PATH INTEGRAL DISCUSSION FOR
SMORODINSKY-WINTERNITZ POTENTIALS:
I. TWO- AND THREE DIMENSIONAL EUCLIDEAN SPACE

Abstract
Path integral formulations for the Smorodinsky-Winternitz potentials in two- and three-dimensional Euclidean space are presented. We mention all coordinate systems which separate the Smorodinsky-Winternitz potentials and state the corresponding path integral formulations. Whereas in many coordinate systems an explicit path integral formulation is not possible, we list in all soluble cases the path integral evaluations explicitly in terms of the propagators and the spectral expansions into the wave-functions.

1. Introduction.

In the study of the Kepler problem and the harmonic oscillator it turns out that they possess properties making them of special interest, for instance, all finite classical trajectories are closed and all energy eigen-values are multiply degenerated. These properties point beyond their specific shape and give rise to ask about their “hidden” or “dynamical” group structure, namely whether it is possible to distort them in a systematic way, and at the same time keep these properties. Furthermore, do they belong to a class of potential problems which have similar properties?

For instance, as has been known for a long time, at the basis of the specific properties of the hydrogen atom lies its O(4) symmetry, or to be more precise, the dynamical group O(4) for the discrete spectrum and the Lorentz group O(3, 1) for the continuous spectrum. All such systems have the particular property that all the energy-levels of the system are organized in representations of the non-invariance group which contain representations of the dynamical subgroup realized in terms of the wave-functions of these energy-levels [42]. In the case of the hydrogen it enabled Pauli [112] and Fock [39] to solve the quantum mechanical Kepler problem without explicitly solving the Schrödinger equation. Actually, the algebra of the dynamical symmetry of the hydrogen atom turns out to be a centerless twisted Kac-Moody algebra [23]. Smorodinsky, Winternitz et al. started a systematic search to find and classify potential problems in two and three dimensions which can be seen as non-central generalizations of the Coulomb-, the harmonic oscillator and radial barrier potentials. The classification scheme starts from the consideration in which way integrals of motion (in classical mechanics), respectively additional operators corresponding to these integrals of motion which commute with the Hamiltonian, are related to the separability of the potential problem in more than one coordinate system. In two dimensions [42] it turns out that there are four potentials of the sought type which all have three constants of motion (including energy), i.e. there are two more operators commuting with the Hamiltonian. Smorodinsky, Winternitz et al. extended their investigations in a classical paper [23] to three dimensions by listing all potentials which separate in more than one coordinate system. However, in three dimensions one must distinguish two cases, namely minimally super-integrable systems, where four, and maximally super-integrable systems, where five functionally independent integrals of motion exist.

Actually in $D$ dimensions a system is called minimally super-integrable if it has $2D - 2$ functionally independent integrals of motions, and it is called maximally super-integrable if it has $2D - 1$ functionally independent integrals of motion [1, 23]. A discussion of the two-dimensional case is due to e.g. Winternitz et al. [23], and a detailed study of the three-dimensional case can be found in [33, 82]. Moreover, the Smorodinsky-Winternitz potentials allow a generalization to $D$ dimensions and are then also maximally super-integrable [30].

In the three-dimensional Euclidean space there are eleven coordinate systems which separate the free Hamiltonian [74, 101, 105]. Each potential must now be analysed according to its separability in these coordinate systems. Because each potential can be rotated and translated with respect to itself, one has to look for the equivalence classes among them. As it turns out there are eight minimally super-integrable (including a ring-shaped oscillator and the Hartmann potential) and five maximally super-integrable (including harmonic oscillator and Coulomb) potentials. Evans [33] presented a list of these potentials including the corresponding integrals of motion and (almost) all separating coordinate systems. The group structure of the two-dimensional potentials was given in [23], for the Hartmann potential by Gerry [46] and Granovsky et al. [54], for the ring-shaped oscillator by Quesne [116] and Zhedanov [131], and the harmonic oscillator including $1/x^2$-terms (a Smorodinsky-Winternitz potential, see below) was analysed by Evans [33].
The purpose of this paper is to give a path integral discussion of all Smorodinsky-Winternitz potentials in two- and three-dimensional Euclidean space. This includes the statement of the propagator (the time-evolution kernel), respectively, if only available, the corresponding Green function, and the spectral expansion into wave-functions and energy-levels. In the discussion of the two-dimensional Smorodinsky-Winternitz potentials the evaluation will be somewhat more elaborated in order to demonstrate the techniques. Of particular importance will be the basic path integral solutions of the radial harmonic oscillator by Peak and Inomata [113] (compare also Duru [29] and Goovaerts [48]), and of the Pöschl-Teller potential by Böhm and Junker [6] which is based on the SU(2) path integral (compare also Duru [28], and Inomata and Wilson [72]). All these path integral solutions are now well-known in the literature and will not be repeated here.

One may ask, if it is possible to analyse the path integral of a potential problem in terms of its dynamical symmetry group. [71, 77]. In order to look at such a path integral formulation we consider the Lagrangian $L(\mathbf{x}, \dot{\mathbf{x}}) = V(\mathbf{x})$ ($\mathbf{x} \in \mathbb{R}^{p+q}$) as formulated, say, in a not-necessarily positive definite space with signature

$$(g_{ab}) = \text{diag}(+1, \ldots , +1, -1, \ldots, -1) . \quad (1)$$

One introduces, say, polar coordinates $x_{\nu} = re_{\nu}(\vartheta_1, \ldots , \vartheta_{p+q-1})$ ($\nu = 1, \ldots, p + q$), where the $e_{\nu}$ are unit vectors in some suitable chosen (timelike, spacelike or lightlike) set $\mathbb{I}$. One then expresses the Lagrangian in terms of these polar coordinates and seeks for an expansion of the quantity $e^{(\mathbf{\hat{e}}, \mathbf{\hat{e}})}$ expressed in terms of group elements $g_1$, $g_2$. If this is possible one can re-express the path integration of the coordinates $\mathbf{\hat{x}}$ into a path integration over group elements $g$ yielding

$$\mathbf{\hat{x}}(t')=\mathbf{\hat{x}}'' \int \mathcal{D}\mathbf{\hat{x}}(t) \exp \left[ i \int_{t'}^{t''} L(\mathbf{x}, \dot{\mathbf{x}}) d\mathbf{t} \right] \rightarrow \int dE_{\lambda} d\lambda \sum_{mn} \hat{f}_{mn}^{\lambda} D_{mn}^{\lambda}(g^{-1}g'') \quad (2)$$

$$= \int dE_{\lambda} d\lambda \sum_{mn} \hat{f}_{mn}^{\lambda} \sum_{k} D_{m,k}^{\lambda}(g')D_{m,k}^{\lambda}(g'') . \quad (3)$$

Here $\hat{f}_{mn}^{\lambda}$ is defined via the Fourier transformation

$$f(g) = \int dE_{\lambda} d\lambda \sum_{mn} \hat{f}_{mn}^{\lambda} D_{mn}^{\lambda}(g) , \quad \hat{f}_{mn}^{\lambda} = \int_D f(g) D_{mn}^{\lambda}(g^{-1}) dg \quad (4)$$

and $dg$ is the invariant group (Haar) measure. $\int dE_{\lambda}$ stands for a Lebesque-Stieltjes integral to include discrete ($\int dE_{\lambda} \rightarrow \sum_{\lambda}$) as well as continuous representations. $\int dE_{\lambda}$ is to be taken over the complete set $\{\lambda\}$ of class one representations. $d_{\lambda}$ denotes (in the compact case) the dimension of the representation and we take

$$d_{\lambda} \int_D D_{mn}^{\lambda}(g)D_{m'n'}^{\lambda'}(g) dg = \delta(\lambda, \lambda')\delta_{m,m'}\delta_{n,n'} \quad (5)$$

as a definition for $d_{\lambda}$. $\delta(\lambda, \lambda')$ can denote a Kronecker delta, respectively, a $\delta$-function, depending whether the quantity $\lambda$ is a discrete or continuous parameter. We have furthermore used the group (composition) law

$$D_{mn}^{\lambda}(g_{a}^{-1}g_{b}) = \sum_{k} D_{kn}^{\lambda'}(g_{a})D_{km}^{\lambda}(g_{b}) . \quad (6)$$

Choosing a basis $\{\mathbf{\hat{b}}\}$ in the relevant Hilbert space fixes the matrix elements $D_{mn}^{\lambda}$ through $D_{mn}^{\lambda} = (D^{\lambda}(g)b_{m}, b_{n})$ of the representation $D^{\lambda}(g)$ of the group. In particular the $D^{\lambda}_{0m}$ are called
associated spherical harmonics, and the $D^\lambda_{00}$ are the zonal harmonics. These spherical functions are eigen-functions of the corresponding Laplace-Beltrami operator on $a$, say, homogeneous space, and the entire Hilbert space is spanned by a complete set of associated spherical functions $D^\lambda_{0m}$ (Gelfand et al. [43, 44] and Vilenkin [126]). In [58], a systematic study was presented of path integrals of the free motion in two- and three-dimensional spaces of constant curvature, i.e. on homogeneous spaces.

The Smorodinsky-Winternitz potentials can also be discussed in the context of a group path integration, provided the dynamical “hidden” group structure behind the potential problem is known, and the wave-functions and the energy-levels follow from the representations of the group [70, 71]. However, things are not as simple as for the free motion because we have not a problem of quantum motion on a homogeneous space. Whereas in many coordinate system realizations we can actually evaluate the path integral, there remain several ones, where a direct path integral evaluation is not possible because we obtain quartic, sextic, complicated Mathieu-like path integral problems, where no solution is known. Also a consideration along the lines of “quasi-exactly solvable path integrals” [89] can not be applied in an obvious way. However, sometimes the zero-energy Green’s function can be evaluated. As we will see, the technique of separation of variables in the path integral [55] will give us a convenient tool to exploit the actually symmetry structure in such a way that we can systematically reduce the number of degrees of freedom by using the appropriate path integral identities.

We will therefore provide the path integral formulations of all Smorodinsky-Winternitz potentials in two- and three-dimensional Euclidean space. Some can only be stated, others can be explicitly solved. We find that each of the potentials can be at least solved in one coordinate system. The identities arising from the relations between the various formulations serve as a tool to analyse the “hidden” dynamical group structure, however, only in an implicit way. The representations of the group in question where a path integral is not explicitly soluble remain still unknown. Furthermore, the explicit spectral expansions corresponding to various coordinate systems allow to study the interbasis expansions of the problem. An example of particular importance is the two-dimensional hydrogen atom [24, 25], respectively the ring-shaped oscillator [90], and the Hartmann potential [30, 31].

The knowledge of soluble examples and their relation with each other, in particular here the Smorodinsky-Winternitz potentials, is of great value in many branches of theoretical physics. For instance, the Hartmann system [30, 31] with either an oscillator or an Coulomb interaction term appears in the study of molecule physics (modeling ring-shaped molecules like the benzene molecule), in the study of the Aharonov-Bohm effect [1, 81], for path integral studies c.f. e.g. (Bernido and Inomata [6], Cheng [16], Chetouani et al. [18], Gerry and Singh [15], Hoang and Giang [88], Sökmen [117], Tanikella and Inomata [123], and Wiegel [127]), and for a more recent discussion of a deformed generalization [6]. Evans [35] also mentioned cases in celestial mechanics (e.g. an artificial satellite orbiting an oblate planet, dynamics of elliptical galaxies).

The consideration of the Smorodinsky-Winternitz potentials in spaces of constant (positive and negative) curvature models a space-time of closed, respectively open universes, c.f. the Kepler problem and the Higgs oscillator problem (Granovsky et al. [51], Higgs [65], Infeld [67], Leemon [67], Ochik and Red’kov [108], Pogosyan et al. [113], Schrödinger [121], and Steveson [120], and path integral discussions c.f. Barut et al. [2, 3], and Grosche [54]). Path integral discussions of Smorodinsky-Winternitz potentials in space of constant positive and negative curvature will be given in forthcoming publications. Starting from a particular exactly soluble example one can perturb it by a further (vector or scalar) potential which is not destroying separability in a conveniently chosen coordinate system [93], one can expand about the exact solution of the unperturbed one, hence giving a perturbation series in, say, either powers of the coupling parameter (e.g. $\hbar^0$), respectively in powers of $\hbar$. The latter then gives a “pseudo” semi-classical expansion à la DeWitt-Morette [93] – [103].
Our work can be seen as a generalization and extension of the earlier work of Carpio-Bernido et al. [10]-[14]. They discussed only some of the Smorodinsky-Winternitz potentials and they restricted themselves only to a spherical polar coordinate path integral discussion in $E(3)$, the three-dimensional Euclidean space. Their results are, of course, included in our discussion. They also did not discuss a classification scheme of the potentials. In particular, all our path integral evaluations in parabolic coordinates will be new path integral solutions, including the expansion into discrete and continuous wave-functions (if present). The path integral solutions of the two-dimensional Smorodinsky-Winternitz potential $V_4$ and three-dimensional Smorodinsky-Winternitz potential $V_3$ are entirely new (in Refs. [10]-[14] special cases of the latter have been discussed). We therefore give a combined presentation henceforth solutions which have been scattered around in the literature and we also give all admissible solutions of each potential problem.

Our paper will be organized as follows: In the next Section we will list for completeness the coordinate systems in two- and three-dimensional flat space which separate the free Helmholtz, respectively Schrödinger equation. Also a separation formula for path integrals will be stated.

In the third Section we discuss the Smorodinsky-Winternitz potentials in two and three dimensions, respectively. This includes the formulation of the path integral in the various separating coordinate systems, and if possible via the basic path integrals, its solution in terms of the propagator, respectively the Green functions, and its spectral expansion. In particular, we will make frequently use of the separation technique in path integrals as developed in [55], and will not write down explicitly each step in the calculation of the examples of the explicitly soluble Smorodinsky-Winternitz potentials. In our path integral solutions we will state the Feynman kernels as explicitly as possible, and their spectral expansions according to

$$K(\vec{x}'', \vec{x}'; T) = \int dE_\lambda \Psi_\lambda^*(\vec{x}'') \Psi_\lambda(\vec{x}') e^{-iE_\lambda T/\hbar}$$

$$= \sum_n \Psi_n(\vec{x}') \Psi_n(\vec{x}'') e^{-iE_n T/\hbar} - \int dp \Psi_p^*(\vec{x}') \Psi_p(\vec{x}'') e^{-i\hbar p^2 T/2M}$$

$$+ \sum_n \Psi_n(\vec{x}') \Psi_n(\vec{x}'') e^{-iE_n T/\hbar} + \int dp \Psi_p^*(\vec{x}') \Psi_p(\vec{x}'') e^{-i\hbar p^2 T/2M} ,$$

whether the spectrum is purely discrete, purely continuous, or discrete and continuous. In these cases, where only the (energy-dependent) Green function is available, the spectral expansions will be presented similarly.

The fourth Section is devoted to a summary and a discussion of our results.

2. Coordinate Systems in Euclidean Space and the Path Integral.

2.1. Coordinate Systems in Euclidean Space.

2.1.1. Coordinate Systems in $D$ Dimensions. In $D$-dimensional Euclidean space we have the coordinate system corresponding to the elliptic coordinates

$$x_j^2 = \prod_{i=1}^D (\rho_i - e_j) / \prod_{i \neq j} (e_i - e_j) , \quad (j = 1, \ldots, D)$$

$$e_1 < \rho_1 < e_2 < \ldots < e_D < \rho_D .$$

This is the most general coordinate system possible, and all other coordinate systems are included as degenerations. In the following we will explicitly state the coordinate systems in
two- and three-dimensional flat space $E^{(2)}$ and $E^{(3)}$ which separate the Helmholtz, respectively the Schrödinger equation. We rewrite the Hamiltonian, respectively the Laplacian $\Delta L = g^{-1/2} \partial_a g^{ab} g^{1/2} \partial_b$ in terms of the corresponding momentum operators $p_a = -i\hbar g^{-1/2} \partial_a g^{1/2} = -i\hbar(\partial_a + \Gamma_a/2) \ (\Gamma_a = \partial_a \ln \sqrt{g}, \ g\det(g_{ab}))$, where we choose a specific ordering prescription called product ordering [32]. Here it is assumed that $g_{ab} = h_{ac}h_{cb}$, $g^{ab} = h^{ac}h^{cb}$, the $h_{ac}$ being vielbeins, such that we can write $H = -\frac{\hbar^2}{2M} \Delta L = \frac{1}{2M} h^{ac} p_a p_b h^{cb} + \Delta V_{PF}$ with the quantum potential $\Delta V_{PF}$ given by

$$\Delta V_{PF} = \frac{\hbar^2}{8M} \left[ g^{ab} \Gamma_a \Gamma_b + 2(g^{ab} \Gamma_b)_{,b} + g^{ab} \right] + \frac{\hbar^2}{8M} \left( 2h^{ac} h^{bc}_{,ab} - h^{ac}_{,a} h^{bc}_{,b} - h^{ac}_{,b} h^{bc}_{,a} \right). \ (10)$$

The potentials which may be added without spoiling the separability were derived by Eisenhardt [32] and Smorodinsky and Winternitz et al. [42, 93].

2.1.2. Coordinate Systems in Two Dimensions.

Cartesian Coordinates. We consider the usual cartesian coordinates $(x, y) = \bar{x} \in \mathbb{R}^2 \equiv E^{(2)}$. The metric is given by $(g_{ab}) = \mathbb{I}_2$ and for the momentum operators we have $p_x = -i\hbar \partial_x$, $p_y = -i\hbar \partial_y$. Therefore:

$$- \frac{\hbar^2}{2M} \Delta E^{(2)} = - \frac{\hbar^2}{2M} \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) = \frac{1}{2M} \bar{p}^2. \ (11)$$

The most general potential separable in cartesian coordinates has the form

$$V(\bar{x}) = u(x) + v(y). \ (12)$$

Polar Coordinates. Next, we consider two-dimensional polar coordinates

$$x = \rho \cos \phi, \quad \rho > 0, \quad 0 < \phi < 2\pi. \ (13)$$

The metric is given by $(g_{ab}) = \text{diag}(1, \rho^2)$, and the momentum operators have the form

$$p_\rho = \frac{\hbar}{i} \left( \frac{\partial}{\partial \rho} + \frac{1}{2\rho} \right), \quad p_\phi = \frac{\hbar}{i} \frac{\partial}{\partial \phi}. \ (14)$$

This gives for the Hamiltonian

$$- \frac{\hbar^2}{2M} \Delta E^{(2)} = - \frac{\hbar^2}{2M} \left( \frac{\partial^2}{\partial \rho^2} + \frac{1}{\rho} \frac{\partial}{\partial \rho} + \frac{1}{\rho^2} \frac{\partial^2}{\partial \phi^2} \right) = \frac{1}{2M} \left( p_\rho^2 + \frac{1}{\rho^2} p_\phi^2 \right) - \frac{\hbar^2}{8M} \rho^2. \ (15)$$

A separable potential has the form

$$V(\bar{x}) = u(\rho) + \frac{1}{\rho^2} v(\phi). \ (16)$$

Elliptic Coordinates. Third, we consider the coordinate system

$$x = d \cosh \xi \cos \eta, \quad \xi > 0, \quad -\pi < \eta \leq \pi, \ (17)$$

and $d = R/2$, where $R$ is the interfocus distance. The metric is $(g_{ab}) = d^2(\sinh^2 \xi + \sin^2 \eta) \mathbb{I}_2$ and we obtain for the momentum operators

$$p_\xi = \frac{\hbar}{i} \left( \frac{\partial}{\partial \xi} + \frac{\sinh \xi \cosh \xi}{\sinh^2 \xi + \sin^2 \eta} \right), \quad p_\eta = \frac{\hbar}{i} \left( \frac{\partial}{\partial \eta} + \frac{\sin \eta \cos \eta}{\sinh^2 \xi + \sin^2 \eta} \right). \ (18)$$
Consequently we have for the Hamiltonian
\[
- \frac{\hbar^2}{2M} \Delta E^{(2)} = - \frac{\hbar^2}{2M d^2 (\sinh^2 \xi + \sin^2 \eta)} \left( \frac{\partial^2}{\partial \xi^2} + \frac{\partial^2}{\partial \eta^2} \right) \\
= \frac{1}{2M d^2} (\sinh^2 \xi + \sin^2 \eta)^{-1/2} (p^2_{\xi} + p^2_{\eta}) (\sinh^2 \xi + \sin^2 \eta)^{-1/2}.
\] (19)

Replacing \( x \mapsto x = d (\cosh \xi \cos \eta + 1) \) yields a coordinate system which we call in the following elliptic II coordinates \([95]\). The elliptic coordinate system is useful in the study of two center systems. Furthermore, an additional parameter is introduced, the interfocus distance \( R \). This distinguishes it from the other two-dimensional coordinate systems which can be obtained from the elliptic one by considering specific limits. In particular \( R \to 0 \) reproduces polar coordinates, and \( R \to \infty \) cartesian coordinates. In the case of the elliptic II systems, \( R \to \infty \) reproduces parabolic coordinates (see below).

Note \( \Delta V_{PF} = 0 \) which is a peculiarity of two dimensions with metric \( \propto 1/l \), c.f. (10). A potential separable in these coordinates reads
\[
V(\vec{x}) = \frac{u(\cosh \xi) + v(\cos \eta)}{\sinh^2 \xi + \sin^2 \eta}.
\] (20)

Parabolic Coordinates. Finally, we consider the coordinate system
\[
x = \frac{1}{2} (\eta^2 - \xi^2) , \quad y = \xi \eta , \quad \xi \in \mathbb{R}, \eta > 0
\] (alternatively \( \xi > 0, \eta \in \mathbb{R} \)). We have \( (g_{ab}) = (\xi^2 + \eta^2) I_2 \), and consequently for the momentum operators
\[
p_{\xi} = \frac{\hbar}{i} \left( \frac{\partial}{\partial \xi} + \frac{\xi}{\xi^2 + \eta^2} \right) , \quad p_{\eta} = \frac{\hbar}{i} \left( \frac{\partial}{\partial \eta} + \frac{\eta}{\xi^2 + \eta^2} \right).
\] (22)

This gives for the Hamiltonian
\[
- \frac{\hbar^2}{2M} \Delta E^{(2)} = - \frac{\hbar^2}{2M (\xi^2 + \eta^2)} \left( \frac{\partial^2}{\partial \xi^2} + \frac{\partial^2}{\partial \eta^2} \right) = \frac{1}{2M} (\xi^2 + \eta^2)^{-1/2} (p^2_{\xi} + p^2_{\eta}) (\xi^2 + \eta^2)^{-1/2}.
\] (23)

These coordinates have been used in the literature to discuss the two-dimensional “Coulomb-problem”, c.f. \([31, 42, 57, 68]\). The transformation \( (x, y) \mapsto (\xi, \eta) \) actually is the two-dimensional realization of the Levi-Civita transformation. A separable potential has the form
\[
V(\vec{x}) = \frac{u(\xi) + v(\eta)}{\xi^2 + \eta^2}.
\] (24)

2.1.3. Coordinate Systems in Three Dimensions.

Cartesian Coordinates. Again, we start with the simplest case, cartesian coordinates \((x, y, z) = \vec{x} \in \mathbb{R}^3 \equiv E^{(3)}. \) Then \( (g_{ab}) = 1_3, \) and \( \vec{p} = -i\hbar \nabla. \) This gives for the Hamiltonian
\[
- \frac{\hbar^2}{2M} \Delta E^{(3)} = - \frac{\hbar^2}{2M} \nabla^2 = \frac{1}{2M} \vec{p}^2,
\] (25)

The most general potential separable in cartesian coordinates has the form
\[
V(\vec{x}) = u(x) + v(y) + w(z).
\] (26)
Circular Polar Coordinates. Next, we consider circular cylinder coordinates which are very similar to the two-dimensional polar coordinates
\[
\begin{align*}
x &= \rho \cos \phi , & \rho > 0 , \\
y &= \rho \sin \phi , & 0 \leq \phi < 2\pi , \\
z &= z , & z \in \mathbb{R} .
\end{align*}
\]
(27)
The metric reads \((g_{ab}) = \text{diag}(1, \rho^2, 1)\), and the momentum operators are given by (14) and \(p_z = -i\hbar \partial_z\). This gives for the Hamiltonian
\[
-\frac{\hbar^2}{2M} \Delta_{E(3)} = -\frac{\hbar^2}{2M} \left( \frac{\partial^2}{\partial \rho^2} + \frac{1}{\rho} \frac{\partial}{\partial \rho} + \frac{1}{\rho^2} \frac{\partial^2}{\partial \phi^2} + \frac{\partial^2}{\partial z^2} \right) = \frac{1}{2M} \left( p_\rho^2 + \frac{1}{\rho^2} p_\phi^2 + p_z^2 \right) - \frac{\hbar^2}{8M \rho^2} .
\]
(28)

A separable potential has the form
\[
V(\vec{r}) = u(\rho) + \frac{1}{\rho^2} v(\phi) + w(z) .
\]
(29)
Circular Elliptic coordinates. We consider the coordinate system
\[
\begin{align*}
x &= d \cosh \xi \cos \eta , & \xi > 0 , \\
y &= d \sinh \xi \sin \eta , & -\pi < \eta \leq \pi , \\
z &= z , & z \in \mathbb{R}
\end{align*}
\]
(30)
(alternatively \(\xi \in \mathbb{R}, 0 < \eta < \pi\)). The metric is \((g_{ab}) = \text{diag}(d^2(\sinh^2 \xi + \sin^2 \eta), d^2(\sinh^2 \xi + \sin^2 \eta), 1)\), and we obtain for the momentum operators (18), and \(p_z = -i\hbar \partial_z\). Consequently for the Hamiltonian
\[
-\frac{\hbar^2}{2M} \Delta_{E(3)} = -\frac{\hbar^2}{2M} \left[ \frac{1}{d^2(\sinh^2 \xi + \sin^2 \eta)} \left( \frac{\partial^2}{\partial \xi^2} + \frac{\partial^2}{\partial \eta^2} \right) \right]
= \frac{1}{2M} \left[ \frac{1}{d^2(\sinh^2 \xi + \sin^2 \eta)^{1/2}} (p_\xi^2 + p_\eta^2)(\sinh^2 \xi + \sin^2 \eta)^{-1/2} + p_z^2 \right] .
\]
(31)

Similarly as in the two-dimensional case, circular elliptic II coordinates are described by the replacement \(x \mapsto x = d(\cosh \xi \cos \eta + 1)\). A potential separable in elliptic coordinates reads
\[
V(\vec{x}) = \frac{u(\cosh \xi) + v(\cos \eta)}{\sinh^2 \xi + \sin^2 \eta} + w(z) .
\]
(32)
Circular Parabolic Coordinates. The last example for cylinder coordinates in three dimensions are the parabolic cylinder coordinates
\[
\begin{align*}
x &= \frac{1}{2}(\eta^2 - \xi^2) , & \eta \in \mathbb{R}, \xi > 0 , \\
y &= \eta \xi , & z \in \mathbb{R} ,
\end{align*}
\]
(33)
which is the obvious generalization of the two-dimensional case. We have \((g_{ab}) = \text{diag}(\xi^2 + \eta^2, \xi^2 + \eta^2, 1)\), hence for the momentum operators (22) and \(p_z = -i\hbar \partial_z\). This gives for the Hamiltonian
\[
-\frac{\hbar^2}{2M} \Delta_{E(3)} = -\frac{\hbar^2}{2M} \left[ \frac{1}{\xi^2 + \eta^2} \left( \frac{\partial^2}{\partial \xi^2} + \frac{\partial^2}{\partial \eta^2} \right) \right]
= \frac{1}{2M} \left[ (\xi^2 + \eta^2)^{-1/2} (p_\xi^2 + p_\eta^2)(\xi^2 + \eta^2)^{-1/2} + p_z^2 \right] .
\]
(34)

A separable potential has the form
\[
V(\vec{x}) = \frac{u(\xi) + v(\eta)}{\xi^2 + \eta^2} + w(z) .
\]
(35)
Sphero-Conical Coordinates. We consider the coordinate system in terms of Jacobi functions \[11\]

\[
\begin{align*}
  x &= r \text{sni}(\mu, k) \text{dni}(\nu, k'), \\
  y &= r \text{can}(\mu, k) \text{cuni}(\nu, k'), \\
  z &= r \text{dn}(\mu, k) \text{sn}(\nu, k'),
\end{align*}
\]

(36)

The metric tensor \(g_{\alpha\beta}\) in these coordinates has the form

\[
(g_{\alpha\beta}) = \text{diag}[1, r^2(k^2 \text{cn}^2 \mu + k'^2 \text{cn}^2 \nu), r^2(k^2 \text{cn}^2 \mu + k'^2 \text{cn}^2 \nu)]
\]

(37)

the momentum operators are \(p_r = -\hbar (\partial / \partial r + 1/r)\), and

\[
p_\mu = \frac{\hbar}{i} \left( \frac{\partial}{\partial \mu} - \frac{k^2 \text{sn} \mu \text{cn} \mu \text{dn} \mu}{k^2 \text{cn}^2 \mu + k'^2 \text{cn}^2 \nu} \right), \quad p_\nu = \frac{\hbar}{i} \left( \frac{\partial}{\partial \nu} - \frac{k'^2 \text{sn} \nu \text{cn} \nu \text{dn} \nu}{k^2 \text{cn}^2 \mu + k'^2 \text{cn}^2 \nu} \right).
\]

(38)

The Hamiltonian has the form

\[
-\frac{\hbar^2}{2M} \Delta_{E^{(3)}} = -\frac{\hbar^2}{2M} \left[ \frac{\partial^2}{\partial r^2} + \frac{2}{r} \frac{\partial}{\partial r} + \frac{1}{r^2 k^2 \text{cn}^2 \mu + k'^2 \text{cn}^2 \nu} \left( \frac{\partial^2}{\partial \mu^2} + \frac{\partial^2}{\partial \nu^2} \right) \right]
\]

\[
= \frac{1}{2M} \left( p_r^2 + \frac{1}{r^2} \frac{1}{\sqrt{k^2 \text{cn}^2 \mu + k'^2 \text{cn}^2 \nu}} (p_\mu^2 + p_\nu^2) \frac{1}{\sqrt{k^2 \text{cn}^2 \mu + k'^2 \text{cn}^2 \nu}} \right)
\]

(39)

Here a separable potential must have the form

\[
V(\vec{x}) = u(r) + \frac{1}{r^2} \frac{v(\text{cna}) + w(\text{cna})}{\text{cn}^2 \alpha + k'^2 \text{cn}^2 \beta}.
\]

(40)

The algebraic representation of these coordinates has the form

\[
\begin{align*}
  x^2 &= r^2 \frac{(\rho_1 - a_1)(\rho_2 - a_1)}{(a_3 - a_1)(a_2 - a_1)} , \quad r > 0 , \\
  y^2 &= r^2 \frac{(\rho_1 - a_2)(\rho_2 - a_2)}{(a_3 - a_2)(a_1 - a_2)} , \quad a_1 < \rho_1 < a_2 < \rho_2 < a_3 , \\
  z^2 &= r^2 \frac{(\rho_1 - a_3)(\rho_2 - a_3)}{(a_1 - a_3)(a_2 - a_3)} .
\end{align*}
\]

(41)

Here we have \([P(\rho) = (\rho - a_1)(\rho - a_2)(\rho - a_3)]\)

\[
(g_{\alpha\beta}) = \text{diag}\left(1, \frac{r^2 \rho_2 - \rho_1}{4 P(\rho_1)}, \frac{r^2 \rho_1 - \rho_2}{4 P(\rho_2)}\right).
\]

(42)

The momentum operators are

\[
p_{\rho_1} = \frac{\hbar}{i} \left( \frac{\partial}{\partial \rho_1} + \frac{1}{2} \frac{1}{\rho_1 - \rho_2} - \frac{1}{4} \frac{P'(\rho_1)}{P(\rho_1)} \right), \quad p_{\rho_2} = \frac{\hbar}{i} \left( \frac{\partial}{\partial \rho_2} + \frac{1}{2} \frac{1}{\rho_2 - \rho_1} - \frac{1}{4} \frac{P'(\rho_2)}{P(\rho_2)} \right).
\]

(43)

Together with the zweibeins

\[
\begin{align*}
  h_{\rho_1 \rho_1} &= \frac{1}{2} \sqrt{\frac{P(\rho_1)}{\rho_2 - \rho_1}}, \quad h_{\rho_2 \rho_2} = \frac{1}{2} \sqrt{\frac{P(\rho_2)}{\rho_1 - \rho_2}}.
\end{align*}
\]

(44)
we obtain for the Hamiltonian

\[ H = -\frac{\hbar^2}{2M} \left( \frac{\partial^2}{\partial r^2} + \frac{2}{r} \frac{\partial}{\partial r} + \frac{1}{r^2} \Delta_{LB} \right) \]

\[ = \frac{1}{2M} \left[ p_r^2 + \frac{1}{r^2} \left( \sum_{i=1}^{2} h^{\rho_i \rho_i} p_{\rho_i}^2 + \Delta V_{PF}(\rho_i) \right) \right] - \frac{\hbar^2}{8M r^2} , \quad (45) \]

\[ \Delta_{LB} = \frac{4}{\rho_2 - \rho_1} \left[ \sqrt{P(p_1)} \frac{\partial}{\partial \rho_1} \sqrt{P(p_1)} \frac{\partial}{\partial \rho_1} + \sqrt{-P(p_2)} \frac{\partial}{\partial \rho_2} \sqrt{-P(p_2)} \frac{\partial}{\partial \rho_2} \right] , \quad (46) \]

where the \( \Delta V_{PF}(\rho_i) \) are determined by \((\mathbb{I})\). The relation between the coordinates \((\rho_1, \rho_2)\) and \((\mu, \nu)\) is established via

\[ (a_1 - \rho_1) = (a_1 - a_2) \sin^2(\mu, k) , \quad (a_2 - \rho_2) = (a_2 - a_3) \cos^n(\nu, k') . \quad (47) \]

**Spherical Coordinates.** We consider the spherical coordinates

\[ x = r \sin \theta \cos \phi , \quad r > 0 , \quad \{ \]
\[ y = r \sin \theta \sin \phi , \quad 0 < \theta < \pi , \quad \}
\[ z = r \cos \theta , \quad 0 \leq \phi < 2\pi . \quad (48) \]

These are the usual three-dimensional polar coordinates. The metric tensor is \((g_{ab}) = \text{diag}(1, r^2, r^2 \sin^2 \theta)\), and the momentum operators have the form

\[ p_r = \hbar \left( \frac{\partial}{\partial r} + \frac{1}{r} \right) , \quad p_\theta = \hbar \left( \frac{\partial}{\partial \theta} + \frac{1}{2} \cot \theta \right) , \quad p_\phi = \hbar \left( \frac{\partial}{\partial \phi} \right) . \quad (49) \]

For the Hamiltonian we obtain

\[ -\frac{\hbar^2}{2M} \Delta_{E^{(3)}} = -\frac{\hbar^2}{2M} \left[ \frac{\partial^2}{\partial r^2} + \frac{2}{r} \frac{\partial}{\partial r} + \frac{1}{r^2} \left( \frac{\partial^2}{\partial \theta^2} + \cot \theta \frac{\partial}{\partial \theta} + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2}{\partial \phi^2} \right) \right] \]

\[ = \frac{1}{2M} \left[ p_r^2 + \frac{1}{r^2} \frac{\partial^2}{\partial \theta^2} + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2}{\partial \phi^2} \right] - \frac{\hbar^2}{8M r^2} \left( 1 + \frac{1}{\sin^2 \theta} \right) . \quad (50) \]

A potential which is separable in spherical coordinates reads

\[ V(\vec{x}) = u(r) + \frac{1}{r^2} v(\theta) + \frac{1}{r^2 \sin^2 \theta} w(\phi) . \quad (51) \]

**Parabolic Coordinates.** We consider the coordinate system

\[ x = \xi \eta \cos \phi , \quad y = \xi \eta \sin \phi , \quad \xi, \eta > 0 , \quad 0 \leq \phi < 2\pi . \quad (52) \]

This gives for the metric tensor \((g_{ab}) = \text{diag}(\xi^2 + \eta^2, \xi^2 + \eta^2, \xi^2 \eta^2)\), and for the momentum operators we get

\[ p_\xi = \hbar \left( \frac{\partial}{\partial \xi} + \frac{\xi}{\xi^2 + \eta^2} + \frac{1}{2 \xi} \right) , \quad p_\eta = \hbar \left( \frac{\partial}{\partial \eta} + \frac{\eta}{\xi^2 + \eta^2} + \frac{1}{2 \eta} \right) , \quad (53) \]

\[ \text{together with } p_\phi = -i \hbar \partial_\phi . \] For the Hamiltonian we obtain

\[ -\frac{\hbar^2}{2M} \Delta_{E^{(3)}} = -\frac{\hbar^2}{2M} \left[ \frac{1}{\xi^2 + \eta^2} \left( \frac{\partial}{\partial \xi^2} + \frac{\partial}{\partial \xi} + \frac{\partial^2}{\partial \eta^2} \right) + \frac{1}{\xi^2 \eta^2} \frac{\partial^2}{\partial \phi^2} \right] \]

\[ = \frac{1}{2M} \left[ \frac{1}{\sqrt{\xi^2 + \eta^2}} \left( p_\xi^2 + p_\eta^2 \right) + \frac{1}{\sqrt{\xi^2 + \eta^2}} + \frac{1}{\xi^2 \eta^2} \frac{1}{\partial \phi^2} \right] - \frac{\hbar^2}{8M \xi^2 \eta^2} . \quad (54) \]
In parabolic coordinates a potential is separable if it has the form
\[
V(\vec{x}) = \frac{u(\xi) + v(\eta)}{\sqrt{x^2 + y^2 + z^2}} + \frac{w(\phi)}{x^2 + y^2}.
\] (55)

**Prolate Spheroidal Coordinates.** We consider the coordinate system
\[
x = \frac{R}{2}\sqrt{(\xi^2 - 1)(1 - \eta^2)} \cos \phi = d \sinh \mu \sin \nu \cos \phi , \quad \mu > 0 , \quad 0 < \nu < \pi , \\
y = \frac{R}{2}\sqrt{(\xi^2 - 1)(1 - \eta^2)} \sin \phi = d \sinh \mu \sin \nu \sin \phi , \quad \xi > 1 , \quad |\eta| < 1 , \\
z = \frac{R}{2}\xi \eta = d \cosh \mu \cos \nu , \quad 0 \leq \phi < 2\pi .
\] (56)

For convenience we have also introduced the alternative representation of the coordinates in terms of trigonometric and hyperbolic functions via \( \xi = \cosh \mu, \eta = \cos \nu \). \( R = 2d \) is the interfocus distance. This yields \((g_{ab}) = d^2 \text{diag}(\sinh^2 \mu + \sin^2 \nu, \sinh^2 \mu + \sin^2 \nu, \sinh^2 \mu \sin^2 \nu)\), and for the momentum operators we obtain
\[
p_\mu = \frac{\hbar}{i} \left( \frac{\partial}{\partial \mu} + \frac{\sinh \mu \cosh \mu}{\sinh^2 \mu + \sin^2 \nu} + \frac{1}{2} \coth \mu \right) , \quad p_\nu = \frac{\hbar}{i} \left( \frac{\partial}{\partial \nu} + \frac{\sin \nu \cos \nu}{\sinh^2 \mu + \sin^2 \nu} + \frac{1}{2} \cot \nu \right) ,
\] (57)
and \( p_\phi = -i\hbar \partial_\phi \). The Hamiltonian has the form
\[
-\frac{\hbar^2}{2M} \Delta_{E(3)} = -\frac{\hbar^2}{2Md^2} \left[ \frac{1}{\sinh^2 \mu + \sin^2 \nu} \left( \frac{\partial^2}{\partial \mu^2} + \coth \mu \frac{\partial}{\partial \mu} + \frac{\partial^2}{\partial \nu^2} + \cot \nu \frac{\partial}{\partial \nu} \right) + \frac{1}{\sinh^2 \mu \sin^2 \nu} \frac{\partial^2}{\partial \phi^2} \right] \\
= \frac{1}{2Md^2} \left[ \frac{1}{\sqrt{\sinh^2 \mu + \sin^2 \nu}} \left( p_\mu^2 + p_\nu^2 \right) \frac{1}{\sqrt{\sinh^2 \mu + \sin^2 \nu}} + \frac{1}{\sinh^2 \mu + \sin^2 \nu} p_\phi^2 \right] \\
- \frac{\hbar^2}{8Md^2 \sinh^2 \mu \sin^2 \nu} .
\] (58)

A separable potential must have the form
\[
V(\vec{x}) = \frac{u(\cosh \mu) + v(\cos \nu)}{\sinh^2 \mu + \sin^2 \nu} + \frac{w(\phi)}{\sinh^2 \mu \sin^2 \nu} .
\] (59)

Replacing \( z \mapsto z = d(\cosh \mu \cos \nu + 1) \) gives the prolate spheroidal II coordinate system \([22, 26, 33, 34, 128]\), which is one of the four coordinate systems which separate the Coulomb potential problem, c.f. the potential \( V_3(\vec{x}) \) in 3.2.3. Note that there is no mathematical difference between the prolate spheroidal and prolate spheroidal II coordinate systems. The later has a shifted origin such that the left focus is located at the coordinate origin. As in the elliptic coordinate system in two dimensions the prolate (and oblate) spheroidal coordinate system is a one parameter coordinate system. The prolate spheroidal coordinate has the property of separating the two-center Coulomb problem (Coulson and Robinson \([22]\), Morse \([104]\) and Teller \([124]\)).

**Oblate Spheroidal Coordinates.** We consider the coordinate system
\[
x = \frac{\bar{R}}{2}\sqrt{(\xi^2 + 1)(1 - \eta^2)} \cos \phi = \bar{d} \cosh \bar{\mu} \sin \bar{\nu} \cos \phi , \quad \bar{\mu} > 0 , \quad 0 < \bar{\nu} < \pi , \\
y = \frac{\bar{R}}{2}\sqrt{(\xi^2 + 1)(1 - \eta^2)} \sin \phi = \bar{d} \cosh \bar{\mu} \sin \bar{\nu} \sin \phi , \quad \bar{\xi} > 0 , \quad |\bar{\eta}| < 1 , \\
z = \frac{\bar{R}}{2}\bar{\xi} \bar{\eta} = \bar{d} \sinh \bar{\mu} \cos \bar{\nu} , \quad 0 \leq \phi < 2\pi 
\] (60)
(alternatively \( \bar{\mu} \in \mathbb{R}, 0 < \bar{\nu} < \pi/2 \)). We again use also the alternative representation \( \bar{\xi} = \sinh \bar{\mu}, \bar{y} = \cos \bar{\nu}. \bar{R} = 2\bar{d} \) is the interfocus distance. This yields \((g_{ab}) = \partial^2 \text{diag} \left( \cosh^2 \bar{\mu} - \sin^2 \bar{\nu}, \cosh^2 \bar{\mu} - \sin^2 \bar{\nu}, \cosh^2 \bar{\mu} \sin^2 \bar{\nu} \right)\), and for the momentum operators we obtain
\[
 p_{\bar{\mu}} = \frac{\hbar}{i} \left( \frac{\partial}{\partial \bar{\mu}} + \frac{\sinh \bar{\mu} \cosh \bar{\mu}}{\cosh^2 \bar{\mu} - \sin^2 \bar{\nu}} \right), \quad p_{\bar{\nu}} = \frac{\hbar}{i} \left( \frac{\partial}{\partial \bar{\nu}} + \frac{\sin \bar{\nu} \cos \bar{\nu}}{\cosh^2 \bar{\mu} - \sin^2 \bar{\nu}} + \frac{1}{2} \cot \bar{\nu} \right),
\]
and \( p_{\phi} = -i\hbar \partial_{\phi} \). The Hamiltonian has the form
\[
 \frac{-\hbar^2}{2M} \Delta_{E^{(3)}}^x = -\frac{\hbar^2}{2Md^2} \left[ \frac{1}{\cosh^2 \bar{\mu} - \sin^2 \bar{\nu}} \left( \frac{\partial^2}{\partial \bar{\mu}^2} + \frac{\tanh \bar{\mu}}{\cosh \bar{\mu}} \frac{\partial}{\partial \bar{\mu}} + \frac{\partial^2}{\partial \bar{\nu}^2} + \cot \bar{\nu} \frac{\partial}{\partial \bar{\nu}} \right) + \frac{1}{\cosh^2 \bar{\mu} - \sin^2 \bar{\nu}} \frac{\partial^2}{\partial \phi^2} \right] = \frac{1}{2Md^2} \left[ \frac{1}{\sqrt{\cosh^2 \bar{\mu} - \sin^2 \bar{\nu}}} \left( p_{\bar{\mu}}^2 + p_{\bar{\nu}}^2 \right) - \frac{1}{\sqrt{\cosh^2 \bar{\mu} - \sin^2 \bar{\nu}}} \frac{1}{\sqrt{\cosh^2 \bar{\mu} - \sin^2 \bar{\nu}}} p_{\phi}^2 \right] - \frac{\hbar^2}{8Md^2 \cosh^2 \bar{\mu} \sin^2 \bar{\nu}}.
\]
Here a separable potential must have the form
\[
 V(x) = \frac{u(\sinh \bar{\mu}) + v(\cos \bar{\nu})}{\cosh^2 \bar{\mu} - \sin^2 \bar{\nu}} + \frac{w(\phi)}{\cosh^2 \bar{\mu} \sin^2 \bar{\nu}}.
\]

Paraboloidal Coordinates. The last two coordinate system are the most complicated ones and are similar in some of their features, c.f. \([84, 85]\) and \([58, 103, 106]\) for further information. First we consider the coordinate system
\[
 \begin{align*}
 x^2 &= \frac{(\eta_1 - a)(\eta_2 - a)(\eta_3 - a)}{a - b}, & 0 < \eta_1 < b < \eta_2 < a < \eta_3, \\
 y^2 &= \frac{(\eta_1 - b)(\eta_2 - b)(\eta_3 - b)}{b - a}, \\
 z &= \frac{1}{2}(\eta_1 + \eta_2 + \eta_3 - a - b),
\end{align*}
\]

The metric tensor is given by \((P(\eta) = (\eta - a)(\eta - b))\)
\[
 (g_{ab}) = \frac{1}{4} \text{diag} \left( \frac{(\eta_1 - \eta_2)(\eta_1 - \eta_3)}{P(\eta_1)}, \frac{(\eta_2 - \eta_1)(\eta_2 - \eta_3)}{P(\eta_2)}, \frac{(\eta_3 - \eta_1)(\eta_3 - \eta_2)}{P(\eta_3)} \right).
\]
The momentum operators are
\[
 \begin{align*}
 p_{\eta_1} &= \frac{\hbar}{i} \left( \frac{\partial}{\partial \eta_1} + \frac{1}{2} \frac{1}{\eta_1 - \eta_2} + \frac{1}{2} \frac{1}{\eta_1 - \eta_3} - \frac{1}{4} \frac{P'(\eta_1)}{P(\eta_1)} \right), \\
 p_{\eta_2} &= \frac{\hbar}{i} \left( \frac{\partial}{\partial \eta_2} + \frac{1}{2} \frac{1}{\eta_2 - \eta_1} + \frac{1}{2} \frac{1}{\eta_2 - \eta_3} - \frac{1}{4} \frac{P'(\eta_2)}{P(\eta_2)} \right), \\
 p_{\eta_3} &= \frac{\hbar}{i} \left( \frac{\partial}{\partial \eta_3} + \frac{1}{2} \frac{1}{\eta_3 - \eta_1} + \frac{1}{2} \frac{1}{\eta_3 - \eta_2} - \frac{1}{4} \frac{P'(\eta_3)}{P(\eta_3)} \right).
\end{align*}
\]
Together with the dreibeins
\[
 \begin{align*}
 h_{\eta_1\eta_1} &= \frac{1}{2} \sqrt{\frac{P(\eta_1)}{(\eta_1 - \eta_2)(\eta_1 - \eta_3)}}, \\
 h_{\eta_2\eta_2} &= \frac{1}{2} \sqrt{\frac{P(\eta_2)}{(\eta_2 - \eta_1)(\eta_2 - \eta_3)}}, \\
 h_{\eta_3\eta_3} &= \frac{1}{2} \sqrt{\frac{P(\eta_3)}{(\eta_3 - \eta_1)(\eta_3 - \eta_2)}},
\end{align*}
\]

11
we obtain for the Hamiltonian
\[- \frac{\hbar^2}{2M} \Delta E^{(3)} = - \frac{2\hbar^2}{M} \left[ \frac{\sqrt{P(\eta_1)}}{(\eta_1 - \eta_2)(\eta_1 - \eta_3)} \frac{\partial}{\partial \eta_1} \frac{\partial}{\partial \eta_1} + \frac{\sqrt{P(\eta_2)}}{(\eta_2 - \eta_3)(\eta_2 - \eta_1)} \frac{\partial}{\partial \eta_2} \frac{\partial}{\partial \eta_2} \right. \]
\[+ \left. \frac{\sqrt{P(\eta_3)}}{(\eta_3 - \eta_1)(\eta_3 - \eta_2)} \frac{\partial}{\partial \eta_3} \frac{\partial}{\partial \eta_3} \right], \tag{68} \]
\[= \frac{1}{2M} \sum_{i=1}^{3} \left( h^{n_{\eta_i}} p^{2}_{\eta_i} h^{n_{\eta_i}} + \Delta V(\eta_i) \right). \tag{69} \]

The $\Delta V_{PF}(\eta_i)$ are determined by (10). A potential separable in paraboloidal coordinates must have the form
\[V(\vec{x}) = \frac{(\eta_2 - \eta_3)u(\eta_1) + (\eta_1 - \eta_3)v(\eta_2) + (\eta_1 - \eta_2)w(\eta_3)}{(\eta_1 - \eta_2)(\eta_1 - \eta_3)(\eta_2 - \eta_3)}. \tag{70} \]

**Ellipsoidal Coordinates.** As the last coordinate system we consider
\[x^2 = \frac{(\rho_1 - a_3)(\rho_2 - a_3)(\rho_3 - a_3)}{(a_3 - a_1)(a_2 - a_1)}, \quad 0 < a_1 < \rho_1 < a_2 < \rho_2 < a_3 < \rho_3, \tag{71} \]
\[y^2 = \frac{(\rho_1 - a_2)(\rho_2 - a_2)(\rho_3 - a_2)}{(a_3 - a_2)(a_1 - a_2)}, \]
\[z^2 = \frac{(\rho_1 - a_1)(\rho_2 - a_1)(\rho_3 - a_1)}{(a_1 - a_3)(a_2 - a_3)}. \]

For the metric tensor we have $[P(\rho) = (\rho - a_1)(\rho - a_2)(\rho - a_3)]$
\[(g_{ab}) = \frac{1}{4} \text{diag} \left( \frac{(\rho_1 - \rho_2)(\rho_1 - \rho_3)}{P(\rho_1)}, \frac{(\rho_2 - \rho_3)(\rho_2 - \rho_1)}{P(\rho_2)}, \frac{(\rho_3 - \rho_1)(\rho_3 - \rho_2)}{P(\rho_3)} \right). \tag{72} \]

The momentum operators are
\[p_{\rho_1} = \frac{\hbar}{i} \left( \frac{\partial}{\partial \rho_1} + \frac{1}{2} \frac{1}{\rho_1 - \rho_2} + \frac{1}{2} \frac{1}{\rho_1 - \rho_3} - \frac{1}{4} \frac{P'(\rho_1)}{P(\rho_1)} \right), \tag{73} \]
\[p_{\rho_2} = \frac{\hbar}{i} \left( \frac{\partial}{\partial \rho_2} + \frac{1}{2} \frac{1}{\rho_2 - \rho_1} + \frac{1}{2} \frac{1}{\rho_2 - \rho_3} - \frac{1}{4} \frac{P'(\rho_2)}{P(\rho_2)} \right), \]
\[p_{\rho_3} = \frac{\hbar}{i} \left( \frac{\partial}{\partial \rho_3} + \frac{1}{2} \frac{1}{\rho_3 - \rho_1} + \frac{1}{2} \frac{1}{\rho_3 - \rho_2} - \frac{1}{4} \frac{P'(\rho_3)}{P(\rho_3)} \right). \]

Together with the dreibeins
\[h^{\rho_1 \rho_1} = \frac{1}{2} \sqrt{\frac{P(\rho_1)}{(\rho_1 - \rho_2)(\rho_1 - \rho_3)}}, \]
\[h^{\rho_2 \rho_2} = \frac{1}{2} \sqrt{\frac{P(\rho_2)}{(\rho_2 - \rho_1)(\rho_2 - \rho_3)}}, \tag{74} \]
\[h^{\rho_3 \rho_3} = \frac{1}{2} \sqrt{\frac{P(\rho_3)}{(\rho_3 - \rho_1)(\rho_3 - \rho_2)}}, \]

we obtain for the Hamiltonian
\[- \frac{\hbar^2}{2M} \Delta E^{(3)} = - \frac{2\hbar^2}{M} \left[ \frac{\sqrt{P(\rho_1)}}{(\rho_1 - \rho_2)(\rho_1 - \rho_3)} \frac{\partial}{\partial \rho_1} \frac{\partial}{\partial \rho_1} + \frac{\sqrt{P(\rho_2)}}{(\rho_2 - \rho_3)(\rho_2 - \rho_1)} \frac{\partial}{\partial \rho_2} \frac{\partial}{\partial \rho_2} \right. \]
\[+ \left. \frac{\sqrt{P(\rho_3)}}{(\rho_3 - \rho_1)(\rho_3 - \rho_2)} \frac{\partial}{\partial \rho_3} \frac{\partial}{\partial \rho_3} \right], \tag{75} \]
\[= \frac{1}{2M} \sum_{i=1}^{3} \left( h^{\rho_i \rho_i} p^{2}_{\rho_i} h^{\rho_i \rho_i} + \Delta V(\rho_i) \right). \tag{76} \]
In order to develop such a theory we consider according to [10 5] the Lagrangian

We want to look for the coordinate systems which separate the relevant partial differential equations. The parabolic system is obtained from the degeneration of the elliptic II system, c.f. 2.1.2. The parabolic system then follows from the paraboloidal system in the limit \( R/2 \to \infty \). The circular system must fulfill the constraint \( R_1 R_2 R_3 = 1 \), respectively, in the following way (where only orthogonal coordinate systems are listed in table 1 (note \( \bar{\rho}_i = \rho_i - a_2 \)).

| System            | Coordinate System | \( x = (R/2)\sqrt{(\xi^2 - 1)(1 - \eta^2)} \cos \phi \) | \( y = (R/2)\sqrt{(\xi^2 - 1)(1 - \eta^2)} \sin \phi \) | \( z = (R/2)\xi \eta \) | \( R_1 \to 0 \) | \( R_2 \to R^2/4 \) | \( R_3 \to \) |
|-------------------|-------------------|--------------------------------------------------|--------------------------------------------------|-------------------|------------------|------------------|------------------|
| Prolate spheroidal |                   |                                                  |                                                  |                   | \( \bar{\rho}_1 \to R_1^2(\eta^2 - 1) \) | \( \bar{\rho}_2 \to R_2^2 \sin^2 \phi \) | \( \bar{\rho}_3 \to R_3^2(\xi^2 - 1) \) |
| Oblate spheroidal  |                   |                                                  |                                                  |                   | \( \bar{\rho}_1 \to -R_1^2 \sin^2 \phi \) | \( \bar{\rho}_2 \to (R^2/4)(1 - \bar{\eta}^2) \) | \( \bar{\rho}_3 \to (R^2/4)(1 + \bar{\eta}^2) \) |
| Spherical system   |                   |                                                  |                                                  |                   | \( \bar{\rho}_1 \to -R_1^2 \sin^2 \theta \) | \( \bar{\rho}_2 \to R_2^2 \sin^2 \theta \sin^2 \phi \) | \( \bar{\rho}_3 \to r^2 \) |
| Spherico-conical   |                   |                                                  |                                                  |                   | \( \bar{\rho}_1 \to -k^2 R^2 \sin^2 (\nu, k') \) | \( \bar{\rho}_2 \to k^2 R^2 \sin^2 (\mu, k) \) | \( \bar{\rho}_3 \to r^2 \) |
| Circular elliptic  |                   |                                                  |                                                  |                   | \( \bar{\rho}_1 \to z^2 - R_1^2 \) | \( \bar{\rho}_2 \to (R^2/4) \cos^2 \nu \) | \( \bar{\rho}_3 \to (R^2/4) \cosh^2 \mu \) |
| Circular polar     |                   |                                                  |                                                  |                   | \( \bar{\rho}_1 \to z^2 - R_1^2 \) | \( \bar{\rho}_2 \to R_2^2 \sin^2 \phi \) | \( \bar{\rho}_3 \to \rho^2 \) |
| Cartesian system   |                   |                                                  |                                                  |                   | \( \bar{\rho}_1 \to z^2 - R_1^2 \) | \( \bar{\rho}_2 \to x^2 + R_2^2 \) | \( \bar{\rho}_3 \to y^2 \) |

We must obtain the remaining three coordinate systems which are not listed in table 1. The paraboloidal system is obtained by the focus translation \( z' \to z - R_1 \) from the ellipsoidal coordinate system by \( R_{1,2} \to \infty \) together with \( R_2/R_1 \to a - b \) which gives three more coordinate systems: The parabolic system then follows from the paraboloidal system in the limit \( a \to b \) (the parabolic system can also be obtained from the prolate spheroidal II system). The circular parabolic system is obtained from the degeneration of the elliptic II system, c.f. 2.1.2.

### 2.2. Separation of Coordinates in the Path Integral.

We want to look for the coordinate systems which separate the relevant partial differential equations, i.e. the Hamiltonian, and, more important from our point of view, the path integral. In order to develop such a theory we consider according to [105] the Lagrangian \( \mathcal{L} = \frac{1}{2} \sum_{i=1}^{D} h_{ij}(\xi) \) and the Laplacian \( \Delta_L \), respectively, in the following way (where only orthogonal coordinate systems are taken into account)

\[
\Delta_{LB} = \sum_{i=1}^{D} \left( \frac{1}{\prod_{j=1}^{D} h_j(\xi)} \frac{\partial}{\partial \xi_i} \left( \frac{\prod_{k=1}^{D} h_k(\xi)}{h_i^2(\xi)} \frac{\partial}{\partial \xi_i} \right) \right)
\]
where \( \{ \xi \} \) denotes the set of variables \( (\xi_1, \ldots, \xi_D) \), and the existence of the functions \( f_i, g_i \) is necessary for the separation \([74, 105]\). We introduce the Stäckel-determinant \([74, 101, 105]\)

\[
S(\{ \xi \}) = \det(\Phi_{ij}) = \prod_{i=1}^{D} \frac{h_i(\{ \xi \})}{f_i(\xi_i)}, \quad M_i(\xi_1, \ldots, \xi_{i-1}, \xi_{i+1}, \ldots, \xi_D) = \frac{\partial S}{\partial \Phi_{i1}} = \frac{S(\{ \xi \})}{h_i^2(\{ \xi \})},
\]

and abbreviate \( \Gamma_i = f'_i/f_i \). Then

\[
g_i(\xi_1, \ldots, \xi_{i-1}, \xi_{i+1}, \ldots, \xi_D) = M_i(\xi_1, \ldots, \xi_{i-1}, \xi_{i+1}, \ldots, \xi_D) \prod_{j=1}^{D} f_j(\xi_j),
\]

which fixes the functions \( g_i \). Introducing the (new) momentum operators \( P_{\xi_i} = \frac{\hbar}{i}(\partial_{\xi_i} + \frac{1}{2} f'_i/f_i) \) we obtain according to the general theory the following identity in the path integral \([78]\) by means of the space-time transformation technique (Duru \([28]\), Fischer et al. \([40]\), Refs. \([59, 61]\), Kleinert \([85]\), and Pak and Söken \([110]\))

\[
\prod_{i=1}^{D} \frac{h_{i}(\{ \xi' \})}{\xi_{i}(\{ \xi' \})} \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \sum_{i=1}^{D} h_{i}^2 \xi_{i}^2 - \Delta V_{PF}(\{ \xi \}) \right] dt \right\}
\]

\[
= \prod_{i=1}^{D} \frac{h_{i}(\{ \xi' \})}{\xi_{i}(\{ \xi' \})} \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \sum_{i=1}^{D} \xi_{i}^2 - \Delta V_{PF}(\{ \xi \}) \right] dt \right\}
\]

\[
= (S' S'')^{D(1-D)/2} \int_{\mathbb{R}^D} \frac{dE}{2\pi \hbar} e^{-iE T/\hbar} \int_{0}^{\infty} ds' \prod_{i=1}^{D} \frac{h_{i}(\{ \xi' \})}{\xi_{i}(\{ \xi' \})} \exp \left\{ \frac{i}{\hbar} \int_{0}^{s''} \left[ \frac{M}{2} \sum_{i=1}^{D} \xi_{i}^2 + ES - \frac{\hbar^2}{8M} \sum_{i=1}^{D} M_{i} (\Gamma_{i}^2 + 2\Gamma_{i}) \right] ds \right\} .
\]

Here we have adopted the following lattice formulation of the path integral (c.f. DeWitt \([25]\), Feynman \([37]\), Gervais and Jevicki \([47]\), Refs. \([59, 71]\), McLaughlin and Schulman \([92]\), Mizrahi \([98]\), and Omote \([107]\) for alternative lattice definitions)

\[
K(\bar{q}''', \bar{q}''; T) = \int_{\bar{q}'''}^{\bar{q}''} \sqrt{g} \mathcal{D}_{PF} \bar{q}(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} h_{ac}(\bar{q}) h_{cb}(\bar{q}) \bar{q}_{a} \bar{q}_{b} - V(\bar{q}) - \Delta V_{PF}(\bar{q}) \right] dt \right\}
\]

\[
\equiv \lim_{N \to \infty} \left( \frac{M}{2\pi \hbar} \right)^{N D/2} \prod_{j=1}^{N-1} \int d\bar{q}_{j} \sqrt{g(\bar{q}_{j})} \exp \left\{ \frac{i}{\hbar} \sum_{j=1}^{N} \left[ \frac{M}{2\epsilon} h_{ac}(\bar{q}_{j}) h_{ac}(\bar{q}_{j-1}) \Delta \bar{q}_{j}^{a} \Delta \bar{q}_{j}^{b} - \epsilon V(\bar{q}_{j}) - \epsilon \Delta V_{PF}(\bar{q}_{j}) \right] \right\} .
\]

This path integral formulation will be used in the sequel.
3. Path Integral Formulation of Smorodinsky-Winternitz Potentials.

3.1. Two-Dimensional Smorodinsky-Winternitz Potentials.

In this subsection we discuss the four two-dimensional Smorodinsky-Winternitz potentials\cite{42}. They are characterized by having three functionally independent integrals of motion, i.e. there are two more operators related to these integrals of motion which commute with the Hamiltonian.

We will state if ever possible both the propagator and its spectral expansion into the wavefunctions and energy-levels. \(\vec{x}\) denotes a two-dimensional variable: \(\vec{x} = (x, y) \equiv (x_1, x_2)\), and without loss of generality it will be assumed that \(\vec{x} \in \mathbb{R}^2, \mathbb{R}^3\).

In the table 2 we list the two-dimensional maximally super-integrable Smorodinsky-Winternitz potentials together with the separating coordinate systems\cite{42}. The cases where an explicit path integration is possible are underlined.

Table 2: The two-dimensional maximally super-integrable potentials

| Potential \(V(x, y)\) | Coordinate System |
|------------------------|-------------------|
| \(V_1 = \frac{M}{2} \omega^2 (x^2 + y^2) + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2} \right)\) | Cartesian          |
|                         | Polar             |
|                         | Elliptic          |
| \(V_2 = \frac{M}{2} \omega^2 (4x^2 + y^2) + k_1 x + \frac{\hbar^2}{2M} k_2^2 - \frac{1}{4}\) | Cartesian          |
|                         | Parabolic         |
| \(V_3 = -\frac{\alpha}{\sqrt{x^2 + y^2}} + \frac{\hbar^2}{4M} \frac{1}{\sqrt{x^2 + y^2}} \left( \frac{k_1^2 - \frac{1}{4}}{\sqrt{x^2 + y^2} + x} + \frac{k_2^2 - \frac{1}{4}}{\sqrt{x^2 + y^2} - x} \right)\) | Polar              |
|                         | Elliptic II       |
|                         | Parabolic         |
| \(V_4 = -\frac{\alpha}{\rho} + \sqrt{\frac{2}{\rho}} \left( \beta_1 \cos \frac{\phi}{2} + \beta_2 \sin \frac{\phi}{2} \right)\) | Mutually           |
|                         | Parabolic         |

3.1.1. We consider the potential \((k_{1,2} > 0)\)

\[ V_1(\vec{x}) = \frac{M}{2} \omega^2 (x_1^2 + x_2^2) + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x_1^2} + \frac{k_2^2 - \frac{1}{4}}{x_2^2} \right) \]  \hspace{1cm} (82)

This potential is separable in three coordinate systems. We obtain the path integral formulations, c.f. (81) for their lattice definitions

\[ K^{(V_1)}(\vec{x}'', \vec{x}', T) \]

**Cartesian Coordinates:**

\[ = \int_{\vec{x}(t') = \vec{x}''} D\vec{x}(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (\vec{x}'' - \omega^2 \vec{x}'') - \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x_1''} + \frac{k_2^2 - \frac{1}{4}}{x_2''} \right) \right] dt \right\} \]  \hspace{1cm} (83)
Polar Coordinates:
\[\rho(t''') = \rho''', \quad \phi(t'') = \phi''\]
\[
= \int_{\rho(t') = \rho'}^{\rho(t'') = \rho''} \rho D\rho(t) \int_{\phi(t') = \phi'}^{\phi(t'') = \phi''} D\phi(t) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (\dot{\rho}^2 + \rho^2 \dot{\phi}^2 - \omega^2 \rho^2) - \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{\cos^2 \phi} + \frac{k_2^2 - \frac{1}{4}}{\sin^2 \phi} - \frac{1}{4} \right) \right] dt \right\} \quad (84)
\]

Elliptic Coordinates:
\[\xi(t'') = \xi'', \quad \eta(t'') = \eta''\]
\[
= \int_{\xi(t') = \xi'}^{\xi(t'') = \xi''} \int_{\eta(t') = \eta'}^{\eta(t'') = \eta''} D\xi(t) \int_{D\eta(t)} D\eta(t) d^2(\sinh^2 \xi + \sin^2 \eta) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} d^2 \left( (\sinh^2 \xi + \sin^2 \eta)(\xi^2 + \eta^2) - \omega^2 (\cosh^2 \xi \cos^2 \eta + \sinh^2 \xi \sin^2 \eta) \right) \right.ight.
\[
\left. - \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{\cosh^2 \xi \cos^2 \eta} + \frac{k_2^2 - \frac{1}{4}}{\sinh^2 \xi \sin^2 \eta} \right) \right] dt \right\} \quad (85)
\]
\[
= \int_{\mathbb{R}} \frac{dE}{2\pi \hbar} e^{-iET/\hbar} \int_{0}^{\infty} ds'' \int_{\xi(0) = \xi'}^{\xi''} \int_{\eta(0) = \eta'}^{\eta''} D\xi(s) D\eta(s) \times \exp \left\{ \frac{i}{\hbar} \int_{0}^{s''} \left[ \frac{M}{2} \left( (\xi^2 + \eta^2) - \omega^2 (\cosh^2 \xi \sinh^2 \xi + \sin^2 \eta \cos^2 \eta) \right) + E d^2 (\sinh^2 \xi + \sin^2 \eta) \right.ight.
\[
\left. - \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{\cosh^2 \eta} + \frac{k_2^2 - \frac{1}{4}}{\sinh^2 \xi} \right) \right] ds \right\} \quad . \quad (86)
\]

Note that in the last line a pure time-transformation \[\square\] has been performed.

We are going to discuss the path integral \[\square\] in some detail in order to demonstrate the relevant technique. All subsequent path integral evaluations are similarly done and our method remains the same whether polar, parabolic, or other coordinate systems are used.

The path integral solution in cartesian coordinates is straightforward by applying the path integral solution for the radial harmonic oscillator for the coordinates \(x_{1,2}\), respectively, c.f. \(\square\), \(\square\), \(\square\). In the case of polar coordinates one first separates the \(\phi\)-path integration by means of the path integral identity of the Pöschl-Teller potential \((0 < \phi < \pi/2) \square \square \square \square \)

\[\phi(\tau') = \phi', \quad \phi(\tau'') = \phi''\]
\[
= \int_{\phi(t') = \phi'}^{\phi(t'') = \phi''} D\phi(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \dot{\phi}^2 - \frac{\hbar^2}{2M} \left( \frac{\alpha^2 - \frac{1}{4}}{\sin^2 \phi} + \frac{\beta^2 - \frac{1}{4}}{\cos^2 \phi} \right) \right] dt \right\} \quad \sum_{n=0}^{\infty} e^{-iE_n T/\hbar} \Phi_n^{(\alpha,\beta)}(\phi') \Phi_n^{(\alpha,\beta)}(\phi''), \quad (87)
\]

and \(\Phi_n^{(\alpha,\beta)}(\phi)\) denote the normalized Pöschl-Teller wave-functions

\[\Phi_n^{(\alpha,\beta)}(\phi) = \left[ \frac{2(\alpha + \beta + 2l + 1) \Gamma(\alpha + \beta + l + 1) \Gamma(\alpha + l + 1) \Gamma(\beta + l + 1)}{\Gamma(\alpha + \beta + 2l + 2) \Gamma(\alpha + \beta + l + 2)} \right]^{1/2} \times (\sin \phi)^{\alpha+1/2} (\cos \phi)^{\beta+1/2} P_n^{(\alpha,\beta)}(\cos 2\phi) \quad . \quad (88)\]

The \(P_n^{(\alpha,\beta)}(x)\) are Jacobi polynomials \((\square), p.1035\). Note that the genuine Pöschl-Teller potentials requires \(\alpha, \beta > \frac{1}{2}\). Otherwise one can call it an attractive Pöschl-Teller-like potential. This rule of separation of variables in the path integral consists of the following path integral identity
The expansion into the wave-functions has been obtained by means of the Hille-Hardy formula (91). The remaining \( \rho \)-path integration \( (59) \) is again of the radial harmonic oscillator type. The radial \( 1/\rho^2 \)-dependence must be incorporated into the path integral in terms of a functional weight \( \mu_\lambda[\rho^2] \) in order to guarantee a proper definition of the corresponding lattice formulation of the radial path integral \[ (53), (119) \]. As it turns out, this Besselian path integral formulation \[ (59) \] with the functional weight \( \mu_\lambda[\rho^2] \) for radial path integrals can be interpreted as an additional potential term, and vice versa \[ (40), (56) \]. We also want to point out that a similar reasoning must be done in the case of the Pöschl-Teller and modified Pöschl-Teller potential, respectively \[ (41), (53) \]. Hence we apply the radial harmonic oscillator the path integral solution and its expansion into wave-functions according to \( (\lambda \) an arbitrary parameter \[ (29), (48), (113), (119) \)

\[
\int_{r(t')=r'}^{r(t'')=r''} \mathcal{D}r(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left( \frac{M}{2} \frac{r^2}{r^2} - \hbar^2 \frac{2}{2M} - \frac{M}{2} \omega^2 r^2 \right) dt \right\}
\]

\[
= \int_{r(t')=r'}^{r(t'')=r''} \mu_\lambda[\rho^2] \mathcal{D}r(t) \exp \left\{ \frac{iM}{2\hbar} \int_{t'}^{t''} \left( \dot{r}^2 - \omega^2 r^2 \right) dt \right\}
\]

\[
= \frac{M\sqrt{r(t'')r(t')}}{\hbar \sin \omega T} \exp \left\{ - \frac{M\omega}{2\hbar} \frac{r(t'')^2 + r(t')^2}{\omega T} \right\} I_\lambda \left( \frac{M\omega r(t'')}{\hbar \sin \omega T} \right)
\]

\[
= \frac{2M\omega}{\hbar} \sqrt{r(t'')r(t')} \sum_{n=0}^{\infty} \frac{e^{-\omega T(2n+\lambda+1)}}{\Gamma(n+\lambda+1)} \frac{n!}{\Gamma(n+\lambda+1)} \left( \frac{M\omega}{\hbar} r(t'') \right)^n \times \exp \left( - \frac{M\omega}{2\hbar} (r(t'')^2 + r(t')^2) \right) L_n^{(\lambda)} \left( \frac{M\omega}{r(t'')^2} \right) L_n^{(\lambda)} \left( \frac{M\omega}{r(t')} \right).
\]

The expansion into the wave-functions has been obtained by means of the Hille-Hardy formula \[ (49), p.1038 \]

\[
\frac{t^{-\alpha/2}}{1-t} \exp \left\{ - \frac{1}{2} \frac{(x+y)^{1}+t}{1-t} I_\alpha \left( \frac{2\sqrt{xy}t}{1-t} \right) \right\} = \sum_{n=1}^{\infty} \frac{t^n n! e^{-\frac{1}{2}(x+y)}}{\Gamma(n+\alpha+1)} (xy)^{\alpha/2} L_n(x) L_n(y). \]

The \( L_n(x) \) are Laguerre polynomials \[ (13), p.1037 \]. We therefore obtain
\[ K^{(V)}(\vec{x}'', \vec{x}'; T) \]

**Cartesian Coordinates** \cite{29, 83, 13, 19}:

\[
= \left( \frac{M\omega}{i\hbar \sin \omega T} \right)^2 \prod_{i=1}^{2} \sqrt{x_i' x_i''} \exp \left[ -\frac{M\omega}{2i\hbar} (x_i'^2 + x_i''^2) \cot \omega T \right] I_{\pm k_i} \left( \frac{M\omega x_i' x_i''}{i\hbar \sin \omega T} \right) \tag{95}
\]

\[
= \sum_{n_1, n_2 = 0} e^{-iE_N T / h} \Psi_{n_1, n_2} (x_1', x_2') \Psi_{n_1, n_2} (x_1'', x_2'') \tag{96}
\]

**Polar Coordinates:**

\[
= \frac{1}{\sqrt{\rho''}} \sum_{n=0}^{\infty} \Phi_n^{(\pm k_2, \pm k_1)} (\phi') \Phi_n^{(\pm k_2, \pm k_1)} (\phi'') \int_{\rho(t') = \rho'}^{\rho(t'') = \rho''} D\rho(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \rho'^2 - \omega^2 \rho''^2 \right) - \hbar^2 \frac{\lambda^2}{2M} \rho'' \right] dt \right\} \tag{97}
\]

\[
= \rho''^{-1/2} \sum_{n=0}^{\infty} \Phi_n^{(\pm k_2, \pm k_1)} (\phi') \Phi_n^{(\pm k_2, \pm k_1)} (\phi'') \int_{\rho(t') = \rho'}^{\rho(t'') = \rho''} \mu_{\phi} [\rho^2] D\rho(t) \exp \left[ \frac{iM}{2\hbar} \int_{t'}^{t''} (\rho'^2 - \omega^2 \rho''^2) dt \right] \tag{98}
\]

\[
= \frac{M\omega}{i\hbar \sin \omega T} \sum_{n=0}^{\infty} \Phi_n^{(\pm k_2, \pm k_1)} (\phi') \Phi_n^{(\pm k_2, \pm k_1)} (\phi'') \exp \left[ -\frac{M\omega}{2i\hbar} (\rho'^2 + \rho''^2) \cot \omega T \right] I_{\lambda} \left( \frac{M\omega \rho''}{i\hbar \sin \omega T} \right) \tag{99}
\]

\[
= \sum_{m, n=0} e^{-iE_N T / h} \Psi_{m, n} (\phi', \rho') \Psi_{m, n} (\phi'', \rho''), \tag{100}
\]

where \( \lambda = 2n \pm k_1 \pm k_2 + 1 \). The wave-functions and the energy-spectra are given by

**Cartesian Coordinates:**

\[
\Psi_{n_1, n_2} (x_1, x_2) = \frac{2M\omega}{\hbar} \prod_{i=1}^{2} \left( \frac{M\omega}{\hbar} \right)^{-k_i/2} \sqrt{\frac{n_i!}{\Gamma(n_i \pm k_i + 1)}} x_i^{1/2 \pm k_i} \exp \left( -\frac{M\omega}{2\hbar} x_i^2 \right) L_{n_i}^{(\pm k_i)} \left( \frac{M\omega}{\hbar} x_i^2 \right), \tag{101}
\]

\[
E_N = \hbar \omega (2N \pm k_1 \pm k_2 + 2), \quad N = n_1 + n_2, \tag{102}
\]

**Polar Coordinates:**

\[
\Psi_{m, n} (\rho, \phi) = \Phi_n^{(\pm k_2, \pm k_1)} (\phi) \sqrt{\frac{2M\omega}{\hbar}} \left( \frac{M\omega}{\hbar} \rho \right)^{\lambda/2} \sqrt{\frac{m!}{\Gamma(m + \lambda + 1)}} \exp \left( -\frac{M\omega}{2\hbar} \rho^2 \right) L_m^{(\lambda)} \left( \frac{M\omega}{\hbar} \rho^2 \right), \tag{103}
\]

\[
E_N = \hbar \omega (2N \pm k_1 \pm k_2 + 2), \quad N = m + n, \tag{104}
\]

and \( \Phi_n^{(\alpha, \beta)} (\phi) \) of (88) with \( \alpha = \pm k_2, \beta = \pm k_1 \). Let us remark that the wave-functions have been normalized in the domain \([0, \infty)\). The positive sign at the \( k_i \) has to be taken whenever \( k_i > 1/2 \), i.e. the radial potential term is repulsive at the origin, and the motion takes only place in the domain \( x_i > 0 \). If \( 0 < |k_i| < 1/2 \), i.e. the radial potential term is attractive at the origin, both the positive and the negative sign must be taken into account in the solution. This is indicated by the notion \( \pm k_i \) in the formula. It has also the consequence that for each \( k_i \) the motion can take place on the entire real line. In the present case this means that in cartesian coordinates we must distinguish four cases: i) \( x_1, x_2 > 0 \), ii) \( x_1 > 0, x_2 \in \mathbb{R} \), iii) \( x_1 \in \mathbb{R}, x_2 > 0 \) and iv) \( (x_1, x_2) \in \mathbb{R}^2 \). In polar coordinates the same feature is recovered by the observation that the Pöschl-Teller barriers are absent for \( |k_i| < 1/2 \). We will keep this notion in the sequel for all
following Smorodinsky-Winternitz potentials.

3.1.2. We consider the potential \((k_{1,2} > 0)\)

\[
V_2(\vec{x}) = \frac{M}{2} \omega^2 (4x^2 + y^2) + k_1 x + \frac{\hbar^2}{2M} k_2^2 - \frac{1}{4} \frac{1}{y^2}, \tag{105}
\]

which is separable in two coordinate systems. For \(k_1 = 0\) this potential is also called Holt-potential [66]. We have

\[K^{(V_2)}(\vec{x}'', \vec{x}'; T)\]

**Cartesian Coordinates:**

\[
\int_{\vec{x}'(t''=x''t'')} D\vec{x}(t) \exp \left\{ \frac{i}{\hbar} \int_{t''}^{t'} \left[ \frac{M}{2} (\dot{x}_t^2 - \omega^2 (4x_t^2 + y_t^2)) - k_1 x_t - \frac{\hbar^2}{2M} k_2^2 - \frac{1}{4} \frac{1}{y_t^2} \right] dt \right\} \tag{106}
\]

**Parabolic Coordinates:**

\[
\int_{\eta(t'')=\eta''}^{\xi(t'')=\xi''} \int_{\eta(t')=\eta'}^{\xi(t')=\xi'} D\eta(t) D\xi(t) (\xi^2 + \eta^2) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} ((\dot{\xi}^2 + \dot{\eta}^2)(\dot{\xi}^2 + \dot{\eta}^2) - \omega^2 ((\xi^2 - \eta^2)^2 - \xi^2 \eta^2)) - k_1 (\xi^2 - \eta^2) - \frac{\hbar^2}{2M} k_2^2 - \frac{1}{4} \frac{1}{\xi^2} \right] dt \right\} \tag{107}
\]

\[
= \int_{\mathbb{R}} \frac{dE}{2\pi \hbar} e^{-iET/h} \int_0^{\infty} ds'' \int_{\eta(0)=s'}^{\xi(0)=\xi''} D\eta(s) D\xi(s) \times \exp \left\{ \frac{i}{\hbar} \int_0^{s''} \left[ \frac{M}{2} ((\dot{\xi}^2 + \dot{\eta}^2) - \omega^2 (\xi^2 + \eta^2)) - k_1 (\xi^4 - \eta^4) + E(\xi^2 + \eta^2) - \frac{\hbar^2}{2M} \left( \frac{k_2^2 - \frac{1}{4}}{\eta^2} + \frac{k_2^2 - \frac{1}{4}}{\xi^2} \right) \right] ds \right\}. \tag{108}
\]

In the \(x\)-path integration one makes use of the shifted harmonic oscillator path integral solution [37, 38], and in the \(y\)-path integration one makes use of the radial harmonic oscillator path integral. The expansion into the wave-functions in \(x\) is obtained by means of the Mehler formula (33, p.272)

\[
e^{-\left(\frac{x^2+y^2}{2}\right)} \sum_{n=0}^{\infty} \frac{1}{n!} \left(\frac{x}{2}\right)^n H_n(x) H_n(y) = \frac{1}{\sqrt{1-z^2}} \exp \left[ \frac{4xyz - (x^2 + y^2)(1+z^2)}{2(1-z^2)} \right]. \tag{109}
\]

The \(H_n(x)\) are Hermite polynomials [35, p.1033]. We have for the harmonic oscillator path integral the kernel and its expansion into wave-functions according to (we omit the Maslow indices)

\[
x(t'')=x'' \int_{x(t')=x'} Dx(t) \exp \left\{ \frac{iM}{2\hbar} \int_{t'}^{t''} (\dot{x}_t^2 - \omega^2 x_t^2) dt \right\} = \left( \frac{M \omega}{2 \pi \hbar \sin \omega T} \right)^{1/2} \exp \left\{ - \frac{M \omega}{2i\hbar} \left[ (x_t^2 + x''_t^2) \cot \omega T - 2 \frac{x' x''}{\sin \omega T} \right] \right\} \tag{110}
\]

\[
= \sum_{n=0}^{\infty} \frac{e^{-\omega T / (n+1/2)}}{2^n n!} \left( \frac{M \omega}{\pi \hbar} \right)^{1/2} H_n \left( \sqrt{\frac{M \omega}{\hbar}} x \right) H_n \left( \sqrt{\frac{M \omega}{\hbar}} x'' \right) \exp \left\{ - \frac{M \omega}{2\hbar} \left( x_t^2 + x''_t^2 \right) \right\}. \tag{111}
\]
The $\xi^4, \eta^4, \xi^6, \eta^6$-terms make the path integral in parabolic coordinates intractable. For $k_1 = 0$ the anharmonic sextic potential problems in $\xi$ and $\eta$ can only be treated for a zero separation constant, c.f. the appendix. The result in cartesian coordinates has the form $(\tilde{x} = x + k_1/4M\omega^2)$
with the wave-functions and the energy-spectrum given by
\[
\Psi_{n_1,n_2}(x,y) = \sqrt{\frac{2M\omega}{\hbar}} \left( \frac{\omega}{\hbar} \right)^{\pm k_2/2} \sqrt{\frac{n_2!}{\Gamma(n_2 \pm k_2 + 1)}} y^{1/2 \pm k_2} \exp \left( - \frac{M\omega}{2\hbar} y^2 \right) L_{n_2}^{(\pm k_2)} \left( \frac{M\omega}{\hbar} y^2 \right) \times \sqrt{\frac{2M\omega}{\pi \hbar}} \frac{1}{2^{n_1} n_1!} \exp \left( - M\omega \frac{1}{\hbar} \bar{x} \right) H_{n_1} \left( \sqrt{\frac{2M\omega}{\hbar}} \bar{x} \right)
\]
\[
E_{n_1,n_2} = \hbar \omega (n_1 + 2n_2 \pm k_2 + \frac{3}{2}) + \frac{k_2^4}{8M\omega^2}.
\]
Note the cases whether \(k_2 \geq \frac{1}{2}\), respectively \(0 < k_2 < \frac{1}{2}\).

3.1.3. We consider the potential \((k_{1,2} > 0)\)
\[
V_3(\bar{x}) = -\frac{\alpha}{\sqrt{x^2 + y^2}} + \frac{\hbar^2}{4M} \left( \frac{1}{\sqrt{x^2 + y^2}} \left( \frac{k_1^2 - \frac{1}{2}}{\sqrt{x^2 + y^2} + x} + \frac{k_3^2 - \frac{1}{2}}{\sqrt{x^2 + y^2} - x} \right) \right).
\]
This potential is separable in polar, parabolic and elliptic II coordinates. A path integral discussion for the pure Coulomb case is due to Inomata [58] and Duru and Kleinert [31]. We have
\[
\text{Polar Coordinates:}
\]
\[
\rho(t') = \rho', \quad \phi(t') = \phi'
\]
\[
= \int_{\rho(t') = \rho'} \rho D\rho(t) \int_{\phi(t') = \phi'} D\phi(t) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (\dot{\rho}'^2 + \rho'^2 \dot{\phi}'^2) + \frac{\alpha}{\rho} - \frac{\hbar^2}{8M\rho'^2} \left( \frac{k_1^2 - \frac{1}{2}}{\cos^2 \frac{\phi'}{2}} + \frac{k_3^2 - \frac{1}{2}}{\sin^2 \frac{\phi'}{2}} - 1 \right) \right] \right\}
\]

\[
\text{Elliptic II Coordinates [95]:}
\]
\[
\xi(t') = \xi'', \quad \eta(t') = \eta''
\]
\[
= \int_{\xi(t') = \xi'} D\xi(t) \int_{\eta(t') = \eta'} D\eta(t) d^2 (\sinh^2 \xi + \sin^2 \eta) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (\sinh^2 \xi^2 + \sin^2 \eta)(\dot{\xi}'^2 + \dot{\eta}'^2) + \frac{\alpha}{d(\cosh \xi + \cos \eta)} - \frac{\hbar^2}{4Md(\cosh^2 \xi - \cos^2 \eta)} \left( \frac{(k_1^2 + k_3^2 - \frac{1}{2}) + (k_2^2 - k_1^2) \cos \eta}{\sin^2 \eta} + \frac{(k_1^2 + k_3^2 - \frac{1}{2}) + (k_2^2 - k_1^2) \cosh \xi}{\sin^2 \xi} \right) \right] \right\}
\]

\[
\text{Parabolic Coordinates [21]:}
\]
If the domain of the angular variable is $\phi \in (0, 2\pi)$ there are two separated domains (half-planes) in the case of $k_1 > \frac{1}{2}$. A rotation of the axis about $\pi/2$ interchanges the roles of $k_1$ and $k_2$. In order to evaluate the two path integrals in polar and parabolic coordinates a space-time transformation must be performed. The result in polar coordinates has the form $[\kappa = \alpha \sqrt{-M/2E}/\hbar, \lambda = m + (1 \pm k_1 \pm k_2)/2$, only the radial Green function can be explicitly evaluated]

$$
G^{(V_3)}(\bar{x}'', \bar{x}' ; E) = \frac{i}{\hbar} \int_0^\infty dt e^{iTE/\hbar} K^{(V_3)}(\bar{x}'', \bar{x}' ; T)
$$

$$
= \frac{1}{2} (r r'')^{-1/2} \sum_{n=0}^\infty \Phi_n^{(\pm k_2, \pm k_1)} \left( \frac{\rho'}{2} \right) \Phi_n^{(\pm k_2, \pm k_1)} \left( \frac{\rho''}{2} \right) \times \frac{i}{\hbar} \int_0^\infty d\rho e^{iTE/\hbar} \int_{\rho(\rho'=\rho'')} D\rho(t) \exp \left[ \frac{i}{\hbar} \int_0^t \left( \frac{M}{2} \rho^2 + \frac{\alpha}{\rho} - \hbar^2 \lambda^2 - \frac{1}{2} \right) dt \right]
$$

$$
= \frac{1}{2} (\rho' \rho'')^{-1/2} \sum_{n=0}^\infty \Phi_n^{(\pm k_2, \pm k_1)} \left( \frac{\rho'}{2} \right) \Phi_n^{(\pm k_2, \pm k_1)} \left( \frac{\rho''}{2} \right) \times \frac{1}{\hbar} \sqrt{-\frac{M}{2E}} \frac{\Gamma(\frac{1}{2} + \lambda - \kappa)}{\Gamma(2\lambda + 1)} W_{\kappa,\lambda} \left( \sqrt{-8ME \rho_\geq /\hbar} \right) M_{\kappa,\lambda} \left( \sqrt{-8ME \rho_\leq /\hbar} \right)
$$

$$
= \sum_{n=0}^\infty \sum_{m=0}^\infty \Psi_{n,m}^{*}(\rho', \phi') \Psi_{n,m}(\rho'', \phi'') \frac{E_m - E}{E_p - E} + \int_R dp \Psi_{p,m}^{*}(\rho', \phi') \Psi_{p,m}(\rho'', \phi'') \frac{E_p - E}{\hbar^2 p^2 / 2M - E}
$$

(120)

In the $\phi$-path integration the path integral solution of the Pöschl-Teller potential has been used. In the radial path integration the path integral solution for the radial Coulomb potential was used (Chetouani and Hammann [19], Duru and Kleinert [30, 31], and Refs. [59, 113]), and the Green function is expanded according to (Kratzer potential, $\kappa = \alpha \sqrt{-M/2E}/\hbar$)

$$
\frac{i}{\hbar} \int_0^\infty dt e^{iTE/\hbar} \int_{x(t')=x'}^x D\chi(t) \exp \left[ \frac{i}{\hbar} \int_{x'}^x \left( \frac{M}{2} \dot{x}^2 + \frac{\alpha}{x} - \hbar^2 \lambda^2 - \frac{1}{2} \right) dx \right]
$$

$$
= \frac{1}{\hbar} \sqrt{-\frac{M}{2E}} \frac{\Gamma(\frac{1}{2} + \lambda - \kappa)}{\Gamma(2\lambda + 1)} W_{\kappa,\lambda} \left( \sqrt{-8ME x_\geq /\hbar} \right) M_{\kappa,\lambda} \left( \sqrt{-8ME x_\leq /\hbar} \right)
$$

$$
= \sum_{n=0}^\infty \Psi_n(x') \Psi_n(x'') \frac{E_n - E}{E_p - E} + \int_R dp \Psi_p^{*}(x') \Psi_p(x'') \frac{E_p - E}{\hbar^2 p^2 / 2M - E}
$$

(123)

$x_{<,>}$ denotes the smaller/larger of $x', x''$. The $W_{\kappa,\lambda}(x)$ and $M_{\kappa,\lambda}(x)$ are Whittaker functions ([19], p.1059). The bound state wave-functions and the energy-spectrum of the Kratzer potential are given by ($a = \hbar^2 / M\alpha$)

$$
\Psi_n(x) = \frac{1}{n + \lambda + \frac{1}{2}} \left[ \omega \Gamma(n + 2\lambda + 1) \right]^{1/2}
$$

22
\[ E_n = -\frac{M\alpha^2}{2\hbar^2(n + \lambda + \frac{1}{2})^2}, \]  

and for the continuous spectrum with \( E_p = p^2\hbar^2/2M \) one has

\[ \Psi_p(x) = \frac{\Gamma(\frac{1}{2} + \lambda - i/\alpha p)}{\sqrt{2\pi\Gamma(2\lambda + 1)}} \exp\left(\frac{\pi}{2\alpha p}\right) M_{i\alpha p, \lambda}(-2i\pi x). \]  

Therefore the polar coordinate wave-functions and the energy-spectrum of our potential problem are given by \( (a = M/\alpha\hbar^2) \):

\[ \Psi_{n,m}(\rho, \phi) = 2^{-1/2} \Phi_n^{(\pm k_2, \pm k_1)} \left(\frac{\phi}{2}\right) \left[ \frac{2m!}{a^2(m + \lambda + \frac{1}{2})^2 \Gamma_m(2\lambda + 1)} \right]^{1/2} \]
\[ \times \left(\frac{2\rho}{a(m + \lambda + \frac{1}{2})}\right)^\lambda \exp\left(\frac{\rho}{a(m + \lambda + \frac{1}{2})}\right) L_n^{(2\lambda)} \left(\frac{2\rho}{a(m + \lambda + \frac{1}{2})}\right), \]  

\[ E_n = -\frac{M\alpha^2}{2\hbar^2(n + \lambda + \frac{1}{2})^2}, \]  

\[ \Psi_{n,p}(\rho, \phi) = 2^{-1/2} \Phi_n^{(\pm k_2, \pm k_1)} \left(\frac{\phi}{2}\right) \frac{\Gamma(\frac{1}{2} + \lambda - i/\alpha p)}{\sqrt{2\pi\rho \Gamma(2\lambda + 1)}} \exp\left(\frac{\pi}{2\alpha p}\right) M_{i\alpha p, \lambda}(-2i\pi p). \]

The \( \Phi_n^{(\pm k_2, \pm k_1)}(\phi/2) \) are the Pöschl-Teller wave-functions. In parabolic coordinates we obtain by performing a time transformation and applying the path integral solution of the radial harmonic oscillator in the \( \xi \) and \( \eta \) variables, respectively

\[ \psi = \sqrt{\frac{-2E}{M}} \]

\[ \frac{i}{\hbar} \int_0^\infty dt e^{iTE/\hbar} K^{(V)}(x'', x''; T) \]

\[ = \int_0^\infty ds'' e^{2i\alpha s''/\hbar} \int \int \mathcal{D}\eta(s) \int \int \mathcal{D}\xi(s) \]
\[ \times \exp\left\{ \frac{i}{\hbar} \int_0^{s''} \left[ \frac{M}{2} (\xi''^2 + \eta''^2) + E(\xi'' + \eta'') - \frac{\hbar^2}{2M} \left( k_1^2 - \frac{1}{4} + k_2^2 - \frac{1}{4} \right) \right] dt \right\}. \]

\[ = \left( \frac{M}{\hbar} \right)^2 \sqrt{\xi'' \eta''} \omega \int_0^\infty \frac{\omega}{\sin^2 \omega \sin \omega''} e^{2i\alpha s''/\hbar} \]
\[ \times \exp \left[ -\frac{M\omega}{2\hbar} (\xi''^2 + \xi''^2 + \eta''^2 + \eta''^2) \cot\omega'' \right] I_{k_1} \left( \frac{M\omega\xi'' \eta''}{i\hbar \sin \omega''} \right) I_{k_2} \left( \frac{M\omega\eta'' \eta''}{i\hbar \sin \omega''} \right) \]
\[ = \sum_{n_1, n_2=0}^\infty \frac{\Psi_{n_1, n_2}^*(\xi', \eta') \Psi_{n_1, n_2}(\xi'', \eta'')}{E_{n_1, n_2} - E} + \int_0^\infty dp \int_{\mathbb{R}} d\xi \Psi_{p, \xi}^*(\xi', \eta') \Psi_{p, \xi}(\xi'', \eta''), \]  

where are \( (N = n_1 + n_2 + \frac{1}{2}(k_1 + k_2) + 1, a = \hbar^2/M\alpha) \)

\[ \Psi_{n_1, n_2}(\xi, \eta) = \left[ \frac{2}{a^2N^2} \cdot \frac{n_1! n_2!}{\Gamma(n_1 \pm k_1 + 1) \Gamma(n_2 \pm k_2 + 1)} \right]^{1/2} \]
\[ \times \left(\frac{\xi}{aN}\right)^{\pm k_1/2} \left(\frac{\eta}{aN}\right)^{\pm k_2/2} \exp\left( -\frac{\xi^2 + \eta^2}{2aN} \right) L_n^{(\pm k_1)} \left(\frac{\xi^2}{aN}\right) L_n^{(\pm k_2)} \left(\frac{\eta^2}{aN}\right), \]

\[ E_{n_1, n_2} = \frac{M\alpha^2}{\hbar^2N^2}, \]
\[ \Psi_{p,\zeta}(\xi, \eta) = \frac{\Gamma[\frac{1+k_2}{2} + i(1/a + \zeta)/2p] \Gamma[\frac{1+k_1}{2} + i(1/a - \zeta)/2p]}{2\pi \sqrt{\xi \eta} \Gamma(1 \pm k_2) \Gamma(1 \pm k_1)} e^{\pi / 2a p} \times M_{-i(1/a + \zeta)/2p, \pm k_1 / 2} e^{-ip \xi^2} M_{-i(1/a - \zeta)/2p, \pm k_2 / 2} e^{-ip \eta^2} , \] 
\[ E_p = \frac{\hbar^2}{2M} p^2 . \]
\begin{align}
\times \exp \left\{ \frac{i}{\hbar} \int_{\nu'}^{\nu''} \left[ \frac{M}{2} (\xi^2 + \eta^2) (\xi''^2 + \eta''^2) + 2\alpha - (\beta_1 \xi + \beta_2 \eta) \right] d\nu \right\} \\
= \int_0^\infty ds'' e^{2i\alpha s''/\hbar} \int_{\eta(0)=\eta''}^{\eta(\nu'')=\eta''} D\eta(s) \int_{\xi(0)=\xi'}^{\xi(\nu'')=\xi''} D\xi(s) \\
\times \exp \left\{ \frac{i}{\hbar} \int_{\nu'}^{\nu''} \left[ \frac{M}{2} (\xi^2 + \eta^2) + E(\xi^2 + \eta^2) - 2(\beta_1 \xi + \beta_2 \eta) \right] d\nu \right\} 
\end{align}

\begin{align}
= \int_0^\infty ds'' \frac{M\omega}{\pi \hbar \sin \omega s''} \cosh \left( \frac{M\omega (\xi''^2 + \eta''^2)}{i \hbar \sin \omega s''} \right) \\
\times \exp \left[ \frac{2i\alpha s''}{\hbar} - \frac{i}{\hbar} \frac{\beta_1^2 + \beta_2^2}{2\hbar} s'' + \frac{iM\omega}{2\hbar} (\xi''^2 + \eta''^2 + \xi''^2 + \eta''^2) \cot \omega s'' \right] 
\end{align}

= \sum_{n_1,n_2=0}^{\infty} \Psi_{n_1,n_2}(\xi'', \eta'') \sum_{e,o} \int d\xi \int dp \frac{\Psi_{\xi''}^{(e,o)}(\xi', \eta') \Psi_{\xi''}^{(e,o)}(\xi'', \eta'')}{h^2 p^2 / 2M - E} ,

\text{and} \sum_{e,o} \text{denotes the summation over even and odd states, respectively; the bound state energy-levels are determined by} (N = n_1 + n_2 + 1, n_1,n_2 \in \mathbb{N}_0, \omega_N = \sqrt{-2E_N / M})

\begin{align}
\omega_N^3 - \frac{2\alpha}{N\hbar} \omega_N^2 - \frac{2\beta_1^2 + \beta_2^2}{MN\hbar} = 0 .
\end{align}

For \( \alpha > 0 \) the discriminant of this cubic equation shows that there is one real root \( \omega_N \) for each \( N \) such that the bound state energy-levels \( E_N \) are given by

\begin{align}
E_N = E_{n_1,n_2} = -\frac{M}{2} \omega_N^2 , \quad \omega_N = y_N + \frac{2\alpha}{3hN} , \quad y_N = u_1 + u_2 ,
\end{align}

\begin{align}
u_{1,2} = \left\{ \frac{2\alpha}{3hN} \right\}^3 + \frac{\beta_1^2 + \beta_2^2}{MN\hbar} + \sqrt{\left( \frac{\beta_1^2 + \beta_2^2}{MN\hbar} \right)^2 + 2\frac{\beta_1^2 + \beta_2^2}{MN\hbar} \left( \frac{2\alpha}{3hN} \right)^3} .
\end{align}

The corresponding bound-state wave-functions have the form

\begin{align}
\Psi_{n_1,n_2}(\xi, \eta) = \frac{M}{\pi \hbar} \cdot \frac{4}{n_1! n_2! 2^{n_1+n_2}} \left( \frac{\Gamma[1 + \frac{2p}{\hbar} (1/\tilde{\alpha} + \tilde{\xi})] E^{(0)}_{\frac{1}{2} + \frac{2p}{\hbar} (1/\tilde{\alpha} + \tilde{\xi})} (e^{-i\pi/4} \sqrt{2p \tilde{\xi}}) \tilde{\xi}}{\sqrt{24\pi^2}} \right) \\
\times \exp \left[ -\frac{M\omega_N}{2\hbar} (\xi^2 + \eta^2) \right] H_{n_1} \left( \sqrt{\frac{M\omega_N}{2\hbar} \tilde{\xi}} \right) H_{n_2} \left( \sqrt{\frac{M\omega_N}{2\hbar} \tilde{\eta}} \right) .
\end{align}

\( N = n_1 + n_2 \) must be chosen in such a way that \( N = n_1 + n_2 \) is an even number. The continuous functions \( \Psi_{\xi''}^{(e,o)}(\xi, \eta) \) are given by [\( \tilde{\alpha} = h^2 / M(\alpha - m(\beta_1^2 + \beta_2^2)/h^2 p^2) \)]

\begin{align}
\Psi_{\xi''}^{(e,o)}(\xi, \eta) = \frac{e^{\pi/2ap}}{\sqrt{24\pi^2}} \left( \frac{\Gamma[1 + \frac{2p}{\hbar} (1/\tilde{\alpha} + \tilde{\eta})] E^{(0)}_{\frac{1}{2} + \frac{2p}{\hbar} (1/\tilde{\alpha} + \tilde{\eta})} (e^{-i\pi/4} \sqrt{2p \tilde{\eta}}) \tilde{\eta}}{\sqrt{24\pi^2}} \right) \\
\times \left( \Gamma[1 + \frac{2p}{\hbar} (1/\tilde{\alpha} - \tilde{\eta})] E^{(1)}_{\frac{1}{2} + \frac{2p}{\hbar} (1/\tilde{\alpha} - \tilde{\eta})} (e^{-i\pi/4} \sqrt{2p \tilde{\eta}}) \right) .
\end{align}

For the determination of the continuous spectrum one uses the dispersion relation [148], p.896

\begin{align}
\int_{c-i\infty}^{c+i\infty} \frac{D_{\nu}(x) D_{-\nu-1}(iy) + D_{\nu}(-x) D_{-\nu-1}(-iy)}{\sin(-\nu\pi)} \frac{e^{-\nu-1} d\nu}{\sin(\nu\pi)} = 2i \sqrt{\frac{2\pi}{1 + t^2}} \exp \left( -\frac{1 - t^2}{1 + t^2} \frac{x^2 + y^2}{4} + \frac{ixy}{1 + t^2} \right) ,
\end{align}

\( c = -\nu \) is the pole of the integrand.
and performs the variable substitution \((\nu_1, \nu_2) \mapsto (p_\xi, p_\eta) \mapsto [(1/\bar{a} + \zeta)/2p, (1/\bar{a} - \zeta)/2p]\). \(\zeta\) is the parabolic separation constant. The \(D_{\nu}(z)\) are parabolic cylinder functions, and the \(E_{\nu}^{(0)}(z)\) and \(E_{\nu}^{(1)}(z)\) are even and odd parabolic cylinder functions [3], respectively.

Note that in the evaluation of the path integral one has to take into account that by using the linearly shifted harmonic oscillator solution for the \(\xi\)- and \(\eta\)-variable, respectively, one actually uses a double covering of the original \((x, y) \in \mathbb{R}^2\)-plane, i.e. \(\bar{u} \equiv (\xi, \eta) \in \mathbb{R}^2\). Furthermore we have taken into account that our mapping is of the “square-root” type which gives rise to a sign ambiguity. “Thus, if one considers all paths in the complex \(|z| = -\infty\) plane, the final \(|z| = 0\). We may choose the \(\bar{u}'\) corresponding to the initial \(z'\) to lie on the first sheet i.e. in the right half \(\bar{u}-\)plane. The final \(\bar{u}''\) can be in the right as well as the left half-plane and all paths on the \(z\)-plane go over into paths from \(\bar{u}'\) to \(\bar{u}''\) and those from \(\bar{u}'\) to \(-\bar{u}''\) [31]. Thus the two contributions arise in \((140)\).

### 3.2. Three-Dimensional Maximally Super-Integrable Smorodinsky-Winternitz Potentials.

We discuss in this subsection the five three-dimensional maximally super-integrable potentials. They are characterized by having five functionally independent integrals of motion. In the sequel \(\vec{x}\) denotes a three-dimensional coordinate: \(\vec{x} = (x, y, z) \equiv (x_1, x_2, x_3)\).

In table 3 we list the three-dimensional maximally super-integrable Smorodinsky-Winternitz potentials together with the separating coordinate systems (where the italicized coordinates systems were not mentioned in [35]). The cases where an explicit path integration is possible are underlined.

#### 3.2.1. We consider the three-dimensional potential \((k_{1,2,3} > 0)\)

\[
V_1(\vec{x}) = \frac{M}{2} \omega^2 \vec{x}^2 + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x_1^2} + \frac{k_2^2 - \frac{1}{4}}{x_2^2} + \frac{k_3^2 - \frac{1}{4}}{x_3^2} \right). \tag{148}
\]

Note furthermore that the pure three-dimensional harmonic oscillator [32] has the same separating coordinate systems as \(V_1(\vec{x})\) and therefore the additional centrifugal terms do not spoil this property.

We formulate the corresponding path integral in the coordinate systems which separate the path integral for this potential problem. We have

\[
K(V_1)(\vec{x}'', \vec{x}'; T)
\]

**Cartesian Coordinates:**

\[
\int_{\vec{x}(t) = \vec{x}'}^{\vec{x}(t) = \vec{x}''} \mathcal{D}\vec{x}(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \dot{x}^2 - \omega^2 \vec{x}^2 \right) - \frac{\hbar^2}{2M} \sum_{i=1}^{3} \frac{k_i^2 - \frac{1}{4}}{x_i^2} \right] dt \right\} \tag{149}
\]

**Spherical Coordinates:**

\[
= \int_{r(t) = r'}^{r(t) = r''} \sin \theta d\theta d\phi(t) \int_{\theta(t) = \theta'}^{\theta(t) = \theta''} d\theta d\phi(t) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \dot{r}^2 + r^2 \dot{\theta}^2 + r^2 \sin^2 \theta \dot{\phi}^2 - \omega^2 \vec{x}^2 \right) \right] dt \right\}
\]

26
\[- \frac{\hbar^2}{2Mr^2} \left( \frac{1}{\sin^2 \theta} \left( \frac{k_1^2}{\cos^2 \phi} + \frac{k_2^2}{\sin^2 \phi} - \frac{1}{4} \right) + \frac{k_3^2}{\cos^2 \theta} - \frac{1}{4} \right) \right] \right\} dt \} (150)
Table 3: The three-dimensional maximally super-integrable potentials

| Potential $V(x, y, z)$                                                                 | Coordinate System                                      |
|--------------------------------------------------------------------------------------|--------------------------------------------------------|
| $V_1 = \frac{M}{2} \omega^2 x^2 + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2} + \frac{k_3^2 - \frac{1}{4}}{z^2} \right)$ | Cartesian                                              |
|                                                                                      | Spherical                                              |

$$

(151)
Circular Elliptic Coordinates:

\[
\begin{align*}
\int_\mathcal{D} z(t) & \int_\mathcal{D} \xi(t) \int_\mathcal{D} \eta(t) \, d^2 \left( \sinh^2 \xi + \sin^2 \eta \right) \\
\times \exp \left\{ \frac{i}{\hbar} \int_{\xi(\tau')}^{\xi(\tau)} \left[ \frac{M}{2} \left( d^2 (\sinh^2 \xi + \sin^2 \eta) (\xi^2 + \eta^2) + \dot{z}^2 \right) \\
- \frac{M}{2} \omega^2 \left( d^2 (\cosh^2 \xi \cos^2 \eta + \sin^2 \xi \sin^2 \eta) + z^2 \right) \\
- \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{2}}{d^2 \cosh^2 \xi \cos^2 \eta} + \frac{k_2^2 - \frac{1}{2}}{d^2 \sin^2 \xi \sin^2 \eta} + \frac{k_3^2 - \frac{1}{2}}{z^2} \right) \right] \, dt \right\}
\end{align*}
\]

Conical Coordinates:

\[
\begin{align*}
\int_\mathcal{D} r(t) & \int_\mathcal{D} \alpha(t) \int_\mathcal{D} \beta(t) (k^2 \cosh^2 \alpha + k^2 \cosh^2 \beta) \\
\times \exp \left\{ \frac{i}{\hbar} \int_{\alpha(\tau')}^{\alpha(\tau)} \left[ \frac{M}{2} \left( \dot{r}^2 + r^2 (k^2 \cosh^2 \alpha + k^2 \cosh^2 \beta) (\dot{\alpha}^2 + \dot{\beta}^2) - \omega r^2 \right) \\
- \frac{\hbar^2}{2Mr^2} \left( \frac{k_1^2 - \frac{1}{2}}{\sin^2 \alpha \cosh^2 \beta} + \frac{k_2^2 - \frac{1}{2}}{\cosh^2 \alpha \cosh^2 \beta} + \frac{k_3^2 - \frac{1}{2}}{\cosh^2 \beta} \right) \right] \, dt \right\}
\end{align*}
\]

Oblate Spherical Coordinates (\(\lambda_1 = 2n \pm k_1 + 1\)):

\[
\begin{align*}
\int_\mathcal{D} \mu(t) & \int_\mathcal{D} \nu(t) \int_\mathcal{D} \phi(t) \, d^2 (\cosh^2 \mu - \sin^2 \nu) \cosh \mu \sin \nu \\
\times \exp \left\{ \frac{i}{\hbar} \int_{\mu(\tau')}^{\mu(\tau)} \left[ \frac{M}{2} \left( (\cosh^2 \mu - \sin^2 \nu) (\dot{\mu}^2 + \dot{\nu}^2) + \cosh^2 \mu \sin^2 \nu \dot{\nu}\dot{\phi}^2 \\
- \omega^2 (\cosh^2 \mu \sin^2 \nu + \sinh^2 \mu \cos^2 \nu) \right) \\
- \frac{\hbar^2}{2Md^2} \left( \frac{1}{\cosh^2 \mu \sin^2 \nu} \left( \frac{k_1^2 - \frac{1}{2}}{\cosh^2 \phi} + \frac{k_2^2 - \frac{1}{2}}{\sin^2 \phi} - \frac{1}{4} \right) + \frac{k_3^2 - \frac{1}{2}}{\cosh^2 \mu \cos^2 \nu} \right) \right] \, dt \right\}
\end{align*}
\]

\[
= (d^2 \cosh \mu' \sinh \mu'' \sin \nu')^{-1/2} \sum_{n=0}^\infty \Phi_n^{(\pm k_2, \pm k_1)} (\mu') \Phi_n^{(\pm k_2, \pm k_1)} (\nu')
\]

\[
\times \int_{\mathbb{R}} \frac{dE}{2\pi \hbar} e^{-iEt/\hbar} \int_0^\infty ds' \int_{\mu(0)=\mu'}^{\mu(0)=\mu''} \int_{\nu(0)=\nu'}^{\nu(0)=\nu''} \mathcal{D} \mu(s) \mathcal{D} \nu(s) \mathcal{D} \phi(s) \mathcal{D} \psi(s) \mathcal{D} \psi(s')
\]

\[
\times \exp \left\{ \frac{i}{\hbar} \int_{s'}^{s} \left[ \frac{M}{2} \left( (\dot{\mu}^2 + \dot{\nu}^2) - \omega^2 (\cosh^2 \mu \sinh^2 \mu + \sin^2 \nu \cosh^2 \nu) + E d^2 (\cosh^2 \mu - \sin^2 \nu) \right) \\
- \frac{\hbar^2}{2M} \left( (k_1^2 - \frac{1}{4}) \left( \frac{1}{\cosh^2 \phi} - \frac{1}{\sinh^2 \mu} \right) + (k_2^2 - \frac{1}{4}) \left( \frac{1}{\sin^2 \phi} - \frac{1}{\cosh^2 \mu} \right) \right) \right] \, ds \right\}
\]

Prolate Spherical Coordinates:

\[
\begin{align*}
\int_\mathcal{D} \mu(t) & \int_\mathcal{D} \nu(t) \int_\mathcal{D} \phi(t) \, d^2 (\sinh^2 \mu + \sin^2 \nu) \sinh \mu \sin \nu \\
\times \exp \left\{ \frac{i}{\hbar} \int_{\mu(\tau')}^{\mu(\tau)} \left[ \frac{M}{2} \left( (\sinh^2 \mu + \sin^2 \nu) (\dot{\mu}^2 + \dot{\nu}^2) + \sinh^2 \mu \sin^2 \nu \dot{\phi}^2 \right) \\
\right. \right.
\end{align*}
\]
\[-\omega^2(\sinh^2 \mu \sin^2 \nu + \cosh^2 \mu \cos^2 \nu)\]
\[-\frac{\hbar^2}{2M d^2} \left( \frac{1}{\sinh^2 \mu \sin^2 \nu} \left( \frac{k_1^2 - \frac{1}{4}}{\cos^2 \phi} + \frac{k_2^2 - \frac{1}{4}}{\sin^2 \phi} - \frac{1}{4} \right) + \frac{k_3^2 - \frac{1}{4}}{\cosh^2 \mu \cos^2 \nu} \right) \right] dt \}
\tag{156}

Ellipsoidal Coordinates:
\[
\rho_1(t')=\rho_1'' \quad \rho_2(t')=\rho_2'' \quad \rho_3(t')=\rho_3''
\]
\[
= \int_{\rho_1(t')}^{\rho_1''} D\rho_1(t) \int_{\rho_2(t')}^{\rho_2''} D\rho_2(t) \int_{\rho_3(t')}^{\rho_3''} D\rho_3(t) \frac{(\rho_2 - \rho_1)(\rho_3 - \rho_2)(\rho_3 - \rho_1)}{8\sqrt{-P(\rho_1)P(\rho_2)P(\rho_3)}} \]
\[
\times \exp \left\{ \frac{i}{\hbar} \sum_{i=1}^{3} \int_{t'}^{t''} \left[ \frac{M}{2} \rho_i \rho_i' \rho_i'' - \frac{1}{\prod_{i \neq j}(\rho_i - \rho_j)} \left( \frac{M \omega^2}{2} P(\rho_i) + \frac{\hbar^2}{2M} A(\rho_i) \right) - \Delta V_{PF}(\rho_i) \right] dt \right\}.
\tag{157}

In this example we have explicitly written down the separated \((\tilde{\xi}, \tilde{\eta})\)-path integrations in the case of the oblate spheroidal coordinates. The case of the prolate spheroidal coordinates is, of course, similar. For the separation in the ellipsoidal coordinates \(A(\rho)\) denotes \((a_k = a_1 - a_k)\)
\[
A(\rho) = a_{31} a_{21} \frac{k_1^2 - \frac{1}{4}}{\rho - a_1} + a_{12} a_{32} \frac{k_2^2 - \frac{1}{4}}{\rho - a_2} + a_{13} a_{23} \frac{k_3^2 - \frac{1}{4}}{\rho - a_3}.
\tag{158}

The separation of variables then is performed by means of \([30]\). In the case of the conical coordinates the separation of variables in the path integral becomes obvious if we consider for fixed \(R\) the identity
\[
\int_{\alpha(t')}^{\alpha''} D\alpha(t) \int_{\beta(t')}^{\beta''} D\beta(t) (k^2 \sin^2 \alpha + k^2 \sin^2 \beta)
\]
\[
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \bar{R}^2 (k^2 \sin^2 \alpha + k^2 \sin^2 \beta) (\dot{\alpha}^2 + \dot{\beta}^2)
\right.\right.
\]
\[
- \frac{\hbar^2}{2M R^2} \left( \frac{k_2^2 - \frac{1}{4}}{\sin^2 \alpha \sin^2 \beta} + \frac{k_3^2 - \frac{1}{4}}{\csc^2 \alpha \csc^2 \beta} + \frac{k_1^2 - \frac{1}{4}}{\csc^2 \alpha \csc^2 \beta} \right) \right] dt \right\}
\tag{159}

We find that the path integral for this potential can be explicitly evaluated in the cartesian, circular polar and spherical coordinate system \([17]\). The others cannot be explicitly evaluated, but are however connected through the above path integral identities. We obtain (c.f. for path integral discussions for special cases of \(k_{1,2,3}\) e.g. Carpio-Bernido and Bernido \([10, 12]\)

\[
K(V_1)(\bar{x}''', \bar{x}'; T)
\]

Cartesian Coordinates:
\[
= \left( \frac{M \omega}{\hbar \sin \omega T} \right)^3 \prod_{i=1}^{3} \sqrt{x_i' x_i''} \exp \left[ - \frac{M \omega}{2 \hbar} (x_i'^2 + x_i''^2) \cot \omega T \right] I_{k_i} \left( \frac{M \omega x_i' x_i''}{\hbar \sin \omega T} \right),
\tag{160}
\]
Circular Polar Coordinates ($\lambda_1 = 2n + k_1 + k_2 + 1$):

\[
= \sum_{n_1, n_2, n_3 = 0}^{\infty} e^{-iEN/T} \Psi_{n_1, n_2, n_3}(x_1'', x_2'', x_3'') \Psi_{n_1, n_2, n_3}(x_1', x_2', x_3') (161)
\]

Spherical Coordinates ($\lambda_2 = 2m + \lambda_1 + k_3 + 1$):

\[
= \sum_{l, n, m = 0}^{\infty} e^{-iEN/T} \Psi_{l, n, m}(\theta'', \phi'', r'') \Psi_{l, n, m}(\theta', \phi', r') (165)
\]

with the wave-functions and the energy-spectra given by ($N$ is the principal quantum number)

**Cartesian Coordinates:**

\[
\Psi_{n_1, n_2, n_3}(x_1, x_2, x_3) = \left(\frac{2M\omega}{\hbar}\right)^{3/2} \prod_{i=1}^{3} \left(\frac{M\omega}{\hbar}\right)^{i/2}
\times \sqrt{\frac{n_i!}{\Gamma(n_i + k_i + 1)}} x_i^{1/2 \pm k_i} \exp\left(-\frac{M\omega}{2\hbar} \frac{x_i^2}{x_i^2}\right) L_{n_i}^{(\pm k_i)} \left(\frac{M\omega x_i^2}{\hbar}\right) , (166)
\]

\[
E_N = \hbar \omega \left(2N + \sum_{i=1}^{3} (1 \pm k_i)\right) , \quad N = n_1 + n_2 + n_3 , (167)
\]

**Circular Polar Coordinates ($\lambda_1 = 2n + k_1 + k_2 + 1$):**

\[
\Psi_{n, m, n_z}(\phi, \rho, z) = \Phi_n^{(\pm k_2, \pm k_1)}(\phi) \sqrt{2M\omega \hbar} \left(\frac{M\omega}{\hbar}\right)^{\pm k_3/2}
\times \sqrt{\frac{n_z!}{\Gamma(n_z + k_3 + 1)}} z^{1/2 \pm k_3} \exp\left(-\frac{M\omega}{2\hbar} \frac{z^2}{z^2}\right) L_{n_z}^{(\pm k_3)} \left(\frac{M\omega z^2}{\hbar}\right)
\times \sqrt{\frac{2M\omega}{\hbar} \left(\frac{M\omega}{\hbar}\right)^{\lambda_1/2}} \sqrt{\frac{m!}{\Gamma(m + \lambda_1 + 1)}} \exp\left(-\frac{M\omega}{2\hbar} \frac{\rho^2}{\rho^2}\right) L_m^{(\lambda_1)} \left(\frac{M\omega \rho^2}{\hbar}\right) , (168)
\]

\[
E_N = \hbar \omega \left(2N + \sum_{i=1}^{3} (1 \pm k_i)\right) , \quad N = m + n + n_z , (169)
\]

**Spherical Coordinates ($\lambda_2 = 2m + \lambda_1 + k_3 + 1$):**

\[
\Psi_{l, n, m}(\theta, \phi, r) = (r \sin \theta)^{-1/2} \Phi_n^{(\pm k_2, \pm k_1)}(\phi) \Phi_m^{(\lambda_1, \pm k_3)}(\theta)
\times \sqrt{2M\omega \hbar} \left(\frac{M\omega}{\hbar}\right)^{\lambda_2/2} \sqrt{\frac{l!}{\Gamma(l + \lambda_2 + 1)}} \exp\left(-\frac{M\omega}{2\hbar} \frac{r^2}{r^2}\right) L_l^{(\lambda_2)} \left(\frac{M\omega r^2}{\hbar}\right) , (170)
\]

\[
E_N = \hbar \omega \left(2N + \sum_{i=1}^{3} (1 \pm k_i)\right) , \quad N = n + m + l , (171)
\]

and $\Phi_n^{(\pm k_2, \pm k_1)}(\phi)$ and $\Phi_m^{(\lambda_1, \pm k_3)}(\theta)$ denote the wave-functions [88], c.f. Calogero [3] and Evans
for the Schrödinger approach. Note that our solution in circular polar coordinates is new. The $D$-dimensional generalization of this potential is also maximally super-integrable \[36\], and it is immediately obvious that it is at least separable (and exactly soluble) in cartesian and spherical coordinates (and any combination of circular spherical subsystems).

Let us furthermore consider the two following special cases of the potential $V_1(\vec{x})$ where $\omega = 0$. Here we have a continuous spectrum instead of a discrete one.

(i) $k_3^2 - \frac{1}{4} = 0$: We have $(\lambda = 2n \pm k_1 \pm k_2 + 1)$

$$K^{(V_1)}(\vec{x}''', \vec{x}''; T)$$

**Paraboloidal Coordinates:**

$$\begin{align*}
\eta_1(t') &= \eta_1' \\
\eta_2(t') &= \eta_2' \\
\eta_3(t'') &= \eta_3''
\end{align*}$$

$$= \frac{i}{\hbar} \int_0^t \int_0^{\tau'} \int_0^t D\eta_1(t) D\eta_2(t) D\eta_3(t) \left( \frac{\eta_2 - \eta_1}{\eta_3 - \eta_2} \right) \left( \frac{\eta_3 - \eta_1}{\eta_3 - \eta_2} \right) \frac{1}{8\sqrt{-P(\eta_1) P(\eta_2) P(\eta_3)}}$$

$$\times \exp \left\{ \frac{i}{\hbar} \sum_{i=1}^3 \int_{\tau'}^{\tau''} \left[ \frac{M}{2} D\eta_i D\eta_i - \frac{\hbar^2}{2M} \frac{B(\eta_i)}{\prod_{i \neq j} (\eta_i - \eta_j)} - \Delta V_{PF}(\eta_i) \right] dt \right\}$$

(172)

**Parabolic Coordinates:**

$$\begin{align*}
\eta(t') &= \eta' \\
\xi(t') &= \xi' \\
\phi(t') &= \phi'
\end{align*}$$

$$= \frac{i}{\hbar} \int_0^t \int_0^{\tau'} \int_0^t D\eta(t) D\xi(t) D\phi(t)$$

$$\times \exp \left\{ \frac{i}{\hbar} \int_{\tau'}^{\tau''} \left[ \frac{M}{2} \left( (\xi^2 + \eta^2)(\dot{\xi}^2 + \dot{\eta}^2) + \xi^2 \eta^2 \phi^2 \right) - \frac{\hbar^2}{2M\xi^2\eta^2} \left( \frac{k_3^2}{\sin^2 \phi} + \frac{k_2^2}{\sin^2 \phi} + \frac{1}{4} \right) \right] dt \right\}$$

(173)

$$= (\xi' \eta' \phi')^{-1/2} \sum_{n=0}^{\infty} \Phi_n^{(k_2, \pm k_1)}(\phi') \Phi_n^{(k_2, \pm k_1)}(\phi'')$$

$$\times \int_{\mathbb{R}} \int_0^\infty \frac{dE}{2\pi \hbar} e^{-iET/\hbar} \int_0^\infty \int_0^\infty D\eta(s) D\xi(s)$$

$$\times \exp \left\{ \frac{i}{\hbar} \int_0^{s''} \left[ \frac{M}{2} \left( (\xi^2 + \eta^2)(\dot{\xi}^2 + \dot{\eta}^2) + E(\xi^2 + \eta^2) - \frac{\hbar^2}{2M} \left( \frac{1}{\xi^2} + \frac{1}{\eta^2} \right) \right) ds \right\}$$

(174)

$$= \sum_{n=0}^{\infty} \int_{\mathbb{R}} \int_0^{\infty} dp e^{-ip\sqrt{2} \xi^2} \Psi_n^{*}(\phi', \xi', \eta') \Psi_n(\phi'', \xi'', \eta'') \right\}.$$ (175)

In paraboloidal coordinates $\Delta V_{PF}(\eta_i)$ are determined by \[10\] and the $B(\eta_i)$ are given by $(i = 1, 2, 3, a_{ik} = a_i - a_k, a_1 = b, a_2 = a)$

$$B(\eta_i) = a_{21} \frac{k_2^2}{\eta_i - a} + a_{12} \frac{k_3^2 - \frac{1}{4}}{\eta_i - b}.$$ (176)

The wave-functions in parabolic coordinates are given by $(\zeta$ is the parabolic separation constant)

$$\Psi_n(\phi, \xi, \eta) = \Phi_n^{(k_2, \pm k_1)}(\phi) \frac{[\lambda \xi^2 + i\zeta / 2p]^2}{2\pi \sqrt{\Gamma^2(1 + \lambda)}} \left( \frac{1}{\xi^2 / 2p} \right)$$

$$\times M_{-i\zeta / 2p, \lambda / 2}(-ip\xi^2)M_{-i\zeta / 2p, \lambda / 2}(-ip\eta^2).$$ (177)
We write down the corresponding path integral formulations

\[ K^{(V_1)}(\vec{x}'', \vec{x}'; T) \]

Cartesian Coordinates:

\[
\eta(t'')=\eta'' \quad \xi(t'')=\xi'' \quad z(t'')=z''
\]

\[
= \int \mathcal{D}\eta(t) \int \mathcal{D}\xi(t)(\xi^2 + \eta^2) \int \mathcal{D}z(t)
\]

\[
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ M^2 \left( (\xi''^2 + \eta''^2)(\xi''^2 + \eta'^2) + \dot{z}^2 \right) - \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{\xi''^2 \eta^2} + \frac{k_2^2 - \frac{1}{4}}{z^2} \right) \right] dt \right\}
\]

\[
= \frac{M}{i\hbar T} \exp \left[ \frac{iM}{2\hbar} (z'^2 + z''^2) \right] \exp \left[ \frac{M z''}{i\hbar T} \right]
\]

\[
\times \int_{\mathbb{R}} dE \int_{0}^{\infty} d\eta' \int \mathcal{D}\eta (s) \int \mathcal{D}\xi (s)
\times \exp \left[ \frac{i}{\hbar} \int_{0}^{s''} \left[ M \left( (\xi''^2 + \eta''^2) + E (\xi^2 + \eta^2) - \frac{\hbar^2 k_1^2}{2M} \left( \frac{1}{\xi'^2} + \frac{1}{\eta'^2} \right) \right] ds \right]
\]

\[
= \int_{0}^{\infty} dp \int_{\mathbb{R}} d\zeta \int_{0}^{\infty} dp \exp \left[ -iET/\hbar \right] \Psi_{p_z, \xi, \eta}(z'', \xi', \eta') \Psi_{p_z, \xi, \eta}(z'', \xi'', \eta'')
\]

(178)

with the wave-functions given by \( \zeta \) is the parabolic separation constant

\[
\Psi_{n, k, \eta}(\phi, \xi, \eta) = \frac{\sqrt{p_z}}{2\pi \sqrt{k_1}} \frac{1}{\sqrt{p_z \xi \eta}} e^{\pi/2ap} \times M_{-ic/2p, k, p, k, p, k, p} (-ip \xi^2) M_{-ic/2p, k, p, k, p, k, p} (-ip \eta^2)
\]

(181)

\[
E = \frac{\hbar^2}{2M} (p_z^2 + p^2)
\]

(182)

3.2.2. We consider the potential \( (x_3 \equiv z \in \mathbb{R}, k_{1,2} > 0) \)

\[
V_2(\vec{x}) = \frac{M}{2} \omega^2 (x_1^2 + x_2^2 + 4x_3^2) + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x_1^2} + \frac{k_2^2 - \frac{1}{4}}{x_2^2} \right)
\]

(183)

We write down the corresponding path integral formulations

\[ K^{(V_2)}(\vec{x}'', \vec{x}'; T) \]

Cartesian Coordinates:

\[
\begin{aligned}
\vec{x}(t'') &= \vec{x}'' \\
\eta(t'') &= \eta'' \\
\xi(t'') &= \xi'' \\
\phi(t'') &= \phi''
\end{aligned}
\]

\[
= \int \mathcal{D}\vec{x}(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \dot{x}^2 - \omega^2 (x_1^2 + x_2^2 + 4x_3^2) \right) - \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x_1^2} + \frac{k_2^2 - \frac{1}{4}}{x_2^2} \right) \right] dt \right\}
\]

(184)

Parabolic Coordinates \( (\lambda = 2n \pm k_1 \pm k_2 + 1): \)

\[
\begin{aligned}
\eta(t'') &= \eta'' \\
\xi(t'') &= \xi'' \\
\phi(t'') &= \phi''
\end{aligned}
\]

\[
= \int \mathcal{D}\eta(t) \int \mathcal{D}\xi(t)(\xi^2 + \eta^2) \xi \eta \int \mathcal{D}\phi(t)
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( (\xi''^2 + \eta''^2)(\xi''^2 + \eta'^2) + \xi^2 \eta^2 \phi^2 - \omega^2 (\xi^2 \eta^2 + (\xi^2 - \eta^2)^2) \right) \right. \\
- \frac{\hbar^2}{2M \xi^2 \eta^2} \left( \frac{k_1^2 - \frac{1}{4}}{\cos^2 \phi} + \frac{k_2^2 - \frac{1}{4}}{\sin^2 \phi} - \frac{1}{4} \right) \right] dt \right\}
\]

(185)
= (ξ' ξ'' η''') −1/2 \sum_{n=0}^{∞} \Phi_n(±k_2, ±k_1)(∅')(∅''')
\times \int_{\mathbb{R}} \frac{dE}{2\pi h} e^{-iE T/\hbar} \int_{0}^{∞} ds'' \int \mathcal{D}n(s) \int \mathcal{D}ξ(s)
\times \exp \left\{ \frac{i}{\hbar} \int_{0}^{s''} \left[ \frac{M}{2} \left( (ξ'^2 + η'^2) - ω^2(ξ''^2 + η'') \right) + E(ξ''^2 + η'') \right] - \hbar^2 \frac{λ^2 - 1}{ω^2} \left( \frac{1}{ξ'^2} + \frac{1}{η'^2} \right) ds \right\}
(186)

Circular Polar Coordinates:
\begin{align*}
ρ'(t') = ρ'' & \quad φ'(t') = φ'' & \quad z(t') = z'' \\
= \int_{ρ'(t') = ρ''} \int_{φ'(t') = φ''} \int_{z(t') = z''} ρD ρ(t) Dφ(t) Dz(t) \\
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (ρ'^2 + ρ''^2 + z'^2 - ω^2(ρ'^2 + 4z'^2)) - \frac{h^2}{2M ρ^2} \left( \frac{k_1^2}{cos^2 ξ} + \frac{k_2^2}{sin^2 ξ} - \frac{1}{4} \right) \right] dt \right\}
(187)
\end{align*}

Circular Elliptic Coordinates:
\begin{align*}
ξ'(t') = ξ'' & \quad η'(t') = η'' & \quad z(t') = z'' \\
= \int_{ξ'(t') = ξ''} \int_{η'(t') = η''} \int_{z(t') = z''} Dξ(t) Dη(t) d^2 (sinh^2 ξ + sinh^2 η) Dz(t) \\
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} d^2 (sinh^2 ξ + sinh^2 η)(ξ''^2 + η'') - ω^2(cos^2 ξ cos^2 η + sinh^2 ξ sinh^2 η) + 4z'^2) \right]
\right\}
- \hbar^2 \frac{2M d^2}{2M } \left( \frac{k_1^2}{cos^2 ξ cos^2 η} + \frac{k_2^2}{sinh^2 ξ sinh^2 η} \right) \right\} dt \right\}
(188)
\end{align*}

and \( \Phi_n^{(α, β)} \) denote the wave-functions. \( K(V_2)(T) \) is explicitly soluble in cartesian and circular polar coordinates by means of the harmonic oscillator in \( z \), and the radial harmonic oscillator in \( x_1, x_2 \), respectively (note the similarity to the Hott potential)

\( K(V_2)(\vec{x}''', \vec{x}'; T) \)

Cartesian Coordinates:
\begin{align*}
= \sqrt{\frac{M ω}{ih sin 2\omega T}} \exp \left\{ \frac{M ω}{ih sin 2\omega T} \left[ (z'^2 + z''^2) cos 2ωT - 2z'z'' \right] \right\}
\times \left( \frac{M ω}{ih sin ω T} \right)^2 \prod_{i=1}^{2} x''_i \exp \left\{ \frac{M ω}{2ih} (x'^2_1 + x''^2_1) cot ωT \right\} I_k \left( \frac{M ωx''_1 x''_2}{ih sin ω T} \right)
(189)
\end{align*}

Circular Polar Coordinates \( (λ = 2n ± k_1 ± k_2 + 1) \):
\begin{align*}
= \sqrt{\frac{M ω}{ih sin 2ω T}} \exp \left\{ \frac{M ω}{ih sin 2ω T} \left[ (z'^2 + z''^2) cos 2ωT - 2z'z'' \right] \right\}
\times \frac{M ω}{ih sin ω T} \sum_{n=0}^{∞} \Phi_n(±k_2, ±k_1)(∅') \Phi_n(±k_2, ±k_1)(∅'') \exp \left\{ \frac{M ω}{2ih} (ρ'^2 + ρ''^2) cot ωT \right\} I_λ \left( \frac{M ωρ'ρ''}{ih sin ω T} \right)
(191)
\end{align*}
where the wave-functions and the energy-levels are given by \((N \text{ is the principal quantum number})

**Cartesian Coordinates:**

\[
\psi_{n_z,n_1,n_2}(x_1,x_2,z) = \frac{2M\omega}{\hbar} \prod_{i=1}^{2} \left( \frac{M\omega}{\hbar} \right)^{k_i/2} \sqrt{\frac{n_i!}{\Gamma(n_i + k_i + 1)}} \times x_1^{1/2 \pm k_1} \exp \left( \frac{-M\omega x_1^2}{2\hbar} \right) L_n^{(k_1)} \left( \frac{M\omega}{\hbar} x_1 \right) \times \sqrt{\frac{2M\omega}{\pi \hbar}} \frac{1}{2^{m_z}n_z!} \exp \left( \frac{-M\omega z^2}{\hbar} \right) H_n \left( \sqrt{\frac{2M\omega}{\hbar}} z \right), \tag{193}
\]

\[
E_N = \hbar \omega (N \pm k_1 \pm k_2 + \frac{5}{2}), \quad N = 2(n_1 + n_2) + n_z, \tag{194}
\]

**Circular Polar Coordinates (\(\lambda = 2n_1 \pm k_1 \pm k_2 + 1\):**

\[
\psi_{n_z,n,m}(z,\phi) = \Phi_n^{(\pm k_2,\pm k_1)}(\phi) \sqrt{\frac{2M\omega}{\hbar}} \frac{1}{2^{m_z}n_z!} \exp \left( \frac{-M\omega z^2}{\hbar} \right) H_n \left( \sqrt{\frac{2M\omega}{\hbar}} z \right) \times \sqrt{\frac{2M\omega}{\hbar}} \left( \frac{M\omega}{\hbar} \rho^2 \right)^{\lambda/2} \frac{m!}{\Gamma(m + \lambda + 1)} \exp \left( \frac{-M\omega \rho^2}{\hbar} \right) L_m^{(\lambda)} \left( \frac{M\omega}{\hbar} \rho^2 \right), \tag{195}
\]

\[
E_N = \hbar \omega (N \pm k_1 \pm k_2 + \frac{5}{2}), \quad N = 2(n + m) + n_z, \tag{196}
\]

and the \(\Phi_n^{(\pm k_2,\pm k_1)}(\phi)\) denote the wave-functions.

3.2.3. We consider the three-dimensional potential \((k_{1,2} > 0)\)

\[
V_3(\vec{x}) = -\frac{\alpha}{\sqrt{x^2 + y^2 + z^2}} + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2} \right). \tag{197}
\]

This potential can be interpreted as a maximally super-integrable generalization of the Coulomb potential. Note furthermore that the pure Coulomb potential has the same separating coordinate systems as \(V_3(\vec{x})\) and therefore the additional centrifugal terms do not spoil this property. The pure Coulomb path integral was discussed by many authors, e.g. Castrigiano and St"ark [14], Chetouani and Hammann [19, 20], Duru and Grosche [56], Kleinert [30, 31], Inomata [69], Kleinert [84], Pak and S"okmen [109], Steiner [118], and Storchak [22]. We formulate the path integrals in which this potential is separable

\[
K^{(V_3)}(\vec{x}''',\vec{x}''; T) = \int_{\vec{x}(t')=\vec{x}''}^{\vec{x}(t'')=\vec{x}'''} D\vec{x}(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \vec{\dot{x}}^2 + \frac{\alpha}{r} - \frac{\hbar^2}{2M} \sum_{i=1}^{2} \frac{k_i^2 - \frac{1}{4}}{x_i^2} \right] dt \right\} \tag{198}
\]

**Conical Coordinates:**

\[
r(t'')=r'' \quad \alpha(t'')=\alpha'' \quad \beta(t'')=\beta'' \]

\[
= \int_{r(t')=r'}^{r^2} r^2 Dr(t) \int_{\alpha(t')=\alpha'} D\alpha(t) \int_{\beta(t')=\beta'} D\beta(t) (k^2 \text{cn}^2 \alpha + k^2 \text{cn}^2 \beta) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( r^2 + r^2 (k^2 \text{cn}^2 \alpha + k^2 \text{cn}^2 \beta) (\dot{\alpha}^2 + \dot{\beta}^2) \right) + \frac{\alpha}{r} \right] \right\}
\]

\[\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( r^2 + r^2 (k^2 \text{cn}^2 \alpha + k^2 \text{cn}^2 \beta) (\dot{\alpha}^2 + \dot{\beta}^2) \right) + \frac{\alpha}{r} \right] \right\}
\]
Spherical Coordinates:

\[ r(t'') = r'' \quad \theta(t'') = \theta'' \quad \phi(t'') = \phi'' \]

\[
= \int_{r(t')}^{r''} r^2 D_r(t) \int_{\theta(t')}^{\theta''} \sin \theta D_\theta(t) \int_{\phi(t')}^{\phi''} D_\phi(t)
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( r^2 + r^2 \dot{\theta}^2 + r^2 \sin^2 \theta \dot{\phi}^2 \right) + \frac{\alpha}{r} - \frac{\hbar^2}{2Mr^2 \sin^2 \theta} \left( \frac{k_1^2}{\cos^2 \phi} + \frac{k_2^2}{\sin^2 \phi} - \frac{1}{4} \right) \right] dt \right\}
\]

Parabolic Coordinates:

\[ \eta(t'') = \eta'' \quad \xi(t'') = \xi'' \]

\[
= \int_{\eta(t')}^{\eta''} D_\eta(t) \int_{\xi(t')}^{\xi''} D_\xi(t)(\xi^2 + \eta^2) \xi \eta \int_{\phi(t')}^{\phi''} D_\phi(t)
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( (\xi^2 + \eta^2)(\xi''^2 + \eta''^2) + \xi''^2 \eta''^2 \right) + \frac{2\alpha}{\xi^2 + \eta^2} - \frac{\hbar^2}{2M \xi^2 \eta^2} \left( \frac{k_1^2}{\cos^2 \phi} + \frac{k_2^2}{\sin^2 \phi} - \frac{1}{4} \right) \right] dt \right\}
\]

Prolate Spheroidal II Coordinates \( (\lambda_1 = 2n \pm k_1 \pm k_2 + 1) \):

\[
\frac{\mu(t'') = \mu''}{\nu(t'') = \nu''}
\]

\[
= \int_{\mu(t')}^{\mu''} D_\mu(t) \int_{\nu(t')}^{\nu''} D_\nu(t) d^3(\sinh^2 \mu + \sin^2 \nu) \sin \nu \sinh \mu \int_{\phi(t')}^{\phi''} D_\phi(t)
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} d^2 \left( \sinh^2 \mu + \sin^2 \nu \right)(\mu''^2 + \nu''^2) + \sinh^2 \mu \sin \nu \phi^2 \right)
\right. \\
+ \frac{\alpha}{d(\cosh \mu + \cos \nu)} - \frac{\hbar^2}{2Md^2 \sinh^2 \mu \sin^2 \nu} \left( \frac{k_1^2}{\cos^2 \phi} + \frac{k_2^2}{\sin^2 \phi} - \frac{1}{4} \right) \right] dt \right\}
\]

\[
= (d^2 \sinh \mu' \sinh \mu'' \sin \nu' \sin \nu'')^{-1/2} \sum_{n=0}^{\infty} \Phi_n^{(\pm k_2, \pm k_1)}(\phi'') \Phi^{(\pm k_2, \pm k_1)}(\phi') \int_{\mathbb{R}} \frac{dE}{2\pi \hbar} e^{-iEt/\hbar} \int_{0}^{\infty} ds''
\times \int_{\mu(0) = \mu'}^{\mu''} D_\mu(s) \int_{\nu(0) = \nu'}^{\nu''} D_\nu(s) \exp \left\{ \frac{i}{\hbar} \int_{0}^{s''} \left[ \frac{M}{2} \left( \mu''^2 + \nu''^2 \right) + Ed^2 (\cosh^2 \mu - \cos^2 \nu) \right) + \alpha d(\cosh \mu - \cos \nu) - \frac{\hbar^2}{2M} \left( \frac{\lambda_1^2}{\sinh^2 \mu} + \frac{\lambda_2^2}{\sin^2 \nu} \right) \right] ds \right\}.
\]

We now obtain \( \lambda_1 = 2n \pm k_1 \pm k_2 + 1, \lambda_2 = m + \lambda_1 + \frac{1}{2}, \kappa = \alpha \sqrt{-M/2E/\hbar}, \) only the radial Green function can be explicitly evaluated.

\[
\frac{i}{\hbar} \int_{0}^{\infty} dT e^{iTE/\hbar} K^{(3)}(\vec{x}'', \vec{x}'; T)
\]

Spherical Coordinates:
The continuous wave-functions are

\[
\Psi_n,\omega,\phi,\theta, r = \sum_{m=-\infty}^{\infty} \Phi_n(\phi) \Phi_m(\theta) e^{i m \phi / \hbar} \sqrt{\frac{M \Gamma(\frac{1}{2} + \lambda_2)}{2 E \Gamma(2 \lambda_2 + 1)}} M_{\kappa, \lambda_2} \left( \sqrt{-8 ME r / \hbar} \right)
\]

The discrete state wave-functions in the spherical coordinates are

\[
\Psi_{n,\omega,\phi,\theta, r} = \sum_{m,l} \Phi_n(\phi) \Phi_m(\theta) e^{i m \phi / \hbar} \sqrt{\frac{M \Gamma(\frac{1}{2} + \lambda_2)}{2 E \Gamma(2 \lambda_2 + 1)}} M_{\kappa, \lambda_2} \left( \sqrt{-8 ME r / \hbar} \right)
\]

Parabolic Coordinates \((\omega = -2E/M)\):

\[
\Psi_{n,m,p}(\phi', \phi''; r') = \frac{\int_0^\infty \omega^2 ds'' \exp\left[-\frac{M \omega}{2i \hbar}(s''^2 + \xi''^2 + \eta''^2) \cot \omega s''\right]}{\hbar^2 p^2 / 2M - E}
\]

The discrete state wave-functions in the spherical coordinates are

\[
\Psi_{n,m,l}(\phi, \phi', \theta, \phi'') = \sum_{n,m} \Phi_n(\phi) \Phi_m(\theta) e^{i m \phi / \hbar} \sqrt{\frac{M \Gamma(\frac{1}{2} + \lambda_2)}{2 E \Gamma(2 \lambda_2 + 1)}} M_{\kappa, \lambda_2} \left( \sqrt{-8 ME r / \hbar} \right)
\]

The continuous wave-functions are

\[
\Psi_{n,m,p}(\phi, \phi', \theta, \phi'') = \sum_{n,m} \Phi_n(\phi) \Phi_m(\theta) e^{i m \phi / \hbar} \sqrt{\frac{M \Gamma(\frac{1}{2} + \lambda_2)}{2 E \Gamma(2 \lambda_2 + 1)}} M_{\kappa, \lambda_2} \left( \sqrt{-8 ME r / \hbar} \right)
\]

The discrete state wave-functions in parabolic coordinates are

\[
\Psi_{n,n_1,n_2}(\phi, \xi, \eta) = \sum_{n_1,n_2} \Phi_n(\phi) \sqrt{\frac{2}{a^2 N^2}} \left[ \frac{2 \Gamma(n_1 + 1)}{\Gamma(n_1 + 1 + 1) \Gamma(n_2 + 1 + 1)} \right]^{1/2} \exp\left(-\frac{\xi^2 + \eta^2}{2aN} \right) L_{\lambda_1}^{(\lambda_1)} \left( \frac{\xi^2}{aN} \right) L_{\lambda_2}^{(\lambda_2)} \left( \frac{\eta^2}{aN} \right)
\]

The continuous wave-functions are

\[
\Psi_{n,p,\zeta}(\phi, \xi, \eta) = \sum_{n} \Phi_n(\phi) \sqrt{\frac{2}{a^2 N^2}} \left[ \frac{2 \Gamma(n_1 + 1)}{\Gamma(n_1 + 1 + 1) \Gamma(n_2 + 1 + 1)} \right]^{1/2} \exp\left(-\frac{\xi^2 + \eta^2}{2aN} \right) L_{\lambda_1}^{(\lambda_1)} \left( \frac{\xi^2}{aN} \right) L_{\lambda_2}^{(\lambda_2)} \left( \frac{\eta^2}{aN} \right)
\]
For the expansion into the wave-functions one uses (135) and performs the variable substitution 
\( (p_x, p_y) \mapsto [(1/a + \zeta)/2p, (1/a - \zeta)/2p], a = \hbar^2/M\alpha. \) \( \zeta \) is the parabolic separation constant.

3.2.4. We consider the potential \((k_{1,2,3} > 0)\)

\[
V_4(\vec{x}) = \frac{\hbar^2}{2M} \left( \frac{k_1^2 x}{y^2 \sqrt{x^2 + y^2}} + \frac{k_2^2}{y^2} + \frac{k_3^2}{z^2} - \frac{1}{4} \right)
\]

(214)

Note that for \( k_3^2 - \frac{1}{4} = 0 \) we obtain a trivial extension of the \( \alpha = 0 \) case of the two-dimensional maximally super-integrable potential \( V_3(\vec{x}) \). We formulate the path integral in spherical, circular polar, circular parabolic and circular elliptic II coordinates, respectively

\[
K^{(V_4)}(\vec{x}'', \vec{x}'; T) = \int_{\vec{x}(t'')=\vec{x}''}^{\vec{x}(t')=\vec{x}'} D\vec{x}(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \dot{z}^2 - \frac{\hbar^2}{2M} \left( \frac{k_1^2}{y^2 \sqrt{x^2 + y^2}} + \frac{k_2^2}{y^2} + \frac{k_3^2}{z^2} - \frac{1}{4} \right) \right] dt \right\}
\]

(215)

**Spherical Coordinates:**

\[
\rho(t'')=\rho'' \quad \theta(t'')=\theta'' \quad \phi(t'')=\phi''
\]

\[
= \int_{\rho(t')=\rho'}^{\rho''} \int_{\theta(t')=\theta'}^{\theta''} \int_{\phi(t')=\phi'}^{\phi''} dr D\rho(t) \sin \theta D\theta(t) D\phi(t) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (r^2 + r^2 \dot{\theta}^2 + r^2 \sin^2 \theta \dot{\phi}^2) \right. \right.
\]

\[
- \frac{\hbar^2}{2M r^2} \left( \frac{1}{\sin^2 \theta} \left( \frac{k_1^2 + k_1^2 - \frac{1}{4}}{4 \sin^2 \frac{\rho}{2}} + \frac{k_2^2 + k_2^2 - \frac{1}{4}}{4 \cos^2 \frac{\rho}{2}} - \frac{1}{4} \right) \right. \left. + \frac{k_3^2 - \frac{1}{4}}{4 \cos^2 \theta} - \frac{1}{4} \right) \left. \right] dt \right\}
\]

(216)

**Circular Polar Coordinates:**

\[
\rho(t'')=\rho'' \quad \phi(t'')=\phi'' \quad z(t'')=z''
\]

\[
= \int_{\rho(t')=\rho'}^{\rho''} \int_{\phi(t')=\phi'}^{\phi''} \rho d\rho(t) \int_{\theta(t')=\theta'}^{\theta''} D\phi(t) \int_{z(t')=z'}^{z''} Dz(t) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (\rho^2 + \rho^2 \dot{\phi}^2 + z^2) \right. \right.
\]

\[
- \frac{\hbar^2}{2M} \left( \frac{1}{\rho^2} \left( \frac{k_1^2 + k_1^2 - \frac{1}{4}}{4 \cos^2 \frac{\rho}{2}} + \frac{k_2^2 + k_2^2 - \frac{1}{4}}{4 \sin^2 \frac{\rho}{2}} - \frac{1}{4} \right) \right. \left. + \frac{k_3^2 - \frac{1}{4}}{4 \cos^2 \theta} - \frac{1}{4} \right) \left. \right] dt \right\}
\]

(217)

**Circular Elliptic II Coordinates:**

\[
\xi(t'')=\xi'' \quad \eta(t'')=\eta'' \quad z(t'')=z''
\]

\[
= \int_{\xi(t')=\xi'}^{\xi''} \int_{\eta(t')=\eta'}^{\eta''} D\xi(t) D\eta(t) d^2(\sinh^2 \xi + \sin^2 \eta) \int_{z(t')=z'}^{z''} Dz(t) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( (\sinh^2 \xi + \sin^2 \eta)(\dot{\xi}^2 + \dot{\eta}^2) + \dot{z}^2 \right) + \frac{\alpha}{d(\cosh \xi + \cos \eta)} \right. \right.
\]

\[
- \frac{\hbar^2}{2M} \left( \frac{1}{d^2 \sinh^2 \xi \sin^2 \eta} \left( \frac{k_1^2 \cosh \xi \cos \eta + 1}{\cosh \xi \cos \eta} + k_2^2 \frac{1}{2} \right) \right. \left. + \frac{k_3^2 - \frac{1}{4}}{4 \cos^2 \theta} - \frac{1}{4} \right) \left. \right] dt \right\}
\]

(218)

**Circular Parabolic Coordinates:**

\[
\eta(t'')=\eta'' \quad \xi(t'')=\xi'' \quad z(t'')=z''
\]

\[
= \int_{\eta(t')=\eta'}^{\eta''} \int_{\xi(t')=\xi'}^{\xi''} D\eta(t) D\xi(t) (\xi^2 + \eta^2) \int_{z(t')=z'}^{z''} Dz(t) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( (\xi^2 + \eta^2)(\dot{\xi}^2 + \dot{\eta}^2) + \dot{z}^2 \right) \right. \right.
\]

(219)
\[- \frac{\hbar^2}{2M} \left( \frac{k^2_1 (\eta^2 - \xi^2)}{\xi^2 \eta^2 (\xi^2 + \eta^2)} + \frac{k^2_2 - \frac{1}{4}}{\xi^2 \eta^2} + \frac{k^2_3 - \frac{1}{4}}{z^2} \right) \right\} dt \right\}.

(219)

We obtain for the path integral solutions \( \lambda_\pm^2 = k^2_2 \pm k^2_1 \), \( \lambda_1 = n + (\lambda_+ + \lambda_- + 1)/2 \), \( \lambda_2 = 2m + \lambda_1 \pm k_3 + 1 \).
In the path integral evaluation subsequently the path integral solution for the Pöschl-Teller potential

\[ K^{(V)}(\bar{x}'', \bar{x}'', T) \]

**Spherical Coordinates:**

\[
\frac{1}{2} (r' r'' \sin \theta' \sin \theta'')^{-1/2} \sum_{n=0}^{\infty} \Phi_n^{(\lambda_+, \lambda_-)} \left( \frac{\phi'}{2} \right) \Phi_n^{(\lambda_+, \lambda_-)} \left( \frac{\phi''}{2} \right) \\
\times \frac{M}{i \hbar T} \exp \left[ \frac{i M}{2 \hbar T} (r'^2 + r''^2) \right] \sum_{m=0}^\infty \Phi_m^{(\lambda_1, \pm k_3)} \Phi_n^{(\lambda_1, \pm k_3)} I_{\lambda_2} \left( \frac{M r' r''}{i \hbar T} \right)
\]

\[
= \sum_{n,m=0}^{\infty} \int_0^\infty dp e^{-i E_p T / \hbar} \Phi_n^{\epsilon_1} \Phi_n^{\epsilon_2} \Phi_n^{\epsilon_3} I_{\lambda_2} \left( \frac{M r' r''}{i \hbar T} \right)
\]

**Circular Polar Coordinates:**

\[
\left( \frac{M}{i \hbar T} \right)^2 \sqrt{z' z''} \exp \left[ \frac{i M}{2 \hbar} (z'^2 + z''^2) \right] I_{\lambda_2} \left( \frac{M z' z''}{i \hbar T} \right) \\
\times \frac{1}{2} \sum_{n=0}^\infty \Phi_n^{(\lambda_+, \lambda_-)} \left( \frac{\phi'}{2} \right) \Phi_n^{(\lambda_+, \lambda_-)} \left( \frac{\phi''}{2} \right) I_{\lambda_2} \left( \frac{M \rho' \rho''}{i \hbar T} \right)
\]

\[
= \sum_{n=0}^{\infty} \int_0^\infty dp z \int_0^\infty dp e^{-i E_p T / \hbar} \Phi_n^{\epsilon_1} \Phi_n^{\epsilon_2} I_{\lambda_2} \left( \frac{M z' z''}{i \hbar T} \right)
\]

**Circular Parabolic Coordinates:**

\[
\left( \frac{M}{i \hbar T} \right)^2 \sqrt{z' z''} \exp \left[ \frac{i M}{2 \hbar} (z'^2 + z''^2) + \rho'^2 + \rho''^2 \right] I_{\lambda_2} \left( \frac{M z' z''}{i \hbar T} \right) \\
\times \frac{1}{2} \sum_{n=0}^\infty \Phi_n^{(\lambda_+, \lambda_-)} \left( \frac{\phi'}{2} \right) \Phi_n^{(\lambda_+, \lambda_-)} \left( \frac{\phi''}{2} \right) I_{\lambda_2} \left( \frac{M \rho' \rho''}{i \hbar T} \right)
\]

\[
= \sum_{n=0}^{\infty} \int_0^\infty dp \int_0^\infty dp e^{-i E_p T / \hbar} \Psi_n^{\epsilon_1} \Psi_n^{\epsilon_2} \left( \frac{M z' z''}{i \hbar T} \right)
\]

(\zeta is the parabolic separation constant) where the wave-functions and the energy-spectra are given by

**Spherical Coordinates:**

\[
\Psi_{n,m,p}^{\epsilon_1} \left( \theta, \phi, \rho \right) = (2 \sin \theta)^{-1/2} \Phi_n^{(\lambda_+, \lambda_-)} \left( \frac{\phi}{2} \right) \Phi_n^{(\lambda_1, \pm k_3)} \left( \theta \right) \sqrt{\rho} J_{\lambda_2} \left( \rho \right) ,
\]

\[
E_p = \frac{\hbar^2}{2 M} p^2 ,
\]

**Circular Polar Coordinates:**

\[
\Psi_{n,p_1}^{\epsilon_1} \left( \phi, \rho, z \right) = \sqrt{p_1 \rho} J_{\lambda_2} \left( p_1 z \right) J_{\lambda_1} \left( \rho \right) 2^{-1/2} \Phi_n^{(\lambda_+, \lambda_-)} \left( \frac{\phi}{2} \right) ,
\]

\[
E_{p_1} = \frac{\hbar^2}{2 M} \left( p_1^2 + p^2 \right) ,
\]

**Circular Parabolic Coordinates:**

\[
\Psi_{p_2, \zeta}^{\epsilon_1} \left( z, \xi, \eta \right) = \sqrt{p_2 z} J_{\lambda_2} \left( p_2 z \right) \Gamma(1/2 + \lambda_+ + i \xi) \Gamma(1/2 + \lambda_- - i \xi) e^{\pi/2 a p} \\
\times M_{-\zeta/2 p_1 \lambda_+ /2} \left( -i p \xi \right) M_{-\zeta/2 p_1 \lambda_- /2} \left( -i p \eta \right) ,
\]

\[
E_{p_2} = \frac{\hbar^2}{2 M} \left( p_2^2 + p^2 \right) .
\]

In the path integral evaluation subsequently the path integral solution for the Pöschl-Teller potential and the radial harmonic oscillator have been used. The spectral expansion in the
Applying (234) gives in an obvious way the spectral expansion of the circular parabolic case, and for the remaining path integrations we obtain the identity
\[ \int_{\kappa}^{\infty} \rho z^3.2.5. \]

Hille-Hardy formula (93). For the spherical coordinates the expansion into radial wave-functions, and for the circular super-integrable potential \( V \)
in circular elliptic II coordinates the \( \rho \)-dependent kernel are performed by means of the functional weight formulation
\[ r(t') = r'' \]
\[ \int_{\rho(t') = \rho'}^{\infty} \mu_{\lambda}[\rho^2] D r(t) \exp \left( \frac{i M}{2\hbar} \int_{t'}^{t''} \rho^2 dt \right) = \sqrt{r''} \frac{M}{i\hbar_T} \exp \left[ \frac{i M}{2\hbar_T} (r'^2 + r''^2) \right] I_\lambda \left( \frac{M r^2}{i\hbar_T} \right) \]
\[ = \sqrt{r'} \frac{M}{\hbar_T} \int_{0}^{\infty} pd p e^{-\frac{1}{4} p^2} J_\lambda(p r') J_\lambda(p r'') . \]

Applying (234) gives in an obvious way the spectral expansion of the \( z \) and \( \rho \)-dependent kernel. For the extraction of the continuous states in parabolic one applies (135) by introducing a Coulomb coupling \( \alpha \) and sets \( a = \infty \), i.e. infinite Bohr radius, in the in the final formulæ.

In circular elliptic II coordinates the \( z \)-path integration is separated in the same way as for the circular parabolic case, and for the remaining path integrations we obtain the identity
\[ K_{V_b}(x'', x'; T) \]
\[ = \frac{M}{i\hbar_T} \sqrt{z'' z''} \exp \left[ \frac{i M}{2\hbar_T} (z'^2 + z''^2) \right] \]
\[ \times \int \frac{dE}{2\pi \hbar} e^{-iE T / \hbar} \int_{0}^{\infty} ds'' \int_{\xi(0) = \xi'}^{\xi(\infty) = \xi''} D\xi(s) \int_{\eta(0) = \eta'}^{\eta(\infty) = \eta''} D\eta(s) \]
\[ \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (\xi'^2 + \eta'^2) + E d^2 (\cos^2 \xi - \cos^2 \eta) \right. \right. \]
\[ \left. \left. - \frac{\hbar^2}{2M} \left( \frac{k_2^2 - \frac{1}{4}}{\sin^2 \eta} + \frac{k_2^2 + k_2 \cos \xi}{\sin^2 \xi} \right) \right] \right\} . \]

For the spherical coordinates the expansion into radial wave-functions, and for the circular parabolic coordinates the expansion of the \( z \)-dependent kernel are performed by means of the Hille-Hardy formulæ (133).

3.2.5. We consider the potential \( (k_{1,2} > 0) \)
\[ V_b(x) = \frac{\hbar^2}{2M} \left( \frac{k_2^2 x}{y^2 \sqrt{x^2 + y^2}} + \frac{k_2^2 - \frac{1}{4}}{y^2} \right) - k_3 z . \]

Note that for \( k_3 = 0 \) we obtain a trivial extension of the \( \alpha = 0 \) two-dimensional maximally super-integrable potential \( V_3(x) \). We obtain the path integral formulations
\[ K_{V_b}(x'', x'; T) \]

Circular Polar Coordinates:
\[ \rho(t'') = \rho'' \quad \phi(t'') = \phi'' \quad z(t'') = z'' \]
\[ = \int_{\rho(t') = \rho'}^{\rho''} \int_{\phi(t') = \phi'}^{\phi''} \int_{z(t') = z'}^{z''} \rho D \rho(t) \phi D \phi(t) z D z(t) \]
\[ \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (\rho^2 + \rho^2 \phi^2 + z^2) - k_3 z \right. \right. \]
\[ \left. \left. - \frac{\hbar^2}{2M \rho^2} \left( \frac{k_2^2 - k_2^2 - \frac{1}{4}}{4 \cos^2 \frac{\phi}{2}} + \frac{k_2^2 + k_2^2 - \frac{1}{4}}{4 \sin^2 \frac{\phi}{2}} \right) \right] \right\} . \]
Circular Elliptic II Coordinates:
\[
\frac{\xi(t'')=\xi''}{\eta(t'')=\eta''} \int_{\xi(t')=\epsilon'}^{\xi''} \int_{\eta(t')=\eta'}^{\eta''} D\xi(t) D\eta(t) D\xi(t') D\eta(t') D\xi(t'') D\eta(t'') \frac{M}{2} \left( \sinh^2 \xi + \sin^2 \eta \right) \frac{1}{z(t')=z''} \frac{1}{z(t')=z'} \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \sinh^2 \xi + \sin^2 \eta \right) \left( \dot{\xi}^2 + \dot{\eta}^2 + z^2 \right) - k_3 z - \frac{\hbar^2}{2M} \left( k_1 \cosh \xi \cos \eta + 1 + k_2 - \frac{1}{2} \right) \right] dt \right\}
\]

Circular Parabolic Coordinates:
\[
\frac{\eta(t'')=\eta''}{\xi(t'')=\xi''} \int_{\eta(t')=\eta'}^{\eta''} \int_{\xi(t')=\xi'}^{\xi''} D\eta(t) D\xi(t) D\eta(t) D\xi(t) \frac{M}{2} \left( \xi^2 + \eta^2 \right) \left( \dot{\xi}^2 + \dot{\eta}^2 + z^2 \right) - \frac{\hbar^2}{2M} \left( k_1 \eta^2 - \xi^2 + k_2 \left( \frac{1}{2} \frac{2}{2} \right) - k_3 z \right) dt \right\}
\]

Parabolic Coordinates \((\lambda^2 = k_1^2 + k_2^2)\):
\[
\frac{\eta(t'')=\eta''}{\xi(t'')=\xi''} \int_{\eta(t')=\eta'}^{\eta''} \int_{\xi(t')=\xi'}^{\xi''} D\eta(t) D\xi(t) D\eta(t) D\xi(t) \frac{M}{2} \left( \eta^2 + \xi^2 \right) \left( \dot{\eta}^2 + \dot{\xi}^2 + \lambda^2 \right) \left( \dot{\eta}^2 + \dot{\xi}^2 \right) \left( \lambda^2 - k_1^2 - \frac{1}{4} \right) - \frac{\hbar^2}{2M} \left( \frac{1}{2} \frac{1}{2} \right) \left( \dot{\xi}^2 + \dot{\eta}^2 \right) \right) \]

The path integral in parabolic coordinates cannot be done due to the \(\xi^4, \eta^4\) dependence. Actually \(V_5\) represents a Stark effect. In the cases of the circular polar and circular parabolic coordinates the corresponding Green function can be evaluated by means of the path integral solution for the linear potential \(B\) for the \(z\)-path integration, and the radial harmonic oscillator in the \((r, \phi)\), and in the \(\xi\)- and \(\eta\)-path integration \([\lambda_{\pm}^2 = k_1^2 \pm k_2^2, \lambda_1 = n + (\lambda_+ + \lambda_- + 1)/2] \)

**Circular Polar Coordinates:**
\[
K^{(V_5)}(\bar{z}'', \bar{z}'', T) = \left( \frac{M}{2\pi \hbar T} \right)^{1/2} \exp \left\{ \frac{i}{\hbar} \left( \frac{M}{2T} \left( \bar{z}' - \bar{z}' \right)^2 - \frac{k_3 T}{2} (\bar{z}' + \bar{z}'') - \frac{k_3 T^3}{24 M} \right) \right\}
\]
\[ \psi(z, \phi, \rho) = \left( \frac{2M}{\hbar^2 \sqrt{k}} \right)^{1/3} \text{Ai} \left[ \left( \frac{z - E_z}{k} \right) \left( \frac{2Mk}{\hbar^2} \right)^{1/3} \right] 2^{-1/2} \Phi_{\lambda, \lambda_\pm}^{(1/2)} \left( \frac{\phi}{2} \right) \sqrt{p}J_\lambda(p) , \tag{246} \]

\[ E_{E_z, p} = E_z + \frac{\hbar^2}{2M} p^2 , \tag{247} \]

Circular Parabolic Coordinates:
\[ \psi_{E_z, p, \zeta}(z, \xi, \eta) = \left( \frac{2M}{\hbar^2 \sqrt{k}} \right)^{1/3} \text{Ai} \left[ \left( \frac{z - E_z}{k} \right) \left( \frac{2Mk}{\hbar^2} \right)^{1/3} \right] \times \frac{\Gamma \left( \frac{1+\lambda_\pm}{2} + \frac{i}{2p} \right) \Gamma \left( \frac{1+\lambda_\pm}{2} - \frac{i}{2p} \right) e^{\pi/2p}}{2\pi \sqrt{p} \eta \Gamma \left( 1 + \lambda_- \right) \Gamma \left( 1 + \lambda_+ \right)} M_{-i\xi/2p, \lambda_+/2} M_{i\xi/2p, \lambda_-/2} , \tag{248} \]

\[ E_{E_z, \zeta} = E_z + \frac{\hbar^2}{2M} p^2 . \tag{249} \]

\( \zeta \) is the parabolic separation constant.

The expansion into the wave-function in the \( z \) coordinates is done according to \((248), \) \( \text{Ai}(z) \) are Airy functions:
\[ z(t') = z'' \]
\[ \int_{z(t') = z} \mathcal{D}z(t) \exp \left[ \frac{i}{\hbar} \int_{t'}^{t''} \left( \frac{m}{2} z^2 - k z \right) dt \right] \]
\[ = \left( \frac{M}{2\pi i \hbar T} \right)^{1/2} \exp \left[ \frac{i}{\hbar} \left( \frac{M}{2T} (z'' - z')^2 - \frac{kT}{2} (z' + z'') - \frac{k^2 T^3}{24M} \right) \right] \]
\[ = \int_{\mathbb{R}} dE e^{-iET/\hbar} \left( \frac{2M}{\hbar^2 \sqrt{k}} \right)^{2/3} \text{Ai} \left[ \left( \frac{z' - E_z}{k} \right) \left( \frac{2Mk}{\hbar^2} \right)^{1/3} \right] \text{Ai} \left[ \left( z'' - E_z \right) \left( \frac{2Mk}{\hbar^2} \right)^{1/3} \right] . \tag{251} \]

The expansion into the radial wave-functions for the circular polar coordinates is performed by the Weber formula \((234).\)

### 3.3. Three-Dimensional Minimally Super-Integrable Smorodinsky-Winternitz Potentials.

We discuss in this subsection the eight three-dimensional minimally super-integrable potentials.
The are characterized by having four functionally independent integrals of motion. In the sequel \( \vec{x} \) denotes a three-dimensional coordinate: \( \vec{x} = (x, y, z) \equiv (x_1, x_2, x_3) \).

In Table 4 we list the three-dimensional minimally super-integrable Smorodinsky-Winternitz potentials together with the separating coordinate systems (where the italicized coordinates systems were not mentioned in [35]). The cases where an explicit path integration is possible are underlined.

**Table 4:** The three-dimensional minimally super-integrable potentials

| Potential \( V(x, y, z) \) | Coordinate System |
|-----------------------------|------------------|
| \( V_1 = F(r) + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2} + \frac{k_3^2 - \frac{1}{4}}{z^2} \right) \) | Spherical |
| \( V_2 = \frac{M}{2} \omega^2(x^2 + y^2) + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2} \right) + F(z) \) | Conical |
| \( V_3 = \frac{M}{2} \omega^2(x^2 + y^2) + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2} + \frac{k_3^2 - \frac{1}{4}}{z^2} \right) + F(z) \) | Cartesian |
| \( V_4 = -\frac{\alpha}{\sqrt{x^2 + y^2}} + \frac{\hbar^2}{2M} \left( \frac{k_1^2 x}{y^2 \sqrt{x^2 + y^2}} + \frac{k_2^2 - \frac{1}{4}}{y^2} \right) + F(z) \) | Circular Polar |
| \( V_5 = \frac{M}{2} \omega^2(x^2 + y^2 + z^2) + \frac{\hbar^2}{2M} \left( \frac{k_3^2 - \frac{1}{4}}{z^2} + \frac{F(y/x)}{x^2 + y^2} \right) \) | Circular Parabolic |
| \( V_6 = \frac{M}{2} \omega^2(x^2 + y^2 + 4z^2) + \frac{\hbar^2}{2M} \frac{F(y/x)}{x^2 + y^2} \) | Spherical |
| \( V_7 = -\frac{\alpha}{r} + \frac{\hbar^2}{2M(x^2 + y^2)} \left( \frac{k_1^2 z}{r} + F \left( \frac{y}{x} \right) \right) \) | Circular Polar |
| \( V_8 = -\frac{\alpha}{\rho} + \sqrt{\frac{2}{\rho}} \left( \frac{\beta_1 \cos \phi}{2} + \frac{\beta_2 \sin \phi}{2} \right) + F(z) \) | Spherical |

3.3.1. We consider the potential \( (r = |\vec{x}|, k_{1,2,3} > 0) \)

\[
V_1(\vec{x}) = F(r) + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2} + \frac{k_3^2 - \frac{1}{4}}{z^2} \right). \tag{252}
\]
We formulate the path integral in the separating coordinate systems and obtain

\[
K^{(V_1)}(\vec{x}'', \vec{x}'; T) = \int_{\vec{x}(t') = \vec{x}'}^{\vec{x}(t'') = \vec{x}''} D\vec{x}(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \dot{\vec{x}}^2 - F(r) - \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2} + \frac{k_3^2 - \frac{1}{4}}{z^2} \right) \right] dt \right\}
\]  

(253)

Spherical Coordinates:

\[
\begin{aligned}
& \quad \theta(t'') = \theta'' \quad \phi(t'') = \phi'' \\
& = \int_{r(t') = r'}^{r(t'') = r''} r^2 D\alpha(t) \int \sin \theta D\theta(t) \int D\phi(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \dot{r}^2 + r^2 \dot{\theta}^2 + r^2 \sin^2 \theta \dot{\phi}^2 \right) - F(r) \right. \\
& \quad \left. - \frac{\hbar^2}{2M r^2} \left( \frac{1}{\sin^2 \theta} \left( \frac{k_1^2 - \frac{1}{4}}{\cos^2 \phi} + \frac{k_2^2 - \frac{1}{4}}{\sin^2 \phi} - \frac{1}{4} \right) + \frac{k_3^2 - \frac{1}{4}}{\cos^2 \theta} - \frac{1}{4} \right) \right] dt \right\} 
\end{aligned}
\]

(254)

Conical Coordinates:

\[
\begin{aligned}
& \quad \alpha(t'') = \alpha'' \quad \beta(t'') = \beta'' \\
& = \int_{r(t') = r'}^{r(t'') = r''} r^2 D\alpha(t) \int D\alpha(t) \int D\beta(t) D\beta(t) (k^2 \alpha^2 + k^2 \alpha^2 \beta) \\
& \quad \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \dot{r}^2 + r^2 \dot{\alpha}^2 + r^2 \alpha^2 \beta (\dot{\alpha}^2 + \dot{\beta}^2) \right) - F(r) \right. \\
& \quad \left. - \frac{\hbar^2}{2M r^2} \left( \frac{k_1^2 - \frac{1}{4}}{\sin^2 \alpha \alpha^2 \beta} + \frac{k_2^2 - \frac{1}{4}}{\cos^2 \alpha \alpha^2 \beta} + \frac{k_3^2 - \frac{1}{4}}{\cos^2 \beta \alpha^2 \beta} \right) \right] dt \right\} .
\end{aligned}
\]

(255)

For this potential the angular path integrations can be easily done and one is left with a radial path integral \[10\], i.e. \((\lambda_1 = 2n + k_1 \pm k_2 + 1, \lambda_2 = 2m + \lambda_1 \pm k_3 + 1)\)

\[
K^{(V_1)}(\vec{x}'', \vec{x}'; T) = (r^2 r''^2 \sin \theta' \sin \theta'')^{-1/2} \sum_{n=0}^{\infty} \Phi_n(\pm k_2, \pm k_1) (\phi'') \Phi_{n}(\pm k_2, \pm k_1) (\phi') \sum_{m=0}^{\infty} \Phi_m(\lambda_1, \pm k_3) (\theta'') \Phi_m(\lambda_1, \pm k_3) (\theta') \\
\times \int_{r(t') = r'}^{r(t'') = r''} D\alpha(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left( \frac{M}{2} r^2 - F\left( \frac{r^2}{2M} \right) \right) dt \right\}
\]

(256)

\[
\equiv (r^2 r''^2 \sin \theta' \sin \theta'')^{-1/2} \sum_{n=0}^{\infty} \Phi_n(\pm k_2, \pm k_1) (\phi'') \Phi_{n}(\pm k_2, \pm k_1) (\phi') \sum_{m=0}^{\infty} \Phi_m(\lambda_1, \pm k_3) (\theta'') \Phi_m(\lambda_1, \pm k_3) (\theta') \\
\times \int_{r(t') = r'}^{r(t'') = r''} \mu_{\lambda_1} [r^2] D\alpha(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left( \frac{M}{2} r^2 - F\left( r \right) \right) dt \right\}
\]

(257)

\[
= \sum_{m,n=0}^{\infty} \int dE_{\lambda_1} e^{-iE_{\lambda_1}} / h \Phi_{n}(\lambda_1, \pm k_3) (\theta'') \Phi_{m}(\lambda_1, \pm k_3) (\theta') \Phi_{n,m}(\theta', \phi', r') \Phi_{n,m}(\theta'', \phi'', r'')
\]

(258)

Here use has been made of the functional weight formulation in path integrals according to \[59, 61, 113\]. The wave-functions have the form

\[
\Phi_{\lambda_1,n,l}(\theta, \phi, r) = (r^2 \sin \theta)^{-1/2} \Phi_n(\pm k_2, \pm k_1) (\phi) \Phi_m(\lambda_1, \pm k_3) (\theta) \Phi_{n,l}(r),
\]

(259)

where \(\Phi_{\lambda_1}(r)\) are the radial wave-functions. Of special interest are the cases \(F(r) = m\omega^2 r^2 / 2\) and \(F(r) = -\alpha / r\), c.f. 3.2.1 and 3.2.3, respectively.
3.3.2. The next three potentials represent a simple $z$-dependence extension of the two-dimensional potentials $V_1 - V_3$. We consider the potential $(k_{1,2} > 0)$

$$V_2(\vec{x}) = \frac{M}{2} \omega^2 (x^2 + y^2) + \frac{\hbar^2}{2M} \left( \frac{k_1^2 - \frac{1}{4}}{x^2} + \frac{k_2^2 - \frac{1}{4}}{y^2} \right) + F(z) \ .$$  \ (260)

For the case of $F(z) = 2M\omega^2 z^2$ there is an additional coordinate system, the parabolic coordinates, which separate $V_2$, c.f. the three-dimensional maximally super-integrable potential $V_2$. Here now we have

$$K^{(V_2)}(\vec{x}'', \vec{x}'; T)$$

**Cartesian Coordinates:**

$$\vec{x}(t'') = \vec{x}' \Rightarrow \int_{\vec{x}(t') = \vec{x}'} \mathcal{D}\vec{x}(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \dot{x}^2 - \omega^2 (x^2 + y^2) \right) - \frac{\hbar^2}{2M} \sum_{i=1}^{2} \frac{k_i^2}{x_i^2} - F(z) \right] dt \right\} \ .$$  \ (261)

**Circular Polar Coordinates:**

$$z(t'') = z'' \quad \rho(t'') = \rho'' \quad \phi(t'') = \phi''$$

$$= \int_{z(t') = z'} \mathcal{D}z(t) \int_{\rho(t') = \rho'} \rho \mathcal{D}\rho(t) \int_{\phi(t') = \phi'} \mathcal{D}\phi(t) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \dot{\rho}^2 + \rho^2 \dot{\phi}^2 - \omega^2 \rho^2 \right) - \frac{\hbar^2}{2M\rho^2} \left( \frac{k_1^2 - \frac{1}{4}}{\cos^2 \phi} + \frac{k_2^2 - \frac{1}{4}}{\sin^2 \phi} - \frac{1}{4} \right) - F(z) \right] dt \right\} \ .$$  \ (262)

**Circular Elliptic Coordinates:**

$$z(t'') = z'' \quad \xi(t'') = \xi'' \quad \eta(t'') = \eta''$$

$$= \int_{z(t') = z'} \mathcal{D}z(t) \int_{\xi(t') = \xi'} \mathcal{D}\xi(t) \int_{\eta(t') = \eta'} \mathcal{D}\eta(t) d^2(\sinh^2 \xi + \sin^2 \eta) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( d^2(\sin^2 \xi + \sin^2 \eta)(\dot{\xi}^2 + \dot{\eta}^2) + \dot{z}^2 - \omega^2 d^2(\cosh^2 \xi \cos^2 \eta + \sinh^2 \xi \sin^2 \eta) \right) - F(z) \right] \right\} \ .$$  \ (263)

Except for the $z$-path integration, we can perform in the case of cartesian and circular polar the path integration explicitly yielding

$$K^{(V_2)}(\vec{x}''', \vec{x}''; T)$$

**Cartesian Coordinates:**

$$= \left( \frac{M\omega}{i\hbar \sin \omega T} \right)^3 \prod_{i=1}^{2} \sqrt{x_i' x_i''} \exp \left[ - \frac{M\omega}{2i\hbar} (x_i'^2 + x_i''^2) \cot \omega T \right] I_{k_1} \left( \frac{M\omega x_i' x_i''}{i\hbar \sin \omega T} \right)$$

$$\times \int_{z(t') = z'} \mathcal{D}z(t) \exp \left[ \frac{i}{\hbar} \int_{t'}^{t''} \left( \frac{M}{2} \dot{z}^2 - F(z) \right) dt \right] \ .$$  \ (264)

**Circular Polar Coordinates** ($\lambda_1 = 2n \pm k_1 \pm k_2 + 1$):

$$= \sum_{n_1, n_2 = 0}^{\infty} e^{-iE_{n_1, n_2} T / h} \Phi_{n_1, n_2}(x_1', x_2') \Psi_{n_1, n_2}(x_1'', x_2'') \int dE_{\lambda_2} e^{-iE_{\lambda_2} T / h} \Phi_{\lambda_2}(z'') \Phi_{\lambda_2}(z'') \ .$$  \ (265)

**Circular Polar Coordinates** ($\lambda_1 = 2n \pm k_1 \pm k_2 + 1$):

$$= \frac{M\omega}{i\hbar \sin \omega T} \sum_{n=0}^{\infty} \Phi(\pm k_2, \pm k_1) \Phi(\pm k_2, \pm k_1) \exp \left[ - \frac{M\omega}{2i\hbar} (\rho^2 + \rho_n^2) \cot \omega T \right] I_{k_1} \left( \frac{M\omega \rho \rho_n}{i\hbar \sin \omega T} \right) \times K_F(z'', z'; T) \ .$$  \ (266)
\[ \sum_{n,m=0}^{\infty} e^{-iE_{n,m}T/h} \psi_{n,m}(\phi', \rho') \psi_{n,m}(\phi'', \rho'') \int dE_{\lambda_n} e^{-iE_{\lambda_n}T/h} \Phi^*_{\lambda_n}(z') \Phi_{\lambda_n}(z'') \] (267)

and in the sequel we denote the remaining \( z \)-path integral by

\[ K_F(z'', z'; T) = \int dE_{\lambda_n} e^{-iE_{\lambda_n}T/h} \Phi^*_{\lambda_n}(z') \Phi_{\lambda_n}(z'') . \] (268)

The wave-functions in \((x, y)\) and \((\rho, \phi)\) are the same as in 3.1.1.

### 3.3.3. We consider the potential \((k_2 > 0)\)

\[ V_3(\vec{x}) = \frac{M}{2} \omega^2(4x^2 + y^2) + \frac{h^2 k_2^2}{2M} \frac{1}{y^2} + F(z) . \] (269)

Due to the similarity of the corresponding two-dimensional case in 3.1.2 we just give the path integral formulations which have the form

\[ K^{(V_3)}(\vec{x}'', \vec{x}'; T) \]

**Cartesian Coordinates:**

\[
\left. \begin{array}{l}
\int \mathcal{D} \vec{x}(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (\vec{x}'^2 - \omega^2(4x'^2 + y'^2)) - F(z) - \frac{h^2 k_2^2}{2M} \frac{1}{y^2} \right] dt \right\} \\
= \sum_{n,l=0}^{\infty} e^{-iE_{n,l}T/h} \psi_{n,l}(x'', y'') \psi_{n,l}(x', y') \int dE_{\lambda_n} e^{-iE_{\lambda_n}T/h} \Phi^*_{\lambda_n}(z') \Phi_{\lambda_n}(z'') \\
\end{array} \right. \] (270)

**Circular Parabolic Coordinates:**

\[
\left. \begin{array}{l}
\int \mathcal{D} \eta(t) \int \mathcal{D} \xi(t) (\xi^2 + \eta^2) \\
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( (\xi'^2 + \eta'^2)(\xi^2 + \eta^2) - \omega^2(\xi''^2 - \eta''^2)^2 - \xi^2 \eta^2 \right) - \frac{k_1}{2} (\xi^2 - \eta^2) - \frac{h^2 k_2^2}{2M} \frac{1}{y^2} \right] dt \right\} \\
\times K_F(z'', z'; T) , \\
\end{array} \right. \] (272)

with the same Feynman kernel and wave-functions in \((x, y)\) as in 3.1.2.

### 3.3.4. We consider the potential \((k_{1,2} > 0)\)

\[ V_4(\vec{x}) = -\frac{\alpha}{\sqrt{x^2 + y^2}} + \frac{h^2}{2M} \left( \frac{k_2^2 x}{y^2 \sqrt{x^2 + y^2}} + \frac{k_2^2}{y^2} - \frac{1}{4} \right) + F(z) , \] (273)

We formulate the path integral in circular polar and circular parabolic coordinates, respectively

\[ K^{(V_4)}(\vec{x}'', \vec{x}'; T) \]

\[
\left. \begin{array}{l}
\int \mathcal{D} \vec{x}(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \frac{x'^2}{\sqrt{x'^2 + y'^2}} + \frac{\alpha}{\sqrt{x'^2 + y'^2}} - \frac{h^2}{2M} \left( \frac{k_2^2 x}{y^2 \sqrt{x^2 + y^2}} + \frac{k_2^2}{y^2} - \frac{1}{4} \right) - F(z) \right] dt \right\} \\
\end{array} \right. \] (274)

**Circular Polar Coordinates:**

\[
\left. \begin{array}{l}
= \int \rho(t') \phi(t') \int \mathcal{D} \rho(t) \mathcal{D} \phi(t) \\
\end{array} \right. \]
\[
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \rho'^2 + \rho^2 \phi'^2 \right) + \frac{\alpha}{\rho} - \frac{\hbar^2}{2M\rho^2} \left( \frac{k_2^2 - k_1^2 - \frac{1}{4}}{4 \cos^2 \frac{\phi}{2}} + \frac{k_2^2 + k_1^2 - \frac{1}{4}}{4 \sin^2 \frac{\phi}{2}} - \frac{1}{4} \right) \right] dt \right\} \\
\times K_F(z'', z'; T) \\
\]

(275)

Circular Elliptic II Coordinates:

\[
\xi(t'')=\xi'' \quad \eta(t'')=\eta'' \\
= \int_{\xi(t')=\xi'}^{\eta(t')=\eta'} \mathcal{D}\xi(t) \int_{\eta(t')=\eta'}^{\eta(t')=\eta'} \mathcal{D}\eta(t) d^2(z'' + \eta^2) \int \mathcal{D}z(t) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \left( \sin^2 \xi' + \sin^2 \eta' \right) \left( \xi'^2 + \eta'^2 \right) + z^2 \right) + \frac{\alpha}{d \cosh \xi + \cosh \eta} - F(z) \right. \\
\left. - \frac{\hbar^2}{2M} \frac{1}{d \sinh^2 \xi \sinh^2 \eta} \left( \frac{k_1^2 \cosh \xi \cos \eta + 1}{\cosh \xi + \cos \eta} + \frac{k_1^2 - \frac{1}{2}}{2} \right) \right] dt \right\} \\
\]

(276)

Circular Parabolic Coordinates:

\[
\eta(t'')=\eta'' \quad \xi(t'')=\xi'' \\
= \int_{\eta(t')=\eta'}^{\eta(t')=\eta'} \mathcal{D}\eta(t) \int_{\xi(t')=\xi'}^{\xi(t')=\xi'} \mathcal{D}\xi(t) (\xi'^2 + \eta'^2) \int \mathcal{D}z(t) \times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \left( \xi'^2 + \eta'^2 \right) \left( \xi'^2 + \eta'^2 \right) + z^2 \right) + \frac{2\alpha}{\xi'^2 + \eta'^2} - F(z) \right. \\
\left. - \frac{\hbar^2}{2M} \left( \frac{k_1^2 \eta'^2 - \xi'^2}{\xi'^2 \eta'^2 \left( \xi'^2 + \eta'^2 \right)} + \frac{k_1^2 - \frac{1}{2}}{\xi'^2 \eta'^2} \right) \right] dt \right\} . \\
\]

(277)

The circular polar an circular parabolic path integral formulations can be explicitly evaluated in terms of the corresponding Green function \((\lambda_2^2 = k_2^2 \pm k_1^2, \lambda_1 = n + (\lambda_+ + \lambda_- + 1)/2, \kappa = \alpha \sqrt{-M/2E/\hbar})\)

\[
K^{(V)}(\vec{x}'', \vec{x}'; T) \\
\]

Circular Polar Coordinates:

\[
= K_F(z'', z'; T)(\rho'^2 + \rho^2)^{-1/2} \frac{1}{2} \sum_{n=0}^{\infty} \Phi_{n}(\lambda_+, \lambda_-) \left( \frac{\phi'}{2} \right) \Phi_{n}(\lambda_+, \lambda_-) \left( \frac{\phi''}{2} \right) \\
\times \frac{1}{\hbar} \int_{\mathbb{R}} \frac{dE}{2\pi\hbar} e^{-iET/\hbar} \sqrt{-M \Gamma \left( \frac{1}{2} + \lambda_1 - \kappa \right) \Gamma \left( 1 + 2\lambda_1 \right)} W_{\kappa, \lambda_1} \left( \sqrt{-8ME/\hbar} \rho_+ \right) M_{\kappa, \lambda_1} \left( \sqrt{-8ME/\hbar} \rho_- \right) \\
= \int \frac{dE_{\lambda_1}}{} e^{-iE_{\lambda_1} T/\hbar} \Phi_{\lambda_1}(z') \Phi_{\lambda_1}(z'') \\
\times \sum_{m=0}^{\infty} \left\{ \sum_{n=0}^{\infty} \frac{\Phi_{\lambda_1,m}(\rho', \phi') \Phi_{\lambda_1,m}(\rho'', \phi'')}{E_n - E} + \int_{\mathbb{R}} \frac{d\rho'}{h^2 p^2/2M - E} \right\} \\
\times \int_{\mathbb{R}} \frac{d\rho''}{h^2 p^2/2M - E} \\
\]

(278)

Circular Parabolic Coordinates:

\[
= \int \frac{dE_{\lambda_1}}{} e^{-iE_{\lambda_1} T/\hbar} \Phi_{\lambda_1}(z') \Phi_{\lambda_1}(z'') \\
\times \left\{ \sum_{n_1, n_2=0}^{\infty} \frac{\Psi_{n_1, n_2}(\xi', \eta') \Psi_{n_1, n_2}(\xi'', \eta'')}{E_{n_1, n_2} - E} + \int_{\mathbb{R}} \frac{d\xi'}{h^2 p^2/2M - E} \right\} , \\
\]

(279)

(280)

with the same wave-functions in \((\phi, \rho)\) and \((\xi, \eta)\) as in 3.2.3.

3.3.5. The next three potential involve an arbitrary \(\phi\)-dependence where \(F(y/x) = \gamma^2 > 0\) describes the well-known double ring-shaped oscillator (c.f. e.g. Carpio-Bernido et al. [12, 13], Kibler et al. [76, 77, 81], Lutsenko et al. [91], and Quesne [116]). We consider the potential
We consider the spherical and circular polar coordinate cases, the others can be treated in a similar way as far as the separation of the $\phi$-path integration is concerned. We denote the

$$K^{(V_5)}(\vec{x}''', \vec{x}'; T)$$

Spherical Coordinates:

$$r(t'')=r'' \quad \theta(t'')=\theta'' \quad \phi(t'')=\phi''$$

$$= \int_{r(t')=r'} r^2 \mathcal{D}r(t) \int \sin \theta \mathcal{D}\theta(t) \int \mathcal{D}\phi(t)$$

$$\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \dot{r}^2 + r^2 \dot{\theta}^2 + r^2 \sin^2 \theta \dot{\phi}^2 - \omega^2 r^2 \right) \right. \right.$$

$$\left. - \frac{\hbar^2}{2Mr^2} \left( \frac{F(\tan \phi) - \frac{1}{4}}{\sin^2 \theta} + \frac{k_3^2 - \frac{1}{4}}{z^2} \right) \right] dt \right\} \tag{282}$$

Circular Polar Coordinates:

$$z(t'')=z'' \quad \rho(t'')=\rho'' \quad \phi(t'')=\phi''$$

$$= \int_{z(t')=z'} \mathcal{D}z(t) \int \rho \mathcal{D}\rho(t) \int \mathcal{D}\phi(t)$$

$$\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \rho^2 + \rho^2 \dot{\phi}^2 + z^2 - \omega^2 (\rho^2 + z^2) \right) \right. \right.$$

$$\left. - \frac{\hbar^2}{2M} \left( \frac{F(\tan \phi) - \frac{1}{4}}{\rho^2} + \frac{k_3^2 - \frac{1}{4}}{z^2} \right) \right] dt \right\} \tag{283}$$

Oblate Spheroidal Coordinates:

$$\mu(t'')=\mu'' \quad \nu(t'')=\nu'' \quad \phi(t'')=\phi''$$

$$= \int_{\mu(t')=\mu'} \mathcal{D}\mu(t) \int \nu \mathcal{D}\nu(t) d^3 \left( \cosh^2 \mu - \sin^2 \nu \right) \cosh \mu \sin \nu \int \mathcal{D}\phi(t)$$

$$\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \cosh^2 \mu - \sin^2 \nu \right) (\dot{\mu}^2 + \dot{\nu}^2) + \cosh^2 \mu \sin^2 \nu \dot{\phi}^2 \right. \right.$$

$$\left. - \omega^2 (\cosh^2 \mu \sin^2 \nu + \sinh^2 \mu \cos^2 \nu) \right. \right.$$

$$\left. - \frac{\hbar^2}{2Md^2} \left( \frac{F(\tan \phi) - \frac{1}{4}}{\cosh^2 \mu \sin^2 \nu + \frac{k_3^2 - \frac{1}{4}}{\sinh^2 \mu \cos^2 \nu} \cosh \mu \sin \nu} \right) \right] dt \right\} \tag{284}$$

Prolate Spheroidal Coordinates:

$$\mu(t'')=\mu'' \quad \nu(t'')=\nu'' \quad \phi(t'')=\phi''$$

$$= \int_{\mu(t')=\mu'} \mathcal{D}\mu(t) \int \nu \mathcal{D}\nu(t) d^3 \left( \sinh^2 \mu + \sin^2 \nu \right) \sinh \mu \sin \nu \int \mathcal{D}\phi(t)$$

$$\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \sinh^2 \mu + \sin^2 \nu \right) (\dot{\mu}^2 + \dot{\nu}^2) + \sinh^2 \mu \sin^2 \nu \dot{\phi}^2 \right. \right.$$

$$\left. - \omega^2 (\sinh^2 \mu \sin^2 \nu + \cosh^2 \mu \cos^2 \nu) \right. \right.$$

$$\left. - \frac{\hbar^2}{2Md^2} \left( \frac{F(\tan \phi) - \frac{1}{4}}{\sinh^2 \mu \sin^2 \nu + \frac{k_3^2 - \frac{1}{4}}{\cosh^2 \mu \cos^2 \nu} \cosh \mu \sin \nu} \right) \right] dt \right\} \tag{285}$$

We consider the spherical and circular polar coordinate cases, the others can be treated in a similar way as far as the separation of the $\phi$-path integration is concerned. We denote the
energy-spectrum of the \( \phi \)-dependent problem by \( E_{\lambda \phi} = \hbar^2 \lambda_\phi^2 / 2M \). The most important case occurs when \( F(\tan \phi) = \text{constant} \). Then the quantum motion in \( \phi \) are just circular waves and we have in this case \( \Phi_{\lambda \phi}(\phi) = \Phi_\nu(\phi) = e^{i \nu \phi \sqrt{2n} \pi} (\nu \in \mathbb{Z}) \). This is also the case for the potentials \( V_6 \) and \( V_7 \). We have \( \lambda_2 = 2n + \lambda_\phi \pm k_3 + 1 \)
We consider the potential $F(r)$ and write down the corresponding path integral formulations

\begin{align}
K(V_5)(\vec{x}'', \vec{x}'; T) &= \langle \phi'' | \Phi \rangle \langle \Phi | \phi' \rangle \\
&= \int \mathcal{D}z(t) \int \rho \mathcal{D}\rho(t) \int \mathcal{D}\phi(t) \\
&\quad \delta [z(t) - \vec{x}'] \delta [\rho(t) - \bar{r}] \delta [\phi(t) - \phi] \\
&= \int \mathcal{D}z(t) \int \rho \mathcal{D}\rho(t) \int \mathcal{D}\phi(t) \\
&\quad \delta [z(t) - \vec{x}'] \delta [\rho(t) - \bar{r}] \delta [\phi(t) - \phi]
\end{align}

We obtain the following path integral formulations in the corresponding separable coordinate systems:

**Circular Polar Coordinates:**

\begin{align}
K_{\lambda_\phi, n_\phi, \Lambda} &= \frac{2M\omega}{\hbar} \left( \frac{M\omega}{\hbar} \right)^{3/2} \sqrt{\frac{n_\phi}{n_\phi + 1}} \exp \left( - \frac{M\omega}{\hbar} \rho^2 \right) L_{n_\phi}^{(\Lambda)} \left( \frac{M\omega}{\hbar} \rho^2 \right) \\
E_N &= \hbar \omega(N \pm k_3 + 2), \quad N = 2l + 2n + \lambda_\phi.
\end{align}

**Spherical Coordinates:**

\begin{align}
\Phi_{\lambda_\phi, \Lambda}(\phi, \theta) &= \frac{2M\omega}{\hbar} \left( \frac{M\omega}{\hbar} \right)^{3/2} \sqrt{\frac{n_\phi}{n_\phi + 1}} \exp \left( - \frac{M\omega}{\hbar} \rho^2 \right) L_{n_\phi}^{(\Lambda)} \left( \frac{M\omega}{\hbar} \rho^2 \right) \\
E_N &= \hbar \omega(N \pm k_3 + 2), \quad N = 2l + 2n + \lambda_\phi.
\end{align}

For $F(\tan \phi) = constant$, $\lambda_\phi = |\nu|$, c.f. also $V_6$ and $V_7$.

**3.3.6.** We consider the potential

\begin{align}
V_6(\vec{x}) &= \frac{M}{2} \omega^2 (x^2 + y^2 + 4z^2) + \frac{\hbar^2}{2M} F(y/x).
\end{align}

We obtain the following path integral formulations in the corresponding separable coordinate systems:

\begin{align}
K(V_6)(\vec{x}'', \vec{x}'; T) &= \int \mathcal{D}z(t) \int \rho \mathcal{D}\rho(t) \int \mathcal{D}\phi(t) \\
&\quad \delta [z(t) - \vec{x}'] \delta [\rho(t) - \bar{r}] \delta [\phi(t) - \phi]
\end{align}
\[
\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} \left( \rho^2 + \rho^2 \phi^2 + z^2 - \omega^2 (\rho^2 + 4z^2) \right) - \hbar^2 \frac{F(\tan \phi) - \frac{1}{4}}{2M \rho^2} \right] dt \right\} \quad (295)
\]

\[
= (\rho' \rho'')^{-1/2} \int dE_{\lambda_\phi} \Phi^*_{\lambda_\phi}(\phi') \Phi_{\lambda_\phi}(\phi'')
\]

\[
\times \int z(t') = z' \quad \rho(t') = \rho' \\quad \int z(t'') = z'' \quad \rho(t'') = \rho''
\]

\[
= \int dE_{\lambda_\phi} \sum_{n_z=1}^{\infty} e^{-iE_{n_z,m}T/\hbar} \Psi^*_{n_z,\lambda_\phi,m}(\phi', \rho', z') \Psi_{n_z,\lambda_\phi,m}(\phi'', \rho'', z'') \quad (297)
\]

**Parabolic Coordinates:**

\[
= (\xi'^\prime \eta'^\prime \eta'^\prime) \int dE_{\lambda_\phi} \Phi^*_{\lambda_\phi}(\phi') \Phi_{\lambda_\phi}(\phi'')
\]

\[
\times \int \frac{dE}{2\pi^2} \frac{e^{-iET/\hbar}}{\hbar} \int_0^T ds'' \int_0^T D\eta(s) \int_0^T D\xi(s)
\]

\[
\times \exp \left\{ \frac{i}{\hbar} \int_{s'}^{s''} \left[ \frac{M}{2} \left( (\xi'^2 + \eta'^2) - \omega^2 (\xi'^2 + \eta'^2) \right) + E(\xi'^2 + \eta'^2) - \hbar^2 \frac{\lambda_\phi^2 - \frac{1}{4}}{2M} \left( \frac{1}{\xi'^2} + \frac{1}{\eta'^2} \right) \right] ds \right\} \quad (298)
\]

Here we have used the same notation as in the previous case. The wave-functions and the energy-spectrum in **circular polar coordinates** are given by

\[
\Psi_{n_z,\lambda_\phi,m}(\phi, \rho, z) = \Phi_{\lambda_\phi}(\phi) \left[ \frac{2M \omega}{\hbar} \left( \frac{M \omega}{\hbar} \rho^2 \right)^{\lambda_\phi/2} \right]^{m!} \frac{1}{\sqrt{\Gamma(m + \lambda_\phi + 1)}} \exp \left( - \frac{M \omega}{2\hbar} \rho^2 \right) L_m(\lambda_\phi) \left( \frac{M \omega}{\hbar} \rho^2 \right)
\]

\[
\times \sqrt{\frac{2M \omega}{\pi \hbar}} \frac{1}{2^{m+n_z}} \exp \left( - \frac{M \omega}{2\hbar} z^2 \right) H_{n_z} \left( \frac{2M \omega}{\hbar} z \right) \quad (299)
\]

\[
E_{n_z,m} = \hbar \omega (2m + \lambda_\phi + n_z + \frac{\lambda_\phi}{2}) \quad (300)
\]

**3.3.7.** We consider \( (k_1 > 0) \)

\[
V(x) = -\frac{\alpha}{\sqrt{x^2 + y^2 + z^2}} + \frac{\hbar \omega}{2 M (x^2 + y^2 + z^2 + F \left( \frac{y}{x} \right))} \quad (301)
\]

For \( F(y/x) = \gamma^2 > 0 \) this potential is known as the ring-shaped Hartmann potential (c.f. Calogero [3], Carpio-Bernido et al. [4], Chetouani at al. [5], Gerry [6], Granovsky et al. [7], Grosche [8], Guha and Mukherjee [9], Hartmann [10], Kibler et al. [11], Lutsen et al. [12], Vaidya and Boschi-Filho [13], and Zhedanov [14]; compare also the connection with a Coulomb plus Aharonov-Bohm solenoid, e.g. Chetouani et al. [15], Kibler and Negad [16], and Sökmen [17]). We write down the corresponding path integral formulations where only the corresponding Green function can be evaluated \( |\lambda_\perp^2 = \lambda_\parallel^2 + k_1^2 |, \lambda_1 = n + (\lambda_+ + \lambda_- + 1)/2, \alpha = \sqrt{-M/2\hbar} \)

\[
\frac{i}{\hbar} \int_0^T dT e^{iET/\hbar} K^{(V)}(x''', x'''', T)
\]

**Spherical Coordinates:**

\[
= \frac{i}{\hbar} \int_0^T dT e^{iET/\hbar} \int r(t'') \int_0^\phi \int_0^{\pi} d\phi(t) \phi(t'') = \phi''
\]

\[
= \frac{i}{\hbar} \int_0^T dT e^{iET/\hbar} \int r(t') \int_0^\phi \int_0^{\pi} d\phi(t) \phi(t') = \phi'
\]

52
The continuous wave-functions are

\[ (r^2 r''^2 \sin \theta' \sin \theta'')^{-1/2} \int dE \Phi_{n}(\psi') \Phi_{m}(\phi'') \frac{1}{2} \sum_{n=0}^{\infty} \Phi_{n}(\lambda_{+}, \lambda_{-}) \left( \frac{\theta'}{2} \right) \Phi_{n}(\lambda_{+}, \lambda_{-}) \left( \frac{\theta''}{2} \right) \]

Parabolic Coordinates:

\[ x = \exp \left\{ \frac{i}{\hbar} \int_{\psi'}^{\psi''} \left[ \frac{M}{2} \left( r^2 + r''^2 + r^2 \sin^2 \theta' \right) \right. \right. \]
\[ + \frac{\alpha}{2} \left. - \frac{\hbar^2}{2Mr^2} \left( k_1^2 \cos \theta + \frac{F(\tan \phi) - \frac{1}{4}}{\sin^2 \theta} - \frac{1}{4} \right) \right] dt \}

(302)

(303)

Parabolic Coordinates:

\[ \frac{1}{\hbar} \int_{0}^{\infty} d\eta e^{iEt/\hbar} \int_{\eta}^{\eta''} d\xi \int_{\xi}^{\xi''} d\phi \int_{\phi}^{\phi''} D\eta(t) D\xi(t) D\phi(t) \]

\[ \exp \left\{ \frac{i}{\hbar} \int_{\psi'}^{\psi''} \left[ \frac{M}{2} \left( (\xi'^2 + \eta'^2)(\xi''^2 + \eta''^2) + \xi^2 \eta^2 \phi' \phi'' \right) \right. \right. \]
\[ + \frac{2\alpha}{\xi'^2 + \eta'^2} - \frac{\hbar^2}{2M\xi'^2 \eta'^2} \left( k_1^2 \eta'^2 - \xi'^2 + \xi^2 \right) + F(\tan \phi) - \frac{1}{4} \right] dt \}

(305)

(306)

The bound state wave-functions in the polar coordinates are

\[ \Psi_{n,m,l}(\theta, \phi, r) = (2 \sin \theta)^{-1/2} \Phi_{n}^{*}(\phi) \Phi_{m}(\lambda_{+}, \lambda_{-}) \left( \frac{\theta}{2} \right) \]
\[ \times \frac{2}{(l + \lambda_{1} + \frac{1}{2})^2} \left[ \Gamma(l + \frac{1}{2}) \Gamma(l + 2\lambda_{1} + 1) \right]^{1/2} \]
\[ \times \left( \frac{2r}{a(l + \lambda_{1} + \frac{1}{2})} \right)^{\lambda_{1}} \exp \left( - \frac{r}{a(l + \lambda_{1} + \frac{1}{2})} \right) L_{l}(2\lambda_{1}) \left( \frac{2r}{a(l + \lambda_{1} + \frac{1}{2})} \right) , \]

(307)

\[ E_{N} = -\frac{M \alpha^2}{h^2 N^2} , \quad N = l + n + \frac{1}{2}(1 + \lambda_{-} + \lambda_{+}) . \]

(308)

The continuous wave-functions are

\[ \Psi_{n,l,b}(\theta, \phi, r) = (2 \sin \theta)^{-1/2} \Phi_{n}^{*}(\phi) \Phi_{b}(\lambda_{+}, \lambda_{-}) \left( \frac{\theta}{2} \right) \]
\[ \times \frac{\Gamma(\frac{1}{2} + \lambda_{2} - i/\alpha)}{\sqrt{2\pi r} \Gamma(2\lambda_{2} + 1)} \exp \left( \frac{\pi}{2\alpha p} \right) M_{l,b} \left( -2ipr \right) . \]

(309)

The wave-functions in parabolic coordinates are the same as in 3.2.3, except for the modification that \( \lambda_{\pm}^2 = \lambda_{\phi}^2 \pm k_{1}^2 \) instead of \( \lambda_{\pm}^2 = k_{2} \pm k_{1}^2 \).
The potential $V_7$ is also separable in prolate spheroidal II coordinates and we have the identity

$$K^{(V_7)}(\vec{x}''', \vec{x}''; T)$$

$$= \int_{\mu(t')=\mu'}^{\mu(t'')=\mu''} \mathcal{D} \mu(t) \mathcal{D} \nu(t) d^3(\sin^2 \mu + \sin^2 \nu) \sin \nu \sinh \mu \int_{\phi(t')=\phi'}^{\phi(t'')=\phi''} \mathcal{D} \phi(t)$$

$$\times \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{\hbar^2}{2M} \left( \sin^2 \mu + \sin^2 \nu \right) \left( \mu^2 + \nu^2 \right) + \sin^2 \mu \sin^2 \nu \phi^2 \right]$$

$$+ \frac{\alpha}{d(\cosh \mu + \cos \nu)} - \frac{\hbar^2}{2Md^2 \sin^2 \mu \sin^2 \nu} \left( \frac{k^2 (\cosh \mu \cos \nu + 1)}{\cosh \mu + \cos \nu} + F(\tan \phi) - \frac{1}{4} \right) \right\} dt \right\}$$

$$= (d^2 \sinh \mu' \sin \mu'' sin \nu' \sin \nu'')^{-1/2} \int dE \lambda \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi \Phi \lambda \Phi (310) \right\}$$

Unfortunately we cannot solve this path integral.

3.3.8. We consider the potential $V_8(\vec{x}) = -\frac{\alpha}{\rho} + \sqrt{\frac{2}{\rho}} \left( \beta_1 \cos \frac{\phi}{2} + \beta_2 \sin \frac{\phi}{2} \right) + F(z).$ (312)

This potential is the same potential as in 3.1.4 with an additional $z$-dependence via $F(z)$. The corresponding path integral formulations and solutions in mutually orthogonal circular parabolic coordinates are therefore a straightforward combination of the results of 3.1.4 and $K_F(z''', z''; T)$.

4. Summary.

In the present work we have made the first step in the classification of all the presently possible path integral solutions of the Smorodinsky-Winternitz potentials in two and three dimensions. This approach as compared with the Schrödinger approach has advantages as well as disadvantages. The advantages are that the path integral gives a global view of the problem in question, whereas the Schrödinger equation only a local one. This property enables one to incorporate into the Feynman path integral many important features like topological effects, perturbation theory as well as the investigation of non-perturbative effects, semi-classical expansion of the propagator, and many more. It is quite likely that the Feynman path integral is possibly the only consistent way to incorporate renormalization theory in a unified field theory. Therefore it is always important to investigate solvable quantum systems “from the point of view of fluctuating paths” [31]. A further advantage is that the explicit computation of the propagator (the Feynman kernel), respectively the (energy-dependent) Green’s function, gives simultaneously the spectral expansion into the wave-functions and the energy spectrum.

A disadvantage is the fact that an explicit path integration can be done only in a limited number of coordinate systems, namely in polar, spherical, and some problems in parabolic coordinates, respectively coordinate systems which are related to them. Path integral evaluations
in, say, elliptic, paraboloidal and other parametric coordinate systems are not accessible. One may say that one of the very advantages of the Feynman path integral, i.e. its global approach to a quantum mechanical problem, leads in these cases to a disadvantage, because the actual path integration would require “addition theorems” in terms of special functions of parametric coordinate systems, i.e. their corresponding spherical functions of the Laplace operator. Such “addition theorems” are not to our disposal presently. However, it seems reasonable that a path integral identity in conical coordinates can be derived via the path integral on the sphere $S^2$, where for the spherical functions a representation in terms of Jacobi functions is chosen.

Explicitly solvable models always involve solutions in terms of hypergeometric and confluent hypergeometric functions. We have seen that in at least one coordinate system each of the discussed Smorodinsky-Winternitz potentials can be solved in terms of these higher transcendental functions. In the parameter dependent coordinates the solution cannot be written in closed form. Therefore an investigation of the Feynman path integral in such coordinate systems is desirable and further studies along these lines will be subject to future work. This is not idle doing, then, for instance, the spheroidal coordinate system is only one into which the two-center problem separates. In future investigations we will try to discuss these more complicated problems.

The present work does not claim a full analysis of the quantum mechanical Smorodinsky-Winternitz system. Such an analysis must include not only a comprehensive classification but also the determination of the interbasis coefficients of the wave-functions of the same energy. This requires the knowledge of the dynamical symmetry group which is responsible for the accidental degeneracy of the energy spectrum of a Smorodinsky-Winternitz potential.

In due time we will continue our work along the lines described above, and we will also try to include an analysis in which quantum mechanical problems in spaces of (positive and negative) constant curvature are taken into account. This will include a path integral approach of parametric coordinate systems on the sphere and pseudo-sphere, the study of the Coulomb- and the Higgs oscillator problem in particular, and of Smorodinsky-Winternitz potentials in spaces of constant curvature in general.

Acknowledgement.

G.S.Pogosyan would like to thank the members of the II. Institut für Theoretische Physik, Hamburg University, for their kind hospitality.

Appendix.

In this appendix we want to give a short discussion of the path integral problem of the anharmonic sextic oscillator as encountered in parabolic coordinates for the Holt potential. Let us consider the one-dimensional path integral

$$K(x'',x';T) = \int_{x(t)=x'}^{x(t'')=x''} Dx(t) \exp \left\{ \frac{i}{\hbar} \int_{t'}^{t''} \left[ \frac{M}{2} (\dot{x}^2 - \omega^2 x^6) + \frac{\hbar^2 k^2}{2M} x^2 - \frac{\hbar^2 \beta^2}{2M} x^2 \right] dt \right\}$$ (313)

Performing a combined space-time transformation with the new coordinate $z = x^4$, i.e. $x = F(z) = z^{1/4}$, and the new “pseudo-time” defined by $s_j - s_{j-1} = \delta_j = 16x_j^3 x_{j-1}^3 (t_j - t_{j-1})$ on the lattice, respectively $s'' = 16 \int_0^t x^6(s)ds$, we obtain the transformation formulae (c.f. [28, 40, 59, 61, 85, 110])

$$K(x'',x';T) = \int_{-\infty}^{\infty} \frac{dE}{2\pi i} e^{-iTE/\hbar} G(z'',z';E)$$ (314)
\[ G(z', z'; E) = \left[ F'(z')F'(z) \right]^{1/2} \frac{i}{\hbar} \int_{0}^{\infty} \hat{K}(z'', z'; s'') ds'' , \]  

(315)

and the kernel \( \hat{K}(z'', z'; s'') \) is given by \[ \lambda^2 - \frac{1}{4} = (\beta^2 + 15/4)16 \]

\[ \hat{K}(z'', z'; s'') = \int_{z(0)=z'}^{z(s'')=z''} Dz(s) \exp \left\{ \frac{1}{\hbar} \int_{0}^{s''} \left[ \frac{M}{2} z^2 + \frac{\hbar^2 k^2}{32Mz} + \frac{E}{16z^{3/2}} - \frac{\hbar^2 \lambda^2 - \frac{1}{4}}{z^2} \right] ds \right\} . \]  

(316)

We see that this path integral cannot be evaluated for \( E \neq 0 \). This corresponds in the case of the Holt potential (and all related ones as well) that we can only “solve” it for the parabolic separation parameter equal to zero.

If we now set \( E = 0 \) the path integral \( \hat{K}(s'') \) is actually a Coulomb potential problem. For the Coulomb potential the Feynman kernel is not known in closed form, however the corresponding Green’s function \( G(C)(E) \) is. Insertion in (315) gives the the zero-energy Green’s function of \( G(z'', z'; 0) = \left[ F'(z'')F'(z') \right]^{1/2} G(C) \left( z'', z'; -\frac{M\omega^2}{32} \right) \]  

(317)

\[ = (z'z'')^{1/8} \frac{4}{\hbar \omega} \frac{\Gamma \left( \frac{1}{2} + \lambda + \frac{\hbar k^2}{8M\omega} \right)}{\Gamma(1 + 2\lambda)} \times \left. \right|_{-\hbar k^2/8M\omega, \lambda} \left( \frac{M\omega}{2h} z'' \right) \left. \right|_{-\hbar k^2/8M\omega, \lambda} \left( \frac{M\omega}{2h} z' \right) . \]  

(318)

Note that this formula is a generalization of the result of Steiner [119] where only one power potential term was taken into account. It is obvious that in a similar way an \( x^{14} \) potential term can be considered instead of a \( x^6 \), leading to a (zero-energy) Green’s function of a radial harmonic oscillator. Furthermore, higher power potentials can be also treated by choosing another power dependence in the transformation \( x = F(z) \).

Note that the zero-energy Green’s function can also be evaluated in cases, where coordinate systems in flat space separate the Laplace equation (and not the Helmholtz, respectively the Schrödinger equation), i.e. coordinate systems which are R-separable, as for instance bispherical or toroidal coordinates.
