STABILITY ESTIMATE FOR AN INVERSE PROBLEM FOR THE TIME
HARMONIC MAGNETIC SCHRÖDINGER OPERATOR FROM THE NEAR
AND FAR FIELD PATTERN

MOURAD BELLASSOUED, HOUSSEM HADDAR, AND AMAL LABIDI

ABSTRACT. We derive conditional stability estimates for inverse scattering problems re-
lated to time harmonic magnetic Schrödinger equation. We prove logarithmic type esti-
mates for retrieving the magnetic (up to a gradient) and electric potentials from near field
or far field maps. Our approach combines techniques from similar results obtained in the
literature for inhomogeneous inverse scattering problems based on the use of geometrical
optics solutions.

1. INTRODUCTION AND MAIN RESULTS

1.1. Introduction. This paper is concerned with the inverse scattering problem of recov-
ering the magnetic and electric potentials in the magnetic Schrödinger model from near
field or far field measurements at a fixed frequency. The forward model is as follows (see
for instance [20, 10]). Let $D \subset \mathbb{R}^3$ be a bounded open set with smooth boundary such
that $\mathbb{R}^3 \setminus D$ is connected and let $A = (a_1, a_2, a_3) \in W^{1,\infty}(\mathbb{R}^3)^3$ be a real valued vector
modelling the magnetic potential and $q \in L^\infty(\mathbb{R}^3)$ be a complex valued function with
non negative imaginary part modelling the electric potential such that $\text{Supp}(A) \subset D$ and
$\text{Supp}(q) \subset D$. The magnetic Schrödinger operator we are considering is

$$H_{A,q} := -\left(\nabla + iA\right)^2 + q = -\Delta - Q_{A,q},$$

(1.1)

where $Q_{A,q}$ is the first order operator given by

$$Q_{A,q}v := i \text{div}(Av) + iA \cdot \nabla v - (|A|^2 + q)v, \quad v \in H^1_{\text{loc}}(\mathbb{R}^3).$$

(1.2)

The direct scattering problem in the near field setting can be phrased as follows. Let $B$
be a smooth bounded and simply connected domain (typically a ball) containing $D$ with
outward normal denoted by $\nu$ and let $y \in \partial B$ be the location of a point source. The total
field $u(\cdot, y)$ generated by the point source satisfies

$$H_{A,q}u(\cdot, y) - k^2 u(\cdot, y) = \delta_y \quad \text{in } \mathbb{R}^3,$$

(1.3)

with $\delta_y$ denoting the Dirac distribution at $y$ and $k > 0$ is the wave number. The total field
is decomposed into

$$u_{A,q}(\cdot, y) = \Phi(\cdot, y) + u^s_{A,q}(\cdot, y) \quad \text{in } \mathbb{R}^3,$$

(1.4)
where the scattered field \( u_{A,q}^s(\cdot, y) \in H^2_{\text{loc}}(\mathbb{R}^3) \) and satisfies the Sommerfeld radiation condition at infinity
\[
\lim_{r \to \infty} r \left( \partial_r u^s - i k u^s \right) = 0, \quad r = |x|
\]
uniformly with respect to \( \hat{x} = \frac{x}{|x|} \). The incident field is given by
\[
\Phi(x, y) := \frac{1}{4\pi} \frac{e^{ik|x-y|}}{|x-y|}, \quad x \neq y
\]
and is the fundamental solution of the Helmholtz equation, i.e. satisfying (1.3) for \( A = q = 0 \) together with the Sommerfeld radiation condition.

The first inverse problem that we shall investigate is to recover \( A \) and \( q \) from the knowledge \( u_{A,q}^s(x, y) \) for all \( (x, y) \in \partial B \times \partial B \). Defining the near field operator \( N_{A,q} : L^2(\partial B) \to L^2(\partial B) \), as
\[
N_{A,q} h(x) := \int_{\partial B} u_{A,q}^s(x, y) h(y) \, ds(y), \quad x \in \partial B,
\]
where \( u_{A,q}^s(\cdot, y) \) is given by (1.4) and satisfying (1.5), the inverse problem in the near field setting can be equivalently stated as identifying \( A \) and \( q \) from the knowledge of \( N_{A,q} \).

The direct scattering problem in the far field setting formally corresponds with letting \( |y| \to \infty \) in the direction \(-d \) with \( d \in S^2 \) (the unit sphere of \( \mathbb{R}^3 \)) and can be phrased as follows: Given an incident plane wave \( u^i(x, d) = e^{i k x \cdot d}, x \in \mathbb{R}^3 \), seek a total field \( u_{A,q}(\cdot, d) \) that satisfies
\[
\mathcal{H}_{A,q} u(\cdot, d) - k^2 u(\cdot, d) = 0 \quad \text{in } \mathbb{R}^3
\]
and can be decomposed into
\[
u_{A,q}(\cdot, d) = u^i(\cdot, d) + u_{A,q}^s(\cdot, d) \quad \text{in } \mathbb{R}^3,
\]
where the scattered field \( u_{A,q}^s(\cdot, d) \in H^2_{\text{loc}}(\mathbb{R}^3) \) and satisfies the Sommerfeld radiation condition. The latter implies in particular that the scattered field has the following asymptotic behavior as \( |x| \to \infty \),
\[
u_{A,q}^s(x, d) = \frac{e^{i k |x|}}{|x|} \left( u_{A,q}^\infty(\hat{x}, d) + O \left( \frac{1}{|x|} \right) \right),
\]
where \( u_{A,q}^\infty(\cdot, d) \) is the so-called far field pattern. The second inverse problem that we shall consider is the identification of \( A \) and \( q \) from the knowledge of \( u_{A,q}^\infty(\hat{x}, d) \) for all \( (\hat{x}, d) \in S^2 \times S^2 \).

Our main goal for both settings is to investigate the conditional stability of recovering the electric potential and the magnetic field from the given so-called full aperture measurements. Our strategy relies the use of geometrical optics solutions to the magnetic Schrödinger equation to derive estimates on the Fourier coefficients of these potentials under additional regularity assumptions. The stability for the electric potential requires the use of an adapted version of the Helmholtz decomposition. Transferring the results from the near field operator to the far field measurements necessitate a careful study of the near field to far field mapping. The reciprocity between the operators \( \mathcal{H}_{A,q} - k^2 \) and \( \mathcal{H}_{-A,q} - k^2 \) (supplemented with the radiation condition) and mixed reciprocity between far field and near field play a central role in the proofs.
In the absence of the magnetic potential \( A \), the study of the identifiability of \( q \) from full aperture measurements is one of the first foundational problems in inverse scattering theory and we refer to [14, 16, 17, 23] for pioneering uniqueness results under various (regularity) assumptions. In the presence of a magnetic potential \( A \), we remark that there is an obstruction to uniqueness for both near field and far field settings (as has been noted in [22] for instance). In fact, the scattered field outside a ball \( B \) containing \( D \) is invariant under the gauge transformation of the magnetic potential. Namely, given \( \varphi \in W^{2,\infty}(\mathbb{R}^3) \) with support compactly embedded in \( B \) and letting \( \tilde{u} = u(x)e^{-i\varphi(x)} \) one easily observes that

\[
\mathcal{H}_{A+\nabla\varphi,q}\tilde{u} := -(\nabla + i(A + \nabla\varphi))^2\tilde{u} + q(x)\tilde{u} = e^{-i\varphi(x)}\mathcal{H}_{A,q}u.
\]  

(1.11)

Since \( \varphi = 0 \) outside \( B \), \( \tilde{u} \) then satisfies the same equation as \( u \), namely (1.4) (respectively (1.9)) in the near field setting (respectively in the far field setting) with \( \mathcal{H}_{A,q} \) replaced by \( \mathcal{H}_{A+\nabla\varphi,q} \). Let us denote by \( u^s_{A+\nabla\varphi,q} \) the scattered field associated with the potentials \( A + \nabla\varphi \) and \( q \). From uniqueness of solutions to the above stated scattering problems one easily deduces that for all \( y \in \partial B \) and \( d \in \mathbb{S}^2 \)

\[
u_{A+\nabla\varphi,q}^s(\cdot,y) = (e^{-i\varphi(x)} - 1)\Phi(\cdot,y) + e^{-i\varphi(x)}u^s_{A,q}(\cdot,y) \quad \text{in } \mathbb{R}^3,
\]

\[
u_{A+\nabla\varphi,q}^s(\cdot,d) = (e^{-i\varphi(x)} - 1)u_i(\cdot,d) + e^{-i\varphi(x)}u^s_{A,q}(\cdot,d) \quad \text{in } \mathbb{R}^3.
\]

This clearly shows that \( u^s_{A+\nabla\varphi,q}(\cdot,y) = u^s_{A,q}(\cdot,y) \) and \( u^s_{A+\nabla\varphi,q}(\cdot,d) = u^s_{A,q}(\cdot,d) \) outside \( D \) and therefore, the magnetic potential \( A \) cannot be uniquely determined from far field or near field measurements outside \( B \). It indicates that the best we can expect from the knowledge of the near field operator \( \mathcal{N}_{A,q} \) or the far field \( u^\infty_{A,q} \) is to identify \((A, q)\) modulo a gauge transformation of \( A \). When \( \text{Supp}(A) \subset D \) is known, the problem may be equivalently reformulated as whether the magnetic field defined by the 2-form associated with the vector \( A \),

\[
\text{curl } A := \frac{1}{2} \sum_{i,j=1}^3 \left( \partial_{x_i} a_j - \partial_{x_j} a_i \right) dx_j \wedge dx_i,
\]  

(1.12)

and the electric potential \( q \) can be retrieved from far field or near field measurements. The uniqueness for similarly stated inverse problems has been established in [11] for \( L^\infty \) regularity of the coefficients. It has been studied in earlier works under more regularity assumptions in [15] and for small perturbations in [22, 20]. We also quote the recent uniqueness result in [13] for measurements associated with finite number of incident waves but with full frequency range.

Concerning stability results with full aperture measurements, in [8] Hähner and Hohage established logarithmic stability estimates for the case \( A = 0 \). These results improve previous ones due to Stefanov [21] by giving an explicit exponent in the logarithmic estimate and using the \( L^2 \)-norm for far field patterns. In [9] Isaev and Novikov proved stability estimates with explicit dependence on the wave number. We hereafter shall follow a similar approach as in [8, 21] to study the case when one would like to simultaneously recover \( \text{curl } A \) and \( q \) from full aperture measurements in the light of geometrical optics solutions developed in [1, 19, 22, 24] for various context in relation with the inverse problem we are interested in. We establish the stability result first for the magnetic field in the case of near field data. We then employ a carefully designed Helmholtz decomposition to infer the stability result for the electric potential. The derivation of the results for far field data are obtained after establishing some key properties relating this data to the near field data.
For bounded domains, the inverse problem with full aperture measurements corresponds with measuring the global Dirichlet to Neumann map. For this problem Tzou proved in [24] log-type stability estimate for $H^{-1}$ norms of the coefficients, assuming that the magnetic potentials are in $W^{2,\infty}$ and the electric potentials are in $L^\infty$. We here consider stability with respect to the $L^\infty$ norm with explicit link between the additional needed regularity for the coefficients and the logarithm exponent. Let us indicate that uniqueness and log-log stability results with partial data have been also studied by many authors in the literature (see for instance [24, 2, 18, 4, 1]) but are not addressed in the present work. We finally note that we restrict ourselves in the present work to space dimension $n = 3$ but the the proofs for $n \geq 4$ would follow the same lines as for $n = 3$ (with eventually different explicit exponents in the stability estimates of Section 1.2). We choose to focus on the case $n = 3$ for conciseness and since it is the more relevant for applications.

1.2. Main stability results. We here state the main results of this paper concerning conditional log-stability in determining the magnetic field curl $A$ given by (1.12) and the electric potential $q$ from knowledge of the full aperture far field measurements, i.e., $u_{\tilde{A},q}^\infty(\tilde{x},d)$ for any $(\tilde{x},d) \in \mathbb{S}^2 \times \mathbb{S}^2$ or from knowledge of the near field operator $\mathcal{N}_{A,q}$.

Let us first indicate the required conditions for admissible compactly supported magnetic potentials $A$ and electric potentials $q$. Let $M > 0$ and $\sigma > 0$ be given. We define the class of admissible magnetic potentials $\mathcal{A}_\sigma(M)$ by

$$\mathcal{A}_\sigma(M) := \{ A \in W^{2,\infty}(\mathbb{R}^3, \mathbb{R}^3), \text{ Supp}(A) \subset D, \|A\|_{W^{2,\infty}} \leq M, \text{ and } \|\text{curl}A\|_{L^1_\gamma(\mathbb{R}^3)} \leq M \}, \quad (1.13)$$

where $\hat{\sigma}$ denotes the Fourier transform of $u$ and $L^1_\gamma(\mathbb{R}^3)$ is the weighted $L^1(\mathbb{R}^3)$ space with norm

$$\|v\|_{L^1_\gamma(\mathbb{R}^3)} := \int_{\mathbb{R}^3} (1 + |\xi|^2)^{\gamma/2} |v(\xi)| d\xi.$$ 

Given $M > 0$ and $\gamma > 0$, we define the class of admissible electric potentials $\mathcal{Q}_\gamma(M)$ by

$$\mathcal{Q}_\gamma(M) := \{ q \in L^\infty(\mathbb{R}^3, \mathbb{C}), \exists(q) \geq 0, \text{ Supp}(q) \subset D, \|q\|_{L^\infty(D)} \leq M \text{ and } \|\hat{q}\|_{L^1_\gamma(\mathbb{R}^3)} \leq M \}. \quad (1.14)$$

The first main result of this paper is the following log-stability for the magnetic field curl $A$ and the electric potential $q$ from the near field measurements.

**Theorem 1.1.** Let $M > 0$, $\sigma > 0$ and $\gamma > 0$. Then there exists a constant $C > 0$ such that for any $(A_j, q_j) \in \mathcal{A}_\sigma(M) \times \mathcal{Q}_\gamma(M)$, $j = 1, 2$, we have

$$\|\text{curl}(A_1 - A_2)\|_{L^\infty} \leq C\left(\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|_{L^\infty}^{1/2} + \|\log(\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|)\|_{L^\infty}^{1/2}\right),$$

$$\|q_2 - q_1\|_{L^\infty} \leq C\left(\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|_{L^\infty}^{1/2} + \|\log(\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|)\|_{L^\infty}^{1/2}\right),$$

Here $C$ depends only on $B$, $M$, $\sigma$ and $\gamma$.

An exactly similar stability result can be deduced for far field measurements if one uses the following very restrictive norm on the measurements. Let

$$\Gamma := \{ (\ell, m), \ell, m \in \mathbb{N} \cup \{0\}, m \in [-\ell, \ell] \}, \quad (1.15)$$
and denote by $Y^m_{\ell}, (\ell, m) \in \Gamma$ the complete system of special harmonics on $S^2$. For a far field pattern, $u^\infty$ we denote by $\mu(\ell_1, m_1; \ell_2, m_2), (\ell_i, m_i) \in \Gamma, i = 1, 2$ its Fourier coefficients given by

$$
\mu(\ell_1, m_1; \ell_2, m_2) := \int_{S^2} \int_{S^2} u^\infty(\hat{x}, d) \overline{Y^m_{\ell_1}(\hat{x})} \overline{Y^m_{\ell_2}(d)} \, ds(\hat{x}) \, ds(d). \tag{1.16}
$$

Let $a > 0$ such that $D \subset \{x \in \mathbb{R}^3; |x| < a\}$. Following [8], we then introduce the following norm

$$
\|u^\infty\|^2_F := \sum_{(\ell_1, m_1) \in \Gamma} \sum_{(\ell_2, m_2) \in \Gamma} \left(\frac{2\ell_1 + 1}{e^a} \right)^{2\ell_1} \left(\frac{2\ell_2 + 1}{e^a} \right)^{2\ell_2} |\mu(\ell_1, m_1; \ell_2, m_2)|^2. \tag{1.17}
$$

In Lemma 4.1 below we prove that this norm is finite for all far fields $u^\infty_A$ with $A \in \mathcal{A}_r(M)$ and $q \in \mathcal{Q}_\gamma(M)$. Using Lemma 4.3 and Theorem 1.1, we immediately get.

**Theorem 1.2.** Let $M > 0, \sigma > 0$ and $\gamma > 0$. Then there exists a constant $C > 0$ such that for any $(A_j, q_j) \in \mathcal{A}_r(M) \times \mathcal{Q}_\gamma(M), j = 1, 2$, we have

$$
\|\text{curl}(A_1 - A_2)\|_{L^\infty} \leq C \left(\|u^\infty_{A_1, q_1} - u^\infty_{A_2, q_2}\|_F^{1/2} + \log\|u^\infty_{A_1, q_1} - u^\infty_{A_2, q_2}\|_F\right)^{-\frac{\gamma}{(\alpha + 3)(\alpha + 5)}},
$$

and

$$
\|q_2 - q_1\|_{L^\infty} \leq C \left(\|u^\infty_{A_1, q_1} - u^\infty_{A_2, q_2}\|_F^{1/2} + \log\|u^\infty_{A_1, q_1} - u^\infty_{A_2, q_2}\|_F\right)^{-\frac{\gamma}{(\alpha + 3)(\alpha + 5)}}. \tag{1.17}
$$

Here $C$ depends only on $D, a, M, \sigma$ and $\gamma$.

One can also obtain a slightly modified stability result using the $L^2$ norm of the measurements following the method in [8]. It is summarized in the following theorem.

**Theorem 1.3.** Let $M > 0, \sigma > 0, \gamma > 0$ and $\delta > 0$. Then there exist two constants $C > 0$ and $\varepsilon > 0$ such that for all $(A_j, q_j) \in \mathcal{A}_r(M) \times \mathcal{Q}_\gamma(M), j = 1, 2$ verifying

$$
\|u^\infty_{A_1, q_1} - u^\infty_{A_2, q_2}\|_{L^2(S^2 \times S^2)} < \delta
$$

we have

$$
\|\text{curl}(A_1 - A_2)\|_{L^\infty(D)} \leq C \left|\log\|u^\infty_{A_1, q_1} - u^\infty_{A_2, q_2}\|_{L^2(S^2 \times S^2)}\right|^{-\frac{\gamma}{(\alpha + 3)(\alpha + 5)} + \varepsilon},
$$

and

$$
\|q_2 - q_1\|_{L^\infty(D)} \leq C \left|\log\|u^\infty_{A_1, q_1} - u^\infty_{A_2, q_2}\|_{L^2(S^2 \times S^2)}\right|^{-\frac{\gamma}{(\alpha + 3)(\alpha + 5)} + \varepsilon}. \tag{1.18}
$$

Here $C$ depends only on $D, a, M, \sigma, \varepsilon, \delta$ and $\gamma$.

From Theorems 1.1 and 1.2 (or 1.3) we immediately derive the uniqueness corollary.

**Corollary 1.4.** Let $A_1$ and $A_2 \in \mathcal{A}_r(M)$ be two vector fields, $q_1$ and $q_2 \in \mathcal{Q}_\gamma(M)$ and $B \supset D$. Then, we have

$$
u_{A_1, q_1}(\hat{x}, d) = u_{A_2, q_2}(\hat{x}, d), \quad \forall (\hat{x}, d) \in S^2 \times S^2,$$

or

$$
u^s_{A_1, q_1}(x, y) = u^s_{A_2, q_2}(x, y), \quad \forall (x, y) \in \partial B \times \partial B,$$

implies $q_1 = q_2$ and $\text{curl} A_1 = \text{curl} A_2$ in $D$.

The remainder of this paper is organized as follows. In Section 2, we give a brief outline of some basic properties of solutions to the Helmholtz equation, the magnetic Lippmann-Schwinger equation and some properties of the near field operator. In Section 3, we review the construction of the complex geometric optics solutions due to Tzou [24] and we estimate the magnetic fields and the electric potentials respectively from the near field operator. In section 4 we establish a relation between the far field and the near field and then we
prove Theorems 1.2 and 1.3. An appendix is dedicated to some technical results in relation with geometric optics solutions and the connection between far field and near field data.

2. HELMHOLTZ EQUATION AND MAGNETIC LIPPMANN-SCHWINGER EQUATION

We here outline some results on the well-posedness of the direct scattering problem using the formulation of the problem as a Lippmann-Schwinger equation (see for instance [20, 7]) and prove a uniform bound with respect to the potentials.

Throughout this section, we assume that \( A \in W^{1,\infty}((\mathbb{R}^3, \mathbb{R}^3)) \) and \( q \in L^{\infty}((\mathbb{R}^3, \mathbb{C}) \) with \( \text{Supp}(A), \text{Supp}(q) \subset D \) and \( \Im(q) \geq 0 \).

The function \( v \) will be referring in this section to the incident wave (i.e. \( \Phi(\cdot, y) \) or \( u^i(\cdot, d) \)), the associated total field is denoted by \( u = u_{A,q} \) and the scattered field \( u^s = u_{A,q}^s = u - v \in H^2_{\text{loc}}((\mathbb{R}^3)) \). Both scattering problems can then be stated as solving for \( u^s \in H^2_{\text{loc}}((\mathbb{R}^3)) \) satisfying
\[
- \Delta u^s - k^2 u^s = Q_{A,q}(u^s + v) \quad \text{in} \quad \mathbb{R}^3, \tag{2.18}
\]
and the Sommerfeld radiation condition (1.5). For the study of this problem, we only require that \( v \in H^1(D) \). Convolution properties imply in particular that \( u^s \) can be represented as
\[
u^s(x) = \int_D \Phi(x, y)Q_{A,q} u(y)dy, \quad x \in \mathbb{R}^3, \quad \text{with} \quad u = u^s + v \quad \text{in} \quad D. \tag{2.19}\]

Let us introduce the integral operator \( T_{A,q} : H^1(D) \to H^1(D) \) defined by
\[
T_{A,q} w(x) := \int_D \Phi(x, y)Q_{A,q} w(y)dy, \quad x \in D. \tag{2.20}
\]

We remark that since \( Q_{A,q} : H^1(D) \to L^2(D) \) is continuous (by regularity assumptions on \( A \) and \( q \)), and since the volume potential \( w \to \int_D \Phi(\cdot, y)w(y)dy, \)
continuously maps \( L^2(D) \) into \( H^2_{\text{loc}}((\mathbb{R}^3)) \) (see [3]), we deduce that \( T_{A,q} \) is compact. Equation (2.19) implies in particular that the total field \( u \in H^1(D) \) and is a solution of the Lippmann-Schwinger equation
\[
u - T_{A,q} u = v \quad \text{in} \quad H^1(D). \tag{2.21}\]

Conversely, if \( u \in H^1(D) \) satisfies (2.21), then one easily verifies using the properties of volume potentials [3] that \( u^s_{A,q} \) given by (2.19) is in \( H^2_{\text{loc}}((\mathbb{R}^3)) \) and is a solution of the scattering problem (2.18)-(1.5). The well posedness of the latter is then a consequence of the following proposition.

**Proposition 2.1.** The operator \( I - T_{A,q} : H^1(D) \to H^1(D) \), with \( I \) denoting the identity operator on \( H^1(D) \) is continuously invertible.

**Proof.** The operator \( I - T_{A,q} \) is of Fredholm type with index 0. It is therefore sufficient to prove the injectivity of this operator. If \( u - T_{A,q} u = 0 \), then from the above equivalence, \( u^s \) given by (2.19) with \( v = 0 \), satisfies
\[
- \Delta u^s - k^2 u^s = Q_{A,q} u^s \quad \text{in} \quad \mathbb{R}^3.
\]
Multiplying by \( \overline{u^s} \) and integrating over a ball \( B \) containing \( D \) implies after applying the Green’s theorem in both sides
\[
\int_B (|\nabla u^s|^2 - k^2|u^s|^2) dx - \int_{\partial B} \partial_r u^s \overline{u^s} ds(x)
= \int_B (iA \cdot (\nabla u^s \overline{u^s} - \nabla \overline{u^s} u^s) - (|A|^2 + q)|u^s|^2) dx.
\]
Taking the imaginary part of the previous equality implies that \( \Im(\int_{\partial B} \partial_r u^s \overline{u^s} ds(x)) \geq 0 \) (since \( A \) is real valued and \( \Im(q) \geq 0 \)). The Rellich lemma then implies that \( u^s = 0 \) in \( \mathbb{R}^3 \setminus B \). We now observe that
\[
|\Delta u^s(x)| \leq (k^2 + \|q\|_\infty + \|A\|_\infty^2 + \|\nabla \cdot A\|_\infty) |u^s(x)| + 2\|A\|_\infty |
\n|\nabla u^s(x)|, \text{ for a.e. } x \in \mathbb{R}^3.
\]
Unique continuation theorem yields \( u^s = 0 \) in \( \mathbb{R}^3 \) and therefore \( u = 0 \) in \( D \). This proves the injectivity of \( I - T_{A,q} \) and finishes the proof of the proposition.

It is also possible to prove the following uniform bound.

**Proposition 2.2.** Let \( A \in W^{1,\infty}(\mathbb{R}^3, \mathbb{R}^3) \) and \( q \in L^\infty(\mathbb{R}^3, \mathbb{C}) \) as above and such that \( \|A\|_{W^{1,\infty}} \leq M \) and \( \|q\|_{L^\infty} \leq M \), for some constant \( M > 0 \). Then there exists a constant \( C \) that only depends on \( D, M \) and \( k \) such that \( \|(I - T_{A,q})^{-1}\| \leq C \). Here \( \| \cdot \| \) denotes the norm in \( L(H^1(D)) \).

**Proof.** We prove the result using a contradiction argument. Let us assume that, for each \( n \in \mathbb{N} \), there exists \( A_n \in W^{1,\infty}(\mathbb{R}^3)^3 \) and \( q_n \in L^\infty(\mathbb{R}^3) \) as in the proposition such that
\[
\|(I - T_{A_n,q_n})^{-1}\| \geq n.
\]
This implies in particular the existence of a non trivial function \( v_n \in H^1(D) \) such that the function \( u_n \in H^1(D) \) satisfying \( u_n - T_{A_n,q_n} u_n = v_n \) in \( H^1(D) \) verifies
\[
\|u_n\|_{H^1(D)} \geq \frac{1}{n} \|v_n\|_{H^1(D)}.
\]
This gives for the normalized sequence \( \tilde{u}_n = \frac{u_n}{\|u_n\|_{H^1(D)}} \)
\[
\tilde{u}_n - T_{A_n,q_n} \tilde{u}_n = \frac{v_n}{\|u_n\|_{H^1(D)}} =: \tilde{v}_n \text{ in } H^1(D), \tag{2.22}
\]
where \( \|\tilde{v}_n\|_{H^1(D)} \leq \frac{1}{n} \). The associated scattered field \( \tilde{u}_n^s \in H_{sc}^2(\mathbb{R}^3) \) is defined by
\[
\tilde{u}_n^s(x) = \int_D \Phi(x,y) Q_{A_n,q_n} \tilde{u}_n(y) dy, \quad x \in \mathbb{R}^3, \text{ with } \tilde{u}_n = \tilde{u}_n^s + \tilde{v}_n \text{ in } D. \tag{2.23}
\]
Since the sequence \( (\tilde{u}_n) \) is bounded in \( H^1(D) \), the assumptions on \( A_n \) and \( q_n \) imply that the sequence \( (Q_{A_n,q_n}(\tilde{u}_n)) \) is also bounded in \( L^2(D) \). It yields in particular, using (2.23), that the sequence \( (\tilde{u}_n^s) \) is bounded in \( H^2(D) \). Using the Rellich-Kondrachov compactness theorem, we infer that, an extracted subsequence, that we keep denoting \( (\tilde{u}_n^s) \) is a Cauchy sequence in \( H^1(D) \). From \( \tilde{u}_n = \tilde{u}_n^s + \tilde{v}_n \) we deduce that \( (\tilde{u}_n) \) is also a Cauchy sequence in \( H^1(D) \) and therefore converges to some \( u \) in \( H^1(D) \). Given the boundedness of the sequences \( (A_n) \) and \( (q_n) \), by changing the original sequence and without corrupting the contradiction argument (i.e the \( H^1 \)-norm of \( \tilde{u}_n \) is equal to 1 and \( \|\tilde{v}_n\|_{H^1(D)} \to 0 \) as \( n \to \infty \)), one can assume that \( (A_n) \) and \( (q_n) \) weak-* converge to \( A \) and \( q \) respectively in \( W^{1,\infty}(\mathbb{R}^3)^3 \) and \( L^\infty(\mathbb{R}^3) \). One then easily verifies that \( Q_{A_n,q_n}(\tilde{u}_n) \) weakly converges in \( L^2(D) \) to \( Q_{A,q}(u) \). Consequently, from (2.20), we get that \( T_{A_n,q_n} \tilde{u}_n \) strongly converges to \( T_{A,q} \tilde{u} \) in \( H^1(D) \). Passing to the limit in (2.22) implies that \( u \in H^1(D) \) verifies
Let us observe for later use that, thanks to \( (2.19) \), the far field associated with the scattered wave verifying \((2.18)\) can be expressed as
\[
u_{A,q}^\infty(\hat{x}) := \frac{1}{4\pi} \int_{\mathbb{R}^3} e^{-ik\hat{x} \cdot y} Q_{A,q}u(y) \, dy, \quad \hat{x} \in S^2, \tag{2.24}
\]
where \( u \) is the solution of \((2.21)\).

As a straightforward corollary of Proposition \(2.2\), the continuity properties of volume potentials and \((2.24)\), we have the following uniform estimates for \( u^s \) solution of \((2.18)-(1.5)\) and associated far field.

**Corollary 2.3.** Let \( A \in W^{1,\infty}(\mathbb{R}^3, \mathbb{R}^3) \) and \( q \in L^\infty(\mathbb{R}^3) \) as above such that \( \|A\|_{W^{1,\infty}} \leq M \) and \( \|q\|_{L^\infty} \leq M \) for some constant \( M > 0 \). Then there exists a constant \( C \) that depends only on \( M, D \) and \( k \) such that
\[
\|u_{A,q}^s\|_{H^2(D)} \leq C\|v\|_{H^1(D)}\quad \text{and} \quad \|u_{A,q}^\infty\|_{L^2(\mathbb{R}^2)} \leq C\|v\|_{H^1(D)},
\]
for all \( v \in H^1(D) \), where \( u_{A,q}^s \in H^2_{loc}(\mathbb{R}^3) \) and is a solution of the scattering problem \((2.18)-(1.5)\). Moreover, for any compact \( K \) there exists a constant \( C \) that depends only on \( M, D, K \) and \( k \) such that for all \( v \in H^1(D) \)
\[
\|u_{A,q}^s\|_{H^2(K)} \leq C\|v\|_{H^1(D)}.
\]

Armed with with above, let us define for later use the linear and continuous solution operator \( \mathcal{M}_{A,q} \) by
\[
\mathcal{M}_{A,q} : H^1(D) \to H^2_{loc}(\mathbb{R}^3), \quad v \mapsto \mathcal{M}_{A,q}v := u_{A,q}^s
\tag{2.25}
\]
where \( u_{A,q}^s \) is the solution of \((2.18)-(1.5)\).

We use this data to define the near field operator \( \mathcal{N}_{A,q} : L^2(\partial B) \to L^2(\partial B) \), as
\[
\mathcal{N}_{A,q}h(x) := \int_{\partial B} u_{A,q}^s(x, y) h(y) \, ds(y), \quad x \in \partial B, \tag{2.26}
\]
where \( u_{A,q}^s(\cdot, y) := \mathcal{M}_{A,q} \Phi(\cdot, y), \; y \in \partial B \). We first remark that
\[
\|N_{A,q}\| \leq \|u_{A,q}^s\|_{L^2(\partial B \times \partial B)},
\]
and therefore it is sufficient to study the stability of \( N_{A,q} \to (A, q) \) in order to infer stability results in terms of near field measurements.

We second observe that, after introducing the single-layer operator \( \mathcal{S} : L^2(\partial B) \to H^1(D) \) defined by
\[
\mathcal{S}h(x) := \int_{\partial B} \Phi(x, y) h(y) \, ds(y), \quad x \in D, \tag{2.27}
\]
one has by linearity and continuity properties of the mapping \( \mathcal{M}_{A,q} \) the following identity
\[
\mathcal{N}_{A,q}h = (\mathcal{M}_{A,q}\mathcal{S}h)|_{\partial B}. \tag{2.28}
\]
This equality states that \( \mathcal{N}_{A,q}h \) is nothing but the near field measurements on \( \partial B \) generated by an incident field \( v := \mathcal{S}h \).
From properties and jump relations for single-layer potential (see [3]) \( v = Sh \) with density \( h \in L^2(\partial B) \) is defined in \( \mathbb{R}^3 \), satisfies the Helmholtz equation in \( \mathbb{R}^3 \setminus \partial B \), the Sommerfeld radiation condition (1.5) and the following continuity and jump properties across \( \partial B \),

\[
\begin{align*}
v^-(x) &= v^+(x) = v(x) & \text{on } \partial B, \\
\partial_n v^-(x) - \partial_n v^+(x) &= h(x) & \text{on } \partial B,
\end{align*}
\]

(2.29)

where \( v^+ \) and \( v^- \) respectively denote the restriction of \( v \) to \( \mathbb{R}^3 \setminus \overline{B} \) and \( B \). In order to exploit the information encoded into the identity (2.28), one can easily check the following lemma by using (2.29).

**Lemma 2.4.** Let \( A \in W^{1,\infty}(\mathbb{R}^3, \mathbb{R}^3) \), \( q \in L^\infty(\mathbb{R}^3) \) as above, and \( h \in L^2(\partial B) \). Set \( v = Sh \) and \( u^s = M_{A,q}v \). Then the total field \( u = v + u^s \) is solution to the transmission problem

\[
\begin{align*}
\mathcal{H}_{A,q}u(x) &= k^2 u(x) & \text{in } \mathbb{R}^3 \setminus \partial B, \\
u^+(x) &= u^-(x) & \text{on } \partial B, \\
\partial_n u^-(x) - \partial_n u^+(x) &= h(x) & \text{on } \partial B,
\end{align*}
\]

(2.30)

together with the Sommerfeld radiation condition (1.5).

We finally point out the following lemma that will be useful in the sequel where the proof is provided in the Appendix.

**Lemma 2.5.** Let \( A \in W^{1,\infty}(\mathbb{R}^3, \mathbb{R}^3) \), \( q \in L^\infty(\mathbb{R}^3) \) as above. Then, we have

\[
\int_{\partial B} (\mathcal{N}_{A,q}f) g ds(x) = \int_D Sg Q_{A,q}(M_{A,q}Sf + Sf) dx,
\]

(2.31)

for all \( f, g \in L^2(\partial B) \).

We establish now the following result that proves that the transpose operator associated with \( \mathcal{N}_{A,q} \) is equal to \( \mathcal{N}_{-A,q} \). In order to ease the writing, we indicate two useful formulas that we shall use a few times. The first one is a consequence of the Green’s theorem and states that

\[
\int_B (\mathcal{H}_{A,q} u_1 u_2 - u_1 \mathcal{H}_{-A,q} u_2) dx = \int_{\partial B} (u_1 \partial_r u_2 - u_2 \partial_r u_1) ds(x),
\]

(2.32)

for all \( u_1, u_2 \in H^2(B) \). The second one is a classical consequence of the Green’s theorem and the Rellich lemma and states that [3]

\[
\int_{\partial B} (u_1 \partial_r u_2 - u_2 \partial_r u_1) ds(x) = 0,
\]

(2.33)

for all \( u_1, u_2 \in H^2_{loc}(\mathbb{R}^3 \setminus B) \) satisfying the Helmholtz equation \( \Delta u + k^2 u = 0 \) in \( \mathbb{R}^3 \setminus \overline{B} \) and the Sommerfeld radiation condition (1.5).

**Lemma 2.6.** Let \( A \in W^{1,\infty}(\mathbb{R}^3, \mathbb{R}^3) \), \( q \in L^\infty(\mathbb{R}^3) \) as above. Let \( y, z \in \mathbb{R}^3 \setminus \overline{D} \) and set \( u^s_{A,q}(\cdot, y) := M_{A,q} \Phi(\cdot, y) \) and \( u^-_{A,q}(\cdot, z) := M_{-A,q} \Phi(\cdot, z) \).

Then we have the following reciprocity relation,

\[
u^s_{A,q}(z, y) = u^-_{A,q}(y, z).
\]
This reciprocity implies in particular that \((N_{A,q})^t = N_{-A,q}\), i.e.,
\[
\int_{\partial B} f (N_{-A,q} g) \, ds(x) = \int_{\partial B} (N_{A,q} f) g \, ds(x) \quad \text{for all } f, g \in L^2(\partial B).
\] (2.34)

**Proof.** From equation (2.19)
\[
{u^*_A}_q(z, y) = \int_D \Phi(z, t) Q_{A,q}({u^*_A}_q(t, y) + \Phi(t, y)) \, dt.
\]
On the other hand, applying (2.32) and (2.33) to \(u_1 = {u^*_A}_q(\cdot, y)\) and \(u_2 = {u^*_A}_q(\cdot, z)\) implies
\[
\int_B (H_{A,q} {u^*_A}_q(t, y) {u^*_A}_q(t, z) - {u^*_A}_q(t, y) H_{-A,q} {u^*_A}_q(t, z)) \, dt = 0.
\]
Using (2.18) yields
\[
\int_D (Q_{A,q} \Phi(t, y) {u^*_A}_q(t, z) - {u^*_A}_q(t, y) Q_{A,q} \Phi(t, z)) \, dt = 0.
\]
Using the Green’s theorem we obtain (since \(y, z \in \mathbb{R}^3 \setminus \mathcal{D}\) and \(A\) has compact support in \(D\))
\[
\int_B (\Phi(t, y) Q_{-A,q} {u^*_A}_q(t, z) - Q_{A,q} {u^*_A}_q(t, y) \Phi(t, z)) \, dt = 0.
\]
When then conclude, since \(\Phi(z, t) = \Phi(t, z)\)
\[
{u^*_A}_q(z, y) = \int_D (\Phi(t, y) Q_{-A,q} {u^*_A}_q(t, z) + \Phi(t, z) Q_{A,q} \Phi(t, y)) \, dt.
\]
Applying the Green’s theorem to the second term in the integral finally shows that
\[
{u^*_A}_q(z, y) = \int_D (\Phi(t, y) Q_{-A,q} {u^*_A}_q(t, z) + \Phi(t, z)) \, dt = {u^*_A}_q(y, z).
\]
Identity (2.34) is a direct consequence of the reciprocity relation and the Fubini theorem. □

3. **Stability analysis for near field data**

The aim of this section is to prove the stability estimates given in Theorem 1.1. The first step will be to use the properties of the near fields to prove an orthogonality identity, which relates the difference of potentials to the difference of near field operators. Then we will use a special family of solutions called complex geometric optics solutions (CGO-solutions) to estimate the Fourier transform of the difference of the magnetic fields and the difference of the electric potentials.

Consider two pairs of potentials \((A_j, q_j) \in W^{1, \infty}(\mathbb{R}^3, \mathbb{R}^3) \times L^\infty(\mathbb{R}^3, \mathbb{C}), j = 1, 2,\) satisfying the same assumptions as \((A, q)\) in the beginning of the previous section. We set
\[
A(x) := (A_2 - A_1)(x), \quad q(x) := (q_2 - q_1)(x), \quad x \in \mathbb{R}^3,
\] (3.1)
and introduce the first order operator \(\mathcal{P}_{A, A_2, q}\) defined by
\[
\mathcal{P}_{(A_1, A_2, q)} v := i\text{div}(Av) + iA \cdot \nabla v + (|A_2|^2 - |A_1|^2 + q)v, \quad v \in H^1(\mathbb{R}^3),
\] (3.2)
here we remark that the coefficients of the first order operator \(\mathcal{P}_{(A_1, A_2, q)}\) are supported in \(D\).
3.1. **An orthogonality identity and a key integral inequality.** First, we present an orthogonality identity, which relates the difference of potentials to the difference of near field operators.

**Lemma 3.1.** Let \( f_1, f_2 \in L^2(\partial B) \) and set

\[
u_j := \mathcal{M}_{A_1, q_1} f_1, \quad u_j := \mathcal{M}_{A_2, q_2} f_2 \quad \text{in} \quad \mathbb{R}^3,
\]

and for \( j = 1, 2 \),

\[
\nu_j := \mathcal{S} f_j \quad \text{in} \quad D \quad \text{and} \quad u_j := \nu_j + u_j^* \quad \text{in} \quad D.
\]

Then the following identity holds true.

\[
\int_{\partial B} (\mathcal{N}_{A_1, q_1} f_2 - \mathcal{N}_{A_2, q_2} f_2) \, f_1 \, ds(x) = \int_D \mathcal{P}_{(A_1, A_2, q)} u_1 \, u_2 \, dx.
\]  

**Proof.** Using (2.34) we first observe that

\[
\int_{\partial B} (\mathcal{N}_{A_1, q_1} f_2 - \mathcal{N}_{A_2, q_2} f_2) \, f_1 \, ds(x) = \int_{\partial B} (\mathcal{N}_{A_1, q_1} f_1) \, f_2 - (\mathcal{N}_{A_2, q_2} f_2) \, f_1 \, ds(x).
\]

We deduce from (2.31) that

\[
\int_{\partial B} (\mathcal{N}_{A_1, q_1} f_2 - \mathcal{N}_{A_2, q_2} f_2) \, f_1 \, ds(x) = \int_D (\nu_2 Q_{A_1, q_1} u_1 - \nu_1 Q_{A_2, q_2} u_2) \, dx.
\]

Applying the Green’s theorem and (2.33) to \( u_1^* \) and \( u_2^* \) implies

\[
\int_B (u_2^* (-\Delta u_1^* - k^2 u_1^*) - u_1^* (-\Delta u_2^* - k^2 u_2^*)) \, dx = 0,
\]

which yields according to (2.18),

\[
\int_D (u_2^* (Q_{A_1, q_1} u_1) - (Q_{A_2, q_2} u_2) u_1^*) \, dx = 0.
\]

Adding the left hand side of this equality to the right hand side of (3.6) shows that

\[
\int_{\partial B} (\mathcal{N}_{A_1, q_1} f_2 - \mathcal{N}_{A_2, q_2} f_2) \, f_1 \, ds(x) = \int_D (\nu_2 Q_{A_1, q_1} u_1 - \nu_1 Q_{A_2, q_2} u_2) \, dx.
\]

The result of the lemma follows from (3.7) after integrating by parts in the right hand side and observing that

\[
Q_{A_1, q_1} u_1 - Q_{A_2, q_2} u_1 = \mathcal{P}_{(A_1, A_2, q)} u_1.
\]

This completes the proof. \( \square \)

We now prove the fundamental integral inequality, which relates the difference of two magnetic potentials and electric potential in \( D \) to the difference between their corresponding near pattern fields. This integral inequality will be the starting point in the proof of the stability estimate for the corresponding inverse problem.

**Lemma 3.2.** There is a constant \( C > 0 \) that only depends on \( B \) and \( k \) such that

\[
\left| \int_B \left[ i A \cdot (u_1 \nabla u_2 - u_2 \nabla u_1) - (|A_2|^2 - |A_1|^2 + q) u_1 u_2 \right] \, dx \right| \leq C \mathcal{N}_{A_1, q_1} - \mathcal{N}_{A_2, q_2} \| u_1 \|_{H^2(B)} \| u_2 \|_{H^2(B)},
\]

for all \( u_1 \in H^2(B) \) satisfying \( \mathcal{H}_{-A_1, q_1} u_1 = k^2 u_1 \) in \( B \) and all \( u_2 \in H^2(B) \) satisfying \( \mathcal{H}_{A_2, q_2} u_2 = k^2 u_2 \) in \( B \).
Proof. Let \( u_j, \ j = 1, 2, \) be given as in the lemma. Let \( u_j^+ \in H_{loc}^1(\mathbb{R}^3 \setminus B) \) be the outgoing solution to the following exterior Dirichlet problem (see for instance [3])

\[
\begin{cases}
\Delta u_j^+ + k^2 u_j^+ = 0 & \text{in } \mathbb{R}^3 \setminus B, \\
u_j^+ = u_j & \text{on } \partial B,
\end{cases}
\]

and \( u_j^+ \) satisfies the Sommerfeld radiation condition (1.5). Elliptic regularity infers that \( u_j^+ \in H_{loc}^2(\mathbb{R}^3 \setminus B) \) and in particular, by trace theorems [12, Theorem 2.1 in Chapter 4],

\[
\|\partial_n u_j^+\|_{L^2(\partial B)} \leq C\|u_j\|_{H^2(B)},
\]

for some constant \( C \) that only depends on \( B \) and \( k \). Let us extend the functions \( u_j \) as follows

\[
u_j(x) := \begin{cases} u_j^-(x) = u_j(x) & \text{if } x \in B, \\ u_j^+(x) & \text{if } x \in \mathbb{R}^3 \setminus B, \end{cases}
\]

and set

\[
f_j := \partial_n u_j^- - \partial_n u_j^+ \quad \text{on } \partial B. \quad (3.10)
\]

By trace theorems and (3.9) we have that \( f_j \in L^2(\partial B) \) and

\[
\|f_j\|_{L^2(\partial B)} \leq C\|u_j\|_{H^2(B)},
\]

for some constant \( C \) that only depends on \( B \) and \( k \). One can easily check that \( u_1^+ \) and \( u_2^+ \) satisfy the following transmission problems respectively

\[
\begin{align*}
\mathcal{H}_{-A_1,q_1} u_1^+ &= k^2 u_1 \quad \text{in } \mathbb{R}^3 \setminus B, \\
u_1^+ &= u_1^2 \quad \text{on } \partial B; \\
\partial_n u_1^- - \partial_n u_1^+ &= f_1 \quad \text{on } \partial B,
\end{align*}
\]

\[
\begin{align*}
\mathcal{H}_{A_2,q_2} u_2^+ &= k^2 u_2 \quad \text{in } \mathbb{R}^3 \setminus B, \\
u_2^+ &= u_2^2 \quad \text{on } \partial B; \\
\partial_n u_2^- - \partial_n u_2^+ &= f_2 \quad \text{on } \partial B.
\end{align*}
\]

Moreover, \( u_j^+, \ j = 1, 2, \) satisfy the Sommerfeld radiation condition (1.5). Consider now the functions

\[
v_j(x) := Sf_j = \int_{\partial B} \Phi(x,y)f_j(y) \, ds(y) \quad x \notin \partial B, \quad j = 1, 2.
\]

Therefore, \( u_j^+ := u_j - v_j, \ j = 1, 2, \) are the same as in Lemma 2.4 and then satisfies Lemma 2.6, i.e they verify (3.3)-(3.4). Consequently, identity (3.5) holds, namely

\[
\int_D \mathcal{P}_{(A_1,A_2,q)} u_1 u_2 \, dx = \int_{\partial B} (\mathcal{N}_{A_1,q_1} f_2 - \mathcal{N}_{A_2,q_2} f_2) f_1 \, ds(x).
\]

In view of (3.2), we get

\[
\int_B \left| iA \cdot (u_1 \nabla u_2 - u_2 \nabla u_1) + (|A_2|^2 - |A_1|^2 + q) u_1 u_2 \right| \, dx
\]

\[
= \int_{\partial B} (\mathcal{N}_{A_1,q_1} f_2 - \mathcal{N}_{A_2,q_2} f_2) f_1 \, ds(x). \quad (3.12)
\]

Consequently,

\[
\left| \int_B \left| iA \cdot (u_1 \nabla u_2 - u_2 \nabla u_1) + (|A_2|^2 - |A_1|^2 + q) u_1 u_2 \right| \, dx \right|
\]

\[
\leq \|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|_{L^2(\partial B)} ||f_1||_{L^2(\partial B)} ||f_2||_{L^2(\partial B)}. \quad (3.13)
\]

Identity (3.8) immediately follows from (3.13) and (3.11). \( \square \)
3.2. Complex geometric optics solutions-CGO. The main strategy of the proof of stability estimate on determining the magnetic field and the electric potential from the near field data is the use of complex geometrical optics solutions in (3.8) to estimate the Fourier coefficients of the difference of two magnetic fields \( \text{curl}(A_2 - A_1) \) and the difference of two potential \( q_2 - q_1 \). We therefore first outline some known results about these special solutions extracted from the literature [1, 19, 22, 24]. Let \( \omega = \omega_1 + i\omega_2 \) be a vector with \( \omega_1, \omega_2 \in \mathbb{S}^2 \) and \( \omega_1 \cdot \omega_2 = 0 \). We define the operator \( N_\omega := \omega \cdot \nabla \). Since this operator can be interpreted as the \( \nabla \) operator in the complex plane defined by \( \omega_1 \) and \( \omega_2 \) one can construct an inverse operator that can be formally defined by

\[
N_\omega^{-1}(g)(x) = \frac{1}{(2\pi)^3} \int_{\mathbb{R}^3} e^{-ix\cdot\xi} \left( \frac{\hat{g}(\xi)}{\omega \cdot \xi} \right) d\xi,
\]

for a compactly supported distribution \( g \) (for instance). Some key mapping properties of \( N_\omega^{-1} \) are summarized in the appendix. We remark that if \( \rho \in \mathbb{C}^3 \) satisfies \( \rho \cdot \rho = 0 \), then \( \rho = s\omega \) with \( s = \frac{|\rho|}{\sqrt{2}} \) and \( \omega \) is as above. With this notation for \( \rho \) we have the following Lemma where the proof can be found in [1] with the electric potential \( q \) replaced by \( q + k^2 \).

Note that this lemma requires more regularity than \( W^{1,\infty} \) for the magnetic potentials.

**Lemma 3.3.** Let \( A_0 \in W^{2,\infty}(D) \) and \( q_0 \in L^{\infty}(D) \) such that \( \|A_0\|_{W^{2,\infty}} \leq M, \|q_0\|_{L^{\infty}} \leq M \) for some positive constant \( M \), and \( \text{Supp}(A_0) \), \( \text{Supp}(q_0) \subset D \). There exists \( s_0 > 0 \) such that for any \( s \geq s_0 \), \( \rho = s\omega \) satisfying \( \rho \cdot \rho = 0 \), there exist complex geometrical solutions \( u(\cdot, \rho) \in H^2(B) \) of the form

\[
u(x, \rho) = e^{i\rho \cdot x} + r(x, \rho),
\]

to the equation \( \mathcal{H}_{A_0, q_0} u = k^2 u \) in \( B \), where

\[
u(\cdot, \rho) \|_{H^m(B)} \leq C s^{m-1}, \quad 0 \leq m \leq 2 \quad \text{and} \quad \|u(\cdot, \rho)\|_{H^2(B)} \leq C s^2 e^{\Lambda s},
\]

where \( C, \Lambda \) and \( s_0 \) depend only on \( B, k \) and \( M \).

In the remainder of this section we consider two pairs of potentials \( (A_j, q_j) \in W^{2,\infty} \times L^{\infty}, \ j = 1, 2 \), with \( \text{Supp}(A_j), \text{Supp}(q_j) \subset D \), \( 3(q_j) \geq 0 \) and satisfying

\[
\|A_j\|_{W^{2,\infty}} \leq M, \quad \|q_j\|_{L^{\infty}} \leq M, \quad j = 1, 2,
\]

for some \( M > 0 \) fixed and set as previously

\[
A(x) := (A_2 - A_1)(x), \quad q(x) := (q_2 - q_1)(x), \quad x \in \mathbb{R}^3.
\]

Let \( \xi \in \mathbb{R}^3 \), \( \omega_1, \omega_2 \in \mathbb{S}^2 \) be three mutually orthogonal vectors in \( \mathbb{R}^3 \). For each \( s > |\xi|/2 \), let

\[
\rho_1 = s \left( i\xi + \left( \frac{\xi}{2s} - \sqrt{1 - \frac{|\xi|^2}{4s^2}} \omega_1 \right) \right) := s\omega_1^*(s),
\]

\[
\rho_2 = s \left( -i\xi + \left( \frac{\xi}{2s} + \sqrt{1 - \frac{|\xi|^2}{4s^2}} \omega_1 \right) \right) := s\omega_2^*(s).
\]

For \( s \geq s_0 > 0 \) for some \( s_0 \) sufficiently large (that only depends on \( B \) and \( k \)), Lemma 3.3 guarantees the existence of the geometrical optics solutions: \( u_1 \in H^2(B) \) verifying \( \mathcal{H}_{A_1, q_1} u_1 = k^2 u_1 \) in \( B \) and \( u_2 \in H^2(B) \) verifying \( \mathcal{H}_{A_2, q_2} u_2 = k^2 u_2 \) in \( B \) and such that

\[
u_j(x) = e^{ix \cdot \rho_j}(e^{i\xi_j \cdot x} + r_j(x, \rho_j)),
\]

(3.19)
where $r_j(\cdot, \rho_j)$, $j = 1, 2$, satisfies
\begin{equation}
|r_j(\cdot, \rho_j)|_{H^{m}(D)} \leq C s^{m-1}, \quad 0 \leq m \leq 2,
\end{equation}
and where $\varphi_1(x, \omega_1^*) = N^{-1}_{\omega_1^*}(\omega_1^* \cdot A_1)$ and $\varphi_2(x, \omega_2^*) = N^{-1}_{\omega_2^*}(-\omega_2^* \cdot A_2)$ are a solutions of
\begin{equation}
\omega_1^* \cdot \nabla \varphi_1 = \omega_1^* \cdot A_1, \quad \omega_2^* \cdot \nabla \varphi_2 = -\omega_2^* \cdot A_2.
\end{equation}
Furthermore, according to (3.19), (3.17) and (3.18), there exist $C$ and $\Lambda > 0$ such that
\begin{equation}
\|u_1 u_2\|_{L^1(B)} \leq C, \quad \text{and} \quad \|u_j\|_{H^2(B)} \leq C s^2 e^{\Lambda s}, \quad \text{for } j = 1, 2.
\end{equation}

3.3. Stability estimate for the magnetic potential. We derive in this section a stability estimate for the magnetic fields. First, we will use Lemma 3.1 and the complex geometric solutions constructed as above to estimate the Fourier transform of the difference of the magnetic fields curl $A$. Second, we exploit the condition $\|\text{curl} A\|_{L^\sigma}$, $\sigma > 0$, is a priori bounded to prove the stability estimate.

**Lemma 3.4.** Let $u_j$, $j = 1, 2$, be the functions given by (3.19) and set $\omega = \omega_1 + i\omega_2$. Then for any $|\xi| \leq s$, we have the following identity
\begin{equation}
\int_D A(x) \cdot (u_2 \nabla u_1 - u_1 \nabla u_2) \, dx = 2s \int_D \nabla \cdot A(x) e^{ix \cdot \xi} \, dx + \mathcal{R}(\xi, s),
\end{equation}
with $|\mathcal{R}(\xi, s)| \leq C \langle \xi \rangle$, where $C$ is independent of $s$, $\xi$ and $M$, with the short notation $\langle \xi \rangle := \sqrt{|\xi|^2 + 1}$.

This Lemma is a straightforward extension and adaptation of a similar lemma in [1] and, for shake of completeness, we provide the proof in the Appendix.

In what follows, for $A_1$ and $A_2 \in W^{2,\infty}(\mathbb{R}^3)$ as above, we introduce the notation
\begin{equation}
a_j(x) = (A_2 - A_1)(x) \cdot e_j = A(x) \cdot e_j, \quad j = 1, 2, 3, \quad x \in \mathbb{R}^3,
\end{equation}
where $(e_1, e_2, e_3)$ is the canonical basis of $\mathbb{R}^3$ and set for $j, \ell = 1, 2, 3$,
\begin{equation}
b_{j\ell}(x) := \frac{\partial a_{\ell}}{\partial x_j}(x) - \frac{\partial a_j}{\partial x_\ell}(x), \quad x \in \mathbb{R}^3,
\end{equation}
the components of curl $A$ and
\begin{equation}
b_{j\ell}(\xi) = \int_{\mathbb{R}^3} e^{ix \cdot \xi} b_{j\ell}(x) \, dx,
\end{equation}
the associated Fourier coefficients. We then have the following estimate for the Fourier transform of the difference of the magnetic fields.

**Lemma 3.5.** For any $s \geq s_0$ and $\xi \in \mathbb{R}^3$ such that $|\xi| \leq s$ the following estimate holds true,
\begin{equation}
|b_{j\ell}(\xi)| \leq C \langle \xi \rangle \left(e^{\Lambda s} \|N_{A_1, q_1} - N_{A_2, q_2}\| + s^{-1} \langle \xi \rangle\right),
\end{equation}
for $j, \ell = 1, 2, 3$, where $C$ and $\Lambda$ are positive constants independent of $s$, $\xi$ and $M$.

**Proof.** Let $\xi \in \mathbb{R}^3$ such that $|\xi| \leq s$. Let $\omega = \omega_1 + i\omega_2$, where $\omega_j$, $j = 1, 2$ are as above and consider $u_j$, $j = 1, 2$ the solutions given by (3.19). By using (3.8) and (3.23), we get for $|\xi| \leq s$
\begin{equation}
2s \int_B \nabla \cdot A e^{ix \cdot \xi} \, dx
\end{equation}
\[ \leq C \left( \left\| \mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2} \right\| \left\| u_1 \right\|_{H^2(B)} \left\| u_2 \right\|_{H^2(B)} + \left\| u_1 u_2 \right\|_{L^1(B)} + \langle \xi \rangle \right). \]  

(3.27)

Then, we obtain by (3.22)

\[ \left| \int_B \nabla \cdot A(x) e^{i\xi \cdot x} dx \right| \leq C \left( e^{\Lambda s} \left\| \mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2} \right\| + s^{-1} \langle \xi \rangle \right). \]  

(3.28)

The reasoning above remains valid if we change \( \omega \) by \( -\omega \) and therefore we also have

\[ \left| \int_B -\omega \cdot A(x) e^{i\xi \cdot x} dx \right| \leq C \left( e^{\Lambda s} \left\| \mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2} \right\| + s^{-1} \langle \xi \rangle \right). \]  

(3.29)

Outside the plane \( \xi_j e_k - \xi_k e_j = 0 \), we choose \( \omega_2 = \frac{\xi_j e_k - \xi_k e_j}{|\xi_j e_k - \xi_k e_j|} \) which is indeed an orthogonal unitary direction to \( \xi \). Multiplying both sides of (3.28) and (3.29) by \( |\xi_j e_k - \xi_k e_j| \),

\[ \left| \int_{\mathbb{R}^3} e^{i\xi \cdot x} (\xi_j a_k(x) - \xi_k a_j(x)) dx \right| \leq C \langle \xi \rangle \left( e^{\Lambda s} \left\| \mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2} \right\| + s^{-1} \langle \xi \rangle \right), \]  

(3.30)

for \( \xi_j e_k - \xi_k e_j \neq 0 \). The inequality extends to all \( |\xi| \leq s \) by regularity of both sides in terms of \( \xi \) and proves (3.26).

This ends the proof.

We are now in position to prove the main stability result for the magnetic potential from the near field data using (3.26) and regularity assumptions to estimate Fourier coefficients for large \( |\xi| \). More precisely, we assume now that for \( j = 1, 2 \), \( A_j \in W^{2,\infty}(D) \) with \( \|A\|_{W^{2,\infty}(D)} \leq M \), and

\[ \int_{\mathbb{R}^3} \left( \xi \right)^{\sigma} \left| \text{curl} A_j(\xi) \right| d\xi < M \]  

(3.31)

for some \( \sigma > 0 \), where \( \text{curl} A_j \) denotes the Fourier transform of \( \text{curl} A_j \).

**End of the proof of the stability for the magnetic field.** We derive now the stability estimate for the magnetic fields in \( L^\infty \)-norm. Let \( s_0 > 1 \) be as in Lemma 3.5 and \( s \) and \( R \) be two parameters satisfying \( s \geq R \geq s_0 \). From (3.26) we get

\[ \int_{\mathbb{R}^3} |\hat{b}_{j\ell}(\xi)| d\xi = \int_{\langle \xi \rangle \leq R} |\hat{b}_{j\ell}(\xi)| d\xi + \int_{\langle \xi \rangle \geq R} |\hat{b}_{j\ell}(\xi)| d\xi \leq CR^2 \left( e^{\Lambda s} \left\| \mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2} \right\| + s^{-1} R \right) + 2MR^{-\sigma}. \]

Choosing \( R = s^{1/(\sigma+3)} \) we deduce that for \( s_0 \) sufficiently large (depending only on \( B, k, M \) and \( \sigma \)),

\[ \|b_{j\ell}\|_{L^\infty(\mathbb{R}^3)} \leq C' \left( e^{\Lambda s} \left\| \mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2} \right\| + s^{-\sigma/\sigma+3} \right), \]  

(3.32)

for some positive constants \( C' \) and \( \Lambda' \) and all \( s \geq s_0 \). Now if \( \|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\| \leq \epsilon_0 \), for some \( \epsilon_0 > 0 \), such that \( -\log(\epsilon_0) \geq 2N s_0 \), then taking \( s = \frac{1}{2N} \log(\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|) \) in (3.32) implies

\[ \|b_{j\ell}\|_{L^\infty(\mathbb{R}^3)} \leq C' \left( \|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|^{1/2} + \left( \frac{1}{2N} \log(\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|) \right)^{\sigma/\sigma+3} \right). \]  

(3.33)

We also observe that this type of inequality holds true if \( \|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\| \geq \epsilon_0 \) since in that case we can simply write

\[ \|b_{j\ell}\|_{L^\infty(\mathbb{R}^3)} \leq M \leq (M/\sqrt{\epsilon_0}) \|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|^{1/2}. \]  

(3.34)

The proof of the first estimate of Theorem 1.1 is then completed.
Using the above result, we are able to prove the second main result related to the stability for the electric potential.

3.4. Stability estimate for the electric potential. In this section, we are going to use the complex geometric optics solutions and the stability estimate we already obtained for the magnetic field in order to retrieve a stability result for the electric potential. There are, however, some difficulties with this. In fact, in order to isolate the integral of the magnetic field in order to retrieve a stability result for the electric potential. Unfortunately, we can only estimate the difference of the magnetic fields \( \text{curl}(A) \). To overcome this difficulty we will use the Helmholtz decomposition and write \( A = H - \nabla \vartheta \), with the fact that \( \text{div} H = 0 \) and we are able to estimate the norm of \( \nabla \vartheta \).

**Lemma 3.6.** Let \( p > 3 \). There exist \( \vartheta \in W^{3,p}(B) \cap H_0^1(B) \) and a positive constant \( C \) such that

\[
\| \vartheta \|_{W^{3,p}(B)} \leq C \| A \|_{W^{2,p}(D)},
\]

and

\[
\| A + \nabla \vartheta \|_{W^{1,p}(B)} \leq C \| \text{curl}(A) \|_{L^p(D)}.
\]

Moreover, if \( B' \) is a ball containing \( \overline{D} \) and such that \( \overline{B'} \subset B \), then

\[
\| \vartheta \|_{W^{2,p}(B\setminus B')} \leq C \| \text{curl}(A) \|_{L^p(D)}.
\]

**Proof.** Let \( \vartheta \) solves the following elliptic boundary value problem in the ball \( B \)

\[
\begin{cases}
-\Delta \vartheta = \text{div}(A) & \text{in } B, \\
\vartheta = 0 & \text{on } \partial B.
\end{cases}
\]  

(3.38)

Since the source term \( \text{div}(A) \) belongs to \( W^{1,p}(B) \) by the elliptic regularity (see [6, Theorem 2.5.1.1 in Chapter 2]), we have \( \vartheta \in W^{3,p}(B) \cap H_0^1(B) \). Moreover, there exist \( C > 0 \) such that

\[
\| \vartheta \|_{W^{3,p}(B)} \leq C \| \text{div}(A) \|_{W^{1,p}(D)} \leq C \| A \|_{W^{2,p}(D)},
\]

(3.39)

this ends the prove of (3.35). To prove (3.36), we consider the vector field \( H \in W^{2,p}(B) \) defined by

\[
H = A + \nabla \vartheta.
\]

(3.40)

By (3.38) and (3.40), \( H \) satisfies

\[
\text{div}(H) = 0, \quad \text{curl}(H) = \text{curl}(A) \quad \text{in } B, \quad \text{and } H \land \nu = 0 \quad \text{on } \partial B.
\]

(3.41)

By the \( L^p \)-div-curl estimate, we get

\[
\| H \|_{W^{1,p}(B)} \leq C \| \text{curl}(H) \|_{L^p(B)},
\]

(3.42)

and we conclude (3.36). Finally, to prove (3.37) we consider a cut-off function \( \chi_0 \in C^\infty(\mathbb{R}^n) \) such that \( \chi_0 = 1 \) in \( B' \setminus B' \) and \( \chi_0 = 0 \) in \( \overline{D} \). Set \( \vartheta_0 = \chi_0 \vartheta \), we have by (3.38)

\[
\begin{cases}
-\Delta \vartheta_0 = [\Delta, \chi_0] \vartheta & \text{in } B, \\
\vartheta_0 = 0 & \text{on } \partial B,
\end{cases}
\]

(3.43)

where we have used \( A = 0 \) outside \( D \). Thus, we obtain

\[
\| \vartheta_0 \|_{W^{2,p}(B)} \leq C \| \nabla \vartheta \|_{L^p(B \setminus D)},
\]

(3.44)

since the first order operator \([\Delta, \chi_0] \) is supported in \( B \setminus D \). Then we deduce that

\[
\| \vartheta_0 \|_{W^{2,p}(B)} \leq C \| A + \nabla \vartheta \|_{L^p(B \setminus D)} \leq C \| \text{curl}(A) \|_{L^p(D)}.
\]

(3.45)
Applying now Morrey’s inequality, we obtain for some positive constant $C$
\[
\|A + \nabla \vartheta\|_{L^\infty(B)} \leq C\|\text{curl}(A)\|_{L^\infty(D)},
\]  
and
\[
\|\vartheta\|_{W^{1,\infty}(B \setminus B')} \leq C\|\text{curl}(A)\|_{L^\infty(D)},
\]
We prove now the following inequality which is a slight modification of the previous estimate (3.8) given in Lemma 3.2. This inequality is based on the invariance of the near field operator under gauge transformation for the magnetic potential that was explained in the introduction.

**Lemma 3.7.** Let $B$ denote an open ball containing $\overline{D}$ and let $\varphi \in W^{2,\infty}(B)$ with $\text{Supp}(\varphi) \subset B$. Then there exist a constant $C$ that only depends on $B$ and such that
\[
\left| \int_B e^{-i\varphi} \left[ i(A + \nabla \varphi) \cdot (u_1 \nabla u_2 - u_2 \nabla u_1) - ((A + \nabla \varphi) \cdot (A_1 + A_2) + q)u_1 u_2 \right] \, dx \right| \leq C\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|_{H^2(B)}\|u_1\|_{H^2(B)}\|u_2\|_{H^2(B)},
\]
for all $u_1 \in H^2(B)$ satisfying $\mathcal{H}_{-A_1,q_1} u_1 = k^2 u_1$ in $B$ and all $u_2 \in H^2(B)$ satisfying $\mathcal{H}_{A_2,q_2} u_2 = k^2 u_2$ in the ball $B$.

**Proof.** Define $\tilde{A}_1 = A_1 - \frac{1}{2} \nabla \varphi$ and $\tilde{A}_2 = A_2 + \frac{1}{2} \nabla \varphi$. Consider $u_1, u_2 \in H^2(B)$ as in the lemma. Let denote $\tilde{u}_j = e^{-i\varphi/2} u_j$, then by (1.11) we get
\[
\mathcal{H}_{-A_1,q_1} \tilde{u}_1 = e^{-i\varphi/2} \mathcal{H}_{-A_1,q_1} u_1 = k^2 \tilde{u}_1, \quad \mathcal{H}_{A_2,q_2} \tilde{u}_2 = e^{-i\varphi/2} \mathcal{H}_{A_2,q_2} u_1 = k^2 \tilde{u}_2, \quad \text{in } B.
\]
Moreover, due the gauge invariance of the scattered field and since $\varphi|_{\partial B} = 0$, we have from (2.26) that
\[
\mathcal{N}_{\tilde{A}_j,q_j} = \mathcal{N}_{A_j,q_j}, \quad j = 1, 2.
\]
With these solution at hand, we use the gauge invariance (3.50) and (3.8) with $\tilde{A}_j$ and $\tilde{u}_j$ instead of $A_j$ and $u_j$, respectively, to obtain
\[
\left| \int_B [i\tilde{A}_1 \cdot (\tilde{u}_1 \nabla \tilde{u}_2 - \tilde{u}_2 \nabla \tilde{u}_1) - (|\tilde{A}_2|^2 - |\tilde{A}_1|^2 + q)\tilde{u}_1 \tilde{u}_2] \, dx \right| \leq C\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\|_{H^2(B)}\|\tilde{u}_1\|_{H^2(B)}\|\tilde{u}_2\|_{H^2(B)}.
\]
From the identity (3.51), we get (3.48). This ends the proof. 

Lemma 3.7, allows us then to obtain an estimate to $A$ added with a gradient term. By adding $\nabla \vartheta$, we would thus get an estimate with controlled terms. Unfortunately, we cannot directly add $\nabla \vartheta$, because of the requirement that $\text{Supp}(\varphi) \subset B$ in Lemma 3.7. We can solve this difficulty by using a cutoff argument.

Now, we will fix $\varphi = \chi \vartheta$, for $\chi \in C_0^\infty(B)$ such that $\chi = 1$ in $\overline{B'}$ and $\vartheta \in W^{2,\infty}(B)$ given by Lemma 3.6 which satisfying (3.46) and (3.47).
Lemma 3.8. Let $u_j$, $j = 1, 2$ be the functions given by (3.19) for some $s_0 > 0$. Then there exist positive constants $C$ and $A$ such that
\[
\left| \int_B e^{-i\varphi} q(x) u_1 u_2 dx \right| \leq Ce^{2A} \|N_{A_1, q_1} - N_{A_2, q_2}\| + s \|\text{curl}(A)\|_{L^\infty(D)}
\] (3.52) for all $s > s_0$.

Proof. Let $u_j$, $j = 1, 2$ be the functions given by (3.19) for some $s_0 > 0$. Adding and subtracting the same terms we get
\[
\int_B e^{-i\varphi} q(x) u_1 u_2 dx = \int_B e^{-i\varphi} (A + \nabla \vartheta) \cdot (A_1 + A_2) u_1 u_2 dx
+ \int_B i e^{-i\varphi} (A \cdot \nabla) \cdot (u_1 \nabla u_2 - u_2 \nabla u_1) dx
+ \int_B e^{-i\varphi} (A + \nabla \vartheta) \cdot \nabla \varphi u_1 u_2 dx + \mathcal{R},
\] (3.53)
where $\mathcal{R}$ denotes the integral
\[
\mathcal{R} = - \int_B e^{-i\varphi} \left[(A + \nabla \vartheta) \cdot (u_1 \nabla u_2 - u_2 \nabla u_1)
+ \left((A + \nabla \vartheta) \cdot (A_1 + A_2) - q + (A + \nabla \vartheta) \cdot \nabla \varphi \right) u_1 u_2 \right] dx.
\]
First, we have
\[
|\mathcal{J}_2| \leq C \|A + \nabla \vartheta\|_{L^\infty(B)} \left(\|u_1 \nabla u_2\|_{L^1(B)} + \|u_2 \nabla u_1\|_{L^1(B)} \right).
\] (3.54)
Then, we deduce from (3.46) and (3.22) that
\[
|\mathcal{J}_2| \leq C s \|\text{curl}(A)\|_{L^\infty(D)}.
\] (3.55)
Similarly, we have
\[
|\mathcal{J}_1| \leq C \|A + \nabla \vartheta\|_{L^\infty(B)} \|u_1 u_2\|_{L^1(B)}
\] (3.56)
and then, we have
\[
|\mathcal{J}_1| \leq C \|\text{curl}(A)\|_{L^\infty(D)}.
\] (3.57)
Finally, by the same arguments, we have
\[
|\mathcal{J}_3| \leq C \|\text{curl}(A)\|_{L^\infty(D)}.
\] (3.58)
Now recall that $\varphi = \chi \vartheta$ and set $\tilde{\varphi} = (1 - \chi) \vartheta$. Since $\nabla \vartheta = \nabla \varphi + \nabla \tilde{\varphi}$ we obtain, by Lemma 3.7, that
\[
|\mathcal{R}| \leq C \|N_{A_1, q_1} - N_{A_2, q_2}\| \|u_1\|_{H^2(B)} \|u_2\|_{H^2(B)}
+ \left| \int_B i e^{-i\varphi} \nabla \tilde{\varphi} \cdot (u_1 \nabla u_2 - u_2 \nabla u_1) + e^{-i\varphi} (\nabla \varphi + A_1 + A_2) \cdot \nabla \tilde{\varphi} u_1 u_2 dx \right|.
\] (3.59)
By the same arguments used previously, we get
\[
|R| \leq C e^{2A} \|N_{A_1, q_1} - N_{A_2, q_2}\| + s \|\nabla \varphi\|_{L^\infty(B)}.
\] (3.60)
Since by (3.47) we have
\[
\|\nabla \tilde{\varphi}\|_{L^\infty(B)} \leq \|\nabla \vartheta\|_{L^\infty(B \setminus B)} \leq C \|\text{curl}(A)\|_{L^\infty(D)},
\] we conclude (3.52) from (3.54), (3.57), (3.58) and (3.61). □
We now state the following integral identity for the electric potential which is proved in the Appendix.

**Lemma 3.9.** Let \( u_j, j = 1, 2 \) be the functions given by (3.19) for some \( s_0 > 0 \). Then for all \( \xi \in \mathbb{R}^3 \) and \( s \geq \max(s_0, |\xi|/2) \), we have the following identity

\[
\int_D e^{-ix\cdot q(x)} u_1 u_2 \, dx = \int_D q(x) e^{ix\cdot \xi} \, dx + \mathcal{R}'(\xi, s),
\]

where \( \mathcal{R}'(\xi, s) \) satisfy

\[
|\mathcal{R}'(\xi, s)| \leq C\left( \|\text{curl}(A)\|_{L^\infty(D)} + s^{-1} \langle \xi \rangle \right).
\]

The constants \( C \) and \( s_0 \) depend only on \( B, M \) and \( k \).

This identity allows to obtain the following estimates for the Fourier coefficients

\[
\hat{q}(\xi) := \int_{\mathbb{R}^3} e^{ix\cdot \xi} q(x) \, dx.
\]

From Lemma 3.8 and Lemma 3.9 we deduce the following estimate.

**Lemma 3.10.** There exists \( s_0 > 0 \) such that for all \( s \geq s_0 \) and \( \xi \in \mathbb{R}^3 \) with \( |\xi| \leq s \) the following estimate holds true,

\[
|\hat{q}(\xi)| \leq C\left( e^{\lambda s} \| N_{A_1, q_1} - N_{A_2, q_2} \| + s \|\text{curl}(A)\|_{L^\infty(D)} + s^{-1} \langle \xi \rangle \right).
\]

The constants \( s_0, C \) and \( \lambda \) depend only on \( B, M \) and \( k \).

With the help of the previous lemma, we are now in position to prove the stability result for the electric potential under the assumption

\[
\int_{\mathbb{R}^3} \langle \xi \rangle^\gamma |\hat{q}(\xi)| \, d\xi < M,
\]

for some \( \gamma > 0 \).

**End of the proof of the stability estimate for the electric potential.** Let \( s_0 > 1 \) be as in Lemma 3.10 and \( s \) and \( R \) be two parameters satisfying \( s \geq R \geq s_0 \). From (3.64) and (3.65) we get

\[
\int_{\mathbb{R}^3} |\hat{q}(\xi)| \, d\xi = \int_{|\xi| \leq R} |\hat{q}(\xi)| \, d\xi + \int_{|\xi| \geq R} |\hat{q}(\xi)| \, d\xi \leq CR\left( e^{\lambda s} \| N_{A_1, q_1} - N_{A_2, q_2} \| + s \|\text{curl}(A)\|_{L^\infty} + R s^{-1} \right) + 2MR^{-\gamma}.
\]

Choosing \( R = s^{1/(\gamma+2)} \), we deduce that for \( s_0 \) sufficiently large (depending only on \( B, k, M \) and \( \gamma \)),

\[
\|q\|_{L^\infty(\mathbb{R}^3)} \leq C'\left( e^{\lambda s} \| N_{A_1, q_1} - N_{A_2, q_2} \| + s^{(\gamma+3)/(\gamma+2)} \|\text{curl}(A)\|_{L^\infty} + s^{-\gamma/(\gamma+2)} \right)
\]

for some positive constants \( C' \) and \( \Lambda' \) and all \( s \geq s_0 \). Observe now that (3.32) implies in particular (after eventually changing the constants \( C', \Lambda' \) and \( s_0 \))

\[
\|\text{curl}A\|_{L^\infty(D)} \leq C'\left( e^{\lambda s} \| N_{A_1, q_1} - N_{A_2, q_2} \| + s^{-\kappa/(\gamma+3)} \right),
\]

for all \( \kappa \geq 1 \). Choosing \( \kappa \) such that

\[
-\frac{\kappa\gamma}{\sigma + 3} + \frac{\gamma + 3}{\gamma + 2} = -\frac{\gamma}{\gamma + 2} \Leftrightarrow \kappa = \frac{(2\gamma + 3)(\sigma + 3)}{\sigma(\gamma + 2)},
\]

where \( \sigma = \max(s_0, |\xi|/2) \).
we obtain by substituting (3.67) in (3.66)

\[ \|q\|_{L^\infty(\mathbb{R}^3)} \leq C' \left( e^{A'' s^\alpha} \|N_{A,1,q_1} - N_{A,2,q_2}\| + s^{-\gamma/(\gamma+2)} \right), \]

(3.68)

with possibly different constants \( C' \) and \( \Lambda' \).

Now if \( \|N_{A,1,q_1} - N_{A,2,q_2}\| \leq \varepsilon_0 \), for some \( \varepsilon_0 > 0 \), such that \(- \log(\varepsilon_0) \geq 2\Lambda' s_0^\alpha\), then taking \( s^\alpha = \frac{2\pi}{2\Lambda'} \log(\|N_{A,1,q_1} - N_{A,2,q_2}\|) \) in (3.32) implies

\[ \|q\|_{L^\infty(\mathbb{R}^3)} \leq C' \left( \|N_{A,1,q_1} - N_{A,2,q_2}\|^1/2 + \left( \frac{1}{2\Lambda'} \log(\|N_{A,1,q_1} - N_{A,2,q_2}\|)^{\gamma/(\gamma+2)} \right) \right). \]

(3.69)

We also observe that this type of inequality holds true if \( \|N_{A,1,q_1} - N_{A,2,q_2}\| \geq \varepsilon_0 \) since in that case we can simply write

\[ \|q\|_{L^\infty(\mathbb{R}^3)} \leq M \leq (M/\sqrt{\varepsilon_0}) \|N_{A,1,q_1} - N_{A,2,q_2}\|^{1/2}. \]

(3.70)

The proof of the second part of Theorem 1.2 is then completed.

4. STABILITY ANALYSIS FOR FAR FIELD DATA

In order to prove stability estimates with far field measurements we shall exploit the relation between the far field \( u^\infty_{A,q}(\hat{x},d) \), \( (\hat{x},d) \in \mathbb{S}^2 \times \mathbb{S}^2 \) and the operator \( N_{A,q} \) given by (1.7) with \( B = \{ x \in \mathbb{R}^3, |x| < a \} \) for some sufficiently large \( a > 0 \) so that \( D \subset B \). We here assume that the hypothesis of Section 2 holds. We recall that the far field pattern can be expressed as

\[ u^\infty_{A,q}(\hat{x},d) = \frac{1}{4\pi} \int_D e^{-ik\hat{x} \cdot y} Q_{A,q}(y,d) dy. \]

(4.1)

We denote by \( \mu(\ell, m_1, m_2) \), \( (\ell, m_i) \in \Gamma, i = 1, 2 \) the Fourier coefficients of \( u^\infty_{A,q} \) given by

\[ \mu(\ell, m_1, m_2) := \int_{\mathbb{S}^2} \int_{\mathbb{S}^2} u^\infty_{A,q}(\hat{x},d) Y_{\ell m_1}^{m_1}(\hat{x}) Y_{\ell m_2}^{m_2}(d) ds(\hat{x}) \ ds(d), \]

(4.2)

For proving the first lemma we need the following well known results about the asymptotic of spherical Bessel functions \( j_\ell \) and spherical Hankel functions of the first kind \( h^{(1)}_\ell \) [21, Appendix A]:

\[ |j_\ell(kr)| \leq \alpha \left( \frac{e^{kr}}{2\ell+1} \right)^\ell, \quad 0 \leq r \leq a, \quad \ell \in \mathbb{N} \cup \{0\}, \]

(4.3)

and

\[ |h^{(1)}_\ell(kr)| \leq \alpha \left( \frac{2\ell+1}{ekr} \right)^\ell, \quad 0 < r \leq a, \quad \ell \in \mathbb{N} \cup \{0\}, \]

(4.4)

where \( \alpha \) is a constant that only depend on \( a \) and \( k \). We also recall the following equality that comes from the addition formula [3],

\[ \int_{\mathbb{S}^2} Y_{\ell m_2}^{m_2}(\hat{z}) \Phi(x, rz) \ ds(\hat{z}) = ikj_{\ell_2}(kr)h^{(1)}_{\ell_2}(k|x|) Y_{\ell_2 m_2}^{m_2}(\hat{x}), \quad |x| > r, \]

(4.5)

together with the Funk–Hecke formula

\[ \int_{\mathbb{S}^2} e^{-ikx \cdot \hat{z}} Y_{\ell_2}^{m_2}(\hat{z}) ds(\hat{z}) = \frac{4\pi}{\ell_2} j_{\ell_2}(k|x|) Y_{\ell_2 m_2}^{m_2}(\hat{x}), \quad x \in \mathbb{R}^3. \]

(4.6)
Lemma 4.1. Let $A \in W^{1,\infty}(\mathbb{R}^3, \mathbb{R}^3)$ and $q \in L^\infty(\mathbb{R}^3, \mathbb{C})$ be as in Section 2 and such that $\|A\|_{W^{1,\infty}} \leq M$ and $\|q\|_{L^\infty} \leq M$ for some constant $M > 0$. Let $\mu(\ell_1; m_1; \ell_2; m_2)$ denote the Fourier coefficients of the far field patterns $u_{A,q}^{\infty}$ as defined in (4.2). Then there exists a constant $C > 0$ that only depends on $D$, $a$, $k$ and $M$ such that
\[
|\mu(\ell_1; m_1; \ell_2; m_2)|^2 \leq C \left( \frac{ek\alpha}{2\ell_1 + 1} \right)^{2\ell_1 + 3} \left( \frac{ek\alpha}{2\ell_2 + 1} \right)^{2\ell_2 + 3}
\] (4.7)
and
\[
\sum_{(\ell_1, m_1) \in \Gamma} \sum_{(\ell_2, m_2) \in \Gamma} \left( \frac{2\ell_1 + 1}{ek\alpha} \right)^{2\ell_1 + 1} \left( \frac{2\ell_2 + 1}{ek\alpha} \right)^{2\ell_2 + 1} |\mu(\ell_1, m_1; \ell_2, m_2)|^2 \leq C.
\]

Proof. We only need to prove (4.7). According to (4.2) and (4.1), we obtain
\[
\mu(\ell_1, m_1; \ell_2, m_2) = \frac{1}{4\pi} \int_B \left( \int_{S^2} Q_{A,q} u(y, d)Y_{\ell_2}^m(d)ds(d) \right) \left( \int_{S^2} e^{-ik\varphi y Y_{\ell_1}^m(\hat{x})}ds(\hat{x}) \right) dy.
\]

(4.8)

With the help of the Funk-Hecke formula (4.6) we compute
\[
v_{\ell_1, m_1}(y) := \int_{S^2} e^{-ik\varphi y Y_{\ell_1}^m(\hat{x})}ds(\hat{x}) = \frac{4\pi}{\ell_1} j_{\ell_1}(k|y|)Y_{\ell_1}^m(y), \quad y \in \mathbb{R}^3.
\] (4.9)

Then by (4.3), we get
\[
\|v_{\ell_1, m_1}\|_{L^2(B)}^2 \leq C \int_0^a |j_{\ell_1}(kr)|^2 r^2 dr \leq C \left( \frac{ek\alpha}{2\ell_1 + 1} \right)^{2\ell_1 + 3}.
\] (4.10)

Using again the Funk-Hecke formula, we obtain
\[
\int_{S^2} u(y, d)Y_{\ell_2}^m(d)ds(d) = T_{A,q} \left( \int_{S^2} u(y, d)Y_{\ell_2}^m(d)ds(d) \right) + (-1)^{\ell_2} v_{\ell_2, m_2},
\] (4.11)

and we deduce that
\[
w_{\ell_2, m_2}(x) = (-1)^{\ell_2} Q_{A,q} \left( (I - T_{A,q})^{-1} v_{\ell_2, m_2} \right)(x).
\] (4.12)

Using the fact that $Q_{A,q}$ is a first order operator supported in $D$, then we obtain from Proposition 2.2,
\[
\|w_{\ell_2, m_2}\|_{L^2(B)} \leq C \|(I - T_{A,q})^{-1} v_{\ell_2, m_2}\|_{H^1(D)} \leq C \|v_{\ell_2, m_2}\|_{H^1(D)}.
\] (4.13)

We note that there is a constant $C > 0$ such that the inequality
\[
\|u\|_{H^1(D)} \leq C \|u\|_{L^2(B)}
\] (4.14)
holds true for all $u \in H^1_{loc}(\mathbb{R}^3)$ satisfying the Helmholtz equation $\Delta u + k^2 u = 0$ in $\mathbb{R}^3$. We can then estimate
\[
\|w_{\ell_2, m_2}\|_{L^2(B)} \leq C \|v_{\ell_2, m_2}\|_{H^1(D)} \leq \|v_{\ell_2, m_2}\|_{L^2(B)}^2 \leq C \left( \frac{ek\alpha}{2\ell_2 + 1} \right)^{2\ell_2 + 3},
\] (4.15)
we conclude, from (4.8), (4.10) and (4.15), that
\[
|\mu(\ell_1, m_1; \ell_2, m_2)|^2 \leq C \|v_{\ell_1, m_1}\|_{L^2(B)}^2 \|w_{\ell_2, m_2}\|_{L^2(B)}^2 \leq C \left( \frac{ek\alpha}{2\ell_2 + 1} \right)^{2\ell_2 + 3} \left( \frac{ek\alpha}{2\ell_1 + 1} \right)^{2\ell_1 + 3}.
\] (4.16)

This competes the proof. □
The following lemma makes the link between \(u_{A,q}^s(\cdot, y)\) and \(u_{A,q}^\infty(\cdot, d)\). The proof follows similar ideas as in Stefanov [21] for \(A = 0\) but uses different arguments since we do not rely on the properties of the Green function for \(A \neq 0\) when \(x \sim y\). Our proof would apply to more general contexts since we mainly rely on the reciprocity relation in Lemma 2.6. The proof is given in Appendix B.

**Lemma 4.2.** The scattered field associated with point sources can be expanded as

\[
u_{A,q}^s(x, y) = -\frac{k^2}{4\pi} \sum_{(\ell_1, m_1) \in \Gamma} \sum_{(\ell_2, m_2) \in \Gamma} i^{\ell_1-\ell_2} \rho(\ell_1, m_1; \ell_2, m_2) h_{\ell_1}^{(1)}(y|\ell_1) h_{\ell_2}^{(1)}(y|\ell_2) Y_{\ell_1}^{m_1}(\hat{x}) Y_{\ell_2}^{m_2}(\hat{y}),
\]

(4.17)

uniformly for \(|x|, |y| \geq a\), with \(\hat{x} = x/|x|\) and \(\hat{y} = y/|y|\).

Then we have the following Lemma showing the Lipschitz continuity of the mapping \(u_{A,q}^\infty \to \mathcal{N}_{A,q}\) when \(u_{A,q}^\infty\) is endowed with the norm (1.17).

**Lemma 4.3.** Let \(A_j\) and \(q_j, j = 1, 2\) be as in Section 2. Then

\[
\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\| \leq \alpha^2 \frac{k^2}{4\pi} \|u_{A_1,q_1}^\infty - u_{A_2,q_2}^\infty\|_F, 
\]

(4.18)

**Proof.** For \(j = 1, 2\), denote by \(\rho(\ell_1, m_1; \ell_2, m_2)\) the Fourier coefficients associated with \(u_{A_j,q_j}^\infty\) as above. We get from (4.17)

\[
\left\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\right\|^2 \leq \left(\frac{k^2}{4\pi}\right)^2 \sum_{(\ell_1, m_1) \in \Gamma} \sum_{(\ell_2, m_2) \in \Gamma} |h_{\ell_1}^{(1)}(ka)|^2 |h_{\ell_2}^{(1)}(ka)|^2 |\rho(\ell_1, m_1; \ell_2, m_2)| - |\rho(\ell_1, m_1; \ell_2, m_2)|^2.
\]

The estimate then follows using (4.4).

From (4.18) and Theorem 1.1 we easily derive Theorem 1.2. Following the same arguments as in [8] one can obtain a stability result using only the \(L^2\) norm of the far field. In fact, identity (4.17) and the uniform bound of Corollary 2.3 allows us to reproduce exactly the same arguments as in [8, Section 4] to state the following continuity result.

**Lemma 4.4.** Let \(M > 0\) and \(0 < \theta < 1\) be given. Let \(A_j \in W^{1,\infty}(\mathbb{R}^3, \mathbb{R}^3)\) and \(q_j \in L^\infty(\mathbb{R}^3)\) be as in Section 2 such that \(\|A_j\|_{W^{1,\infty}} \leq M\) and \(\|q_j\|_{L^\infty} \leq M\). Then there exists a constant \(\eta > 0\) that only depends on \(M, k, a\) and \(\theta\) and a constant \(\omega\) that only depends on \(a\) and \(k\) such that

\[
\left\|\mathcal{N}_{A_1,q_1} - \mathcal{N}_{A_2,q_2}\right\| \leq \eta^2 \exp \left(-(\ln \frac{\|u_{A_1,q_1}^\infty - u_{A_2,q_2}^\infty\|_{L^2(\mathbb{R}^2 \times \mathbb{R}^2)}}{\omega\eta})^\theta\right),
\]

where \(\mathcal{N}_{A_j,q_j}, j = 1, 2\) denote here the near field operators associated with \(B = \{x \in \mathbb{R}^3, |x| < 2a\}\). Using the result of this lemma and Theorem 1.1 one can prove Theorem 1.3 as follows.
Proof of Theorem 1.3. According to Lemma 4.4

\[ -\ln \left( \|N_{A_1,q_1} - N_{A_2,q_2}\| \right) \geq -\ln(\eta^2) + \left( -\ln \left( \frac{\|u_{A_1,q_1}^\infty - u_{A_2,q_2}^\infty\|_L^2}{\omega \eta} \right) \right)^\theta \]

\[ \geq \frac{1}{2} \left( -\ln \left( \frac{\|u_{A_1,q_1}^\infty - u_{A_2,q_2}^\infty\|_L^2}{\omega \eta} \right) \right)^\theta, \]

for sufficiently small \( \|u_{A_1,q_1}^\infty - u_{A_2,q_2}^\infty\|_L^2 \) such that \( \|u_{A_1,q_1}^\infty - u_{A_2,q_2}^\infty\|_L^2 \leq \omega \eta e^{-2(\ln(\eta^2))^{\frac{1}{2}}} \).

Then, if we further suppose that \( \|u_{A_1,q_1}^\infty - u_{A_2,q_2}^\infty\|_L^2 \leq \epsilon/(\omega \eta) \), then

\[ (-\ln (\|N_{A_1,q_1} - N_{A_2,q_2}\|))^{-\frac{\sigma}{\sigma + 3}} \leq 2^{\frac{\sigma (1-\theta)}{\sigma + 3}} \left( -\ln \left( \|u_{A_1,q_1}^\infty - u_{A_2,q_2}^\infty\|_L^2 \right) \right)^{-\frac{\sigma \theta}{\sigma + 3}}. \]

Using the first inequality in Theorem 1.1 and choosing \( \theta \) such that \( \theta \frac{\sigma}{\sigma + 3} = \frac{\sigma}{\sigma + 3} - \epsilon \), where \( 0 < \epsilon < \frac{\sigma}{\sigma + 3} \), yield the first inequality of Theorem 1.3 related to \( \|\text{curl} A_1 - \text{curl} A_2\|_{L^\infty(D)} \).

The estimate for \( \|q_1 - q_2\|_{L^\infty(D)} \) is derived analogously.

APPENDIX A. PROOF OF LEMMAS 3.4 AND 3.9

This Appendix is devoted to the proof of the Lemma 3.4. At first, we recall the following three lemmas proved in [24] on the properties of the operator \( N_0^{-1}, \omega \in \mathbb{S}^2 + i\mathbb{S}^2 \), given by (3.14). The first Lemma, due to Salo [19] in the reconstruction methods and similar to the one appearing in Eskin and Ralston [5] and Sun [22], shows that a relation between a non-linear and linear Fourier transform of \( \omega \cdot A \) for a vector field \( A \).

**Lemma A.1.** Let \( \omega = \omega_1 + i\omega_2 \) with \( \omega_1, \omega_2 \in \mathbb{S}^2 \) and \( \xi \in \mathbb{R}^3 \), such that \( \xi, \omega_1 \) and \( \omega_2 \) be three mutually orthogonal vectors in \( \mathbb{R}^3 \). Let \( A \in W^{2,\infty}(\mathbb{R}^3)^3 \) with \( \text{Supp}(A) \subset D \). Then we have the following equality

\[ \int_{\mathbb{R}^3} \omega \cdot A(x)e^{ix \cdot \xi}e^{i\omega_1^\infty(-\omega \cdot A)(x)}dx = \int_{\mathbb{R}^3} \omega \cdot A(x)e^{ix \cdot \xi}dx, \]  

where \( A \) is extended by \( 0 \) outside \( D \).

**Lemma A.2.** Let \( g \in W^{n,\infty}(\mathbb{R}^3), n \geq 0 \), with \( \text{Supp}(g) \subset D \). Then \( N_0^{-1}(g) \in W^{n,\infty}(\mathbb{R}^3) \) and satisfies

\[ \|N_0^{-1}(g)\|_{W^{n,\infty}(\mathbb{R}^3)} \leq C\|g\|_{W^{n,\infty}(\mathbb{R}^3)}, \]

where \( C \) depends only on \( D \).

Finally, we have the following result which gives the dependence of \( N_0^{-1}(-\omega \cdot A) \) on the parameter \( \omega \).

**Lemma A.3.** Let \( A \in W^{2,\infty}(\mathbb{R}^3) \) with \( \text{Supp}(A) \subset D \) such that \( \|A\|_{W^{2,\infty}} \leq M \) and let \( \theta, \theta' \in \mathbb{S}^2 + i\mathbb{S}^2 \) such that \( |\theta - \theta'| < 1 \) such that \( \Re(\theta) \cdot \Im(\theta) = \Re(\theta') \cdot \Im(\theta') = 0 \). Then, we have the following inequality

\[ \|N_0^{-1}(-\theta \cdot A) - N_0^{-1}(-\theta' \cdot A)\|_{L^\infty(D)} \leq C|\theta - \theta'|, \]

where \( C \) depends only in \( D \) and \( M \).

**Proof of Lemma 3.4.** By using (3.19), we have for \( j = 1,2 \)

\[ \nabla u_j = e^{ix \cdot \rho_j} i(\rho_j + \nabla \varphi_j) e^{ix \cdot \rho_j} + i\rho_j r_j + \nabla r_j, \]

where \( \varphi_1 \) and \( \varphi_2 \) are given by

\[ \varphi_1(x, \omega_1^*) = N_{\omega_1^*}^{-1}(\omega_1^* \cdot A_1), \quad \varphi_2(x, \omega_2^*) = N^{\omega_2^*}_2(-\omega_2^* \cdot A_2), \]
where \( A_j, j = 1, 2 \) are extended by 0 outside \( D \).
Therefore, direct calculation gives
\[
\begin{align*}
u_2 \nabla u_1 - u_1 \nabla u_2 = i(\rho_1 - \rho_2)e^{i(\varphi_1 + \varphi_2)}e^{i\omega_1 + \omega_2}(x, \rho_1, \rho_2) + \Psi_1(x, \rho_1, \rho_2) + \Psi_2(x, \rho_1, \rho_2),
\end{align*}
\] (A.5)
where \( \Psi_1 \) and \( \Psi_2 \) are given by
\[
\begin{align*}
\Psi_1(x, \rho_1, \rho_2) &= i(\rho_1 - \rho_2)\left[r_1 e^{i\varphi_1} + r_2 e^{i\varphi_2} + r_1 r_2\right] e^{i\omega_1 + \omega_2}, \\
\Psi_2(x, \rho_1, \rho_2) &= \left[i(\nabla \varphi_1 - \nabla \varphi_2)e^{i(\varphi_1 + \varphi_2)} + (\nabla r_1 e^{i\varphi_1} - \nabla r_2 e^{i\varphi_2})ight. \\
&\quad\quad\left. + (ir_2 \nabla \varphi_1 e^{i\varphi_1} - ir_1 \nabla \varphi_2 e^{i\varphi_2}) + (r \nabla r_1 - r_1 \nabla r_2)\right] e^{i\omega_1 + \omega_2}.
\end{align*}
\]
Using Lemma A.2 and the fact that \( A_j, j = 1, 2 \), is compactly supported in \( \mathbb{R}^3 \), we obtain
\[
\| \varphi_j (\cdot, \omega^2) \|_{L^\infty(D)} \leq C\| A_j \|_{L^\infty(\mathbb{R}^3)} \leq CM. \tag{A.6}
\]
This implies that
\[
\| \Psi_1 (\cdot, \rho_1, \rho_2) \|_{L^1(D)} \leq C. \tag{A.7}
\]
From (A.5), we obtain
\[
\begin{align*}
i \int_{\mathbb{R}^3} A \cdot (u_2 \nabla u_1 - u_1 \nabla u_2) \, dx &= \int_{\mathbb{R}^3} A \cdot (\rho_2 - \rho_1)e^{i\omega_1 + \omega_2} \, dx + \mathcal{R}_1(\xi, s), \tag{A.8}
\end{align*}
\]
where
\[
\mathcal{R}_1(\xi, s) = i \int_{\mathbb{R}^3} A \cdot (\Psi_1(x, \rho_1, \rho_2) + \Psi_2(x, \rho_1, \rho_2)) \, dx, \quad \xi = \rho_1 + \rho_2. \tag{A.9}
\]
Let now compute the first integral in the right hand side of (A.8). By using (3.17) and (3.20), we have for \( \omega = \omega_1 + i\omega_2 \)
\[
\begin{align*}
\int_{\mathbb{R}^3} A \cdot (\rho_2 - \rho_1)e^{i\omega_1 + \omega_2} \, dx &= 2s \int_{\mathbb{R}^3} \overline{\omega} \cdot A e^{i\omega_1 + \omega_2} \, dx \\
&\quad + 2s \left(1 - \frac{\| \omega \|^2}{4s^2} - 1\right) \int_{\mathbb{R}^3} \omega_1 \cdot A e^{i\omega_1 + \omega_2} \, dx, \tag{A.10}
\end{align*}
\]
Let \( \psi_1 = N_{-1}^{-1}(\overline{\omega} \cdot A_1) \), and \( \psi_2 = N_{-1}^{-1}(-\overline{\omega} \cdot A_2) \), then we have
\[
\psi_1(x) + \psi_2(x) = N_{-1}^{-1}(-\overline{\omega} \cdot (A_2 - A_1)) = N_{-1}^{-1}(-\overline{\omega} \cdot A).
\]
We insert \( e^{i(\psi_1 + \psi_2)} \) in (A.10), then we have
\[
\begin{align*}
\int_{\mathbb{R}^3} A(x) \cdot (\rho_2 - \rho_1)e^{i\omega_1 + \omega_2} \, dx &= \mathcal{J}(\xi, s) + \mathcal{R}_2(\xi, s) + \mathcal{R}_3(\xi, s), \tag{A.11}
\end{align*}
\]
where
\[
\begin{align*}
\mathcal{J}(\xi, s) &= 2s \int_{\mathbb{R}^3} \overline{\omega} \cdot A(x)e^{i\omega_1 + \omega_2} \, dx, \\
\mathcal{R}_2(\xi, s) &= 2s \int_{\mathbb{R}^3} \overline{\omega} \cdot A(x)e^{i\omega_1 + \omega_2} \left(e^{i(\varphi_1 + \varphi_2)} - e^{i(\psi_1 + \psi_2)}\right) \, dx, \\
\mathcal{R}_3(\xi, s) &= 2s \left(1 - \frac{\| \omega \|^2}{4s^2} - 1\right) \int_{\mathbb{R}^3} \omega_1 \cdot A(x)e^{i\omega_1 + \omega_2} \, dx.
\end{align*}
\]
By using the Lemma A.1, we obtain
\[
\mathcal{J}(\xi, s) = 2s \int_{\mathbb{R}^3} \overline{\omega} \cdot A(x)e^{i\omega_1} \, dx. \tag{A.12}
\]
On the other hand, we have
\[
\mathcal{R}_2(\xi, s) = -2s \int_{\mathbb{R}} e^{-ix \cdot \xi} \cdot A \left( e^{i\psi_2} (e^{i\psi_2} - e^{i\psi_1}) - e^{i\psi_1} (e^{i\psi_1} - e^{i\psi_1}) \right) dx. \tag{A.13}
\]
Using the dependence of \(N^{-1}_{(\omega \cdot A)}\) on the parameter \(\omega\) given in Lemma A.3 and the fact that \(\text{Supp} A \subset D\), we get
\[
|e^{i\psi_2} - e^{i\psi_1}| \leq C \left| N^{-1}_{-\omega^2 A} - N^{-1}_{-\omega^1 A} \right| \leq C |\omega^2 - \omega^1|,
\]
\[
|e^{i\psi_1} - e^{i\psi_1}| \leq C \left| N^{-1}_{-\omega^2 \omega} - N^{-1}_{-\omega^1 \omega} \right| \leq C |\omega^2 + \omega^1|. \tag{A.14}
\]
Taking into account (A.13), (A.14) and using that \(1 - \sqrt{\frac{1 - |\xi|^2/s^2}{|\xi|^2/4s^2}} \leq |\xi|^2/4s^2\), for all \(|\xi| \leq 2s\), we conclude
\[
|\mathcal{R}_2(\xi, s)| \leq C_s \frac{|\xi|^2}{4s^2} \leq C|\xi|. \tag{A.15}
\]
By the same way, we find \(|\mathcal{R}_3(\xi, s)| \leq C|\xi|\), for some positive constant which is independent of \(\xi\) and \(s\).

The proof is completed. \(\square\)

**Proof of Lemma 3.9.** By a direct calculation, we have
\[
u_1 u_2 = e^{ix \cdot \xi} e^{i(\psi_2 + \psi_1)} + e^{ix \cdot \xi} (e^{i\psi_2} r_1 + e^{i\psi_1} r_2 + r_1 r_2). \tag{A.16}
\]
We use the identity (A.16) and we insert \(e^{ix \cdot \xi} q(x)\), we obtain
\[
\int_{D} e^{-ix \cdot \xi} q(x) u_1 u_2 dx = \int_{D} q(x) e^{ix \cdot \xi} dx + \mathcal{R}_1(\xi, s) + \mathcal{R}_2(\xi, s), \tag{A.17}
\]
where
\[
\mathcal{R}_1(\xi, s) = \int_{D} q(x) e^{ix \cdot \xi} e^{i\psi_1} \left( e^{i(\psi_2 - \psi)} - e^{-i\psi_1} \right) dx,
\]
\[
\mathcal{R}_2(\xi, s) = \int_{D} e^{-ix \cdot \xi} q(x) e^{ix \cdot \xi} (e^{i\psi_2} r_1 + e^{i\psi_1} r_2 + r_1 r_2) dx.
\]
Let \(\psi_3 = N^{-1}_{-\omega^2 A} \). We insert \(e^{i\psi_3}\) in \(\mathcal{R}_1\) and obtain from Lemmas A.2 and A.3
\[
|\mathcal{R}_1(\xi, s)| \leq C \left| e^{i(\varphi_2 - \varphi)} - e^{i\psi_3} \right|_{L^\infty(D)} + \left| e^{i\psi_3} - e^{-i\varphi_1} \right|_{L^\infty(B)} \leq C \left| N^{-1}_{-\omega^2 (\cdot, A_2 + \nabla \varphi)} - N^{-1}_{-\omega^1 (\cdot, A_1)} \right|_{L^\infty(B)}
\] + \left| N^{-1}_{-\omega^2 (\cdot, A_1)} - N^{-1}_{-\omega^1 (\cdot, A_1)} \right|_{L^\infty(B)} \leq C \left( ||A + \nabla \varphi||_{L^\infty(B)} + ||\omega^2 + \omega^1|| \right) \leq C \left( ||A + \nabla \varphi||_{L^\infty(B)} + ||\varphi||_{W^1,\infty(B \setminus B')} + ||\omega^2 + \omega^1|| \right). \tag{A.18}
\]
Using (3.46) and (3.47), we obtain
\[
|\mathcal{R}_1(\xi, s)| \leq C \left( ||\text{curl}(A)||_{L^\infty(B)} + s \langle \xi \rangle^{-1} \right). \tag{A.19}
\]
Moreover from (3.20), we get \(|\mathcal{R}_2(\xi, s)| \leq Cs^{-1}\). Collecting this with (A.19) and (A.17) we obtain the desired result. \(\square\)
This appendix is devoted to the proof of Lemma 4.2. We first establish the following duality result. The coefficients $A$ and $q$ are as in Section 2.

**Lemma B.1.** Let $v_i \in H^1(B)$, $i = 1, 2$ such that $\Delta v_i + k^2 v_i = 0$ in $B$. Then, the following identity

$$\int_B Q_{A,q} v_1 (I - T_{A,q})^{-1} v_2 dx = \int_B Q_{-A,q} v_2 (I - T_{A,q})^{-1} v_1 dx,$$

(B.20)

holds where $Q_{A,q}$ and $T_{A,q}$ are given by (1.2) and (2.20) respectively.

**Proof.** We associate to $v_1$ (respectively $v_2$) a total field $u_{A,q}$ (respectively $u_{-A,q}$) and a scattered field $u^s_{A,q}$ (respectively $u^s_{-A,q}$). Applying (2.33) to $u_1 = u^s_{A,q}$ and $u_2 = u^s_{-A,q}$ implies

$$\int_B (\mathcal{H}_{A,q} u^s_{A,q} - u^s_{A,q} \mathcal{H}_{-A,q} u^s_{-A,q}) dx = 0.$$ 

Making use of $u_{A,q} = u^s_{A,q} + v_1$ and $u_{-A,q} = u^s_{-A,q} + v_2$, it follows by direct calculation

$$\int_B (Q_{A,q} v_1 u_{-A,q} - Q_{-A,q} v_2) dx = \int_B (Q_{A,q} v_1 v_2 - Q_{-A,q} v_2 v_1) dx.$$ 

Moreover, by integrating by parts, we get

$$\int_B (Q_{A,q} v_1 v_2 - Q_{-A,q} v_2 v_1) dx = 0.$$

Due to $u_{A,q} = (I - T_{A,q})^{-1} v_1$ and $u_{-A,q} = (I - T_{-A,q})^{-1} v_2$, we obtain the desired result. 

**Proposition B.2.** For $k > 0$ fixed, we have

$$u^s_{A,q}(x, y) = \frac{1}{4\pi} \frac{e^{ik|x|}}{|x|} \frac{e^{ik|y|}}{|y|} u^\infty_{A,q}(\hat{x}, \hat{y}) + \frac{1}{|x|} \left( \frac{1}{|x|} + \frac{1}{|y|} \right) \Lambda(x, y), \quad x \neq y,$$

(B.21)

where $\Lambda(x, y)$ is uniformly bounded as $|x| \rightarrow \infty$ and $|y| \rightarrow \infty$.

**Proof.** Using the asymptotics of $\Phi(\cdot, z)$ and $\nabla_z \Phi(\cdot, z)$ for $z \in D$, we get

$$u^s_{A,q}(x, y) = \int_D Q_{-A,q} \Phi(x, z) u_{A,q}(z, y) dz$$

(B.22)

$$= \frac{e^{ik|x|}}{4\pi |x|} w(y, -\hat{x}) + O(1) \|u_{A,q}(\cdot, y)\|_{L^2(D)}, \quad |x| \rightarrow \infty,$$

(B.23)

uniformly with respect to $y \in \mathbb{R}^3 \setminus B$, where

$$w(y, d) := \int_D Q_{-A,q} e^{ikz \cdot d} u_{A,q}(z, y) dz.$$ 

Using now Lemma B.1 and integrating by parts, we get

$$w(y, d) = -\int_D \Phi(z, y) Q_{-A,q} u_{-A,q}(z, d) dz,$$

(B.24)
and therefore \( w(\cdot, d) = u^\infty_{A,q}(\cdot, d) \). Consequently, (B.23) and (4.1) imply that for \( |x|, |y| \to \infty \)

\[
u_A^0(x, y) = \frac{1}{4\pi} \frac{e^{ik|x|} e^{ik|y|}}{|x| |y|} u^\infty_{A,q} (\hat{y}, -\hat{x}) + O\left(\frac{1}{|x|^2} \| u_{A,q}(\cdot, y) \|_{L^2(D)}\right) + O\left(\frac{1}{|x||y|^2} \| u_{-A,q}(\cdot, -\hat{x}) \|_{L^2(D)}\right).
\]

(B.25)

Let us observe that according to Corollary 2.3 (and the asymptotic behaviour of \( \Phi(x, y) \) and \( \nabla_x \Phi(x, y) \) with \( x \in D \) and \( |y| \to \infty \)) we get that

\[\| u_{A,q}(\cdot, y) \|_{L^2(D)} = \frac{O(1)}{|y|} \quad \text{as} \quad |y| \to \infty,\]

and \( \| u_{-A,q}(\cdot, -\hat{x}) \|_{L^2(D)} \) is uniformly bounded with respect to \( \hat{x} \). We finally obtain the desired result by noticing the reciprocity relation \( u^\infty_{A,q}(d, \theta) = u^\infty_{-A,q}(-\theta, -d) \) where \( \theta, d \in S^2 \) (which is also a consequence of Lemma B.1) or using Lemma 2.6.

Now, let us expand the scattering amplitude \( u^\infty_{A,q}(d, \theta) \) in spherical harmonics

\[
u^\infty_{A,q}(d, \theta) = \sum_{(\ell_1, m_1) \in \Gamma} \sum_{(\ell_2, m_2) \in \Gamma} \mu_{\ell_1 m_1 \ell_2 m_2} Y^{m_1}_{\ell_1}(d) Y^{m_2}_{\ell_2}(\theta), \tag{B.26}
\]

where \( \mu_{\ell_1 m_1 \ell_2 m_2} \) is given by (4.2).

**Proof of Lemma 4.2.** Making use of the addition formula [3],

\[
\Phi(x, z) = \sum_{\ell, m} \varepsilon_{\ell, m}(z) h^{(1)}_{\ell}(k |x|) Y^m_\ell (\hat{x}), \quad |x| > |z|, \tag{B.27}
\]

\[
\nabla_y \Phi(x, z) = \sum_{\ell, m} \varepsilon'_{\ell, m}(z) h^{(1)}_{\ell}(k |x|) Y^m_\ell (\hat{x}), \quad |x| > |z|, \tag{B.28}
\]

where \( \varepsilon_{\ell, m}(z) = i k j_\ell(k |z|) Y^m_\ell (\zeta) \) and \( \varepsilon'_{\ell, m} = i k \nabla (j_\ell(k |z|) Y^m_\ell (\zeta)) \), it follows from (B.22) that for \( y \in \mathbb{R}^3 \setminus D \) and uniformly for \( |x| \geq a \)

\[
u^s_{A,q}(x, y) = \sum_{(\ell_1, m_1) \in \Gamma} \alpha_{\ell_1 m_1} (y) h^{(1)}_{\ell_1}(k |x|) Y^{m_1}_{\ell_1}(\hat{x}).
\]

Similarly, for \( x \in \mathbb{R}^3 \setminus D \) and uniformly for \( |y| \geq a \)

\[
u^-_{A,q}(y, x) = \sum_{(\ell_2, m_2) \in \Gamma} \beta_{\ell_2 m_2} (x) h^{(1)}_{\ell_2}(k |y|) Y^{m_2}_{\ell_2}(\hat{y}).
\]

We observe that

\[
\alpha_{\ell_1 m_1} (y) h^{(1)}_{\ell_1}(ka) = \int_{S^2} \nu^s_{A,q}(a \hat{x}, y) Y^{m_1}_{\ell_1}(\hat{x}) \, ds(\hat{x}).
\]

Using the reciprocity relation of Lemma 2.6 we then get uniformly for \( |y| \geq a \)

\[
\alpha_{\ell_1 m_1} (y) = \sum_{(\ell_2, m_2) \in \Gamma} \gamma_{\ell_1 m_1 \ell_2 m_2} h^{(1)}_{\ell_2}(k |y|) Y^{m_2}_{\ell_2}(\hat{y}),
\]

where

\[
\gamma_{\ell_1 m_1 \ell_2 m_2} = \frac{1}{h^{(1)}_{\ell_1}(ka)} \int_{S^2} \beta_{\ell_2 m_2} (a \hat{x}) Y^{m_1}_{\ell_1}(\hat{x}) \, ds(\hat{x}).
\]
Proof of Lemma 2.5. Using the definition of \( \mathcal{N}_{A,q} \), we have
\[
\int_{\partial B} (\mathcal{N}_{A,q} f) g ds(x) = \int_{\partial B} \int_{\partial B} u^s_{A,q}(x,y) f(y) g(x) ds(x) ds(y),
\]
where \( u^s_{A,q}(\cdot, y) \) is the scattered field associated to \( \Phi(\cdot, y) \), \( y \in \partial B \). Moreover, from (2.19), we get
\[
\int_{\partial B} (\mathcal{N}_{A,q} f) g ds(x) = \int_{\partial B} \int_{\partial B} \int_{D} \Phi(x, t) Q_{A,q} u(t, y) dt \cdot (x, y) f(y) g(x) ds(x) ds(y).
\]
According to Fubini’s Theorem, we find
\[
\int_{\partial B} (\mathcal{N}_{A,q} f) g ds(x) = \int_{D} \left( \int_{\partial B} \Phi(x, t) g(x) ds(x) \right) \int_{\partial B} Q_{A,q} u(t, y) f(y) ds(y).
\]
Using the fact that \( u_{A,q}(\cdot, y) = u^s_{A,q}(\cdot, y) + \Phi(\cdot, y) \), \( y \in \partial B \), we obtain
\[
\int_{\partial B} (\mathcal{N}_{A,q} f) g ds(x) = \int_{D} S g(t) Q_{A,q} \left( \int_{\partial B} u^s(t, y) f(y) ds(y) + \int_{\partial B} \Phi(t, y) f(y) ds(y) \right) (t) dt
\]
\[
= \int_{D} S g(t) Q_{A,q} (\mathcal{M}_{A,q} S f + S f) (t) dt,
\]
where the operators \( \mathcal{M}_{A,q} \) and \( S \) are given by (2.25) and (2.27) respectively.
The proof is completed.
