Original research

ABSTRACT

This study was carried out to determine mite species on blackberry plants (\textit{Rubus} spp. (Rosaceae)) in Florida and Georgia, USA, and differences in mite species between organic and conventional blackberry plantings in the area sampled. Surveys were conducted in organic and conventional commercial blackberry plantings from June to October 2016. Leaf samples were collected monthly from nine different blackberry cultivars including ‘Arapaho’, ‘Choctaw’, ‘Freedom’, ‘Kiowa’, ‘Natchez’, ‘Navaho’, ‘Osage’, ‘Ouachita’, and ‘Von’. Approximately 20 leaves per blackberry plant were taken. Twenty mite species (a total of 152 mite specimens) belonging to 7 families including Phytoseiidae (9 species), Ascidae (1), Cheyletidae (1), Erythraeidae (1), Stigmaeidae (1), Tetranychidae (4) and Tarsonemidae (3) were identified during the study. It was found that the abundance of predatory mites collected in organic farms was over 2-fold higher (105) than in conventional farms (47), which may be related to pesticide use on these commercial farms. Future surveys should provide a list of predatory species, which may hold potential for biological control of economically important pest mites.

Keywords blackberry; \textit{Rubus} spp.; mite; pest; predatory mite groups

Part of this research was presented as a poster at the 19\textsuperscript{th} International Conference on Entomology ICE 2017 (19-20 October 2017 Paris, France) and published as an abstract.

Introduction

Blackberries (\textit{Rubus} spp. (Rosaceae)) are a major small fruit crop that is grown throughout Europe and the United States (Strik 2007). Mexico is the leading producer of blackberries worldwide. In the US, the crop is valued at 50 million USD (USDA-NASS 2016) with 90% of its production in the northwestern region (Oregon). Production is expanding in the southern United States (Arkansas to Florida) and several new cultivars are being developed that do not require the heat units for satisfactory production that is required of traditional cultivars.

Several mite species have been found in association with blackberry plants (Vincent \textit{et al.} 2010) and most of these mites are agricultural pests that are known to cause economic damage. The broad mite, \textit{Polyphagotarsonemus latus} (Banks) is one of two species in the family Tarsonemidae that cause extensive damage to crop plants (Liburd \textit{et al.} 2020). \textit{Polyphagotarsonemus latus} has been found in association with leaf-curling symptoms on pricocane-fruited blackberry (\textit{Rubus} L. subgenus \textit{Rubus} Watson) in Arkansas (Vincent \textit{et al.} 2010), which negatively affect plant growth and development.

\textbf{How to cite this article} Akyazı R. \textit{et al.} (2021), Mite species (Acari) on blackberry cultivars in organic and conventional farms in Florida and Georgia, USA. \textit{Acarologia} 61(1): 31-45; DOI 10.24349/acarologia/20214414
Davies et al. (2001) examined microhabitats and aggregation patterns of the phytophagous mite, *Acalitus essigi* (Hassan) (Trombidiformes: Eriophyidae), on *Rubus fruticosus* L. (Rosaceae). They found that *A. essigi* was a refugee inhabiting species that resided in the buds and leaf axils on primocanes and fructocanes. Scott et al. (2008) collected the same species of eriophyid mites from the fruits of three species of the weedy blackberry (*R. anglocandicans* A. Newton, *R. laudatus* A. Berger and *R. ulmifolius* Schott) in south-west Australia. This was the first record for this species in Western Australia and these plants appear to be new host records for *A. essigi*. Similarly, Cetin et al. (2010) recorded *A. essigi* as a new pest in blackberry plantings in the Marmara region of Turkey in 2009.

Marchetti and Ferla (2011) determined the diversity and population fluctuation of mites on blackberry (*R. fruticosus*) in Rio Grande do Sul, Brazil. A total of 26 mite species belonging to 12 families were found. Most of the mites were phytophagous species belonging to the families Diptilomiopidae (80.9%) and Tetranychidae (13.9%). The most common families of predaceous mites were Stigmaeidae (2.1%) and Phytoseiidae (0.4%). Recently, Trinidad et al. (2019) evaluated the occurrence of phytophagous and predatory mites in different blackberry genotypes in the municipality of Pelotas, RS, Brazil. They recorded a total of 12 mite species belonging to the families Tetranychidae, Diptilomiopidae, Eriophyidae, Tarsonemidae, Tenuipalpidae, Stigmaeidae, Tydeidae, Phytoseiidae. The families Tydeidae, Diptilomiopidae, Tetranychidae, and Eriophyidae showed a higher representability.

Ozsisli and Cobanoglu (2019) determined predatory and harmful mite species on *R. fruticosus*, and *Rubus sanctus* Schreber in Turkey (Adana, Hatay, Kahramanmaras provinces). *Phytoseius finitimus* Ribaga (Phytoseiidae), *Pronematus ubiquitus* (McGregor), *Tydeus californicus* (Banks) (Tydeidae), and *Zetzelia mali* (Ewing) (Stigmaeidae) were predatory mite species obtained in the study. The phytophagous mites were *Cenopalpus pulcher* (Canestrini & Fanzago), *C. spinosus* (Donnadieu) (Tenuipalpidae) and *Tetranychus urticae* Koch (Tetranychidae).

In a recent study, Akyazi and Liburd (2019) assessed the effectiveness of a commercially available predator, *Neoseiulus californicus* (McGregor) to reduce *T. urticae* populations in a commercial blackberry planting and recommended that an assessment of local phytoseiids and other predators should be considered before further releases of *N. californicus* are considered.

To our knowledge a survey of mite fauna associated with blackberries have not been conducted in Florida and Georgia despite an expanding blackberry industry in the region. This study was carried out to determine phytophagous and predatory mite species on nine commercially available blackberry cultivars in Florida and Georgia, USA in 2016.

**Material and Methods**

**Sampled Areas**

The survey was conducted in selected organic and conventional commercial blackberry farms in Florida and Georgia, USA (Figure 1). Geographical coordinates were recorded using a GPS mobile device.

**Sampled Blackberry Cultivars**

This study was carried out on nine blackberry cultivars including ‘Arapaho’, ‘Choctaw’, ‘Freedom’, ‘Kiowa’, ‘Natchez’, ‘Navaho’, ‘Osage’, ‘Ouachita’ and ‘Von’ (Table 1).

**Sampling Method**

The survey was conducted from June to October 2016. Leaf samples were collected monthly. The number of sampled plants per site was determined according to the total number of the plants in each planting (Table 2). On each sampling date, leaves were taken from different...
parts of the bush canopy, i.e. lower, middle, and upper canopy. Approximately 20 leaves per blackberry plant were collected. The samples were placed in paper bags and then later in Ziplock plastic bags, labeled and transferred to the University of Florida, Small Fruit and Vegetable IPM (UF-SFVIPM) laboratory.

**Extraction, preparation, and identification of mite specimens**

The mites were collected with a 0 or 00 paint brush under a stereomicroscope LEICA M205 C (Leica Microsystems Inc., Buffalo Grove, Illinois, USA) directly from the leaves. In this way, all mites were separated into families before examination using 40 x to 160 x magnification.

| Cultivar | Erect | Thorns | Season | Comments |
|----------|-------|--------|--------|----------|
| Arapaho  | Erect | No     | Early  | Lower yields; plant at higher density. |
| Choctaw  | Erect | Yes    | Early  | High-yielding |
| Freedom  | Erect | No     | Floricane crop very early, Primocane crop from early September to first frost Primocane-fruited; soft berries for home garden or local market only |
| Kiowa    | Erect | Yes    | Mid    | Low chilling; best for local sales and PYO (Pick Your Own) |
| Natchez  | Erect | No     | Early (slightly before or with Arapaho) Very large fruit; very high yield; tends to over produce so careful pruning is essential. Winter hardiness is poor in high elevations. |
| Navaho   | Erect | No     | Mid to late Stores well; excellent flavor; average size. Quite susceptible to orange rust; long harvest season |
| Osage    | Erect | No     | Mid    | New cultivar with superior flavor. It has excellent post-harvest quality with medium- high yields. |
| Ouachita | Erect | No     | Early to mid Excellent flavor; high yields, large fruit size, and good post-harvest quality. |
| Von      | Erect | No     | Mid to late Holds up well in rain; high yields; average size. It has a good post-harvest quality and late season production |
According to the total number of plants in each planting, the number of sampled plants (Madanlar and Kismali 1991).

| Total number of plants in each planting | The number of sampled plants |
|----------------------------------------|-----------------------------|
| 0-50                                    | All plants                  |
| 51-200                                  | 50 plants                   |
| 201-400                                 | 60 plants                   |
| More than 400                           | 20% of the total number of plants |

Specimens were preserved in vials containing 70% ethanol (according to cultivar and family). All mites were cleared in Lacto-phenol medium. Each mite was mounted in a drop of Hoyer’s medium on microscope slides and dried in an oven at 50 °C for 5-7 days according to the method of Krantz and Walter (2009).

Species identifications were made in Division of Plant Industry, FSCA, Gainesville, USA by the second author. The mite specimens were deposited in the Mite Collection at the Division of Plant Industry, FSCA, Gainesville, USA.

Results and Discussion
During the surveys, a total of 20 mite species belonging to 7 families were identified (Table 3) as follows: nine species of Phytoseiidae, four Tetranychidae, three Tarsonemidae, one for each of Ascidae, Stigmaeidae, Cheyletidae and Erythraeidae.

Predatory mite species on nine different blackberry cultivars in selected organic and conventional commercial blackberry farms in Florida and Georgia, USA

Family Phytoseiidae

L: Larva; N: Nymph

*: It was followed what is mentioned in the Phytoseiidae catalogue by Demite et al. (2020) considering Galendromus (Galendromus) gratus (Chant) as a junior synonym of Galendromus (Galendromus) floridanus (Muma)

**: Erythraeid mites are ectoparasitic in their larval stage and predatory in their deutonymphal and adult stages (Goldarazena et al. 2000)
(L.) (Poaceae), Diospyros sp. (Ebenaceae), Pisium sp. (Fabaceae), Quercus durandii Buckley, Quercus sp. (Fagaceae), Rhus copallinum L. var. leucantha (Jacq.) (Anacardiaceae), Stryx americana Lam (Stryaceae) and Vitis sp. (Vitaceae) (Muma and Denmark 1970). During the present study, P. chantii was collected together with P. latus, E. carpini, T. bilobatus, T. confusus, T. schoenei and T. urticae.

Proprioseius meridionalis Chant

Amblyseius (Proprioseius) meridionalis Pritchard & Baker
Phytoseiulus (Proprioseius) meridionalis Wainstein
Amblyseius (Amblyseius) meridionalis Tseng
Proprioseius (Proprioseius) meridionalis Karg
Typhlodromus psychotriae Hirschmann (unjustified replacement name for Proprioseius meridionalis)

Material Examined (n=4; 4 ♀♀) — 1♀ (29°24′30.77″ N, 82°10′16.13″ W, 19 m, 22 August 2016, Arapaho, Organic Farm), 1♀ (29°39′15.95″ N, 82°31′25.49″ W, 32 m, 27 July 2016, Arapaho, Organic Farm), 2♀♀ (30°54′18.31″ N, 82°38′51.06″ W, 46 m, 18 August 2016, Choctaw, Conventional Farm).

Comments — Proprioseius meridionalis was recorded previously on wide range of host plants including blackberry, Rubus sp. in USA, Florida (Chant 1957; De Leon 1959; Denmark and Evans 2011; Denmark and Muma 1966; Muma and Denmark 1970; Walter and Denmark 1991) and New Jersey (Dyer and Swift 1979). In the current study, this species was collected with all phytophagous mite species, which were collected during the present study.

Typhlodromips dentilis (De Leon)

Amblyseius dentilis Athias-Henriot
Amblyseius (Typhlodromopsis) dentilis Muma

Material Examined (n=5; 5 ♀♀) — 1♀ (29°32′35.80″ N, 82°5′7.34″ W, 28 m, 11 August 2016, Natchez, Organic Farm), 1♀ (28°34′5.62″ N, 81°41′22.17″ W, 24 m, 25 August 2016, Von, Organic Farm), 1♀ (29°32′35.80″ N, 82°5′7.34″ W, 28 m, 20 September 2016, Ouachita, Organic Farm), 1♀ (29°32′35.80″ N, 82°5′7.34″ W, 28 m, 28 June 2016, Arapaho, Organic Farm), 1♀ (28°57′13.97″ N, 82°1′49.14″ W, 30 m, 12 July 2016, Natchez, Conventional Farm).

Comments — Typhlodromips dentilis has been found on many different types of plants worldwide (Demite et al. 2020). In Florida, it was recorded for the first time on Rhus copallina in Miami, Florida, USA and subsequently in various localities in Florida (Denmark and Evans 2011; Muma 1964a b; Muma and Denmark 1970). During the present study, T. dentilis was found together with populations of P. latus, T. schoenei, E. carpini and T. confusus.

Typhlodromalus peregrinus (Muma)

Typhlodromalus evansi (Chant)
Typhlodromalus primulae (Chant)
Typhlodromalus robiniae (Chant) Typhlodromalus sextus (Garman)
Typhlodromalus aripo (De Leon)

Material Examined (n=29; 29 ♀♀) — 2♀ (29°32′35.80″ N, 82°5′7.34″ W, 28 m, 11 August 2016, Natchez, Organic Farm), 1♀ (29°24′30.77″ N, 82°10′16.13″ W, 19 m, Choctaw, Organic Farm), 2♀♀ (31°22′49.19″ N, 83°19′8.57″ W, 89 m, 18 August 2016, Natchez, Conventional Farm), 1♀ (29°24′30.77″ N, 82°10′16.13″ W, 19 m, Choctaw, Organic Farm), 2♀♀ (28°34′5.62″ N, 81°41′22.17″ W, 24 m, 25 August 2016, Von, Organic Farm), 1♀ Natchez, 1♀ Osage, 1♀ Ouachita (29°32′35.80″ N, 82°5′7.34″ W, 28 m, 20 September 2016, Organic Farm), 1♀ Natchez, 2♀♀ Osage, 2♀♀ Ouachita (28°34′5.62″ N, 81°41′22.17″ W, 24 m, 21 September 2016 Organic Farm), 1♀ (30°54′18.31″ N, 82°38′51.06″ W, 82 m, 15 August 2016, Osage, Conventional Farm).

Comments — Typhlodromalus peregrinus has been recorded previously on a wide range of plants including blackberry, Rubus sp. in USA, Florida (Chant 1957; De Leon 1959; Denmark and Evans 2011; Denmark and Muma 1966; Muma and Denmark 1970; Walter and Denmark 1991) and New Jersey (Dyer and Swift 1979). In the current study, typhlodromalus species was collected with all phytophagous mite species, which were collected during the present study.
Comments — According to Demite et al. (2020), to date, *T. peregrinus* was reported from 18 countries including the US. In the USA, it was detected in Florida, Georgia, Massachusetts, Missouri, New, North Carolina, Oklahoma, Pennsylvania, South Carolina, Tennessee, Texas, and Virginia (Demite et al. 2020). It was generally found on citrus (Childers 1994; Fadamiro et al. 2008, 2009; Muma 1955a, 1967; Pena 1992; Villanueva and Childers 2004, 2005) and solanaceous plants (Fiaboe et al. 2007; McMurtry 1983; Silva et al. 2016). This species was also collected from ground cover vegetation (weeds) of Alabama (Fadamiro et al. 2008, 2009) and Florida (Childers and Denmark 2011) citrus orchards (Kreiter et al. 2018). Vieira de Souza et al. (2015) detected it on *Cocos nucifera* (L.) (Arecaceae), *Theobroma cacao* L. (Malvaceae), *Psidium guajava* L. (Myrtaceae), *Carica papaya* L. (Caricaceae). It was also found on *Alchornea triplinervea* (Spreng.) Müll.Arg. (Euphorbiaceae) by Zacarias and De Moreas (2001). Kreiter et al. (2018) collected this species from *Neonotonia wightii* (Wight and Arn.) *Pueraria phaseoloides* (Roxb.) *Macroptilium atropurpureum* (DC.) (Fabaceae) and *Paspalum notatum* Flügge cv. Pensacola (Poaceae). However, according to Demite et al. (2020), there is no known record on *Rubus* spp. This species was associated with many insect and mite species by different researchers. While Aleyrodidae, Coccidae and Tetranychidae were evaluated as optimal prey for this species by Muma (1971), Childers and Denmark (2011) indicated that this species is a predator of thrips. According to Muma (1955b, 1971), it is a facultative predator of *Chrysomphalum aonidum* (L) and *Lepidosaphes beckii* (Newn.) (Hemiptera: Diaspididae) (Pena et al. 1989). It was also collected from miners of *Phyllocnistis citrella* Stainton (Lepidoptera: Gracillariidae) and whitefly exuvia, empty scale armour, clump, dead scale insects, sooty mold (Childers 1994; Muma 1967; Villanueva and Childers 2011). It was found associated with *Panonychus citri* (McGregor), *Eotetranychus sexmaculatus* (Riley) (Trombidiformes: Tetranychidae), *Parlatoria pergandii* Comstock (Hemiptera: Diaspididae) (Muma 1969), *Phyllocoptruta oleivora* (Ashmead) (Trombidiformes: Eriophyidae) (Pena, 1992; Kreter et al., 2018). Silva et al. (2016) noted that this predator also was able to feed on all stages of *P. latus*. Immature stages of *P. citri*, all stages of *T. urticae*, and pollens of *Malephora crocea* (Jacq.) Schwant (Aizoaceae), *Quercus virginiana* Miller (Fagaceae), and *Typha latifolia* L. (Typhaceae) were evaluated as suitable diet in the laboratory by Fouly et al. (1995). In the present study, *T. peregrinus* was found together with populations of *P. latus*, *E. carpini*, *T. bilobatus*, *T. confusus*, *T. schoenei* and *T. urticae*.

**Amblyseius sp.**

Material Examined (n=3; 1 ♀, 2 ♂♂) — 1♂ (28°34′.5.62″ N, 81°41′.22.17″ W, 24 m, 25 August 2016, Ouachita, Organic Farm), 1♂ (29°40′.37.56″ N, 82°29′.32.73″ W, 32 m, 1 August 2016, Kiowa, Organic Farm), 1♀ (28°34′.5.62″ N, 81°41′.22.17″ W, 24 m, 21 September 2016, Natchez, Organic Farm).

**Phytoseius sp. 1**

Material Examined (n=5; 5 ♀♀) — 1♀ (30°54′.18.31″ N, 82°38′.51.06″ W, 46 m, 18 August 2016, Ouachita, Organic Farm), 1♂ (29°40′.37.56″ N, 82°29′.32.73″ W, 32 m, 1 August 2016, Kiowa, Organic Farm), 1♀ (28°34′.5.62″ N, 81°41′.22.17″ W, 24 m, 21 September 2016, Natchez, Organic Farm).

**Phytoseius sp. 2**

Material Examined (n=6; 6 ♀♀) — 1♀ (22 August 2016, Arapaho), 1♀ (22 August 2016, Choctaw), 1♀ (22 August 2016, Kiowa); 2♀♀ (20 September 2016, Kiowa); 1♀ (15 July 2016, Kiowa) (29°24′.30.77″ N, 82°10′.16.13″ W, 19 m Organic Farm)
Proprioseiopsis sp.

Material Examined (n=4; 3 ♀♀, 1 ♂) — 1♀ 11 August 2016, Osage, 1♀ 15 July 2016, Ouachita (29°32′35.80″ N, 82°5′7.34″ W, 28 m, Organic Farm), 1♂ (29°24′30.77″ N, 82°10′16.13″ W, 19 m, 22 August 2016, Choctaw, Organic Farm), 1♀ (28°34′5.62″ N, 81°41′22.17″ W, 24 m, 2 August 2016, Ouachita, Organic Farm).

Family Cheyletidae

Oudemanscheyla denmarki (Yunker)

Cheletomimus denmarki Yunker

Material Examined (n=2; 2 ♀♀) — 1♀ (28°34′5.62″ N, 81°41′22.17″ W, 24 m, 2 August 2016, Natchez, Organic Farm), 1♀ (31°22′49.19″ N, 83°19′8.57″ W, 89 m, 18 August 2016, Ouachita, Conventional Farm).

Comments — Yunker (1961) and Muma (1964c) recorded this species from Florida citrus. It was recorded from Lantana camara L. (Verbenaceae) leaves collected from native forests in southeastern Queensland, Australia by Walter (1999). Hagstrum (2013) detected this species on betel nut (Areca catechu L., Arecaceae) in Taiwan. It was observed feeding on tydeid mites in domatia on leaves of wild grapes by Walter and Denmark (1991). In the current study, it was collected together with P. latus, T. confusus, E. carpini and T. schoenei phytophagous mites.

Family Stigmaeidae

Agistemus sp.

Material examined (n=8; 8 nymph) — 1N (28°34′5.62″ N, 81°41′22.17″ W, 24 m, 2 August 2016, Von, Organic Farm), 2N (29°32′35.80″ N, 82°5′7.34″ W, 28 m, 11 August 2016, Osage, Organic Farm), 3N Natchez, 2N Osage (29°32′35.80″ N, 82°5′7.34″ W, 28 m, 15 July 2016, Organic Farm).

Family Ascidae

Asca sp. (n=1; 1♂)

Material examined — 1♂ (29°24′30.77″ N, 82°10′16.13″ W, 19 m, 11 August 2016, Arapaho, Organic Farm)

Family Erythraeidae

Lasioerythraeus sp.

Material examined (n=1, 1 Larva) — 1L (29°24′30.77″ N, 82°10′16.13″ W, 19 m, 15 July 2016, Arapaho, Organic Farm)

Phytophagous mite species on nine different blackberry cultivars in selected organic and conventional commercial blackberry farms in Florida and Georgia, USA

Family Tarsonemidae

Polyphagotarsonemus latus (Banks)

Acarus translucens Green
Polyphagotarsonemus latus (Banks)
Acarus translucens Green
Hemitarsonemus latus Banks
Tarsonemus translucens Green
Avrosita translucens Oudemans
Tarsonemus latus Banks
Tarsonemus phaseoli Bondar
Neotarsonemus latus Smiley

Material examined (n=10; 5 ♀♀, 5 ♂♂) — 1♀ Ouachita, 1♂ Osage (29°32’35.80” N, 82°5’7.34” W, 28 m, 11 August 2016, Organic Farm); 1♂ (29°32’35.80” N, 82°5’7.34” W, 28 m, 28 June 2016, Ouachita, Organic Farm); 1♂ (30°54’18.31” N, 82°38’51.06” W, 46 m, 18 August 2016, Ouachita, Conventional Farm); 1♀ Osage, 1♀ Von (28°34’5.62” N, 81°41’22.17” W24 m, 25 August 2016, Organic Farm); 1♂ (31°22’49.19” N, 83°19’8.57” W, 89 m, 22 September 2016, Ouachita, Conventional Farm), 1♀ (31°22’49.19” N, 83°19’8.57” W, 21 July 2016, Natchez, Conventional Farm).

Comments — Polyphagotarsonemus latus is distributed worldwide and has a wide host range (Fasulo 2019; Azzazy and Alhewairini 2018; Gerson 1992; Johnson et al. 2016; Pena and Campel 2005). It was first described by Banks (1904) as Tarsonemus latus from the terminal buds of mango in a greenhouse in Washington, D.C., USA (Denmark 1980; Fasulo 2019). This mite was recently found in multiple states in the US causing yield reductions in blackberries (Johnson et al. 2016; Lefors et al. 2017). Vincent et al. (2010) reported it on blackberry in organic production in Arkansas. Rebek (2017) detected it in Oklahoma Blackberry orchards. Demchak and Johnson (2017) noticed that it has been problematic for blackberry growers in Pennsylvania. Rebek (2017) also found it on blackberries in Oklahoma. Finally, in 2017, this mite has been detected on blackberries in Arkansas, Illinois, Indiana, Maryland, North Carolina, South Carolina, Pennsylvania, Virginia, California, and Oklahoma (Rebek 2017). Renkema et al. (2017) recorded it from commercial strawberries in Florida. It is also considered a serious pest of Pittosporum spp. (Pittosporaceae) in Florida (Johnson and Lyon 1991). Pena et al. (2000) observed P. latus on citrus.

Tarsonemus (Tarsonemus) bilobatus Suski
Tarsonemus (Tarsonemus) hungaricus Schaarschmidt
Lupotarsonemus bilobatus Suski & Schaarschmidt

Material examined (n=1; 1 ♀) — 1♀ (29°24’30.77” N, 82°10’16.13” W, 19 m 11 August 2016 Arapaho Organic Farm)

Comments — Tarsonemus bilobatus has been reported on many plant species in Central America (Costa Rica), Europe (Byelorussia, Hungary, Italy, Poland, Ukraine), Asia (China, India Japan, Korea,), Africa (Egypt) (Lin and Zhang 2002; Zhang 2003) and South America (Brazil) (Lofego et al. 2005; Rezende et al. 2012). It was also collected from bacterial and fungal cultures, stored food products, litter and soil. It is primarily a fungivorus species (Zhang 2003).

Tarsonemus (Tarsonemus) confusus Ewing
Tarsonemus assimilis Banks
Tarsonemus confusus Ewing; Beer; Smiley; Kaliszewski

Material Examined (n=5; 5 ♀♀) — 1♀ (29°24’30.77” N, 82°10’16.13” W, 19 m, 11 August 2016, Arapaho, Organic Farm); 1♀ (31°22’49.19” N, 83°19’8.57” W, 89 m, 18 August 2016, Ouachita, Conventional Farm); 2♀♀ (30°54’18.31” N, 82°38’51.06” W, 46 m, 18 August 2016 Kiowa Conventional Farm); 1♀ (29°32’35.80” N, 82°5’7.34” W, 28 m, 28 June 2016, Ouachita, Organic Farm).

Comments — Tarsonemus confusus occurs on many types of plants in Canada, Byelorussia, Egypt, China, Ireland, Italy, Japan, Germany, Korea, Netherlands, Ukraine, Poland, Russia, Turkey (Lin and Zhang 2002), Hungary (Ripka et al. 2005) and Brazil (Lofego et al. 2005). It was also previously recorded from multiple states in the US on various plants including Rubus sp. (Lin and Zhang 2002).
Family Tetranychidae

Eotetranychus carpilli (Oudemans)

Material Examined (n=22; 4 ♀♀, 18 ♂♂) — 1 ♂ (28°34’5.62″ N, 81°41’22.17″ W, 24 m, 2 August 2016, Osage, Organic Farm); 11♂♂ 2♀♀ (28°34’5.62″ N, 81°41’22.17″ W, 24 m, 21 September 2016, Von, Organic Farm); 1♂ Von, 1♂2♀♀ Osachita, 28°34’5.62″ N, 81°41’22.17″ W24 m, 25 August 2016, Organic Farm; 1♂ (29°24’30.77″ N, 82°10’16.13″ W, 19 m, 15 July 2016, Kiowa, Organic Farm), 2♀♀ (29°24’30.77″ N, 82°10’16.13″ W, 19 m, 22 August 2016, Arapaho, Organic Farm), 1♂ (29°32’35.80″ N, 82°5’7.34″ W, 28 m, 11 August 2016, Osage, Organic Farm)

Comments — Eotetranychus carpilli has been widely reported in Europe (Migeon et al. 2007; Malagnini et al., 2012) . It is also found in Mexico (Beer and Lang 1958) and USA (McGregor 1917). To date, it was reported from 30 countries in two major regions of Nearctic and Palearctic (Migeon and Dorkeld 2020). This species also exploits a wide range of host plants and have been reported on 54 host plants including Rubus idaeus (Migeon and Dorkeld 2020) and Rubus sp. (Bolland et al. 1998).

Tetranychus schoenei McGregor

Septanychus schoenei McGregor
Tetranychus schoenei Pritchard & Baker
Tetranychus (Polynychus) schoenei Flechtmann & Hunter

Material Examined (n=23; 6 ♀♀, 17 ♂♂) — 1♀ Osage, 1♀ Osachita (31°22’49.19″ N, 83°19’8.57″ W, 89 m, 18 August 2016, Conventional Farm); 1♀ (30°54’18.31″ N, 82°38’51.06″ W, 46 m, 18 August 2016, Osachita, Conventional Farm); 1♀ Kiowa, 1♀ Arapaho, 1♀ Choctaw (29°24’30.77″ N, 82°10’16.13″ W, 19 m, 22 August 2016, Organic Farm), 1♀ (28°34’5.62″ N, 81°41’22.17″ W, 24 m, 25 August 2016, Osage, Organic Farm); 2♀♀ Natchez, 2♀♀ Osage (29°32’35.80″ N, 82°5’7.34″ W, 28 m, 20 September 2016, Organic Farm); 1♂ (29°32’35.80″ N, 82°5’7.34″ W, 28 m, 28 June 2016, Osachita, Organic Farm); 1♀ (28°34’5.62″ N, 81°41’22.17″ W, 24 m, 21 September 2016, Von, Organic Farm); 3♀♀ (30°54’18.31″ N, 82°38’51.06″ W, 46 m, 22 September 2016, Osachita, Conventional Farm); 1♀ (29°32’35.80″ N, 82°5’7.34″ W, 28 m, 15 July 2016, Osage, Organic Farm); 1♀ Osage, 1♀ Osachita (31°22’49.19″ N, 83°19’8.57″ W, 89 m, 21 July 2016, Conventional Farm).

Comments — Tetranychus schoenei is widely distributed over the eastern and southwestern United States. Previous distribution records included Georgia (Flechtmann and Hunter 1971). It is also found in Iran (Beyzavi et al. 2013). According to Migeon and Dorkeld (2020), to date, it was reported from 2 countries and on 52 host plants including Rubus allegheniensis, R. idaeus, R. occidentalis (Reeves 1963), Rubus sp. (Reeves 1963; Seeman and Beard 2011).

Tetranychus urticae Koch

Fifty species names have been synonymized with T. urticae in spider Mites Web (Migeon and Dorkeld 2020).

Material Examined (n=5; 5 ♂♂) — 1♂ (31°22’49.19″ N, 83°19’8.57″ W, 89 m, 18 August 2016, Osage, Conventional Farm); 1♂ (29°24’30.77″ N, 82°10’16.13″ W, 19 m, 22 August 2016, Choctaw, Organic Farm); 2♀♀ (31°22’49.19″ N, 83°19’8.57″ W, 89 m, 21 July 2016, Osage, Conventional Farm); 1♂ (29°39’15.95″ N, 82°31’25.49″ W, 32 m, 27 July 2016, Navaho, Organic Farm).

Comments — Tetranychus urticae has an almost cosmopolitan distribution. It is also a highly polyphagous species. To date, it is reported on 1169 host plants including many Rubus spp. from 124 countries (Migeon and Dorkeld 2020).
**Tetranychus sp.**

Material Examined (n=6; 6 ♂) — 1 ♂ Osage 1 ♂ Von (28°34′5.62″ N, 81°41′22.17″ W, 24 m, 2 August 2016, Organic Farm); 1 ♂ (28°34′5.62″ N, 81°41′22.17″ W, 24 m, 25 August 2016, Von, Organic Farm); 1 ♂ Navaho, 1 ♂ Ouachita (29°39′15.95″ N, 82°31′25.49″ W, 32 m, 27 July 2016, Organic Farm); 1 ♂ (30°54′18.31″ N, 82°38′51.06″ W, 46 m, 21 July 2016, Ouachita, Conventional Farm).

**Conclusion**

In conclusion, the total number of mites collected in organic farms (105) was over 2-fold higher than in conventional farms (47). Moreover, while all of the twenty mite species identified during the study could be collected from organic farms, just nine could be obtained from conventional farms. The total number of beneficial mites collected in the organic farm was 57. In contrast, 23 beneficial mites were collected from conventional farms (Table 3). These results may be related to pesticide use on the conventional farms and are similar to that previously reported for mites (Incekulak and Ecevit 2002; Yanar and Ecevit 2008; Akyazı et al. 2016; Fathipour and Maleknia 2016; Soysal and Akyazı 2018).

Among the nine sampled cultivars, Quachita had 35 mites and 12 mite species, Osage had 27 mites, 9 species, Natchez had 26 mites, 9 species, Von had 22 mites, 7 species, Arapaho had 15 mites, 11 species, Choctaw had 13 mites, 8 species and Kiowa had 12 mites, 7 species. In contrast, no mite was found on the leaf samples taken from the Freedom cultivar, and

### Table 4 Mite numbers according to blackberry cultivars (Arapaho, Choctaw, Freedom, Kiowa, Natchez, Navaho, Osage, Ouachita, Von.)

| Mite Species                          | Arapaho | Choctaw | Freedom | Kiowa | Natchez | Navaho | Osage | Ouachita | Von |

just one mite was collected from Navaho (Table 4). We hypothesize that differences in mite numbers and diversity may be caused by different phytochemical components, morphological and histological leaf structure of blackberry cultivars as stated by Camporese and Duso (1996), Krips et al. (1999), Kretier et al. (2002), Kabicek (2008), Khan et al. (2008) and Ali et al. (2015) for different plants. It should be noted that a single factor is not responsible for the abundance and diversity of mites but a combination of factors. Since the effect of cultivars on the mite population is time-consuming, such results can only be observed in the long term. As far as we know, no previous research has investigated the effect of blackberry cultivars on the mite population. And, future investigations are necessary to validate the kinds of conclusions that can be drawn from this study.

Acknowledgments

We thank growers in Florida and Georgia for allowing collection of samples from their farms.
