \geq 0, \\
&X(0) = \xi_0,
\end{aligned}
\]  
(1.2)

where \(\beta(0) := \beta'(0)\). More precisely, if \(u\) is a Schwartz distributional solution to (1.1) such that \(u : [0, \infty) \to L^1(\mathbb{R}^d)\) is \(\sigma(L^1, C_b)\)-continuous with \(u(0) = u_0 dx, u_0 \in L^1 \cap L^\infty, u \geq 0, \text{ and}\)
\[
\int_{\mathbb{R}^d} u(t, x)dx = 1, \quad \forall t \geq 0,
\]
then there exists a (probabilistically) weak solution process \(X\) to SDE (1.2) such that \(u\) is the probability density of its time marginal laws. (See [3]–[4].)

Here we would like to note that there is a vast literature on McKean–Vlasov SDEs and on Fokker–Planck equations (see [13] and in particular [10], Section 6.7 (iii), respectively, and the references therein). But the dependence of the coefficients on the solution in these references is much more regular than in our so called ”Nemytskii case” (see [4], Section 2, for details).
The existence theory in $\mathbb{R}^d$ for Fokker–Planck equations of the form (1.1) in $\mathbb{R}^d$, $d \geq 1$, and weak existence for the corresponding McKean–Vlasov equations (1.2) was studied in [3]-[4], [5], via nonlinear semigroup theory in $L^1(\mathbb{R}^d)$. Here, we shall extend this approach to the case where the initial data is a bounded measure on $\mathbb{R}^d$. In this case, our existence result extends those in earlier work of H. Brezis and A. Friedman [12] and by M. Pierre [17], who studied the case $D \equiv 0$. One main ingredient of the proof is the $L^1 - L^\infty$ regularity of the solution of (1.1), extending previous results by Ph. Benilan [8], A. Pazy [15], L. Veron [19].

A further contribution of this paper is its applications to McKean-Vlasov SDEs (see Section 6) which in turn was one motivation of this work.

The structure of the paper is as follows. Sections 2 and 3 contain our main existence result for (1.1) for $\mu = u_0 \, dx$, $u_0 \in L^1$. In Section 4, we prove the $L^1 - L^\infty$ regularizing effects of the generalized solutions to (1.1) on the initial data (see Theorem 4.1). Section 5 is devoted to the existence for the Radon measure initial data and Section 6 to applications to McKean-Vlasov SDEs.

**Notation.** For each $1 \leq p \leq \infty$, $L^p(\mathbb{R}^d)$, briefly denoted $L^p$, is the space of Lebesgue integrable functions $u$ on $\mathbb{R}^d$ with the standard norm $\|u\|_p$. We denote by $W^{k,p}(\mathbb{R}^d)$ the Sobolev space of all functions in $L^p$ with partial derivatives $D^k_j$ up to order $k$ in $L^p$, where $D^k_j = \frac{\partial^k}{\partial x_j^k}$ is taken in the sense of Schwartz distributions $D'(\mathbb{R}^d)$. Denote by $L^p_{\text{loc}}$ the space of $L^p$-integrable functions on every compact set and $W^{k,p}_{\text{loc}} = \{u \in L^p_{\text{loc}}; D^k_j u \in L^p_{\text{loc}}, 1 \leq j \leq d, \ell = 1, 2, \ldots, k\}$, $1 \leq p \leq \infty$. We set $H^1 = W^{1,2}(\mathbb{R}^d)$ and $H^2 = W^{2,2}(\mathbb{R}^d)$. We denote by $\langle \cdot, \cdot \rangle_2$ the scalar product of $L^2$ and by $H^{-1}(\cdot, \cdot)_{H^1}$ the duality functional between $H^1$ and its dual space $(H^1)' = H^{-1}$. $C^1_b(\mathbb{R}^d)$ is the space of all continuous and bounded functions $u : \mathbb{R}^d \to \mathbb{R}$ endowed with the supremum norm $\|u\|_{C^1_b}$, and by $C^1_b(\mathbb{R}^d)$ the space of continuously differentiable bounded functions with bounded derivatives. By $\mathcal{M}_b(\mathbb{R}^d)$ we denote the space of bounded Radon measures on $\mathbb{R}^d$. In the following, we shall simply denote $C_b(\mathbb{R}^d)$, $C^1_b(\mathbb{R}^d)$ by $C_b$, $C^1_b$, respectively, and $\mathcal{M}_b(\mathbb{R}^d)$ by $\mathcal{M}_b$. Denote by $\|\cdot\|_{\mathcal{M}_b}$ the norm of $\mathcal{M}_b$, $\|\mu\|_{\mathcal{M}_b} = \sup\{\|\mu(\psi)\|; \|\psi\|_{C^1_b} \leq 1\}$. We set

$$\mathcal{P}_0(\mathbb{R}^d) = \left\{ \rho \in L^1, \rho \geq 0, \int_{\mathbb{R}^d} \rho \, dx = 1 \right\}. $$

For $1 < p < \infty$, we denote by $M^p(\mathbb{R}^d)$ (simply written $M^p$) the Marcinkiewicz space of all (classes of) measurable functions $u : \mathbb{R}^d \to \mathbb{R}$ such that
\[ \|u\|_{M^p} = \inf \left\{ \lambda > 0 : \int_K |u(x)| dx \leq \lambda (\text{meas } K)^{\frac{1}{p'}} \right\} < \infty, \frac{1}{p} + \frac{1}{p'} = 1. \]

We recall that \( M^p(\mathbb{R}^d) \subset L^q_{\text{loc}}(\mathbb{R}^d) \) for \( 1 < q < p < \infty \).

Let \( E(x) = \omega_d |x|^{2-d}, x \in \mathbb{R}^d, d \geq 3, \) be the fundamental solution of the Laplace operator. (Here \( \omega_d \) is the volume of the unit \( d \)-ball and \( | \cdot |_d \) is the Euclidean norm of \( \mathbb{R}^d \).) We recall that (see, e.g., [9]) that, for \( d \geq 3 \),

\[
E \in M^{\frac{d}{d-2}}(\mathbb{R}^d), \ |\nabla E|_d \in M^{\frac{d}{d-1}}(\mathbb{R}^d),
\]

(1.3)

and, for \( f \in L^1 \), the solution \( u \) to the equation \(-\Delta u = f \) in \( \mathcal{D}'(\mathbb{R}^d) \) is given by the convolution product \( u = E \ast f \) and satisfies

\[
\|u\|_{M^{\frac{d}{d-2}}} \leq \|E\|_{M^{\frac{d}{d-2}}} |f|_1. \quad (1.4)
\]

\[
\|\nabla u\|_{M^{\frac{d}{d-1}}} \leq \|\nabla E\|_{M^{\frac{d}{d-1}}} |f|_1. \quad (1.5)
\]

(In this context, we cite also the work of H. Brezis and W. Strauss [13].)

2. Generalized solutions to NFPE

We shall treat first FPE (1.1) for initial data \( u_0 \in L^1 \).

**Definition 2.1.** A continuous function \( u : [0, \infty] \to L^1 \) is said to be a generalized solution (or mild solution) to equation (1.1) if, for each \( T > 0 \),

\[
u(t) = \lim_{h \to 0} u_h(t), \ \text{in } L^1 \text{ uniformly on each interval } [0, T], \quad (2.1)
\]

where \( u_h : [0, T] \to L^1 \) is the step function, defined by the finite difference scheme

\[
u_h(t) = u_h^i, \ \forall t \in (ih, (i+1)h], \ i = 0, 1, ..., N - 1, \quad (2.2)
\]

\[
u_h^0 = u_0, \ \beta(u_h^i) \in L^1_{\text{loc}}, \ u_h^i \in L^1, \ \forall i = 1, 2, ..., N, \ Nh = T, \quad (2.3)
\]

\[
u_h^{i+1} - h\Delta (\beta(u_h^{i+1})) + h \ \text{div}(Db(u_h^{i+1})u_h^{i+1}) = u_h^i, \ \text{in } \mathcal{D}'(\mathbb{R}^d), \quad (2.4)
\]

for all \( i = 0, 1, ..., N - 1. \)

Theorem 2.22 is our first main result.
**Theorem 2.2.** Let \( d \neq 2 \). Under Hypotheses (i), (ii), (iii), for each \( u_0 \in D(A) \), where \( A \) and \( D(A) \) are defined in (3.10), (3.11) below and \( D(A) \) is the \( L^1 \)-closure of \( D(A) \), there is a unique generalized solution \( u = u(t, u_0) \) to equation (1.1). Now assume, in addition, that \( \beta \in C^2(\mathbb{R}) \). (2.5)

Then \( \overline{D(A)} = L^1 \) and, for every \( u_0 \in L^1 \cap L^\infty \),

\[
|u(t)| \leq \exp(|(\text{div } D^-) + |D|^{\frac{1}{2}}t)|u_0|, \quad \forall t > 0.
\] (2.6)

If \( u_0 \in \mathcal{P}_0(\mathbb{R}^d) \), then

\[
u(t) \in \mathcal{P}_0(\mathbb{R}^d), \quad \forall t \geq 0,
\] (2.7)

Moreover, \( t \to S(t)u_0 = u(t, u_0) \) is a strongly continuous semigroup of non-linear contractions from \( L^1 \) to \( L^1 \), that is, \( S(t+s)u_0 = S(t)S(s)u_0 \) for \( 0 < s < t, \) and

\[
|S(t)u_0 - S(t)\bar{u}_0| \leq |u_0 - \bar{u}_0|, \quad \forall t > 0, \; u_0, \bar{u}_0 \in L^1.
\] (2.8)

If \( u_0 \in L^1 \cap L^\infty \), then \( u \) is a solution to (1.1) in the sense of Schwartz distributions on \( (0, \infty) \times \mathbb{R}^d \), that is,

\[
\int_0^\infty \int_{\mathbb{R}^d} (u(\varphi_t + b(u)D \cdot \nabla \varphi) + \beta(u)\Delta \varphi) dt \, dx + \int_{\mathbb{R}^d} u_0(x)\varphi(0, x) dx = 0, \quad \forall \varphi \in C^\infty_0((0, \infty) \times \mathbb{R}^d).
\] (2.9)

We also note that, by (2.6), equation (2.9) is well defined for all \( \varphi \in C^\infty_0((0, \infty) \times \mathbb{R}^d) \).

**Remark 2.3.** It should be noted that the uniqueness of the solution \( u \) given by Theorem 2.2 is claimed in the class of generalized solutions and not in that of distributional solutions. The latter is true in some special cases (see, e.g., \([6], [11]\)) but it is open in the general case we consider here.

### 3. Proof of Theorem 2.2

The idea of the proof is to associate with equation (1.1) an \( m \)-accretive operator \( A \) in \( L^1 \) and so to reduce (1.1) to the Cauchy problem

\[
\frac{du}{dt} + Au = 0, \quad t \geq 0, \quad u(0) = u_0.
\]
To this purpose, consider in $L^1$ the nonlinear operator
\[
A_0 y = -\Delta \beta(y) + \text{div}(Db(y)y), \quad \forall y \in D(A_0),
\]
\[
D(A_0) = \{ y \in L^1, \beta(y) \in L^1_{\text{loc}}, -\Delta \beta(y) + \text{div}(Db(y)y) \in L^1 \},
\]
where the differential operators $\Delta$ and div are taken in $\mathcal{D}'(\mathbb{R}^d)$. The main ingredient of the proof is the following lemma.

**Lemma 3.1.** We have
\[
R(I + \lambda A_0) = L^1, \quad \forall \lambda > 0,
\]
and there is an operator $J_\lambda : L^1 \to L^1$ such that
\[
J_\lambda u \in (I + \lambda A_0)^{-1} u, \quad \forall u \in L^1,
\]
\[
|J_\lambda u - J_\lambda v|_1 \leq |u - v|_1, \quad \forall u, v \in L^1, \lambda > 0.
\]
\[
J_{\lambda_2} u = J_{\lambda_1}\left(\frac{\lambda_1}{\lambda_2} u + \left(1 - \frac{\lambda_1}{\lambda_2}\right) J_{\lambda_2} u\right), \quad \forall 0 < \lambda_1, \lambda_2 < \infty.
\]
Moreover,
\[
\beta(J_\lambda u) \in L^q_{\text{loc}}, \quad 1 < q < \frac{d}{d-1}, \quad \forall u \in L^1,
\]
\[
|J_\lambda u|_\infty \leq (1 + |(\text{div} D)^- + |D||^\frac{1}{q}|u|_\infty) |u|_\infty, \quad \forall u \in L^1 \cap L^\infty,
\]
\[
0 < \lambda < \lambda_0 = \left((|\text{div} D)^- + |D||^\frac{1}{q}|b|_\infty\right)^{-1},
\]
\[
|J_\lambda(u)|_\infty \leq C_\lambda |u|_\infty, \quad \forall u \in L^1 \cap L^\infty, \lambda > 0, \text{ for some } C_\lambda \in (0, \infty).
\]
\[
J_\lambda(P_0(\mathbb{R}^d)) \subset P_0(\mathbb{R}^d), \quad \lambda > 0.
\]
If (2.5) holds, then
\[
|J_\lambda g - g|_1 \leq C\lambda\|g\|_{W^{2,2}(\mathbb{R}^d)}, \quad \forall g \in C^\infty_c(\mathbb{R}^d).
\]
Here $R(I + \lambda A_0)$ is the range of the operator $I + \lambda A_0$ and $(I + \lambda A_0)^{-1} : L^1 \to D(A_0)$ (which, in general, might be multivalues) is a right inverse of $A_0$. Before proving Lemma 3.1 let us discuss some consequences.

Define the operator $A : D(A) \subset L^1 \to L^1$,
\[
Au = A_0 u, \quad \forall u \in D(A),
\]
\[
D(A) = \{ J_\lambda v, \quad v \in L^1 \}.
\]
It is easily seen by (3.4) that
\[ D(A) = \{ u = J_\lambda v, \ v \in L^1 \}, \ \forall \ 0 < \lambda < \infty. \]  
(3.12)

By Lemma 3.1 we have

**Lemma 3.2.**

(i) \( J_\lambda \) coincides with the inverse \( (I + \lambda A)^{-1} \) of \( (I + \lambda A) \).

(ii) The operator \( A \) is \( m \)-accretive in \( L^1 \), that is, \( R(I + \lambda A) = L^1, \ \forall \lambda > 0 \), and
\[ |(I + \lambda A)^{-1}u - (I + \lambda A)^{-1}v|_1 \leq |u - v|_1, \ \forall u, v \in L^1, \ \lambda > 0. \]  
(3.13)

Moreover, (3.5), (3.6), (3.8) hold with \( (I + \lambda A)^{-1} \) instead of \( J_\lambda \). If (2.5) holds, then \( D(A) \) is dense in \( L^1 \).

**Proof of Lemma 3.2.** (i) follows immediately by (3.10), (3.11), (3.12).

Except for the density of \( D(A) \) in \( L^1 \), all assertions of (ii) are immediate by the definition of \( A \) and Lemma 3.1. Now, assume that (2.5) holds and let us prove that \( D(A) \) is dense in \( L^1 \) (that is, \( \overline{D(A)} = L^1 \)). By (3.9), we have \( C_0^\infty(\mathbb{R}^d) \subset \overline{D(A)} \) and, since \( C_0^\infty(\mathbb{R}^d) \) is dense in \( L^1 \), the assertion follows.

We recall that Lemma 3.2 implies via the Crandall and Liggett theorem (see [2], p.140) that, for each \( u_0 \in \overline{D(A)} = L^1 \) and \( T > 0 \), the Cauchy problem
\[ \frac{du}{dt} + Au = 0, \ t \in (0, T), \quad u(0) = u_0, \]  
(3.14)
has a unique mild solution \( u \in C([0, T]; L^1) \), that is,
\[ u(t) = \lim_{h \to 0} u_h(t) \text{ in } L^1 \text{ uniformly on } [0, T], \]  
(3.15)
where \( u_h : [0, T] \to L^1 \) is given by (2.2)-(2.4), that is,
\[ \begin{align*}
  u_h(t) &= u_h^{i+1}, \ t \in (ih, (i + 1)h), \\
  u_h^{i+1} + hAu_h^{i+1} &= u_h^i, \ i = 0, 1, ..., N - 1; \ Nh = T, \\
  u_h^0 &= u_0.
\end{align*} \]  
(3.16)
In fact, the solution $u = u(t, u_0)$ given by (3.15), (3.16) is given by the exponential formula

$$S(t)u_0 = u(t, u_0) = \lim_{n \to \infty} \left( I + \frac{t}{n} A \right)^{-n} u_0 \text{ in } L^1, \; t \geq 0,$$

where the convergence is uniform in $t$ on compact intervals $[0, T]$, and $S(t)$ is a semigroup of contractions on $L^1$, that is,

$$S(t+s) = S(t)S(s)u_0, \; \forall t, s \geq 0, \; S(0) = I,$n

$$|S(t)u_0 - S(t)\bar{u}_0|_1 \leq |u - \bar{u}_0|_1, \; \forall u_0, \bar{u}_0 \in L^1, \; t \geq 0.

**Proof of Lemma 3.1.** We shall follow the argument of [5] (Lemma 3.1). Namely, for $f \in L^1$ consider the equation

$$u + \lambda A_0 u = f$$

or, equivalently,

$$u - \lambda \Delta \beta(u) + \lambda \text{div}(Db(u)u) = f \text{ in } \mathcal{D}'(\mathbb{R}),$$

$$u \in L^1, \; \beta(u) \in L^1_{\text{loc}}, -\Delta \beta(u) + \text{div}(Db(u)u) \in L^1. \quad (3.20)$$

We shall assume first $f \in L^1 \cap L^2$ and we approximate equation (3.19) by

$$u - \lambda \Delta \tilde{\beta}_\varepsilon(u) + \lambda \varepsilon \tilde{\beta}_\varepsilon(u) + \lambda \text{div}(D_\varepsilon b_\varepsilon(u)u) = f,$$

where $\tilde{\beta}_\varepsilon(u) \equiv \beta_\varepsilon(u) + \varepsilon u$, and for $\varepsilon > 0, \; r \in \mathbb{R},$

$$\beta_\varepsilon(r) \equiv \frac{1}{\varepsilon} (r - (1 + \varepsilon \beta)^{-1}r) = \beta((1 + \varepsilon \beta)^{-1}r),$$

$$D_\varepsilon = \begin{cases} D, & \text{if } |D| \in L^2 \text{ and } \text{div} D \in L^2 + L^\infty, \\ \eta_\varepsilon D, & \text{else.} \end{cases}$$

$$b_\varepsilon(r) = \begin{cases} b, & \text{if } b \text{ is a constant,} \\ \frac{(b * \rho_\varepsilon)(r)}{1 + \varepsilon |r|}, & \text{otherwise.} \end{cases}$$

Here $\rho_\varepsilon(r) = \frac{1}{\varepsilon} \rho \left( \frac{r}{\varepsilon} \right), \; \rho \in C^\infty_0(\mathbb{R}), \; \rho \geq 0,$ is a standard modifier and by $I$ we denote the identity on $\mathbb{R}$. Furthermore, $\eta_\varepsilon \in C^1_0(\mathbb{R}^d), \; 0 \leq \eta_\varepsilon \leq 1, \; |\nabla \eta_\varepsilon| \leq 1$ and $\eta_\varepsilon(x) = 1$ if $|x| \leq \frac{1}{\varepsilon}$. Clearly, we have

$$|D_\varepsilon| \in L^\infty \cap L^2, \; |D_\varepsilon| \leq |D|, \; \lim_{\varepsilon \to 0} D_\varepsilon(x) = D(x), \; \text{a.e. } x \in \mathbb{R}^d,$$

$$\text{div } D_\varepsilon^- \leq (\text{div } D)^- + 1_{|x| \geq \frac{1}{\varepsilon}} |D|. \quad (3.24)$$

8
We are going to show that, for $\varepsilon \to 0$, the solution $\{u_\varepsilon\}$ to (3.21) is convergent to a solution $u$ to (3.19). We can rewrite (3.21) as

$$(\varepsilon I - \Delta)^{-1} u + \lambda \tilde{\beta}_\varepsilon(u) + \lambda (\varepsilon I - \Delta)^{-1} \text{div}(D_\varepsilon b_\varepsilon(u)u) = (\varepsilon I - \Delta)^{-1} f.$$  (3.25)

We set

$$F_\varepsilon(u) = (\varepsilon I - \Delta)^{-1} u, \quad G^1_\varepsilon(u) = \lambda \tilde{\beta}_\varepsilon(u), \quad u \in L^2,$$

$$G^2_\varepsilon(u) = \lambda (\varepsilon I - \Delta)^{-1} (\text{div}(D_\varepsilon b_\varepsilon(u)u)), \quad u \in L^2.$$  

It is easily seen that $F_\varepsilon$ and $G^1_\varepsilon$ are accretive and continuous in $L^2$. Since $r \mapsto b_\varepsilon(r)$ is Lipschitz, we also have by assumptions (ii), (iii) that $G^2_\varepsilon$ is continuous in $L^2$ and

$$\int_{\mathbb{R}^d} (G^2_\varepsilon(u) - G^2_\varepsilon(\tilde{u}))(u - \tilde{u})dx = -\lambda \int_{\mathbb{R}^d} D(b_\varepsilon(u) - b_\varepsilon(\tilde{u})) \cdot \nabla (\varepsilon I - \Delta)^{-1} (u - \tilde{u})dx$$

$$\geq -C_\varepsilon \lambda |u - \tilde{u}|_2 |\nabla (\varepsilon I - \Delta)^{-1} (u - \tilde{u})|_2, \quad \forall u, \tilde{u} \in L^2(\mathbb{R}^d).$$

Moreover, we have

$$\int_{\mathbb{R}^d} (\varepsilon I - \Delta)^{-1} uu dx = \varepsilon |(\varepsilon I - \Delta)^{-1} u|_2^2 + |\nabla (\varepsilon I - \Delta)^{-1} u|_2^2, \quad \forall u \in L^2.$$  

Hence, for $u^* = u - \tilde{u}$, we have

$$(F_\varepsilon(u^*) + G^1_\varepsilon(u) - G^1_\varepsilon(\tilde{u}) + G^2_\varepsilon(u) - G^2_\varepsilon(\tilde{u}), u^*)_2$$

$$\geq \lambda \varepsilon |u^*|_2^2 + |\nabla (\varepsilon I - \Delta)^{-1} u^*|_2^2 + \varepsilon |(\varepsilon I - \Delta)^{-1} u^*|_2^2$$

$$- C_\varepsilon \lambda |u^*|_2 |\nabla (\varepsilon I - \Delta)^{-1} u^*|_2.$$  

This implies that $F_\varepsilon + G^1_\varepsilon + G^2_\varepsilon$ is accretive and coercive on $L^2$ for $\lambda < \lambda_\varepsilon$, where $\lambda_\varepsilon > 0$ is sufficiently small. Since this operator is continuous and accretive, it follows that it is $m$-accretive and, therefore, surjective (because it is coercive). Hence, for each $f \in L^2 \cap L^1$ and $0 < \lambda < \lambda_\varepsilon$, equation (3.25) has a unique solution $u_\varepsilon \in L^2$ with $\tilde{\beta}_\varepsilon(u_\varepsilon) \in H^1$. Since $\tilde{\beta}_\varepsilon$ has a Lipschitz inverse, we have that $u_\varepsilon \in H^1$, and hence $b_\varepsilon(u_\varepsilon)u_\varepsilon \in H^1 \cap L^\infty$.

We denote by $u_\varepsilon(f) \in H^1$ the solution to (3.25) for $f \in L^2 \cap L^1$ and we shall prove that

$$|u_\varepsilon(f_1) - u_\varepsilon(f_2)|_1 \leq |f_1 - f_2|_1, \quad \forall f_1, f_2 \in L^1 \cap L^2.$$  (3.26)
To this purpose we set \( u = u_{\varepsilon}(f_1) - u_{\varepsilon}(f_2), \) \( f = f_1 - f_2. \) By (3.21), we have, for \( u_i = u_{\varepsilon}(f_i), \) \( i = 1, 2, \)

\[
u - \lambda \Delta (\bar{\beta}_{\varepsilon}(u_1) - \bar{\beta}_{\varepsilon}(u_2)) + \varepsilon \lambda (\bar{\beta}_{\varepsilon}(u_1) - \bar{\beta}_{\varepsilon}(u_2)) \]
\[+ \lambda \div (D_{\varepsilon}(b_{\varepsilon}(u_1)u_1 - b_{\varepsilon}(u_2)u_2)) = f. \tag{3.27}\]

We consider the Lipschitzian function \( \mathcal{X}_\delta : \mathbb{R} \to \mathbb{R}, \)

\[
\mathcal{X}_\delta(r) = \begin{cases} 
1 & \text{for } r \geq \delta, \\
\frac{r}{\delta} & \text{for } |r| < \delta, \\
-1 & \text{for } r < -\delta,
\end{cases} \tag{3.28}
\]

where \( \delta > 0. \) (We note that \( \mathcal{X}_\delta(r) \to \text{sign } r \) for \( \delta \to 0. \)) We set \( \Phi_{\varepsilon} = \lambda \nabla (\bar{\beta}_{\varepsilon}(u_1) - \bar{\beta}_{\varepsilon}(u_2)) - \lambda D_{\varepsilon}(b_{\varepsilon}(u_1)u_1 - b_{\varepsilon}(u_2)u_2) \)

and rewrite (3.27) as

\[
u = \div \Phi_{\varepsilon} - \varepsilon \lambda (\bar{\beta}_{\varepsilon}(u_1) - \bar{\beta}_{\varepsilon}(u_2)) + f. \tag{3.29}\]

In particular, \( \div \Phi_{\varepsilon} \in L^2. \) We set \( \Lambda_\delta = \mathcal{X}_\delta(\bar{\beta}_{\varepsilon}(u_1) - \bar{\beta}_{\varepsilon}(u_2)). \) Since \( \Lambda_\delta \in H^1, \)

it follows that \( \Lambda_\delta \div \Phi_{\varepsilon} \in L^1, \) and so we have

\[
\int_{\mathbb{R}^d} u \Lambda_\delta dx = -\int_{\mathbb{R}^d} \Phi_{\varepsilon} \cdot \nabla \Lambda_\delta dx
\]
\[\quad - \varepsilon \lambda \int_{\mathbb{R}^d} (\bar{\beta}_{\varepsilon}(u_1) - \bar{\beta}_{\varepsilon}(u_2)) \Lambda_\delta dx + \int_{\mathbb{R}^d} f \Lambda_\delta dx
\]
\[\quad = -\int_{\mathbb{R}^d} \Phi_{\varepsilon} \cdot \nabla (\bar{\beta}_{\varepsilon}(u_1) - \bar{\beta}_{\varepsilon}(u_2)) \mathcal{X}_\delta'(\bar{\beta}_{\varepsilon}(u_1))
\]
\[\quad - (\bar{\beta}_{\varepsilon}(u_2))dx - \varepsilon \lambda \int_{\mathbb{R}^d} (\bar{\beta}_{\varepsilon}(u_1) - \bar{\beta}_{\varepsilon}(u_2)) \mathcal{X}_\delta(\bar{\beta}_{\varepsilon}(u_1))
\]
\[\quad - (\bar{\beta}_{\varepsilon}(u_2))dx + \int_{\mathbb{R}^d} f \Lambda_\delta dx. \tag{3.29}\]

We have

\[
I_\delta^1 = \int_{\mathbb{R}^d} D_{\varepsilon}(b_{\varepsilon}(u_1)u_1 - b_{\varepsilon}(u_2)u_2) \cdot \nabla \Lambda_\delta dx
\]
\[= \frac{1}{\delta} \int_{\|\bar{\beta}_{\varepsilon}(u_1) - \bar{\beta}_{\varepsilon}(u_2)\| \leq \delta} D_{\varepsilon}(b_{\varepsilon}(u_1)u_1 - b_{\varepsilon}(u_2)u_2) \cdot \nabla (\bar{\beta}_{\varepsilon}(u_1) - \bar{\beta}_{\varepsilon}(u_2)) dx. \]
Since the inverse of \(\tilde{\beta}_\varepsilon\) is Lipschitz with constant \(\frac{1}{\varepsilon}\), we have

\[
|b_\varepsilon(u_1)u_1 - b_\varepsilon(u_2)u_2| \leq C_\varepsilon |u_1 - u_2| \leq \frac{C_\varepsilon}{\varepsilon} |\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2)|,
\]

and this yields

\[
\lim_{\delta \to 0} \frac{1}{\delta} \int_{|\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2)| \leq \delta} |D_\varepsilon(b_\varepsilon(u_1)u_1 - b_\varepsilon(u_2)u_2) \cdot \nabla(\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2))| \, dx 
\leq \frac{C_\varepsilon}{\varepsilon} \lim_{\delta \to 0} \left( \int_{|\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2)| \leq \delta} |\nabla(\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2))|^2 \, dx \right)^\frac{1}{2} = 0, \quad (3.30)
\]

because \(\nabla(\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2))(x) = 0\), a.e. on \([x \in \mathbb{R}^d; \tilde{\beta}_\varepsilon(u_1(x)) - \tilde{\beta}_\varepsilon(u_2(x)) = 0]\).

This yields \(\lim_{\delta \to 0} I_1^\delta = 0\). Since \(A_\delta' \geq 0\), a.e. on \(\mathbb{R}\), we also have

\[
\int_{\mathbb{R}^d} \nabla(\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2)) \cdot \nabla(\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2)) A_\delta'(\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2)) \, dx \geq 0.
\]

Then, by (3.29), we get

\[
\lim_{\delta \to 0} \int_{\mathbb{R}^d} u A_\delta(\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2)) \, dx \leq \int_{\mathbb{R}^d} |f| \, dx, \quad \forall \varepsilon > 0,
\]

and, since \(u A_\delta(\tilde{\beta}_\varepsilon(u_1) - \tilde{\beta}_\varepsilon(u_2)) \geq 0\) and \(A_\delta \to \text{sign as } \delta \to 0\), by Fatou’s lemma this yields

\[
|u|_1 \leq |f|_1, \quad (3.31)
\]

as claimed. We note that, since \(f = 0\) implies \(u_\varepsilon(f) = 0\), it follows by (3.31) that \(u_\varepsilon(f) \in L^1, \forall f \in L^1 \cap L^2\).

Next, for \(f\) arbitrary in \(L^1\), consider a sequence \(\{f_n\} \subset L^2\) such that \(f_n \to f\) strongly in \(L^1\). Let \(\{u_\varepsilon^n\} \subset L^1 \cap L^2\) be the corresponding solutions to (3.21) for \(0 < \lambda < \lambda_\varepsilon\). Taking into account (3.31), we obtain by the above equation that \(|u_\varepsilon^n - u_\varepsilon^m|_1 \leq |f_n - f_m|_1, \forall n, m \in \mathcal{N}\). Hence, for \(n \to \infty\), we have \(u_\varepsilon^n \to u_\varepsilon(f)\) in \(L^1\). Define the operator

\[
A_\varepsilon u = -\Delta \tilde{\beta}_\varepsilon(u) + \varepsilon \tilde{\beta}_\varepsilon(u) + \text{div}(D_\varepsilon b_\varepsilon(u)u) \\
D(A_\varepsilon) = \{u \in L^1; -\Delta \tilde{\beta}_\varepsilon(u) + \varepsilon \tilde{\beta}_\varepsilon(u) + \text{div}(D_\varepsilon b_\varepsilon(u)u) \in L^1\}. \quad (3.32)
\]

It is obvious that \((A_\varepsilon, D(A_\varepsilon))\) is closed on \(L^1\). Therefore, \(u_\varepsilon(f) \in D(A_\varepsilon)\) and

\[
u_\varepsilon(f) + \lambda A_\varepsilon u_\varepsilon(f) = f, \quad (3.33)
\]

But then we can show that

\[
\|u_\varepsilon - u_\varepsilon(f)\|_1 \leq \lambda^{-1} \|f\|_1.
\]
for \( \lambda < \lambda_\varepsilon \). We also have
\[
|u_\varepsilon(f_1) - u_\varepsilon(f_2)|_1 \leq |f_1 - f_2|_1, \forall f_1, f_2 \in L^1. \tag{3.34}
\]
Then, by Proposition 3.3 in [2], p. 99, it follows that \( R(1 + \lambda A_\varepsilon) = L^1 \), \( \forall \lambda > 0 \), and also (3.33), (3.34) extend to all \( \lambda > 0 \) (see Proposition 3.1 in [2]).

Moreover, if \( u_\varepsilon = u_\varepsilon(\lambda, f) \) is our solution to (3.21), we have, for all \( 0 < \lambda_1, \lambda_2 < \infty \) and \( f \in L^1 \cap L^2 \), by definition
\[
u_\varepsilon(\lambda_2, f) = u_\varepsilon \left( \frac{\lambda_1}{\lambda_2} f + \left( 1 - \frac{\lambda_1}{\lambda_2} \right) u_\varepsilon(\lambda_2, f) \right) . \tag{3.35}\]

If \( f \in L^1 \cap L^\infty \), we have
\[
|u_\varepsilon(f)|_\infty \leq (1 + |(\nabla f)_-| + |D|_{\frac{2}{\infty}})|f|_\infty, \quad 0 < \lambda < \lambda_0, \tag{3.36}
\]
Indeed, by (3.21), we see that, for \( M_\varepsilon = |(\nabla D_\varepsilon)|^\frac{1}{2}|f|_\infty \), \( u_\varepsilon = u_\varepsilon(f) \), \( b_\varepsilon^*(r) = b_\varepsilon(r)r \) and \( \lambda < \lambda_0 \), where \( \lambda_0 \) is as in (3.6),
\[
(u_\varepsilon - |f|_\infty - M_\varepsilon) - \lambda \Delta (\tilde{\beta}_\varepsilon(u_\varepsilon) - \tilde{\beta}_\varepsilon(|f|_\infty + M_\varepsilon))
+ \lambda \varepsilon (\tilde{\beta}_\varepsilon(u_\varepsilon) - \tilde{\beta}_\varepsilon(|f|_\infty + M_\varepsilon)) + \lambda \nabla(D_\varepsilon(b_\varepsilon^*(u_\varepsilon) - b_\varepsilon^*(|f|_\infty + M_\varepsilon)))
\leq f - |f|_\infty - M_\varepsilon - \lambda b_\varepsilon^*(M_\varepsilon + |f|_\infty) \text{div} D_\varepsilon \leq 0.
\]
Multiplying the above equation by \( \mathcal{X}_\delta((u_\varepsilon - (|f|_\infty + M_\varepsilon))^+ \) and integrating over \( \mathbb{R}^d \), we get as above, for \( \delta \to 0 \), \( |(u_\varepsilon - |f|_\infty - M_\varepsilon)^+|_1 \leq 0 \) and, therefore, by (3.24)
\[
u_\varepsilon \leq (1 + |(\nabla f)_-| + |D|_{\frac{2}{\infty}})|f|_\infty, \quad \text{a.e. in } \mathbb{R}^d.
\]
Similarly, one gets that
\[
u_\varepsilon \geq -(1 + |(\nabla f)_-| + |D|_{\frac{2}{\infty}})|f|_\infty, \quad \text{a.e. in } \mathbb{R}^d,
\]
and so (3.36) follows, which in turn by (3.35) implies that, for some \( C_\lambda > 0 \),
\[
|u_\varepsilon(\lambda, f)|_\infty \leq C_\lambda |f|_\infty \quad \text{for all } \varepsilon > 0, \ f \in L^1 \cap L^\infty. \tag{3.37}
\]
Now, we are going to let \( \varepsilon \to 0 \) in (3.33). To this end, we need some estimates on \( u_\varepsilon \). By (3.21) (or (3.33)), we have
\[
\Delta \tilde{\beta}_\varepsilon(u_\varepsilon) = \lambda^{-1}(u_\varepsilon - f) + \text{div}(D_\varepsilon b_\varepsilon(u_\varepsilon)u_\varepsilon) + \varepsilon \tilde{\beta}_\varepsilon(u_\varepsilon). \tag{3.38}
\]
We shall first consider the case $d \geq 3$. This yields, if $f \in L^1 \cap L^\infty$,
\[
\tilde{\beta}_\varepsilon(u_\varepsilon) = \frac{1}{\lambda} E \ast (-u_\varepsilon - \varepsilon \lambda \tilde{\beta}_\varepsilon(u_\varepsilon) + f) + \text{div}(E \ast (D_\varepsilon b_\varepsilon(u_\varepsilon) u_\varepsilon)), \text{ a.e. in } \mathbb{R}^d,
\]
(3.39)
where $E$ is the fundamental solution to the Laplace operator (see Section 1). Then, recalling (1.3), (1.4) and (3.31), we get, for $\varepsilon \in (0,1)$,
\[
\|\tilde{\beta}_\varepsilon(u_\varepsilon) - \text{div}(E \ast (D_\varepsilon b_\varepsilon(u_\varepsilon) u_\varepsilon))\|_{M^{\frac{d}{d-2}}}
\leq \frac{1}{\lambda} \|E\|_{M^{\frac{d}{d-2}}} |u_\varepsilon + \lambda \varepsilon \tilde{\beta}_\varepsilon(u_\varepsilon) - f|_1 \leq \frac{2 + 3\lambda}{\lambda} \|E\|_{M^{\frac{d}{d-2}}} |f|_1,
\]
(3.40)
$\forall \lambda > 0$, because $\varepsilon |\tilde{\beta}_\varepsilon(u)| \leq (2 + \varepsilon^2)|u|$. Taking into account that, for $d \geq 3$,
\[
M^{\frac{d}{d-2}} \subset L^p_{\text{loc}}, \forall p \in (1,\frac{d}{d-2}), \quad M^{\frac{d}{d-1}} \subset L^p_{\text{loc}}, \forall p \in (1,\frac{d}{d-1})
\]
we see by (3.40) that, for $1 < p < \frac{d}{d-2}$, and, for all compacts $K \subset \mathbb{R}^d$, we have
\[
\|\tilde{\beta}_\varepsilon(u_\varepsilon) - \text{div}(E \ast (D_\varepsilon b_\varepsilon(u_\varepsilon) u_\varepsilon))\|_{L^p(K)} \leq \frac{1 + \lambda}{\lambda} C_K |f|_1, \forall \lambda > 0,
\]
and so, by (1.3), we have, for $1 < q < \frac{d}{d-1}$, $f \in L^1 \cap L^\infty$,
\[
\|\tilde{\beta}_\varepsilon(u_\varepsilon)\|_{L^q(K)} \leq C_K \left( \|\text{div}(E \ast (D_\varepsilon b_\varepsilon(u_\varepsilon) u_\varepsilon))\|_{L^q(K)} + \frac{1 + \lambda}{\lambda} |f|_1 \right)
\leq C_K \left( \|\text{div}(E \ast (D_\varepsilon b_\varepsilon(u_\varepsilon) u_\varepsilon))\|_{M^{\frac{d}{d-2}}} + \frac{1 + \lambda}{\lambda} |f|_1 \right)
\leq C_K \left( |u_\varepsilon|_1 + \frac{1 + \lambda}{\lambda} |f|_1 \right) \leq C_K \left( \frac{1 + \lambda}{\lambda} \right) |f|_1,
\]
(3.41)
$\forall \lambda > 0$, for any compact subset $K \subset \mathbb{R}^d$, where the constant $C_K$ is independent of $f$ and changes from line to line and we used that $|b_\varepsilon|_\infty \leq |b|_\infty$, $|D_\varepsilon| \leq |D|_\infty$.

We assume first that $f \in L^1 \cap L^\infty$ and $0 < \lambda < \lambda_0$. Then, by (3.36), we have, along a subsequence $\{\varepsilon\} \to 0$,
\[
u_\varepsilon \to u \text{ weak-star in } L^\infty, \text{ whence weakly in } L^1_{\text{loc}}.
\]
(3.42)
Therefore, $\left\{\tilde{\beta}_\varepsilon(u_\varepsilon)\right\}$ is bounded in $L^q_{\text{loc}}$ (as a matter of fact, since $|\tilde{\beta}_\varepsilon(r)| \leq C_M (1 + |r|)$, $|r| \leq M$, $\varepsilon \in (0,1)$, see (3.36) below, it is bounded in $L^\infty$). Hence, by selecting a further subsequence $\{\varepsilon\} \to 0$, we also have
\[
\tilde{\beta}_\varepsilon(u_\varepsilon) \to \eta \text{ weakly in } L^q_{\text{loc}}, \forall q \in (1,\frac{d}{d-1}).
\]
(3.43)
Now, we consider two cases:

**Case 1.** $b$ is constant (hence $b_\varepsilon \equiv b$).

By (3.21), (3.23), (3.42), (3.43), we have

$$u - \lambda \Delta \eta + \lambda \text{div}(Dbu) = f \text{ in } \mathcal{D}'(\mathbb{R}^d).$$

(3.44)

It remains to be shown that

$$\eta(x) = \beta(u(x)), \text{ a.e. } x \in \mathbb{R}^d.$$  

(3.45)

For this purpose, we shall prove first, via the Riesz-Kolmogorov compactness theorem, that $\{\tilde{\beta}_\varepsilon(u_\varepsilon)\}_{\varepsilon > 0}$ is compact in $L^q_{\text{loc}}$. We set

$$v_\varepsilon = \tilde{\beta}_\varepsilon(u_\varepsilon), \quad v_\varepsilon(x) = v_\varepsilon(x + \nu) - v_\varepsilon(x), \quad \forall x, \nu \in \mathbb{R}^d.$$

By (3.39), we have

$$v_\varepsilon(x) = \frac{1}{\lambda} E'(-u_\varepsilon - \varepsilon \lambda \tilde{\beta}_\varepsilon(u_\varepsilon) + f) - \text{div}(E'(D_\varepsilon bu_\varepsilon)), \quad E'(x) \equiv E(x + \nu) - E(x),$$

and, by (1.4), (1.5), this yields, for any compact $K \subset \mathbb{R}^d$, $1 < q < \frac{d}{d-1}$, $q < p < \frac{d}{d-2}$, and all $\varepsilon \in (0, 1)$,

$$\|v_\varepsilon\|_{L^q(K)} \leq \frac{C_K}{\lambda} \|E'(u_\varepsilon - \varepsilon \lambda \tilde{\beta}_\varepsilon(u_\varepsilon) + f)\|_{L^p(K)}$$

$$+ \|\text{div}(E'(D_\varepsilon bu_\varepsilon))\|_{L^q(K)}$$

$$\leq \frac{C_K}{\lambda} \|E'(u_\varepsilon - \varepsilon \lambda \tilde{\beta}_\varepsilon(u_\varepsilon) + f)\|_{M^{d/2}}$$

$$+ C_K \|\text{div}(E'(D_\varepsilon bu_\varepsilon))\|_{M^{d/2}}$$

$$\leq \frac{C_K}{\lambda} \|E'\|_{M^{d/2}} (|u_\varepsilon|_1 + |f|_1) + C_K \|\nabla E'\|_{M^{d/2}} |u_\varepsilon|_1$$

$$\leq C_K \left(1 + \frac{1}{\lambda}\right) (\|E'\|_{M^{d/2}} + \|\nabla E'\|_{M^{d/2}}) |f|_1,$$

where we used that $|D_\varepsilon|_\infty \leq |D|_\infty$. On the other hand, we have

$$\lim_{\nu \to 0}(\|E'\|_{M^{d/2}} + \|\nabla E'\|_{M^{d/2}}) = 0.$$
(This continuity property follows as in the case of $L^p$-spaces.) Therefore, 
$\{\tilde{\beta}_\varepsilon(u_\varepsilon); \varepsilon \in (0,1)\}$ is compact in each space $L^q(K)$, $K$ compact subset of $\mathbb{R}^d$, where $1 < q < \frac{d}{d-1}$. We also note that $\varepsilon|u_\varepsilon|_1 \to 0$ as $\varepsilon \to 0$. Hence, on a subsequence $\{\varepsilon\} \to 0$,

$$\beta_\varepsilon(u_\varepsilon) \to \eta \text{ strongly in } L^q_{\text{loc}}.$$  

(3.46)

Since $\{u_\varepsilon; \varepsilon \in (0,1)\}$ are bounded in $L^\infty$, we have

$$\lim_{\varepsilon \to 0} |\beta_\varepsilon(u_\varepsilon) - \beta(u_\varepsilon)|_\infty = 0,$$

so, by (3.46),

$$\beta(u_\varepsilon) \to \eta \text{ strongly in } L^q_{\text{loc}}.$$  

(3.47)

Recalling that $u_\varepsilon \to u$ weak-star in $L^\infty$ and that the map $u \to \beta(u)$ is maximal monotone in each dual pair $(L^q(K), L^{q'}(K))$, hence weakly-strongly closed, we get by (3.47) that (3.45) holds. Hence, by (3.34), (3.42), for $u = u(\lambda, f)$, we have

$$|u(\lambda, f) - u(\lambda, g)|_1 \leq |f - g|_1, \forall \lambda > 0, f, g \in L^1 \cap L^\infty.$$  

(3.48)

(Indeed, first only for $0 < \lambda < \lambda_0$, but then by Proposition 3.1 in [2] for all $\lambda > 0$.) Hence, $u(\lambda, f) \in L^1$ and so, by (3.44), $u(\lambda, f) \in D(A_0)$ and satisfies (3.18) for all $f \in L^1 \cap L^\infty$.

**Case 2.** Let $\beta$ be strictly increasing.

Multiplying (3.33) by $u_\varepsilon = u_\varepsilon(f)$ and integrating over $\mathbb{R}^d$, since $u_\varepsilon, b_\varepsilon(u_\varepsilon)u_\varepsilon \in H^1 \cap L^1 \cap L^\infty$, $\tilde{\beta}_\varepsilon(u_\varepsilon) \in H^2$, we obtain

$$|u_\varepsilon|^2 + \lambda \int_{\mathbb{R}^d} \beta'_\varepsilon(u_\varepsilon)|\nabla u_\varepsilon|^2 dx$$

$$\leq \lambda \int_{\mathbb{R}^d} (\nabla u_\varepsilon \cdot D_\varepsilon)b_\varepsilon(u_\varepsilon)u_\varepsilon dx + \frac{1}{2} |u_\varepsilon|^2 + \frac{1}{2} |f|^2.$$  

(3.49)

Defining

$$\psi(r) = \int_0^r b_\varepsilon(s)s ds, \ r \in \mathbb{R},$$

we see that $\psi \geq 0$, hence the first integral on the right hand side of (3.49) is equal to

$$- \int_{\mathbb{R}} \text{div} D_\varepsilon \psi(u_\varepsilon) dx \leq C < \infty,$$  

(3.50)
where (see (3.24))

\[ C := \frac{1}{2} |b|_{\infty} (\operatorname{div} D)^{-} + |D|_{\infty} \sup_{\varepsilon \in (0, 1)} (|u_{\varepsilon}|_{\infty} |u_{\varepsilon}|_{1}). \]

\( C \) is by (3.34) and (3.37) indeed finite, since \( f \in L^{1} \cap L^{\infty} \).

Define \( g_{\varepsilon}(r) = (I + \varepsilon \beta)^{-1}(r), r \in \mathcal{N} \), and

\[ a(r) = \int_{0}^{r} \frac{\beta'(s)}{1 + \beta'(g_{\varepsilon}(r))} ds, \quad r \in \mathbb{R}. \]

Since

\[ \beta'_{\varepsilon}(r) \geq \frac{\beta'(g_{\varepsilon}(r))}{1 + \beta'(g_{\varepsilon}(r))} \geq \frac{\beta'(g_{\varepsilon}(r))}{1 + \beta'(g_{\varepsilon}(r))} (g'_{\varepsilon}(r))^2, \quad r \in \mathbb{R}, \]

and thus

\[ \beta'_{\varepsilon}(u_{\varepsilon})|\nabla u_{\varepsilon}|^2 \geq |\nabla a(g_{\varepsilon}(u_{\varepsilon}))|^2, \]

we obtain from (3.49), (3.50)

\[ |u_{\varepsilon}|_{2}^{2} + 2 \lambda \int_{\mathbb{R}^{d}} |\nabla a(g_{\varepsilon}(u_{\varepsilon}))|^2 dx \leq |f|_{2}^{2}. \tag{3.51} \]

Since \(|a(r)| \leq |r|\) and \(|g_{\varepsilon}(r)| \leq |r|, r \in \mathbb{R}, this implies that \( a(g_{\varepsilon}(u_{\varepsilon})), \varepsilon > 0, \)

is bounded in \( H^{1} \), hence compact in \( L_{\text{loc}}^{2} \), so along a subsequence \( \varepsilon \to 0 \)

\[ a(g_{\varepsilon}(u_{\varepsilon})) \to v \quad \text{in} \quad L_{\text{loc}}^{2} \quad \text{and a.e.} \]

Since \( a \) is strictly increasing and continuous, and thus so is its inverse function \( a^{-1} \), it follows that \( g_{\varepsilon}(u_{\varepsilon}) \to a^{-1}(v), \ a.e. \), and so, as \( \varepsilon \to 0, \)

\[ u_{\varepsilon} = g_{\varepsilon}(u_{\varepsilon}) + \varepsilon \beta(g_{\varepsilon}(u_{\varepsilon})) \to a^{-1}(v), \ \text{a.e. on} \ \mathbb{R}^{d}. \]

Therefore, by (3.36) we have \( u \in L^{\infty} \) and by (3.42)

\[ u_{\varepsilon} \xrightarrow{\varepsilon \to 0} u \quad \text{in} \quad L_{\text{loc}}^{p}, \quad \forall p \in [1, \infty). \tag{3.52} \]

By Fatou’s lemma and (3.33), it follows that \( u \in L^{1} \). Furthermore, obviously both \( \tilde{\beta}_{\varepsilon} \) and \( b_{\varepsilon}, \varepsilon \in (0, 1), \) are locally equicontinuous. Hence,

\[ \tilde{\beta}_{\varepsilon}(u_{\varepsilon}) \to \beta(u), \quad b_{\varepsilon}(u_{\varepsilon})u_{\varepsilon} \to b(u)u, \ \text{a.e. on} \ \mathbb{R}^{d}. \tag{3.53} \]

16
as \( \varepsilon \to 0 \), since \( \sup_{\varepsilon > 0} |u_\varepsilon|_\infty < \infty \) by (3.30). We note that, since \( \beta \) is locally Lipschitz and \( \beta(0) = 0 \), we have, for \( M > 0 \), \( C_M = \sup_{|r| \leq M} \beta'(r) \),

\[
|\tilde{\beta}_\varepsilon(r)| \leq C_M |(I + \varepsilon \beta)^{-1}r| \leq C_M |r|, \quad r \in [-M, M].
\] (3.54)

Hence, by (3.36), (3.37) and because \( |b_\varepsilon| \leq |b|_\infty \), (3.54) implies that both convergences in (3.53) also hold in \( L^p_\text{loc} \), \( p \in [1, \infty) \). Hence we can pass to the limit in (3.33), (3.34) to conclude that \( u_\varepsilon \) satisfies (3.19), which in turn implies that \( u_\varepsilon \in D(A) \), because \( \beta(u_\varepsilon) \in L^p_\text{loc}, \ p \in [1, \infty) \), and that (3.48) also holds in Case 2.

All that follows now holds in both Cases 1 and 2.

We define \( J_\lambda : L^1 \cap L^\infty \to L^1 \),

\[ J_\lambda(f) = u(\lambda, f), \quad \forall f \in L^1 \cap L^\infty, \ \lambda > 0. \]

Then, (3.4) follows by definition. We note that, by (3.44), it also follows

\[
|\beta(u(\lambda, f))|_{L^q(K)} \leq C_K \left( 1 + \frac{1}{\lambda} \right) |f|_1, \ \forall f \in L^1 \cap L^\infty, \ \lambda > 0.
\] (3.55)

Now, let \( f \in L^1 \) and \( \{f_n\} \subset L^1 \cap L^\infty \) be such that \( f_n \to f \) in \( L^1 \). If \( u_n = u(\lambda, f_n) \), we see by (3.48) that \( u_n \to u \) in \( L^1 \) and, by (3.55), \( \{\beta(u_n)\} \) is bounded in \( L^q(K) \) for each \( K \subset \mathbb{R}^d, \ q \in (0, \frac{d}{d-1}) \). Hence, by the generalized Lebesgue convergence theorem and the continuity of \( \beta \), \( \beta(u_n) \to \beta(u) \) in \( L^q(K) \), and so \( u \in D(A_0), \ A_0u_n \to A_0u \) in \( L^1 \), and

\[ u + \lambda A_0u = f. \] (3.56)

Then, we may extend (3.48) and (3.55) to all of \( f \in L^1 \) and hence (3.3) and (3.5) hold.

By (3.36), (3.42), it follows that (3.6) holds, which by (3.4) implies (3.7). Moreover, if \( f \geq 0 \) on \( \mathbb{R}^d \), by (3.21) it is easily seen that \( u_\varepsilon \geq 0 \) on \( \mathbb{R}^d \), and so, by (3.42) we infer that \( u \geq 0 \). Moreover, we have

\[
\int_{\mathbb{R}^d} u \, dx = \int_{\mathbb{R}^d} f \, dx.
\] (3.57)

By (3.56), we have

\[
\int_{\mathbb{R}^d} u \varphi \, dx - \lambda \int_{\mathbb{R}^d} \beta(u) \Delta \varphi \, dx + \lambda \int_{\mathbb{R}^d} ub(u) D \cdot \nabla \varphi \, dx = \int_{\mathbb{R}^d} f \varphi \, dx,
\] (3.58)
∀φ ∈ C_0^∞. Now, we choose in (3.38) φ = φν ∈ C_0^∞, where φν → 1 on \( \mathbb{R}^d \), 0 ≤ φν ≤ 1, and
\[ |Δφν|_∞ + |\nablaφν|_∞ \to 0 \text{ as } ν \to 0. \]
(Such an example is \( \varphi ν(x) = \exp \left( -\frac{ν|x|^2}{1-ν|x|^2} \right) \). This implies (3.57), and so (3.8) holds.

It remains to prove (3.34). Let \( g ∈ C_0^∞(\mathbb{R}^d) \) be arbitrary but fixed. Coming back to equation (3.33), we can write
\[ g - λΔ\tilde{β}_ν(g) + λε\tilde{β}_ν(g) + λ \text{ div}(D_εb_ε(g)g) = g + λA_ε(g), \]
and so (3.34) yields that, for some \( C ∈ (0, ∞) \),
\[ |u_ε(g) - g| ≤ λ|A_ε(g)| ≤ Cλ(∥g∥_{W^{2,2}(\mathbb{R}^d)} + |g|_∞), \quad ∀ε ∈ (0, 1), \]
because \( β ∈ C^2, b ∈ C^1 \), and hence \( \tilde{β}_ε, (\tilde{β}_ε)', (\tilde{β}_ε)'' \) and \( b_ε' \) are locally uniformly bounded in \( ε ∈ (0, 1) \) and since \( |D|_∞ < ∞, \text{ div } D ∈ L^1_{loc} \) and \( |b_ε| ≤ |b|_∞ \).
This, together with (3.42), implies (3.9), as claimed. This completes the proof of Lemma 3.1 for \( d ≥ 3 \).

Now, we shall sketch the proof of the case \( d = 1 \) only in the case that \( b ≡ 1 \). By (3.38), we have
\[ (\tilde{β}_ε(u_ε))'(x) = D(x)u_ε(x) + λ^{-1} \int_{-∞}^{x} (u_ε(y) - f(y))dy, \quad ∀x ∈ \mathbb{R}, \]
\[ \tilde{β}_ε(u_ε(x)) = \tilde{β}_ε(u_ε(x_0)) + \int_{x_0}^{x} D(y)u_ε(y)dy + λ^{-1} \int_{x_0}^{x} ds \int_{-∞}^{s} (u_ε(y) - f(y))dy, \quad ∀x, x_0 ∈ \mathbb{R}. \] (3.59)
Taking into account that \( \{u_ε\} \) is bounded in \( L^1 \), we may choose \( x_0 \) independent of \( ε \) such that \( \{u_ε(x_0)\} \) is bounded. This implies that \( \{\tilde{β}_ε(u_ε)\}_{ε>0} \) is bounded in \( L^∞_{loc} \) and so estimate (3.41) follows. Hence, it follows as above that (3.42)-(3.44) follow too. We shall prove that \( \{\tilde{β}_ε(u_ε)\}_{ε>0} \) is compact in \( L^1_{loc} \). If \( v_ε = \tilde{β}_ε(u_ε) \) and \( v_ε' = v_ε(x + ν) - v_ε(x) \), we get by (3.59) that
\[ v_ε'(x) = \int_{x}^{x+ν} D(y)u_ε(y)dy + λ^{-1} \int_{x}^{x+ν} ds \int_{-∞}^{s} (u_ε(y) - f(y))dy \]
and, therefore,  \( \lim_{\nu \to 0} |v\nu'_{\nu}|_{L^1_{\text{loc}}} = 0 \) uniformly with respect to \( \varepsilon \). Hence, \( \{v\varepsilon\} \) is compact in \( L^1_{\text{loc}} \) and so \( (3.45) \) follows by \( (3.46) \). As regard \( (3.48)-(3.57) \), and so all conclusion of Lemma 3.1, it follows as in the previous case.

Later, we shall also need the following convergence result for the solution \( u\varepsilon \) to the approximating equation \( (3.21) \).

**Lemma 3.3.** Assume that \( \beta \) is strictly increasing. Then, we have, for \( \varepsilon \to 0 \),

\[
u\varepsilon \to u = J_\lambda f \text{ in } L^1, \quad \forall \ f \in L^1. \tag{3.60}\]

**Proof.** We shall proceed as in the proof of Lemma 3.2 in [5]. It suffices to prove this for \( f \) in a dense subset of \( L^1 \). In Case 2 of the proof of Lemma 3.1 by \( (3.52) \) we have \( u\varepsilon \to u = J_\lambda f \) strongly in \( L^1_{\text{loc}} \). But this also follows in Case 1, because by \( (3.45) \) and \( (3.47) \) we have that \( \beta(u\varepsilon) \to \beta(u) \) in \( L^1_{\text{loc}} \).

So, by our additional assumption that \( \beta \) is strictly increasing, which entails that its inverse \( \beta^{-1} \) is continuous, we have that also \( u\varepsilon \to u \), a.e. (along a subsequence), hence \( u\varepsilon \to u \) in \( L^1_{\text{loc}} \) by \( (3.42) \). Hence it suffices to show that there is \( C \) independent of \( \varepsilon \) such that

\[
\|u\varepsilon\| = \int_{\mathbb{R}^d} |u\varepsilon(x)| \Phi(x)dx \leq C, \quad \forall \ \varepsilon > 0, \tag{3.61}\]

where \( \Phi \in C^2(\mathbb{R}^d) \) is such that \( 1 \leq \Phi(x), \quad \forall \ x \in \mathbb{R}^d, \) and

\[
\Phi(x) \to +\infty \text{ as } |x| \to \infty, \quad \nabla \Phi \in L^\infty, \quad \Delta \Phi \in L^\infty.
\]

(An example is \( \Phi(x) \equiv (1 + |x|^2)^\alpha \) with \( \alpha \in (0, \frac{1}{2}] \).

We fix such a function \( \Phi \) and assume that

\[
f \in L^1 \cap L^\infty, \quad \|f\| = \int_{\mathbb{R}^d} \Phi(x)|f(x)|dx < \infty.
\]

If we multiply equation \( (3.21) \) by \( \varphi_\nu \chi^\varepsilon_\delta(\tilde{\beta}_\varepsilon(u\varepsilon)) \), where \( \varphi_\nu(x) = \Phi(x) \exp(-\nu \Phi(x)) \), \( \nu > 0 \), and integrate over \( \mathbb{R}^d \), we get, since \( \chi^\nu_\delta \geq 0 \),

\[
\int_{\mathbb{R}^d} u\varepsilon \chi^\varepsilon_\delta(\tilde{\beta}_\varepsilon(u\varepsilon)) \varphi_\nu \ dx \leq -\lambda \int_{\mathbb{R}^d} \nabla \tilde{\beta}_\varepsilon(u\varepsilon) \cdot \nabla (\chi^\varepsilon_\delta(\tilde{\beta}_\varepsilon(u\varepsilon))) \varphi_\nu \ dx \\
+ \lambda \int_{\mathbb{R}^d} D\varepsilon b^\varepsilon_\nu(u\varepsilon) \cdot \nabla \varphi_\nu(\chi^\varepsilon_\delta(\tilde{\beta}_\varepsilon(u\varepsilon))) \ dx \\
+ \int_{\mathbb{R}^d} |f| \varphi_\nu \ dx \\
\leq -\lambda \int_{\mathbb{R}^d} (\nabla \tilde{\beta}_\varepsilon(u\varepsilon) \cdot \nabla \varphi_\nu) \chi^\varepsilon_\delta(\tilde{\beta}_\varepsilon(u\varepsilon)) \ dx \\
+ \lambda \int_{\mathbb{R}^d} D\varepsilon b^\varepsilon_\nu(u\varepsilon) \cdot \nabla \varphi_\nu(\chi^\varepsilon_\delta(\tilde{\beta}_\varepsilon(u\varepsilon))) \varphi_\nu \ dx \\
+ \lambda \int_{\mathbb{R}^d} (D\varepsilon \cdot \nabla \varphi_\nu) b^\varepsilon_\nu(u\varepsilon) \chi^\varepsilon_\delta(\tilde{\beta}_\varepsilon(u\varepsilon)) \ dx \\
+ \int_{\mathbb{R}^d} |f| \varphi_\nu \ dx. \tag{3.62}\]
Here, $b^*_\varepsilon(u) = b_\varepsilon(u)u$. Letting $\delta \to 0$, we get as above

$$
\int_{\mathbb{R}^d} |u_\varepsilon| \varphi_\nu \, dx \leq -\lambda \int_{\mathbb{R}^d} \nabla|\tilde{\beta}_\varepsilon(u_\varepsilon)| \cdot \nabla \varphi_\nu \, dx
+ \lim_{\delta \to 0} \frac{\lambda}{\delta} \int_{|\tilde{\beta}_\varepsilon(u_\varepsilon)| \leq \delta} |D_\varepsilon| |b^*_\varepsilon(u_\varepsilon)| \nabla|\tilde{\beta}_\varepsilon(u_\varepsilon)| \varphi_\nu \, dx
+ \lambda \int_{\mathbb{R}^d} (\text{sign } u_\varepsilon) b^*_\varepsilon(u_\varepsilon)(D_\varepsilon \cdot \nabla \varphi_\nu) \, dx + \int_{\mathbb{R}^d} |f| \varphi_\nu \, dx
\leq \lambda \int_{\mathbb{R}^d} (|\tilde{\beta}_\varepsilon(u_\varepsilon)| \Delta \varphi_\nu + |b^*_\varepsilon(u_\varepsilon)| |D_\varepsilon \cdot \nabla \varphi_\nu|) \, dx + \int_{\mathbb{R}^d} |f| \varphi_\nu \, dx,
$$

where in the last step we used that

$$
|b^*_\varepsilon(u_\varepsilon)| \leq \text{Lip}(b^*_\varepsilon)|u_\varepsilon| \leq \frac{1}{\varepsilon} \text{Lip}(b^*_\varepsilon)|\tilde{\beta}_\varepsilon(u_\varepsilon)|.
$$

We have

$$
\nabla \varphi_\nu(x) = (\nabla \Phi - \nu \Phi \nabla \Phi) \exp(-\nu \Phi),
\Delta \varphi_\nu(x) = (\Delta \Phi - \nu |\nabla \Phi|^2 - \nu \Phi \Delta \Phi + \nu^2 \Phi |\nabla \Phi|^2 - \nu |\nabla \Phi|^2) \exp(-\nu \Phi).
$$

Then, letting $\nu \to 0$ in (3.63), since $M := \sup_{\varepsilon > 0} |u_\varepsilon|_\infty < \infty$, $|b^*_\varepsilon(r)| \leq |b|_\infty |r|$, $|D_\varepsilon| \leq |D|$ and $|\tilde{\beta}_\varepsilon(r)| \leq \left(\sup_{|r| \leq M} \beta'(r) + \varepsilon\right)|r|$, $\forall r \in [-M, M]$, we get

$$
\|u_\varepsilon\| \leq \|f\| + C\lambda(|\Delta \Phi|_\infty + |D|_\infty |\nabla \Phi|_\infty)|f|_1, \ \forall \varepsilon \in (0, 1).
$$

Hence (3.61) and, therefore, (3.60), hold for all $f \in L^1 \cap L^\infty$ with $\|f\| < \infty$. Since the latter set is dense in $L^1$, we get (3.60), as claimed.

**Proof of Theorem 2.2 (continued).** As seen earlier, the solution $u_h$ to the finite difference scheme (2.2)–(2.4) is uniformly convergent on every compact interval $[0, T]$ to $u \in C([0, \infty); L^1)$. By (3.6) and (3.17), by a standard argument we obtain that, for $u_0 \in L^1 \cap L^\infty$,

$$
|u(t)|_\infty = |S(t)u_0|_\infty \leq \exp\left(|(\text{div } D)^- + |D||^{\frac{1}{\infty}} t\right)|u_0|_\infty, \ \forall t \geq 0.
$$

(2.7) follows by (3.17) and (3.8).
Let us prove now that $u$ is a distributional solution to (1.1). We note first that by (2.4) we have (setting $u_h(t) = u_0$ for $t \in (-\infty, 0)$)

$$ u_h(t) - h\Delta \beta(u_h(t)) + h \text{ div}(Db(u_h(t))u_h(t)) = u_h(t-h), \ t \geq 0, 
$$

$$ u_h(0) = u_0. $$

(3.64)

Since $\lim_{h \to 0} u_h(t) = S(t)u_0$ in $L^1$ locally uniformly in $t \in [0, \infty)$, we have by (2.6) that

$$ |u_h(t)|_\infty \leq \exp((|\text{div} D^- + |D| 1 2 t)|u_0|_\infty + 1, \ t \geq 0, $$

for small enough $h$, and, hence, for $h \to 0$, $\beta(u_h(t)) \to \beta(u(t))$ in $L^{1}_{\text{loc}}$, a.e. $t > 0$.

Let $\varphi \in C^{\infty}_0([0, \infty) \times \mathbb{R}^d)$. Then, by (3.64) we have

$$ \int_0^\infty \int_{\mathbb{R}^d} \frac{1}{h} (u_h(t,x) - u_h(t-h,x))\varphi(t,x) - \beta(u_h(t,x))\Delta \varphi(t,x) $$

$$ -b(u_h(t,x))u_h(t,x)D\varepsilon(x) \cdot \nabla \varphi(t,x)dt \ dx = 0, $$

if we take $u_h(t,x) \equiv u_0(x)$ for $t \in (-h, 0]$. Then, replacing the first term by

$$ \int_0^\infty \int_{\mathbb{R}^d} \frac{1}{h} u_h(t,x)(\varphi(t+h,x) - \varphi(t,x))dt \ dx + \frac{1}{h} \int_0^h \int_{\mathbb{R}^d} u_0(x)\varphi(t,x)dt \ dx $$

and, letting $h \to 0$, we get (2.9), as claimed. This completes the proof. □

**Remark 3.4.** Theorem 2.2 extends by a slight modification of the proof to the multivalued functions $\beta : \mathbb{R} \to 2^{\mathbb{R}}$ with $D(\beta) = (-\infty, +\infty)$ and which are maximal monotone graphs on $\mathbb{R} \times \mathbb{R}$, that is, $(v_1 - v_2)(u_1 - u_2) \geq 0, \ \forall v_i \in \beta(u_i), i = 1, 2,$ and $R(1 + \beta) = \mathbb{R}$.

**4. Regularizing effect on initial data**

Consider here equation (1.1) under the following hypotheses.

(k) $\beta \in C^2(\mathbb{R})$, $\beta'(r) \geq a|r|^{\alpha-1}, \ \forall r \in \mathbb{R}$; $\beta(0) = 0$, where $\alpha \geq 1$, $d \geq 3$, $a > 0$.

(kk) $D \in L^\infty(\mathbb{R}^d; \mathbb{R}^d)$, div $D \in L^2(\mathbb{R}^d) + L^\infty(\mathbb{R}^d)$, div $D \geq 0$, a.e.

(kkk) $b \in C_b(\mathbb{R}) \cap C^1(\mathbb{R})$, $b \geq 0$. 21
Theorem 4.1. Let $d \geq 3$. Then, under Hypotheses (k), (kk), (kkk), the generalized solution $u$ to \((1.1)\) given by Theorem 2.2 for $\mu = u_0 dx$, $u_0 \in L^1$, satisfies

$$u(t) \in L^\infty, \forall t > 0,$$

$$(4.1)$$

$$|u(t)|_\infty \leq C t^{-\frac{d}{p+\alpha-1}} |u_0|_{1+\frac{d(\alpha-1)}{2}}^2, \forall t \in (0, \infty), u_0 \in L^1,$$

$$(4.2)$$

where $C$ is independent of $u_0$.

Proof. We shall first prove the following lemma.

Lemma 4.2. Let $u_\lambda = (I + \lambda A)^{-1} f$, where $A$ is the operator \((3.10), (3.11)\). Then, for each $p > 1$ and $\lambda > 0$, we have

$$|u_\lambda|^p + \lambda a C \frac{p(p-1)}{(p + \alpha - 1)^2} |u_\lambda|_{\frac{p+\alpha-1}{d-2}} \leq |f|^p, \forall f \in L^p \cap L^1.$$n

$(4.3)$

where $C$ is independent of $p$ and $\lambda$.

Proof. Let $p \in (1, \infty)$. By approximation, we may assume that $f \in L^1 \cap L^\infty$. Let us first explain the proof by heuristic computations in the case $b \equiv 1$, that is, for the equation

$$u_\lambda - \lambda \Delta \beta(u_\lambda) + \lambda \operatorname{div}(Du_\lambda) = f.$$n

$(4.4)$

We multiply \((3.21)\) by $|u_\lambda|^{p-2} u_\lambda$ and integrate over $\mathbb{R}^d$ and get

$$|u_\lambda|^p + (p-1) \lambda \int_{\mathbb{R}^d} \beta'(u_\lambda)|\nabla u_\lambda|^2 |u_\lambda|^{p-2} dx$$

$$= \int_{\mathbb{R}^d} f |u_\lambda|^{p-2} u_\lambda dx - \frac{(p-1)}{p} \lambda \int_{\mathbb{R}^d} |u_\lambda|^p \operatorname{div} D dx$$

$$(4.5)$$

$$\leq |f|^p |u_\lambda|^{p-1} \leq \frac{1}{p} |f|^p + \left(1 - \frac{1}{p}\right) |u_\lambda|^p.$$n

Taking into account (k) yields

$$|u_\lambda|^p + ap(p-1) \lambda \int_{\mathbb{R}^d} |u_\lambda|^{p+\alpha-3} |\nabla u_\lambda|^2 dx \leq |f|^p.$$n

On the other hand,

$$\int_{\mathbb{R}^d} |u_\lambda|^{p+\alpha-3} |\nabla u_\lambda|^2 dx = \left(\frac{2}{p+\alpha-1}\right)^2 \int_{\mathbb{R}^d} \nabla \left(|u_\lambda|^{\frac{\alpha+1}{2}}\right)^2 dx$$

$$\geq C \left(\frac{2}{p+\alpha-1}\right)^2 \left(\int_{\mathbb{R}^d} |u_\lambda|^{\frac{(\alpha+1)p}{d-2}} dx\right)^{\frac{d-2}{d}}.$$n

22
(by the Sobolev embedding theorem in \( \mathbb{R}^d \)). This yields
\[
|u_\lambda|^p + \lambda a C \frac{p(p-1)}{(p+\alpha-1)^2} |u_\lambda|^{\frac{\alpha-1+p}{d-2}} \leq |f|^p, \quad \forall \lambda > 0,
\]
as claimed.

Of course, the above argument is heuristic since e.g. \( u_\lambda \notin H^1 \). To make the proof rigorous, we recall that by Lemma 3.3 the solution \( u := u_\lambda \) to (3.19) constructed in Lemma 3.2 is an \( L^1 \)-limit of solutions \( u_\varepsilon, \varepsilon > 0 \), to the approximating equations (3.33) (with \( A_\varepsilon \) as in (3.32)). So, we shall start with (3.33) (instead of (4.4)) and with its solution \( u_\varepsilon \). Then we know by the proof of Lemma 3.1 (see (3.25)) that \( u_\varepsilon, b(u_\varepsilon)u_\varepsilon \in H^1 \cap L^1 \cap L^\infty, \beta_\varepsilon(u_\varepsilon) \in H^2 \).

We have, for all \( r \in \mathbb{R} \),
\[
\beta'_\varepsilon(r) = \frac{\beta'(g_\varepsilon(r))}{(1 + \varepsilon \beta')(g_\varepsilon(r))} + \varepsilon \geq h_\varepsilon(g_\varepsilon(r)), \quad (4.6)
\]
where
\[
h_\varepsilon(r) = \frac{a|r|^{\alpha-1}}{1 + \varepsilon a|r|^{\alpha-1}}, \quad r \in \mathbb{R}, \quad g_\varepsilon = (I + \varepsilon \beta)^{-1}. \quad (4.7)
\]
Define \( \varphi_\delta : \mathbb{R} \to \mathbb{R} \) by
\[
\varphi_\delta(r) = (|r| + \delta)^{p-2}r, \quad r \in \mathbb{R}.
\]
Then, \( \varphi_\delta \in C^1_\beta, \lim_{\delta \to 0} \varphi'_\delta(r) = (p-1)|r|^{p-2} \) and \( \varphi'_\delta(r) \geq \min(1, p-1)(|r|+\delta)^{p-2} \).

Now, we multiply (3.33) by \( \varphi_\delta(u_\varepsilon) \) and obtain
\[
\int_{\mathbb{R}^d} u_\varepsilon \varphi_\delta(u_\varepsilon) dx + \lambda \int_{\mathbb{R}^d} \beta'_\varepsilon(u_\varepsilon)|\nabla u_\varepsilon|^2 \varphi'_\delta(u_\varepsilon) dx = \lambda \int_{\mathbb{R}^d} (D_\varepsilon \cdot \nabla u_\varepsilon) \frac{\beta'_\varepsilon(u_\varepsilon)}{\beta_\varepsilon(u_\varepsilon)} b_\varepsilon(u_\varepsilon) u_\varepsilon dx + \int_{\mathbb{R}^d} f \varphi_\delta(u_\varepsilon) dx. \quad (4.8)
\]
Defining
\[
\psi(r) = \int_0^r \varphi'_\delta(s)b_\varepsilon(s)s \, ds,
\]
we see that \( \psi \geq 0 \), hence the first integral in the right hand side of (4.8) is equal to
\[
- \int_{\mathbb{R}^d} (\text{div } D_\varepsilon) \psi(u_\varepsilon) dx \leq C_\varepsilon, \quad (4.9)
\]
where (see (3.24))
\[
C_\varepsilon = \frac{1}{2} |b|_{\infty} |D|_{\infty} \sup_{\varepsilon \in (0,1)} |u_{\varepsilon}|_{\infty} \int_{\mathbb{R}^d} 1_{|x| \geq \frac{1}{\varepsilon}} |u_{\varepsilon}| dx.
\]

Furthermore, we deduce from (4.6) that the second integral on the left hand side of (4.8) dominates
\[
\int_{\mathbb{R}^d} h_\varepsilon(g_\varepsilon(u_\varepsilon)) |\nabla u_\varepsilon|^2 \varphi_\delta'(u_\varepsilon) dx = \int_{\mathbb{R}^d} |\nabla \psi_{\varepsilon,\delta}(u_\varepsilon)|^2 dx
\geq C \left( \int_{\mathbb{R}^d} \psi_{\varepsilon,\delta}(u_\varepsilon) \right)^{\frac{d-2}{2}} dx,
\]
where
\[
\psi_{\varepsilon,\delta}(r) = \int_0^r \sqrt{h_\varepsilon(g_\varepsilon(s))} \varphi_\delta'(s) ds, \quad r \in \mathbb{R}.
\]
(Here, we used the Sobolev embedding.) Combining (4.8)–(4.10) and letting \(\delta \to 0\), we obtain by Fatou’s lemma and (3.36)
\[
|u_{\varepsilon}|_p^{p} + \frac{\lambda C}{p} \left( \int_{\mathbb{R}^d} |\psi_{\varepsilon}(u_\varepsilon)|^{\frac{2d}{d-2}} dx \right)^{\frac{d-2}{d}} \leq \frac{1}{p} |f|_p^{p} + \left( 1 - \frac{1}{p} \right) |u_{\varepsilon}|_p^{p} + C_\varepsilon,
\]
where
\[
\psi_{\varepsilon}(r) = \sqrt{p-1} \int_0^r \sqrt{h_\varepsilon(g_\varepsilon(s))} |s|^{p-2} ds, \quad r \in \mathbb{R}.
\]

Obviously, \(\psi_{\varepsilon}(u_\varepsilon), \varepsilon > 0\), are equicontinuous, hence by (3.36) and (3.52)
\[
(\psi_{\varepsilon}(u_\varepsilon))^2 \to a(p-1) \left( \frac{2}{p + \alpha - 1} \right)^2 |u|^{p + \alpha - 1}, \quad \text{a.e. on } \mathbb{R}^d,
\]

and, since \(u_{\varepsilon} \to u\) in \(L^1\) by Lemma 3.3 \(\lim_{\varepsilon \to 0} C_\varepsilon = 0\). Therefore, by Fatou’s lemma, (4.12) implies (4.3).

**Proof of Theorem 4.1.** We choose \(p = p_n\), where \(\{p_n\}\) are defined by
\[
p_{n+1} = \frac{d}{d-2} (p_n + \alpha - 1), \quad p_0 > 1.
\]

Then, by (4.3), we get
\[
|u_{\lambda}|_{p_n}^{p_n} + C \alpha \frac{p_n(p_n - 1)}{(p_n + \alpha - 1)^2} \lambda |u_{\lambda}|_{p_n+\alpha-1}^{p_n+\alpha-1} \leq |f|_{p_n}^{p_n}, \quad n = 0, 1, ...
\]
Now, we apply Theorem 5.2 in A. Pazy \[15\], where \( \varphi_n(u) = |u|^{p_n} \), \( \beta_n = \frac{d-2}{d} \), \( C_n = Ca \inf_{p \in [p_0, \infty)} \frac{p(p-1)}{(p+\alpha-1)^2}, \) and conclude that (see Proposition 6.5 in \[15\] or \[19\]) that

\[
|u(t)|_\infty \leq C_{p_0} t^{-\frac{d}{2p_0 + (\alpha - 1)d}} |u_0|^{\frac{2p_0}{p_0 + d(\alpha - 1)}} \quad \forall t > 0, \ u_0 \in L^{p_0}. \quad (4.14)
\]

Define

\[
C_{\alpha, d} := \frac{d + 2}{2d} + \sqrt{(\alpha - 1) \left( \alpha + \frac{2}{d} \right) + \left( \frac{d + 2}{2d} \right)^2}. \quad (4.15)
\]

Note that, since \( \alpha > 1 - \frac{2}{d} \), the value under the root is strictly bigger than \( (\frac{d - 2}{2d})^2 \), hence \( C_{\alpha, d} > 1 \).

**Lemma 4.3.** Let \( p_0 \in (1, C_{\alpha, d}) \). Then, for some constant \( C_{p_0} > 0 \),

\[
|u(t)|_{p_0} \leq C_{p_0} t^{-\frac{p_0 - 1}{p_0(\gamma + \alpha - 1)}} |u_0|^{\gamma(\alpha + \alpha - 1)} \quad \forall t > 0, \ u_0 \in L^1 \cap L^{p_0}, \quad (4.16)
\]

\[
\gamma = \frac{2p_0 + (\alpha - 1)d}{(p_0 + \alpha - 2)d + 2} \in (0, 1). \quad (4.17)
\]

**Proof.** We may assume that \( u_0 \in L^\infty \). We shall use the approximating scheme \((3.15)-(3.16)\). By estimate \((4.3)\), we have, for \( \lambda = h \),

\[
|u^{i+1}|_{p_0} + Ch|u^{i+1}|_{p_0(\gamma + \alpha - 1)} \leq |u^i|_{p_0}; \quad i = 0, 1, \ldots
\]

By the summation by parts formula, this yields, for all \( t > 0 \),

\[
t|u(t)|_{p_0} + C \int_0^t s|u(s)|_{p_0(\gamma + \alpha - 1)} ds \leq \int_0^t |u(s)|_{p_0} ds + h|u_0|_{p_0}, \quad (4.18)
\]

where \( u_h \) is given by \((3.16)\) and where, here and below, by \( C \) we denote various constants independent of \( t \) and \( u_0 \), but depending on \( p_0 \).

On the other hand, by Hölder’s inequality we have

\[
|u_h(s)|_{p_0} \leq |u_h(s)|_1 |u_h(s)|_{p_0-2(\alpha - 1)}; \quad s > 0.
\]

Then, substituting into \((4.18)\), we get
\[ t|u_h(t)|^{p_0}_{p_0} + C \int_0^t s|u_h(s)|^{\frac{p_0+\alpha-1}{d-2}} ds - h|u_0|^{p_0}_{p_0} \]
\[ \leq |u_0|^\gamma_1 \int_0^t |u_h(s)|^{\frac{p_0-\gamma}{d-2}} ds \]
\[ \leq |u_0|^\gamma_1 \int_0^t s^{\frac{p_0-\gamma}{d-2}} u_h(s) s^{\frac{\gamma-p_0}{p_0+\alpha-1}} ds \]
\[ \leq |u_0|^\gamma_1 \left( \int_0^t s^{\frac{\gamma-p_0}{p_0+\alpha-1}} ds \right)^{\frac{p_0-\gamma}{\gamma+\alpha-1}} \left( \int_0^t s^{\frac{\gamma-p_0}{p_0+\alpha-1}} ds \right)^{\frac{\gamma+\alpha-1}{\gamma+\alpha-1}}. \]

Since \( p_0 < C_{\alpha,d} \), we know by Lemma A.1 in the Appendix that
\[ \frac{\gamma - p_0}{\gamma + \alpha - 1} > -1. \]

Hence the above is dominated by
\[ C|u_0|^\gamma_1 t^{\frac{2\gamma + \alpha - p_0 - 1}{p_0 + \alpha - 1}} \left( \int_0^t s|u_h(s)|^{\frac{p_0+\alpha-1}{d-2}} ds \right)^{\frac{p_0-\gamma}{p_0+\alpha-1}}. \]

This yields, for \( t > 0 \),
\[ t|u_h(t)|^{p_0}_{p_0} + C \int_0^t s|u_h(s)|^{\frac{p_0+\alpha-1}{d-2}} ds \leq C|u_0|^\gamma_1 t^{\frac{\gamma(p_0+\alpha-1)}{\gamma+\alpha-1}} + h|u_0|^{p_0}_{p_0}. \]

Hence, dropping the integral on the left hand side and letting \( h \to 0 \), we obtain that
\[ |u(t)|_{p_0} \leq C_{p_0}|u_0|^\gamma_1 t^{\frac{\gamma(p_0+\alpha-1)}{p_0(\gamma+\alpha-1)}} t^{\frac{\gamma-p_0}{p_0(\gamma+\alpha-1)}}, \quad t > 0, \]
and (4.16) is proved.

**Proof of Theorem 4.11 (continued).** By approximation, we may assume that \( u_0 \in L^1 \cap L^\infty \). Combining estimates (4.14) and (4.16), we get, for \( t > 0 \),
\[ |u(t)|_\infty \leq C_{p_0} \left( \frac{t^2}{2} \right)^d \left| u \left( \frac{t}{2} \right) \right|_{p_0}^{2p_0} \]
\[ \leq C_{p_0} t^{-\frac{d}{p_0(\gamma+\alpha-1)} + \frac{d(p_0-\gamma)2p_0}{p_0(\gamma+\alpha-1)+(d(\alpha-1))}} |u_0|^\gamma_1 t^{\frac{\gamma(p_0+\alpha-1)2p_0}{p_0(\gamma+\alpha-1)+(d(\alpha-1))}} \]
\[ = C_{p_0} t^{-\frac{d}{p_0(\gamma+\alpha-1)}} |u_0|^\gamma_1 t^{\frac{d}{p_0(\gamma+\alpha-1)}}, \]
where we used Lemma A.2 in the Appendix in the last step and where again the constant \( C_{p_0} \) changes from line to line. Hence, Theorem 4.11 is proved.
Remark 4.4. In the proof of Theorem 4.1, we have used the weaker condition $\alpha > 1 - \frac{2}{d}$. However, since $\beta \in C^1(\mathbb{R})$, we should assume in (k) that $\alpha \geq 1$. We plan to remove the assumption $\beta \in C^1(\mathbb{R})$ in a future paper.

5. Equation (1.1) with a measure as initial datum

Consider here equation (1.1) with the initial data $u_0 = \mu \in M^b$.

Definition 5.1. The function $u: [0, \infty) \to M^b$ is a distributional solution to (1.1) if

\begin{align}
&u, \beta(u) \in L^1_{\text{loc}}([0, \infty) \times \mathbb{R}^d), \\
&\int_0^\infty \int_{\mathbb{R}^d} u(t, x)(\varphi_t(t, x) + b(u(t, x))D(x) \cdot \nabla \varphi(t, x)) \\
&\quad + \beta(u(t, x))\Delta \varphi(t, x)dt \, dx + \mu(\varphi(0, \cdot)) = 0, \quad \forall \varphi \in C^\infty_0([0, \infty) \times \mathbb{R}^d).
\end{align}

We have

Theorem 5.2. Assume that Hypotheses (k), (kk), (kkk) from Section 4 hold and, in addition, that $D \in L^2(\mathbb{R}^d; \mathbb{R}^d)$ and

\begin{align}
&|\beta(r)| \leq C|r|^\alpha, \quad \forall r \in \mathbb{R}. \tag{5.3}
\end{align}

Let $\mu \in M^b$. Then, (1.1) has a distributional solution which satisfies, for $dt$-a.e. $t \in (0, \infty)$,

\begin{align}
&u(t, x) \geq 0, \quad \text{a.e. on } \mathbb{R}^d, \quad \text{provided } \mu \geq 0, \tag{5.4}
&\int_{\mathbb{R}^d} u(t, x)dx = \int_{\mathbb{R}^d} d\mu, \tag{5.5}
&|u(t)|_\infty \leq Ct^{-\frac{d}{2+\alpha(d-1)}} \left\| \mu \right\|_{M^b}^{-\frac{\alpha(d-1)}{2+\alpha(d-1)}}, \tag{5.6}
&|u(t)|_1 \leq \left\| \mu \right\|_{M^b}. \tag{5.7}
\end{align}

Furthermore, for all $p \in \left[1, \alpha + \frac{2}{d}\right)$,

\begin{align}
&u \in L^p((0, T) \times \mathbb{R}^d), \quad \forall T > 0, \tag{5.8}
&\beta(u) \in L^1((0, T) \times \mathbb{R}^d), \quad \forall T > 0. \tag{5.9}
\end{align}
The map \( t \mapsto u(t, x)dx \in M_b \) has a \( \sigma(M_b, C_b) \)-continuous version on \((0, \infty)\), denoted by \( S(t)\mu, t > 0 \), for which (5.4), (5.5), (5.6) and (5.7) hold for all \( t > 0 \). Furthermore,

\[
\lim_{t \to 0} \int_{\mathbb{R}^d} (S(t)\mu)(x)\psi(x)dx = \mu(\psi), \quad \forall \psi \in C_b. \tag{5.10}
\]

Defining \( S(0)\mu = \mu \), then \( S(t), t \geq 0 \), restricted to \( L^1 \) coincides with the semigroup from Theorem 2.2 and

\[
\|S(t)\mu_1 - S(t)\mu_2\|_{M_b} \leq \|\mu_1 - \mu_2\|_{M_b}, \quad \forall t \geq 0, \mu_1, \mu_2 \in M_b.
\]

**Proof.** Consider a smooth approximation \( \mu_\varepsilon \) of \( u_0 = \mu \) of the form

\[
\mu_\varepsilon(x) = (\mu * \rho_\varepsilon), \quad \varepsilon > 0,
\]

where

\[
\rho_\varepsilon(x) = \frac{1}{\varepsilon} \rho \left( \frac{1}{\varepsilon} |x| \right), \quad \rho \in C^\infty_0([-1, 1]), \quad \int_{-1}^1 \rho(r) \, dr = 1.
\]

Then, by Theorem 2.1, the equation

\[
(u_\varepsilon)_t - \Delta \beta(u_\varepsilon) + \text{div}(D\beta)(u_\varepsilon) = 0 \quad \text{in} \quad (0, \infty) \times \mathbb{R}^d,
\]

\[
u_\varepsilon(0) = \mu_\varepsilon,
\]

has, for each \( \varepsilon > 0 \), a unique generalized solution \( u_\varepsilon \in C([0, \infty); L^1) \cap L^\infty((\delta, \infty) \times \mathbb{R}^d), \forall \delta > 0 \). More precisely, we have

\[
|u_\varepsilon(t)|_\infty \leq Ct^{-\frac{d}{2+\alpha-1}} \|\mu_\varepsilon\|^{2+\alpha-1}_{L^1} \leq C t^{-\frac{d}{2+\alpha-1}} \|\mu\|^2_{M_b}, \quad t > 0.
\]

(5.12)

Everywhere in the following, \( C \) is a positive constant independent of \( t \) and \( \mu \) possibly changing from line to line. Also, for simplicity, we set \( \|\mu\| = \|\mu\|_{M_b}, \) and \( \|\mu\|^{2+\alpha-1}_{L^1} t^{-\frac{d}{2+\alpha-1}} = \nu(t, \mu), \forall t > 0, \mu \in M_b. \) We also have by (2.8)

\[
|u_\varepsilon(t)|_1 \leq |\mu_\varepsilon|_1 \leq \|\mu\|, \quad \forall t \geq 0, \forall \varepsilon > 0.
\]

(5.13)

If we formally multiply (5.11) by \( \beta(u_\varepsilon) \) and integrate over \((\delta, t) \times \mathbb{R}^d, \) for \( \psi(r) \equiv \int_0^t \beta(s) b(s) s \, ds, \) since \( \psi, \text{div} D \geq 0, \) we get

\[
\int_{\mathbb{R}^d} g(u_\varepsilon(t, x))dx + \int_0^t \int_{\mathbb{R}^d} |\nabla \beta(u_\varepsilon(s))|^2 dx \, ds = \int_0^t \int_{\mathbb{R}^d} \nabla(\psi(u_\varepsilon)) \cdot D \, dx \, ds + \int_{\mathbb{R}^d} g(u_\varepsilon(t, x))dx
\]

(5.14)

\[
\leq \int_{\mathbb{R}^d} g(u_\varepsilon(\delta, x))dx \leq C\|\mu\|(\nu(\delta, \mu))^\alpha, \quad \forall t > \delta,
\]

28
where \( g(r) \equiv \int_0^r \beta(s) ds \geq 0 \) and the last inequality follows by (5.3). Estimate (5.14) can be derived rigorously by using the finite difference scheme (3.15)–(3.16) corresponding to the resolvent of the regularized version (3.33) of equation (5.11). Indeed, by Lemma 3.3, it follows via the Trotter–Kato theorem for nonlinear semigroups (see, e.g., [2], p. 168) that, for each \( \varepsilon > 0 \),

\[
    u_\varepsilon(t) = \lim_{\nu \to 0} \lim_{n \to \infty} \left( I + \frac{t}{n} A_\nu \right)^{-n} \mu_\varepsilon,
\]

where \( A_\nu \) is the operator defined by (3.32) and both limits are in \( L^1 \), locally uniformly in \( t \in [0, \infty) \). Hence,

\[
    u_\varepsilon(t) = \lim_{\nu \to 0} \lim_{h \to 0} u_{\nu,h}(t), \quad t \in [0, T], \tag{5.15}
\]

where

\[
    u_{\nu,h}(t) = u_{\nu,h}^{i+1}, \quad t \in (ih, (i + 1)h],
\]

\[
    u_{\nu,h}^{i+1} + h A_\nu u_{\nu,h}^i = u_{\nu,h}^i, \quad i = 0, 1, \ldots, N - 1; \quad Nh = T, \quad u_{\nu,h}^0 = \mu_\varepsilon. \tag{5.16}
\]

We know by the proof of Lemma 3.1 that, if \( v \in L^1 \cap L^\infty \), then for the solution \( u_h \) to the equation \( u_h + h A_\nu u_h = v \) (see (3.32) and (3.33)), we have \( u_h, b_\nu(u_h)u_h \in H^1 \cap L^1 \cap L^\infty, \beta_\nu(u_h) \in H^2 \) and \( |u_h|_\infty \leq |v|_\infty \). Hence, if we multiply (5.16) by \( \beta_\nu(u_{\nu,h}^{i+1}) \) and integrate over \( \mathbb{R}^d \), we get as above

\[
    \int_{\mathbb{R}^d} g_\nu(u_{\nu,h}^{i+1}(x)) dx + h \int_{\mathbb{R}^d} |\nabla \tilde{\beta}_\nu(u_{\nu,h}^{i+1})|^2 dx \\
    \leq \int_{\mathbb{R}^d} g_\nu(u_{\nu,h}^i) dx, \quad i = 0, 1, \ldots, N, \quad Nh = T,
\]

where \( g_\nu(r) = \int_0^r \tilde{\beta}_\nu(s) ds \) and we used that \( \text{div} \, D_\nu \geq 0 \), since \( D_\nu = D \) because \( D \in L^2(\mathbb{R}^d; \mathbb{R}^d) \). Summing over from \( j = [N\delta/T] + 1 \) to \( k - 1 = [Nt/T] \), we get

\[
    \int_{\mathbb{R}^d} g_\nu(u_{\nu,h}^k) dx + \frac{h}{2} \sum_{i=j}^{k-1} \int_{\mathbb{R}^d} |\nabla \tilde{\beta}_\nu(u_{\nu,h}^{i+1})|^2 dx \leq \int_{\mathbb{R}^d} g_\nu(u_{\nu,h}^j) dx, \quad \forall k.
\]

Then, letting \( h \to 0 \) and afterwards \( \nu \to 0 \), by (5.15) and, since \( |u_{\nu,h}^i|_\infty \leq |\mu_\varepsilon|_\infty \), the closedness of the gradient on \( L^2(0,T; L^2) \) and the weak lower semicontinuity implies (5.14), as claimed.
Multiplying (5.11) by \(|u_\varepsilon|^{q-2}u_\varepsilon|q\geq 2\) and integrating over \((\delta,t) \times \mathbb{R}^d\), we get by hypothesis (k) that

\[
\begin{align*}
&\frac{a(q-1)}{(q+\alpha-1)} \int_{\delta}^{t} \int_{\mathbb{R}^d} |\nabla|u_\varepsilon|^{q-2}u_\varepsilon|^{2}ds\,dx + \frac{1}{q} \int_{\mathbb{R}^d} |u_\varepsilon(t)|^qdx \\
&\leq \frac{1}{q} \int_{\mathbb{R}^d} |u_\varepsilon(\delta)|^qdx \leq C\|\mu\|((\nu(\delta,\mu))^{q-1}.
\end{align*}
\]

(5.17)

As in the previous case, the above calculus can be made rigorous if we replace (5.11) by its discrete version (5.16), which we multiply by \(|u_{i+1,\nu,h}^{q-2}u_{i+1,\nu,h}|q\geq 2\) and integrate over \(\mathbb{R}^d\). Indeed, noting that, since \(u_{i+1,\nu,h}, b_{\nu}(u_{i+1,\nu,h})u_{i+1,\nu,h} \in H^1 \cap L^1 \cap L^\infty\) and \(\tilde{\beta}_\nu(u_{i+1,\nu,h}) \in H^2\) (see (3.25), (3.37)), we get similarly as in the proof of Lemma 4.2 for \(\psi_\nu(r) = \sqrt{p-1} \int_0^r \sqrt{h_\nu(g_\nu(s))}|s|^{q-2}ds, \ r \in \mathbb{R}\), where \(h_\varepsilon, g_\varepsilon\) are as in (4.7),

\[
\begin{align*}
\frac{1}{q} \int_{\mathbb{R}^d} |u_{i+1,\nu,h}|^qdx + h \int_{\mathbb{R}^d} |\nabla\psi_\nu(u_{i+1,\nu,h})|^2dx &\leq \frac{1}{q} \int_{\mathbb{R}^d} |u_{i,\nu,h}|^qdx, \\
&\quad i = 0, \ldots, N-1, \ Nh = T.
\end{align*}
\]

Summing over \(i\) from \(j = [N\delta/T] + 1\) to \(k-1 = [Nt/T]\), we get

\[
\begin{align*}
\frac{1}{q} \int_{\mathbb{R}^d} |u_{k,\nu,h}|^qdx + h \sum_{i=j}^{k-1} \int_{\mathbb{R}^d} |\nabla\psi_\nu(u_{i+1,\nu,h})|^2dx &\leq \frac{1}{q} \int_{\mathbb{R}^d} |u_{j,\nu,h}|^qdx, \\
&\quad i = 0, \ldots, N-1, \ Nh = T.
\end{align*}
\]

Letting \(h \to 0\), and afterwards \(\nu \to 0\), (5.17) follows from (5.15) and the closedness of the gradient on \(L^2(0,T;L^2)\).

Now, taking into account that by (5.17), with \(q = 2p - 1 - \alpha\), we get

\[
\int_\delta^t |\nabla(|u_\varepsilon|^{p-1})|^2ds \leq \|\mu\|((\nu(\delta,\mu))^{(p-1)-\alpha}), \ \forall t \geq \delta, \forall p \geq \frac{\alpha+3}{2}.
\]

(5.18)

Moreover, by (5.14), \(|\nabla\beta(u_\varepsilon)\varepsilon > 0\) is bounded in \(L^2(\delta, T, L^2)\), and so

\[
\|\Delta\beta(u_\varepsilon) - \text{div}(Db(u_\varepsilon)u_\varepsilon)\|_{L^2(\delta,T;H^{-1})} \leq C, \ \forall \varepsilon > 0.
\]

(5.19)

Note also that, by (5.18), it follows that

\[
\int_\delta^t |\nabla(|u_\varepsilon|^{p-2})|^2ds \leq C, \ \forall \varepsilon > 0.
\]

(5.20)
Hence, \( \{ |u_\varepsilon|^{p-1} \}_\varepsilon > 0 \) is bounded in \( L^2(\delta, T; H^1) \) and so, by (5.19), we infer that, for \( m \geq 4 \),

\[
\| |u_\varepsilon|^{p-1}(\Delta \beta(u_\varepsilon)) \|_{L^1(\delta, T; H^{-m})} + \| \text{div}(Db(u_\varepsilon)u_\varepsilon) \|_{L^2(\delta, T; H^{-1})} \leq C.
\]

This implies that the set

\[
\left\{ \frac{\partial}{\partial t} (|u_\varepsilon|^{p-1}u_\varepsilon) \right\}_\varepsilon > 0
\]

is bounded in \( L^1(\delta, T; H^{-1}) \). Note that by (5.18) applied to \( p+1 \) replacing \( p \), we have that also \( \{ |u_\varepsilon|^{p-1}u_\varepsilon \}_\varepsilon > 0 \) is bounded in \( L^2(\delta, T; H^1) \).

Then, by the Aubin-Lions-Simon compactness theorem (see [18]), the set \( \{ |u_\varepsilon|^{p-1}u_\varepsilon \}_\varepsilon > 0 \) is relatively compact in \( L^2(\delta, T; L^2_{\text{loc}}) \) for all \( 0 < \delta < T < \infty \). Hence, along a subsequence, we have for \( \gamma(r) := |r|^{p-1}r, r \in \mathbb{R} \),

\[
\gamma(u_\varepsilon) \to v, \quad \text{a.e. on } (0, \infty) \times \mathbb{R}^d. \tag{5.21}
\]

Then, since \( \gamma \) has a continuous inverse and since \( \beta \) is continuous, we have

\[
u_\varepsilon \to u = \gamma^{-1}(v) \text{ and } \beta(u_\varepsilon) \to \beta(u), \text{ a.e. on } (0, \infty) \times \mathbb{R}^d. \tag{5.22}
\]

By (5.12), (5.13), we have, for all \( p \geq 1, \forall t > 0, \varepsilon > 0, \)

\[
|u_\varepsilon(t)|_p \leq |u_\varepsilon(t)|_1^{\frac{1}{p}} |u_\varepsilon(t)|_\infty^{\frac{p-1}{p}} \leq C\|\mu\|_2^{\frac{\alpha + (\alpha-1)d}{2\alpha + (\alpha-1)d}} t^{-\frac{d(p-1)}{2\alpha + (\alpha-1)d}}. \tag{5.23}
\]

We have \( \frac{d(p-1)}{2\alpha + (\alpha-1)d} < 1 \) for every \( p \in \left[ 1, \alpha + \frac{2}{\alpha} \right) \). Then, for such \( p \), (5.23) implies that, for every \( T > 0, \)

\[
\int_0^T |u_\varepsilon(t)|_p^p dt \leq C, \tag{5.24}
\]

and, therefore, if in addition \( p > 1 \), along a subsequence \( \varepsilon \to 0, \)

\[
u_\varepsilon \to u \text{ weakly in } L^p((0, T) \times \mathbb{R}^d). \tag{5.25}
\]

Moreover, by (5.3), (5.22) and (5.24), it follows that \( \{ \beta(u_\varepsilon) \} \) is bounded in \( L^q((0, T) \times \mathbb{R}^d) \) for all \( q \in \left( 1, 1 + \frac{2}{\alpha q} \right), \) and so (along a subsequence)

\[
\beta(u_\varepsilon) \to \beta(u) \text{ weakly in } L^q((0, T) \times \mathbb{R}^d). \tag{5.26}
\]
Since, by (2.9), we have
\[ \int_0^\infty \int_{\mathbb{R}^d} (u_\varepsilon (\varphi + D \cdot \nabla \varphi) + \beta(u_\varepsilon) \Delta \varphi) dt \, dx + \int_{\mathbb{R}^d} \mu_\varepsilon(x) \varphi(0, x) \, dx = 0 \]
for any \( \varphi \in C_0^\infty([0, \infty) \times \mathbb{R}^d) \), letting \( \varepsilon \to 0 \), we see by (5.25) and (5.26) that \( u \) satisfies (5.2). As regards (5.4), (5.5), (5.6) and (5.7), these by (5.22) immediately follow from the corresponding properties of \( u_\varepsilon \) and (5.12). Furthermore, (5.8) follows from (5.24) and Fatou’s Lemma. Taking \( p = \alpha \) in (5.8), (5.9) follows by (5.3).

By (5.9), we may apply Lemma 8.1.2 in [1], to conclude that \( t \mapsto u(t, x) dt \) has a \( \sigma(\mathcal{M}_b, C_b) \)-continuous version on \((0, \infty)\), denoted by \( \mu_t \), \( t > 0 \). To show (5.10), we apply (5.2) with \( \psi(t, x) = \psi(t) \zeta(x) \), \( \psi \in C_0^\infty((0, \infty)) \) and \( \zeta \in C_0^\infty(\mathbb{R}^d) \). Then, for \( L \zeta(t, x) = \beta(u(t, x)) \Delta \zeta(x) + D(x) \cdot \nabla \zeta(x) \),

we have from (5.2)
\[ \int_0^\infty \psi(t) \int_{\mathbb{R}^d} L \zeta \, d\mu_t \, dt + \psi(0) \int_{\mathbb{R}^d} \zeta \, d\mu = - \int_0^\infty \frac{d}{dt} \psi(t) \int_{\mathbb{R}^d} \zeta \, d\mu_t \, dt, \quad (5.27) \]
hence, choosing \( \psi \in C_0^\infty((0, \infty)) \), we obtain for \( dt \)-a.e. \( t \in (0, \infty) \),
\[ \int_{\mathbb{R}^d} \zeta \, d\mu_t = C + \int_0^t \int_{\mathbb{R}^d} L \zeta \, d\mu_s \, ds. \quad (5.28) \]
By (5.9), the right hand side is continuous in \( t \in [0, \infty) \) and equal to \( C \) at \( t = 0 \), while, as seen above, also the left hand side is continuous in \( t \in (0, \infty) \). Hence, we obtain that (5.28) holds for all \( t \in (0, \infty) \) and
\[ \lim_{t \to 0} \int_{\mathbb{R}^d} \zeta \, d\mu_t = C. \]
Plugging (5.28) into the right hand side of (5.27), with \( \psi \in C_0^\infty([0, \infty)) \) such that \( \psi(0) = 1 \) and integrating by parts, we find
\[ \int_0^\infty \psi \int_{\mathbb{R}^d} L \zeta \, d\mu_t \, dt + \int_{\mathbb{R}^d} \zeta \, d\mu = C + \int_0^\infty \psi \int_{\mathbb{R}^d} L \zeta \, d\mu_t \, dt \]
and (5.11) follows, because (5.5) holds for all \( t > 0 \), as we shall see below. It is obvious that, for the \( \sigma(\mathcal{M}_b, C_b) \)-continuous version \( t \mapsto \mu_t \) of \( t \mapsto u(t, x) dx \)
on \((0,\infty)\), properties \((3.4)\), \((5.5)\) and \((5.7)\) hold for all \(t > 0\). For this version, it is also easily seen that \(t \mapsto |u(t)|_\infty\) is lower semicontinuous, hence also \((5.6)\) follows for all \(t > 0\).

It remains to prove the last assertion in Theorem \(5.2\). To express the dependence of our \(\sigma(M_b,C_b)\)-continuous version \([0,\infty) \ni t \mapsto \mu_t \in M_b\) with \(\mu_0 = \mu\) of our solution to \((5.2)\), we set, for \(\mu \in M_b\), \(P(t)\mu = \mu_t\), \(t \geq 0\), and recall that \(\mu_t\) has a density in \(L^1\) for \(t > 0\), which we identify with \(\mu_t\), i.e., \(\mu_t \in L^1, \forall t > 0\). Let \(T > 0\). By construction, we know that (along a subsequence depending on \(\mu\)) \(\varepsilon \to 0\)

\[ S(\cdot)(\mu*\rho_\varepsilon) \to P(\cdot)\mu, \text{ a.e. on } (0,T) \times \mathbb{R}^d \text{ and weakly in } L^p((0,T) \times \mathbb{R}^d) \text{ (5.29)} \]

as functions of \((t,x)\) for \(p \in \left(1, \alpha + \frac{2}{d}\right)\) (see \((3.22)\), \((5.25)\), respectively). Here \(S(t), t \geq 0\), is the semigroup from Theorem \(5.2\).

Claim. If \(\mu \in L^1\), then \(S(t)\mu = P(t)\mu\) for all \(t \geq 0\).

To prove the claim we recall that, since \(\mu \in L^1\), we have \(\mu * \rho_\varepsilon \to \mu\) in \(L^1\). Hence, by \((2.8)\) and \((5.24)\),

\[ S(t)\mu = P(t)\mu \text{ in } M_b \text{ for } dt - \text{a.e. } t \in [0,T]. \]

Since both sides are \(\sigma(L^1,C_b)\)-continuous in \(t \in [0,T]\), this equality holds \(\forall t \in [0,T], T > 0\), and the Claim is proved.

Therefore, we may rename \(P(t) : M_b \to M_b, t \geq 0\), and set \(S(t) = P(t), t \geq 0\), since it is an extension of \(S(t) : L^1 \to L^1\) for every \(t \geq 0\).

Finally, for \(\mu, \bar{\mu} \in M_b\) with corresponding solutions \(u_\varepsilon, \bar{u}_\varepsilon\) to \((5.11)\), we have by \((2.8)\), for all \(t \geq 0\),

\[ |u_\varepsilon(t) - \bar{u}_\varepsilon(t)|_1 \leq |(\mu - \bar{\mu})*\rho_\varepsilon|_1 \leq \|\mu - \bar{\mu}\|_{M_b}. \]

Hence, for all \(\varphi \in C_b([0,\infty)), \varphi \geq 0\), by \((5.22)\) and Fatou’s lemma, letting \(\varepsilon \to 0\) we get

\[ \int_0^\infty \varphi(t)|S(t)\mu - S(t)\bar{\mu}|_{L^1} \, dt \leq \int_0^\infty \varphi(t)\|\mu - \bar{\mu}\|_{M_b} \, dt, \]

so,

\[ |S(t)\mu - S(t)\bar{\mu}|_1 \leq \|\mu - \bar{\mu}\|_{M_b} \text{ for } dt - \text{a.e. } t \in (0,\infty). \]

But the left hand side is lower semicontinuous in \(t \in [0,\infty)\), since \(t \mapsto S(t)\mu\) is \(\sigma(L^1,C_b)\)-continuous, hence

\[ \|S(t)\mu - S(t)\bar{\mu}\|_{M_b} \leq \|\mu - \bar{\mu}\|_{M_b}, \forall t \in [0,\infty). \]
Remark 5.3. One might suspect that, if $\mu \geq 0$, then under the hypotheses of Theorem 5.2 the solution $u$ is the unique nonnegative solution to (5.2). This is true for the porous media equation (\cite{17}). If the uniqueness is true for all $\mu \in L^1$, it follows by Theorem 2.2 that $u(t) \in C([\delta, \infty); L^1)$, for each $\delta > 0$. In this case, our solutions in Theorem 5.2 starting from any $\mu \in M_b$, would also have the flow property.

Remark 5.4. It should be noted that, as follows from (5.20), (5.22), for every $\mu \in M_b$, $p \geq \alpha + 32$, $|S(\cdot)\mu|^{p-2}S(\cdot)\mu \in L^2(\delta, T; H^1)$, $0 < \delta < T < \infty$.

Remark 5.5. If $D \equiv 0$ and $\beta(r) \equiv ar^\alpha$, where $0 < \alpha < \frac{d-2}{2}$, then (see \cite{16}) equation (1.1) has a nonnegative solution for $\mu \in M_b(\mathbb{R}^d)$ if and only if $\mu(K) = 0$ for each compact set $K$ of $C_{2,\mu}$-capacity zero, where $p = \frac{1}{1-\alpha}$. The extension of this result to the present case remains to be done. (See also Remark 4.4.)

6. The McKean-Vlasov equation

As a direct consequence of Theorems 2.2 and 5.2, we obtain (probabilistically) weak solutions to the McKean-Vlasov SDE (1.2). More precisely, we have

**Theorem 6.1.** Assume that we are in one of the following situations:

(a) Hypotheses (i), (ii), (iii) from Section 4 and (2.3) hold and let $u$ be the solution of (2.9) from Theorem 2.2 with the initial condition $\mu = u_0dx$, $u_0 \in \mathcal{P}_0(\mathbb{R}^d) \cap L^\infty$.

(b) Hypotheses (k), (kk), (kkk) from Section 4 and (5.3) hold and, additionally, let $D \in L^2(\mathbb{R}^d; \mathbb{R}^d)$. Let $u$ be the solution of (5.2) from Theorem 5.2 with the initial condition $\mu \in \mathcal{P}(\mathbb{R}^d)$.

Then, there exists a (probabilistically) weak solution $X$ to (1.2) on some filtered probability space $(\Omega, \mathcal{F}, \mathbb{P}, (\mathcal{F}_t)_{t \geq 0})$ with an $\mathbb{R}^d$-valued $(\mathcal{F}_t)$-Brownian motion $W(t)$, $t \geq 0$, such that $X$ has $\mathbb{P}$-a.s. continuous sample paths and

$$
\mu = \mathbb{P} \circ (X(0))^{-1} \quad \text{and} \quad u(t,x)dx = \mathbb{P} \circ (X(t))^{-1}(dx), \forall t > 0. \quad (6.1)
$$
Proof. By our assumptions, we have, for every \( T > 0 \),
\[
\int_0^T \int_{\mathbb{R}^d} \left( |\beta(u(t,x))| + |b(u(t,\cdot))| |D(x)||u(t,x)| \right) dx \, dt < \infty.
\]
Hence, the assertion follows immediately by Section 2 in [4]. \( \square \)

Appendix

Lemma A.1. Let \( \alpha \in \left( \frac{d-2}{d}, \infty \right) \), \( p_0 \in (1, \infty) \). Let \( C_{\alpha,d} \) and \( \gamma \) be as defined in (4.15), (4.17), respectively. Then

(i) \( \gamma = 1 - \frac{(p_0 - 1)(d - 2)}{(p_0 + \alpha - 2)d + 2}, \gamma + \alpha - 1 > 0. \)

(ii) If \( p_0 < C_{\alpha,d} \), then \( \frac{\gamma - p_0}{\gamma + \alpha - 1} > -1. \)

The proof follows by a direct computation and will be omitted.

By Lemma A.1, it also follows

Lemma A.2. Consider the situation of Lemma A.1. Then

(j) \( p_0 - \gamma = \frac{(p_0 - 1)(p_0 + \alpha - 1)d}{(p_0 + \alpha - 2)d + 2}, \gamma + \alpha - 1 = \frac{(2 + (\alpha - 1)d)(p_0 + \alpha - 1)}{(p_0 + \alpha - 2)d + 2}. \)

(jj) \( \frac{2\gamma(p_0 + \alpha - 1)}{(\gamma + \alpha - 1)(2p_0 + (\alpha - 1)d)} = \frac{2}{2 + (\alpha - 1)d}. \)
