**Abbreviations:**

- **AscNa**: (+)-Sodium L-ascorbate
- **BSA**: Bovine Serum albumin
- **CAPS**: 3-(Cyclohexylamino)-1-propanesulfonic acid
- **CMP-NeuAc**: Cytidine 5'-monophospho-N-acetylneuraminic acid
- **CPG**: Controlled Pore Glass
- **DMAP**: 4-(Dime thylamino)pyridine
- **DMF**: N,N-Dimethylformamide
- **DTT**: dL-Dithiothreitol
- **EDC**: N-(3-dimethylaminopropyl)carbodiimide
- **EDTA**: Ethylenediaminetetraacetic acid
- **FITC**: Fluorescein isothiocyanate isomer I
- **Fmoc-PAL-OH**: 5-[3,5-Dimethoxy-4-(Fmoc-aminomethyl)phenoxy]pentanoic acid
- **Fmoc-TTDS-OH**: N1-(9-Fmoc)-1,13-diamino-4,7,10-trioxa tridecan-succinamic acid
- **GalNAc-T1**: Polypeptide α-N-acetylgalactosaminyl transferase T1
- **HATU**: 1-[Bis(dimethylamino)methylene]-1H-1,2,3-triazolo[4,5-b]pyridinum 3-oxide hexafluorophosphate
- **HCTU**: 1-[Bis(dimethylamino)methylene]-5-chlorobenzotriazolium 3-oxide hexafluorophosphate
- **HEPES**: 4-(2-Hydroxyethyl)piperazine-1-ethanesulfonic acid
- **HOAt**: 3H-[1,2,3]-Triazolo[4,5-b]pyridin-3-ol
- **mCPBA**: 3-Chloroperoxybenzoic acid
- **MES**: 2-(N-Morpholino)ethanesulfonic acid
- **MPAA**: 4-Mercaptophenylacetic acid
- **N3Val-OH**: (S)-2-Azido-3-methylbutanoic acid
- **NMP**: 1-Methyl-2-pyrrolidone
- **PEG**: Poly(ethylene glycol)
- **PBS**: Phosphate buffered saline
- **ST6GalNAc I**: GalNAc α-2,6-sialyltransferase 1
- **TBAF**: Tetra nbutylammonium fluoride
- **TCEP**: Tris(2-carboxyethyl)phosphine
- **TFA**: Trifluoroacetic acid
- **THPTA**: Tris(3-hydroxypropyltriazolylmethyl)amine
- **TIPS**: Triisopropylsilane
- **TRIS**: Tris(hydroxymethyl)aminomethane
- **UDP-GalNAc**: Uridine[5′]diphospho[1](2-acetamido-2-deoxy-α-D-galactopyranose)
- **VVL**: *Vica villosa* lectin
A General information

Unless stated otherwise, all reagents and anhydrous solvents were used without further purification. Protected amino acids, Rink amide ChemMatrix® resin, HCTU were purchased from Merck Biosciences (Nottingham, UK). Controlled Pore Glass beads (TRISOPERL®, pore size: 100 nm, bead diameter: 100 - 200 µm, lot number: PG L 14/04 AMINO 225) was obtained from Vitrabio (Steinach, Germany). SPRInbeads AH130 was obtained from SPRIn technologies (Trieste, Italy). [N1-(9-Fluorenlymethoxycarbonyl)-1,13-diamino-4,7,10-trioxatridecan-succinamic acid (Fmoc-TTDS-OH, CAS Number: 172089-14-4) and Fmoc-NH-PEG-COOH (3000Da) were purchased from Iris Biotech GmbH (Marktredwitz, Germany). Peptide synthesis grade DMF and HATU were obtained from Applied Biosystems (Courtaboeuf, France). Ultrapure water was prepared using a Milli-Q water system from Millipore (Molsheim, France). All other chemicals were from Sigma Aldrich (St-Quentin-Fallavier, France) and solvents from SDS-Carlo Erba (Val de Reuil, France) and were used without any further purification. Polypropylene syringes fitted with polypropylene frits were obtained from Torviq (Niles, MI, USA) and were equipped with PTFE stopcock bought from Chromoptic (Courtaboeuf, France).

(S)-2-azido-3-methylbutanoic acid (N3Val-OH)[1] was prepared using previously described protocols. Its 1H NMR spectra matched the respective literature data.

All the CuAAC reactions were performed under a strict argon atmosphere, using solvents that had been freshly deoxygenated through ten successive vacuum (15 mbar)/argon cycles.

A.1 Characterization and purification of the building blocks

Flash column chromatography purifications were carried out using Kiesegel C60 (Merck, Germany) as the stationary phase, and thin layer chromatography analyses were performed on precoated silica gel plates (0.25 mm thick, 60 F254, Merck, Germany) and observed under UV light at 254 nm then stained with a standard basic potassium permanganate solution.

Purifications by reverse phase column chromatography were carried out on the Interchim SPOT II Flash, equipped with CHROMABOND® Flash RS 40, 43 g C18 ec (flow rate: 40 mL/min)

1H and 13C NMR spectra were recorded on Bruker AV 500 and AV 600 instrument, at a constant temperature of 25 °C. Chemical shifts are reported in parts per million from low to high field. Coupling constants (J) are reported in hertz (Hz). Standard abbreviations indicating multiplicity were used as follows: s = singlet, d = doublet, t = triplet, m = multiplet, b = broad.

Specific rotation [α] are reported in (deg·mL)/(g·dm) and corresponding concentration c in g/100 mL.

[1] E. D. Goddard-Borger, R. V. Stick, Org. Lett. 2007, 9, 3797–3800.
A.2 Peptide characterization and purification

The peptides were analyzed by HPLC and High resolution ESI-MS mass spectrometry. HPLC analyses and semi-preparative purifications were carried out on LaChrom Elite system consisting of a Hitachi L-2130 pump, a Hitachi L-2455 diode array detector and a Hitachi L-2200 autosampler. The machines were equipped with Nucleosil C18 reversed-phase columns, 300 Å, 5 µm, 250 x 4.6 mm (flow rate: 1 mL/min) or Chromolith® High Resolution RP-18e, 150 Å, 10 x 4.6 mm (flow rate: 3 mL/min) for analysis and Nucleosil C18 reversed-phase columns 300 Å, 5 µm, 250 x 10 mm for purification (flow rate: 3 mL/min). Solvents A and B were 0.1% TFA in H₂O and 0.1% TFA in MeCN, respectively.

The Electron-transfer dissociation (ETD) experiments were performed on a HCTultra PTM Discovery System (Bruker Daltonics) ion trap mass spectrometer equipped with an electrospray ion source, at the concentration of 10 µM into a 45:54.8:0.2 CH₃CN/H₂O/formic acid solution. The acquisitions were carried out at standard/enhanced resolution (8100 m/z per second) from m/z 100 to 3000 for MS and MS/MS. Interpretation of the ETD spectra was performed with Biotools 3.2 software (Bruker Daltonics).

High resolution ESI-MS analyses and LC/MS were performed on a maXis ultra-high-resolution Q-TOF mass spectrometer (Bruker Daltonics, Bremen, Germany). LC was carried out on Ultimate® 3000 RSLC system (Dionex, Germering, Germany). The machine was equipped with Zorbx 300 SB-C18 RRHD, 1.8 µm, 2.1 x 100 mm (flow rate: 300 µL/min). Solvents A and B were 0.1% formic acid in H₂O and 0.8% formic acid in MeCN, respectively.

The observed m/z correspond to the monoisotopic ions except when stated otherwise.

A.3 General procedures for solid-phase peptide synthesis

Solid-phase peptide synthesis (SPPS) was run on an automated 433A synthesizer from Applied Biosystem using Fmoc/tBu chemistry at a 0.1 mmol scale with HCTU as coupling reagent and Rink amide ChemMatrix® as solid support. The elongation was carried out automatically using a 10-fold excess of protected amino acids and HCTU; and 20-fold excess of iPr₂NEt. The side chain protecting groups used were Arg(Pbf), Asp(tBu), His(Trt), Ser(tBu), Thr(tBu). Fmoc deprotection was performed using a 20% piperidine solution in DMF. The 0.1 mmol scale program purchased from the manufacturer was used, with a single coupling (unless stated otherwise) followed by capping with acetic anhydride. The crude peptide was released from the resin with TFA/iPr₃SiH/1,3 dimethoxybenzene (90:5:5) for 2 h, and the peptide was precipitated with ice-cold diethyl ether, recovered by centrifugation and washed 3 times with diethyl ether.
A.4 Preparation of the linkers Synthesis of the Pipoc-derived linker[2]

Supplementary scheme S1 - Synthesis of 4-(azidomethyl)piperidin-1-yl 4-nitrophenyl carbonate

• 3-[4-(Azidomethyl)piperidin-1-yl]propanenitrile (S1)

A solution of 4-(aminomethyl)piperidine (1.15 g, 10 mmol) and K$_2$CO$_3$ (2.76 g, 20 mmol, 2 equiv.) in MeOH/H$_2$O (1:1, 40 mL) was cooled in an ice bath. 3-Azidosulfonyl-3$H$-imidazol-1-ium hydrogen sulfate[3] (2.98 g, 11 mmol, 1.1 equiv.) was added portionwise and the reaction mixture was stirred overnight at room temperature. The reaction mixture was cooled down in an ice bath and acrylonitrile (1.31 mL, 20 mmol, 2 equiv.) was added dropwise over 30 min. The resulting mixture was stirred at room temperature for 4 h then volatiles were evaporated under reduced pressure. The resulting suspension was diluted with water (50 mL) and extracted with EtOAc (4 x 40 mL). The combined organic layers were dried over MgSO$_4$, filtrated then concentrated under reduced pressure. Purification by flash column chromatography (eluent: pet. ether/EtOAc 2:8) afforded compound S1 (1.14 g, 59%) as a colorless liquid.

$^1$H NMR (500 MHz, CDCl$_3$): $\delta = 3.17$ (d, $J = 6.8$ Hz, 2H), 2.94 – 2.86 (m, 2H), 2.68 (t, $J = 7.1$ Hz, 2H), 2.49 (t, $J = 7.1$ Hz, 2H), 2.06 (ddd, $J = 11.7$, 11.7, 2.5 Hz, 2H), 1.77 – 1.70 (m, 2H), 1.61 – 1.48 (m, 1H), 1.37 – 1.24 (m, 2H).

$^{13}$C NMR (125 MHz, CDCl$_3$): $\delta = 119.1$, 57.2, 53.8, 53.0, 36.2, 29.9, 16.2.

ESI-HRMS (m/z): [M+H]$^+$ calcd for C$_9$H$_{16}$N$_5$: 194.1406, found: 194.1403.

Copy of the \(^{13}\)C NMR spectrum (125 MHz, CDCl\(_3\)):
• 4-(Azidomethyl)piperidin-1-ol (S2)

A solution of compound S1 (1 g, 5.2 mmol) in CH₂Cl₂ (50 mL) was cooled to -78 °C. mCPBA (84% purity, 1.17 g, 5.7 mmol, 1.1 equiv.) and K₂CO₃ (1.08 g, 7.8 mmol, 1.5 equiv.) were added. The solution was stirred for 3 h then allowed to warm up to room temperature and stirred for an additional 16 h at room temperature. The resulting suspension was then filtrated through a pad of MgSO₄ and then concentrated under reduced pressure. Purification by flash column chromatography (eluent: EtOAc) afforded compound S2 (690 mg, 85%) as a colorless liquid.

1H NMR* (500 MHz, CDCl₃): δ = 3.36 – 3.29 (m, 2H), 3.16 (d, J = 6.7 Hz, 2H), 2.46 (ddd, J = 12.9, 10.2, 2.7 Hz, 2H), 1.86 – 1.78 (m, 2H), 1.60 – 1.51 (m, 1H), 1.41 – 1.29 (m, 2H).

13C NMR (125 MHz, CDCl₃): δ = 57.2, 55.7, 34.3, 28.5.

ESI-HRMS (m/z): [M+H]+ calcd for C₁₆H₁₃N₄O: 157.1089, found: 157.1089.

*NMR description of the major conformer, a minor one (~15%) being observed as broad peaks in the 1H spectrum.

Copy of the $^{13}$C NMR spectrum (125 MHz, CDCl$_3$):
• 4-(Azidomethyl)piperidin-1-yl 4-nitrophenyl carbonate (S3)

A solution of compound S2 (690 mg, 4.4 mmol) and pyridine (3.5 mL, 44.2 mmol, 10 equiv.) in CH₂Cl₂ (20 mL) was cooled in an ice bath and p-nitrophenyl chloroformate (980 mg, 4.9 mmol, 1.1 equiv.) was added. The resulting solution was stirred at room temperature for 30 min then washed with a saturated aqueous NaHCO₃ solution (3 x 10 mL), dried over MgSO₄, filtrated then concentrated under reduced pressure. Purification by flash column chromatography (eluent: pet. ether/EtOAc 6:4) afforded compound S3 (1.06 g, 75%) as a white amorphous solid.

**¹H NMR** (500 MHz, CDCl₃): δ = 8.28 (d, J = 9.1 Hz, 2H), 7.40 (d, J = 8.6 Hz, 2H), 3.69 – 3.50 (m, 2H), 3.32 – 3.11 (m, 2H), 2.82 – 2.73 (m, 2H), 1.98 – 1.83 (m, 2H), 1.74 – 1.52 (m, 3H).

**¹³C NMR** (125 MHz, CDCl₃): δ = 155.5, 152.0, 145.6, 125.5, 121.8, 56.9, 56.4, 35.3, 29.3.

**ESI-HRMS** (m/z): [M+H]+ calcd for C₁₃H₁₆N₅O₅: 322.1151, found: 322.1147.

A.5 Synthesis of the Dde-derived linker[4]

- 2-(5-Azido-1-hydroxypentylidene)-5,5-dimethylcyclohexane-1,3-dione (S4)

A solution of 5-azidopentanoic acid (2.00 g, 14 mmol) and dimedone (2.55 g, 18 mmol, 1.3 equiv.) in CH₂Cl₂ (50 mL) was cooled in an ice bath. DMAP (2.22 g, 18 mmol, 1.3 equiv.) then EDC hydrochloride (2.82 g, 14.7 mmol, 1.05 equiv.) were added. The reaction mixture was stirred at room temperature for 16 h, then washed with a 1 M HCl aqueous solution (3 x 50 mL), dried over MgSO₄, filtrated then concentrated under reduced pressure. Purification by flash column chromatography (eluent: pet. ether/EtOAc 92:8) afforded compound S4 (1.14 g, 75%) as a colorless oil.

¹H NMR (500 MHz, CDCl₃): δ = 3.31 (t, J = 6.4 Hz, 2H), 3.07 (t, J = 6.9 Hz, 2H), 2.54 (s, 2H), 2.35 (s, 2H), 1.77 – 1.62 (m, 4H), 1.08 (s, 6H).

¹³C NMR (125 MHz, CDCl₃): δ = 204.9, 197.5, 195.2, 112.0, 52.6, 51.2, 46.7, 39.9, 30.7, 28.5, 28.2, 21.7.

ESI-HRMS (m/z): [M+H]⁺ calcd for C₁₆H₂₀N₃O₃: 266.1505, found: 266.1503.

A.6 Synthesis of $\text{N}_3$-Dtpp linker$^5$

\[
\begin{align*}
\text{N}_3\text{-Dtpp}-\text{OH} & \quad \rightarrow \quad \text{N}_3\text{-Dtpp-Val-OH}
\end{align*}
\]

**Supplementary scheme S3** - Synthesis of $\text{N}_3$-Dtpp-Val-OH (S6)

- **$\text{N}_3$-Dtpp-OH (S5)**

A solution of 1,3-dimethylbarbituric acid (3.12 g, 20 mmol) and 5-azidopentanoic acid (3.45 g, 24 mmol, 1.2 equiv.) in CH$_2$Cl$_2$ (100 mL) was cooled in an ice bath. DMAP (2.93 g, 24 mmol, 1.2 equiv.) then EDC hydrochloride (4.60 g, 24 mmol, 1.2 equiv.) were added. The reaction mixture was stirred at room temperature for 16 h, then washed with a 1 M HCl aqueous solution (3 x 50 mL), dried over MgSO$_4$, filtrated then concentrated under reduced pressure. Recrystallization from MeOH afforded the product S5 (4.52 g, 81%) as a white solid.

$^1$H NMR (600 MHz, CDCl$_3$): $\delta$ = 17.60 (s, 1H), 3.38 (s, 3H), 3.36–3.32 (m, 5H), 3.21–3.15 (m, 2H), 1.84–1.76 (m, 2H), 1.75–1.68 (m, 2H).

$^{13}$C NMR (151 MHz, CDCl$_3$): $\delta$ 198.8, 169.8, 160.9, 150.3, 95.3, 51.0, 36.1, 28.6, 28.1, 27.9, 22.8.

ESI-HRMS (m/z): [M+H]$^+$ calcd for C$_{11}$H$_{16}$N$_5$O$_4$: 282.1202, found: 282.1197.

S14
• N$_3$-Dtpp-Val-OH (S6)

A solution of compound S5 (844 mg, 3 mmol), valine (703 mg, 6 mmol, 2 equiv.) and triethylamine (1.25 mL, 9 mmol, 3 equiv.) in MeOH (60 mL) was heated at reflux for 24 h. The reaction mixture was cooled down to room temperature then volatiles were evaporated under reduced pressure. The resulting suspension was diluted with CH$_2$Cl$_2$ (150 mL) and washed with a 1 M HCl aqueous solution (3 x 30 mL), dried over MgSO$_4$, filtrated then concentrated under reduced pressure. Purification by reverse phase column chromatography (eluent: H$_2$O/CH$_3$CN 8:2 then 6:7) afforded product S6 (810 mg, 71%) as a white amorphous solid.

$^1$H NMR (600 MHz, CDCl$_3$): $\delta$ = 13.06 (d, $J$ = 9.0 Hz, 1H), 4.32 (dd, $J$ = 9.0, 4.9 Hz, 1H), 3.37 (t, $J$ = 6.6 Hz, 2H), 3.34 (s, 3H), 3.31 (s, 3H), 3.21 - 3.09 (m, 1H), 3.08 – 2.95 (m, 1H), 2.49 – 2.36 (m, 1H), 1.84 – 1.71 (m, 2H), 1.71 – 1.55 (m, 2H), 1.13 (d, $J$ = 6.9 Hz, 3H), 1.09 (d, $J$ = 6.8 Hz, 3H).

$^{13}$C NMR (151 MHz, CDCl$_3$) $\delta$ 175.8, 172.9, 165.9, 161.4, 150.3, 89.5, 60.4, 49.7, 30.6, 28.2, 27.8, 27.1, 26.9, 23.9, 18.1, 16.7.

ESI-HRMS (m/z): [M+H]$^+$ calcd for C$_{16}$H$_{25}$N$_6$O$_5$: 381.1886, found: 381.1880.

UV (MeOH) $\lambda_{\text{max}}$ = 303 nm, $\varepsilon^{303}$ = 27000 M$^{-1}$ cm$^{-1}$, $\varepsilon^{280}$ = 8650 M$^{-1}$ cm$^{-1}$

B Preparation of the model linker-containing peptides 1-4

B.1 Solid-phase synthesis of solid-supported Muc1 peptide resin S7

The backbone amide linker 4-(formyl-3,5-dimethoxyphenoxy)butyric acid, (67 mg, 0.25 mmol, 2.5 equiv.) was loaded on Rink amide ChemMatrix® resin (192 mg, 0.52 mmol/g, 0.1 mmol) using HATU (95 mg, 0.25 mmol, 2.5 equiv.) and 1Pr2NEt (87 µL, 0.5 mmol, 5 equiv.) in DMF for 2 h at room temperature. The resin was then thoroughly washed with DMF. In case of incomplete reaction (positive Kaiser’s test\(^6\)), was repeated once.

3-(Triisopropylsilyl)prop-2-yn-1-amine (106 mg, 0.5 mmol, 5 equiv.) and NaBH\(_3\)CN (32 mg, 0.5 mmol, 5 equiv.) dissolved in 5 mL of DMF/MeOH/AcOH (7:2:1) were added to the resin (1 equiv., swelled in DMF prior to the reaction), and the resulting suspension was mixed overnight at 50 °C with N\(_2\) bubbling.

The resin was then thoroughly washed with DMF and CH\(_2\)Cl\(_2\). Fmoc-His(Trt)-OH (620 mg, 1 mmol, 10 equiv.) was coupled onto the resulting resin with HATU (380 mg, 1 mmol, 10 equiv.) and 1Pr2NEt (348 µL, 2 mmol, 20 equiv.) in DMF overnight at room temperature.

The elongation of the peptide was performed by standard automated solid phase synthesis (p S4) up to \(^2\)Thr. Prolines 4, 5, 24 and 25 were coupled twice following the automated program for double couplings. A 85% elongation yield was obtained, determined by the titration of the first (BAL) and last (\(^2\)Thr) Fmoc group deprotection (UV, 301 nm).

A few beads of the resulting resin S7 were cleaved to give crude peptide S7’ which was analyzed by LC/HRMS.

**ESI-HRMS (m/z):** [M+H]\(^+\) calcd for C\(_{165}\)H\(_{264}\)N\(_4\)O\(_5\)Si: 3791.9289, found: 3791.9177.

B.2 Synthesis of peptide 1

Supplementary scheme S5 - Solid-phase synthesis of peptide 1

The coupling and Fmoc deprotection of the N-terminal Val residue were performed by automated SPPS on the peptide resin S7 (5 µmol). The activated carbonate N$_3$-Esoc-ONp\(^7\) (5 equiv., dissolved in DMF) and iPr$_2$NEt (5 equiv.) were then added to the peptide resin (1 equiv., swelled in DMF prior to the reaction), and the resulting suspension was stirred overnight at room temperature. The resin was then thoroughly washed with DMF. The resin was further washed with CH$_2$Cl$_2$, and treated with TFA/iPr$_3$SiH/1,3 dimethoxybenzene (90:5:5) for 2 h. Peptide 1 was precipitated by dilution with ice-cold diethyl ether, recovered by centrifugation, washed 3 times with diethyl ether then dried under reduced pressure. The crude mixture was purified by semi-preparative HPLC to yield peptide 1 as a white fluffy powder (7.4 mg, 1.6 µmol, 32%* isolated yield based on the original resin loading).

*: estimated considering a MW = 4595 g/mol taking into account 4 trifluoroacetate counter-anions, as predicted from the sequence: 2Arg, 2His = +4 overall charge. Water content is not taken into account.

• Synthesis of peptide 4’

Supplementary scheme S9 - Solid-phase synthesis of peptide S8

Peptide 4 (5 µmol) and 4-pentynoic acid (5 mg, 50 µmol, 10 equiv.) were dissolved in 400 µL of a 2:8 mixture of MeOH and 100 mM HEPES buffer pH 7.5. The reaction mixture was introduced in a 2 mL microcentrifuged tube sealed with a rubber septum and was deoxygenated through several successive vacuum (15 mbar) / argon cycles. Then, a mixture containing copper(I) bromide dimethyl sulfide complex (10 equiv.) and THPTA (15 equiv.) dissolved under argon in 50 µL of deoxygenated NMP was added, the resulting mixture was further deoxygenated and was stirred for 1 h at room temperature. Reaction mixture was analyzed by HPLC to check the total consumption of the peptide 4. The crude mixture was purified by semi-preparative HPLC and lyophilized to yield the peptide 4’ as a white fluffy powder (6.1 mg, 1.3 µmol, 26%* isolated yield based on the original resin loading).

*: estimated considering a MW = 4707 g/mol taking into account 4 trifluoroacetate counter-anions, as predicted from the sequence: 2Arg, 2His = +4 overall charge. Water content is not taken into account.

E.1 Synthesis of protected glycopeptide 5

Supplementary scheme S16 - Solid supported synthesis of protected glycopeptide 5

The backbone amide linker 4-(4-formyl-3,5-dimethoxyphenoxy)butyric acid, (67 mg, 0.25 mmol, 2.5 equiv.) was loaded on Rink amide ChemMatrix® resin (192 mg, 0.52 mmol/g, 0.1 mmol) using HATU (95 mg, 0.25 mmol, 2.5 equiv.) and iPr2NEt (87 µL, 0.5 mmol, 5 equiv.) in DMF for 2 h at room temperature. The resin was then thoroughly washed with DMF. In case of incomplete reaction (positive Kaiser’s test), this protocol was repeated once.

3-(triisopropylsilyl)prop-2-yn-1-amine (106 mg, 0.5 mmol, 5 equiv.) and NaBH3CN (32 mg, 0.5 mmol, 5 equiv.) dissolved in 5 mL of DMF/MeOH/AcOH (7:2:1) were added to the resin (1 equiv., swelled in DMF prior to the reaction), and the resulting suspension was mixed overnight at 50 °C with N2 bubbling.

The resin was then thoroughly washed with DMF and CH2Cl2. Fmoc-His(Trt)-OH (620 mg, 1 mmol, 10 equiv.) was coupled onto the resulting resin with HATU (380 mg, 1 mmol, 10 equiv.) and iPr2NEt (348 µL, 2 mmol, 20 equiv.) in DMF overnight at room temperature.

The elongation of the peptide was performed by standard automated solid phase synthesis (pS4) up to 2Thr. Prolines 4, 5, 24 and 25 were coupled twice following the automated program for double couplings. Glycosylated amino acid were introduced at position 7 and 27 using Fmoc-Thr(Ac3-α-D-GalNAc)-OH (135 mg, 0.2 mmol, 2 equiv.) with HATU (76 mg, 0.2 mmol, 2 equiv.) HOAt (27 mg, 0.2 mmol, 2 equiv.) and 2,4,6-trimethylpyridine (27 µL, 2 mmol, 2 equiv.) in DMF for 2 h at room temperature.[9] A 65% elongation yield was obtained, determined by the titration of the first and last (2Thr) Fmoc group deprotection (UV, 301 nm).

Peptide resin (25 µmol, 1 equiv., swelled in DMF prior to the reaction) was further washed with CH2Cl2, and treated with TFA/iPr3SiH/1,3 dimethoxybenzene (90:5:5) for 2 h. Peptide 5 was precipitated by dilution with ice-cold diethyl ether, recovered by centrifugation, washed 3 times with diethyl ether then dried under reduced pressure. The crude mixture was purified by semi-preparative HPLC and lyophilized to yield 5 as a white fluffy powder (30 mg, 5.7 µmol, 23%* isolated yield based on the original resin loading).

*: estimated considering a MW = 5267 g/mol taking into account 4 trifluoroacetate counter-ions, as predicted from the sequence: 2Arg, 2His = +4 overall charge. Water content is not taken into account.

ESI-HRMS (m/z): [M+H]+ calcd for C209H324N57O72Si: 4812.3213, found: 4812.3197.

E.2  Selective deprotection of the O-acetyl group of 5

Purified glycopeptide 5 (2 mmol) was dissolved in anhydrous methanol (2 mL) under an argon atmosphere. Freshly prepared 1% MeONa/MeOH solution was added dropwise at 0 °C until pH 10 was reached when spotting an aliquot of the solution on a wet pH indicator paper. After 1 h stirring at room temperature and confirmation of the completion of the reaction by RP-HPLC analysis, the reaction mixture was neutralized with acetic acid (10 µL). Volatiles were removed under reduced pressure and the residue was dissolved in mQ water (1 mL). Lyophilization yielded glycopeptide 6 as a white fluffy powder.

ESI-HRMS (m/z): [M+H]^+ calcd for C_{197}H_{312}N_{57}O_{66}Si: 4560.2579, found: 4560.2563.

Supplementary figure S26 - ESI-HRMS mass spectrum of peptide 6
E.3 Selective deprotection of the TIPS group of 6

Crude lyophilized glycopeptide 6 (100 nmol) was dissolved in anhydrous DMF (50 µL) under an argon atmosphere. 50 µL of a 200 mM tetrabutylammonium fluoride trihydrate in anhydrous DMF was added to the mixture. After 1 h stirring at room temperature and confirmation of the completion of the reaction by RP-HPLC, the reaction mixture was neutralized with acetic acid (10 µL) and diluted with water (2 mL). DMF and salts were removed using standard hydrophobic SPE cartridge. Lyophilization yielded glycopeptide 7 as a white fluffy powder.

ESI-HRMS (m/z): [M+H]^+ calcd for C_{188}H_{292}N_{57}O_{66}: 4404.1245, found: 4403.1363.

E.4  Selective cleavage of the Dtpp linker

Supplementary scheme S19 - Selective cleavage of the Dtpp linker of 7

Crude lyophilized glycopeptide 7 (100 nmol) was dissolved in water (50 µL) and a 2M hydroxylamine solution (50 µL) was added to the mixture. After 2 h stirring at room temperature and confirmation of the completion of the reaction by RP-HPLC, the reaction mixture was neutralized with acetic acid (20 µL) and diluted with water (2 mL). Salts and hydroxylamine were removed using standard hydrophobic SPE cartridge. Lyophilization yielded glycopeptide 8 as a white fluffy powder.

ESI-HRMS (m/z): [M+H]^+ calcd for C_{177}H_{279}N_{52}O_{63}: 4141.0227, found: 4141.0252.

**Stability in 1 M aqueous NH$_3$OH**

Purified glycopeptide 8 (100 nmol) was dissolved in water (50 µL) and 50 µL of a 2M aqueous hydroxylamine solution was added. After 24 h stirring at room temperature, the reaction mixture was analyzed by LC/HRMS.
F Studies for improvement of solid supported enzymatic glycosylation

F.1 Preparation of the alkyne-functionalized solid support

Controlled Pore Glass (aminopropyl CPG beads TRISOPERL®) or polymethacrylate resin (SPRINBeads AH130)\(^{[10]}\) was introduced in a syringe equipped with a polypropylene frit and a teflon stopcock and washed successively with DMF (3x), 10% \(i\text{Pr}_2\text{NEt}\) in \(\text{CH}_2\text{Cl}_2\) (3x), DMF (3x) and peptide synthesis-grade DMF (3x). Then, Fmoc-spacer-OH (2 equiv., see Table S3 Fmoc-NH-X-COOH,) and HATU (2 equiv.) dissolved in a minimum amount of DMF, were transferred by suction followed by \(i\text{Pr}_2\text{NEt}\) (4 equiv.). The resin suspension was mixed by rotation for 16 h. In case of incomplete reaction (positive Kaiser’s test), this protocol was repeated once followed by capping with acetic anhydride. The Fmoc group was removed by a treatment by 20% piperidine in DMF (3 x 3min), followed by thorough wash with DMF. Finally, pentynoic acid was coupled using HCTU (10 equiv.) and \(i\text{Pr}_2\text{NEt}\) (20 equiv.) in DMF to give the respective alkyne-containing solid support.

| Support       | Spacer (Fmoc-NH-X-COOH)                   | Final Loading |
|---------------|------------------------------------------|--------------|
| 9a            | CPG, Fmoc-PAL-OH                         | 145 µmol/g   |
| 9b            | CPG, Fmoc-TTDS-OH (172089-14-4, ~ 300 Da)| 120 µmol/g   |
| 9c            | CPG, Fmoc-NH-PEG-COOH (3000 Da polydisperse)| 20 µmol/g |
| S17a          | SPRINBeads, No linker                    | 60 µmol/g    |
| S17b          | SPRINBeads, Fmoc-TTDS-OH                | 60 µmol/g    |

F.2 Typical procedure for the release of the peptide

The peptide was released by cleaving the Dtpp linker through treatment with 1 M NH$_2$-OH aqueous solution (1:10 v/v swollen resin/total volume), for 60 min at room temperature (addition of 100 mM AscNa is required for TIPS-protected alkynes). This protocol was repeated once and the solid support was finally washed with de-ionized water. Released peptide was isolated from the mixture using standard procedures such as hydrophobic SPE cartridge.

[11] Note that contrary to TIPS-protected alkynes, terminal alkynes were much less sensitive to reduction during Dtpp cleavage, and did not require addition of ascorbate
A solution of the azide containing peptide (0.5 µmol) dissolved in 400 µL of a 1:1 mixture of NMP and 200 mM HEPES buffer pH 7.5 was added to a 2 mL microcentrifuge tube containing the alkyne functionalized solid support. To the suspension were subsequently added a 1 M aqueous aminoguanidine solution (15 µL, 30 equiv.), a 1 M aqueous tert-butanol solution (15 µL, 30 equiv.). The tube was sealed with a rubber septum and the resulting mixture was further deoxygenated through several successive vacuum (15 mbar) / argon cycles. Then, a mixture containing copper(I) bromide-dimethyl sulfide complex (30 equiv.) and THPTA (40 equiv.) dissolved under argon in 50 µL of deoxygenated NMP was added, the resulting suspension was further deoxygenated and was stirred for 5 h at 37 °C. The supernatant was analyzed by HPLC to check the total consumption of the azidopeptide. Capping of remaining solid-supported terminal alkyne was performed by adding 2-(2-azidoethoxy)ethanol (100 equiv.). The mixture was stirred an additional hour at 37 °C. The resin was then extensively washed with NMP, de-ionized water, then repeatedly treated (3x) with a pH 7 aqueous buffer containing 6 M guanidinium chloride, 0.1 M EDTA and 0.1 M sodium dihydrogenophosphate for a few minutes then drained and finally extensively washed with de-ionized water.

A few beads of the resulting solid supported peptide were cleaved using the general procedure (p S53) to give crude peptide \( S_8 \) which was analyzed by RP-HPLC and HRMS.

**ESI-HRMS** (\( m/z \)): \([M+H]^+\) calcd for \( C_{170}H_{273}N_{50}O_{53}Si \): 3890.9973, found: 3890.9997.
**Supplementary figure S34** - Analytical HPLC profile of crude peptide 4. Column: Nucleosil®; gradient: from 30% to 60% B over 30 min.

**Supplementary figure S37** - ESI-HRMS mass spectrum of peptide S8
**F.4 Solid-supported deprotection of the TIPS group**

The solid supported peptide was introduced in a syringe fitted with a polypropylene frit and a teflon stopcock and was washed with anhydrous DMF (4x). A mixture of TBAF (100 equiv.) dissolved in anhydrous DMF (final concentration 100 mM) was added and the reaction mixture was stirred by syringe rotation for 15 min at room temperature. This protocol was repeated once and the resin was then extensively washed with DMF, a 0.1% aqueous TFA solution and finally de-ionized water.

A few beads of the resulting solid supported peptide were cleaved to give crude peptide 11a which was analyzed by RP-HPLC and HRMS.

**ESI-HRMS (m/z):** [M+H]$^+$ calcd for C$_{161}$H$_{253}$N$_{50}$O$_{53}$: 3734.8639, found: 3734.8459.

**Supplementary figure S39** - ESI-HRMS mass spectrum of peptide 11a
F.5 Quantification of the yield of the catch-and-release process yield

Supplementary scheme S24 - Grafting, alkyne deprotection and releasing of peptide 4 on alkyne functionalized solid support 9a

Purified azido peptide 4 (5.01 mg, 1.09 µmol\textsuperscript{[a]}) was grafted on alkyne support 9a (100 mg) following the typical procedure (p S54). Then, solid-supported deprotection of the TIPS group was performed following the typical procedure (p S57). The whole resulting solid supported peptide were cleaved using the general procedure (p S53). A third cleavage with 1M aqueous NH\textsubscript{2}OH followed by a TFA cleavage was performed but no trace of peptide was observed by HPLC analysis. Released peptide was isolated from the mixture using a hydrophobic SPE cartridge to give pure peptide 11a as a white fluffy powder (4.14 mg, 0.99 µmol, 91\% \textsuperscript{[b]}).

\textsuperscript{[a]}: estimated considering a MW = 4611 g/mol taking into account 4 trifluoroacetate counter-anions, as predicted from the sequence: 2Arg, 2His = +4 overall charge. Water content is not taken into account.

\textsuperscript{[b]}: estimated considering a MW = 4192 g/mol taking into account 4 trifluoroacetate counter-anions, as predicted from the sequence: 2Arg, 2His = +4 overall charge. Water content is not taken into account.

Supplementary figure S40 - Analytical HPLC profile of crude peptide 11a. Column: Nucleosil\textsuperscript{®}; gradient: from 30\% to 60\% B over 30 min.
F.6 Enzymatic glycosylation

**Supplementary scheme S25** - Enzymatic glycosylation and release of solid supported peptide

Solid supported peptide (20 nmol) was introduced in a 2 mL microcentrifuge tube and washed with de-ionized water (2 x 500 µL). To the solid was added 100 µL of an aqueous solution containing recombinant α-N-acetylgalactosaminyl transferase T1\(^{[12]}\) (GalNAc-T1, 6 mU), MES (50 mM, pH 6.5), MnCl\(_2\) (15 mM), Bovine Serum albumin (BSA, 100 ng), DTT (1 mM) and UDP-GalNAc (2mM). The resulting suspension was mixed at 37 °C for 18 h under moderate agitation. Beads were then washed with de-ionized water (2 x 500 µL), in order to remove the UDP formed during the transfer reaction since it inhibits GalNAc-T1 activity. Solid supported peptide was then incubated under the same conditions as above for another 18 h and the resin was washed with de-ionized water. The resulting solid supported peptide was released under typical procedure (p S53) to give crude peptide which was analyzed by RP-HPLC and HRMS.

F.7 Enzymatic glycosylation in solution

Supplementary scheme S26 – Enzymatic glycosylation of peptide Muc1 11a in solution

In a 2 mL microcentrifuge tube containing peptide 11a (20 nmol) was added 100 µL of an aqueous solution containing GalNAc-T1 (6 mU), MES (50 mM, pH 6.5), MnCl₂ (15 mM), Bovine Serum albumin (BSA, 100 µg), DTT (1 mM) and UDP-GalNAc (2mM). The resulting suspension was mixed at 37 °C for 18 h under moderate agitation. UDP formed during GalNAc transfer was eliminated by addition of calf intestinal alkaline phosphatase (1U). Then 100 µL of fresh GalNAc-T1 enzyme mixture were added for another 18 h period. Resulting glycopeptides were isolated from the mixture using standard hydrophobic SPE cartridge and was analyzed by RP-HPLC and HRMS.

Supplementary figure S48 - Analytical HPLC profile of glycopeptides obtained after enzymatic glycosylation of peptide 11a in solution. Column: Nucleosil®; gradient: from 10% to 25% B over 30 min.
F.8 Kinetics of enzymatic glycosylation

Kinetics experiments were performed with solid supported peptide 10c. Conditions used for kinetics experiments on beads were identical to those described above, and reactions were stopped at different time points by washing the beads with water. Addition of freshly prepared enzyme and substrate solution was performed after 1 h, 3 h, 6 h, 12 h, 24 h, 48 h and 96 h while beads were left under moderate agitation at 37 °C for the indicated time.

[a] Estimated by integration of the corresponding LC-MS peaks at λ = 214 nm. The differences in molar absorption coefficient due to the added GalNAc moieties are not taken into account, thus overestimating a little the glycosylated compounds. [b] An hyphen indicates that the eventually detected amount of the corresponding product is below 2%.

F.9 Optimization of reaction conditions for enzymatic glycosylation

Attempts realized in order to improve the glycosylation score by addition of 0.1% (v/v) of Triton™-X100 (Sigma–Aldrich) to the enzymatic mixture, showed no significative change in GalNAc incorporation.

| Entry | Reaction duration | Addition of Triton™ | 7 (11h) | 6 (11g) | 5 (11f) | 4 (11e) | 3 (11d) | 2 (11c) | 1 (11b) | 0 (11a) |

[a] Estimated by peak area integration on extracted-ion chromatograms; not a rigorous quantification, due to probable differences in ionization of the compounds.
F.10 Glycosylation site identification

After release from solid-support, glycopeptide 11g was purified by semi-preparative HPLC and lyophilized. O-glycosylation sites of the glycopeptides were identified by electron transfer dissociation (ETD) ESI-MS/MS analysis by a mass spectrometry as described above.

G  Solid phase enzymatic glycosylation of chemically-glycosylated peptide 6

G.1  Grafting of peptide 6 on alkyne functionalized solid support 9c

**Supplementary scheme S27** - Grafting of peptide 6 on alkyne functionalized solid support 9c

A solution of the azide-containing glycopeptide 6 (1 µmol) dissolved in 800 µL of a 1:1 mixture of NMP and 200 mM HEPES buffer pH 7.5 was added to a 2 mL microcentrifuge tube containing the alkyne functionalized solid support 9c (100 mg). To the suspension were subsequently added a 1 M aqueous aminoguanidine solution (30 µL, 30 equiv.), a 1 M aqueous tert-butanol solution (30 µL, 30 equiv.). The tube was sealed with a rubber septum and the resulting mixture was further deoxygenated through several successive vacuum (15 mbar) / argon cycles. Then, a mixture containing copper(I) bromide-dimethyl sulfide complex (30 equiv.) and THPTA (40 equiv.) dissolved under argon in 50 µL of deoxygenated NMP was added, the resulting suspension was further deoxygenated and was stirred for 5 h at 37 °C. The supernatant was analyzed by HPLC to check the total consumption of the azidopeptide. Capping of remaining solid-supported terminal alkyne was performed by adding 2-(2-azido-ethoxy)-ethanol (100 equiv.). The mixture was stirred an additional hour at 37 °C. The resin was then extensively washed with NMP, de-ionized water, then repeatedly treated (3x) with a pH 7 aqueous buffer containing 6 M guanidinium chloride, 0.1 M EDTA and 0.1 M sodium dihydrogenophosphate for a few minutes then drained and finally extensively washed with de-ionized water.

A few beads of the resulting solid supported peptide were cleaved to give crude glycopeptide S20’ which was analyzed by RP-HPLC and HRMS.

**ESI-HRMS (m/z):** [M+H]^+ calcd for C_{186}H_{299}N_{52}O_{63}Si: 4297.1561, found: 4297.1514.
**Supplementary figure S51** - Analytical HPLC profile of crude glycopeptide S20* after treatment of the peptide support with typical procedure described above. Column: Nucleosil®; gradient: from 30% to 60% B over 30 min.

**Supplementary figure S52** - ESI-HRMS mass spectrum of glycopeptide S20*
G.2 Solid-supported deprotection of the TIPS group of 15

Supplementary scheme S28 - Solid-supported deprotection of the TIPS group of 15

The solid supported glycopeptide S20 was introduced in a syringe fitted with a polypropylene frit and a teflon stopcock and was washed with anhydrous DMF (4x). A mixture of TBAF (100 equiv.) dissolved in anhydrous DMF (final concentration 100 mM) was added and the reaction mixture was stirred by syringe rotation for 15 min at room temperature. This protocol was repeated once and the resin was then extensively washed with DMF, a 0.1% aqueous TFA solution and finally de-ionized water to give the solid supported peptide 15.

A few beads of the resulting solid supported peptide were cleaved to give crude glycopeptide 8 which was analyzed by RP-HPLC and HRMS.

ESI-HRMS (m/z): [M+H]⁺ calcd for C₁₇₇H₂₇₉N₅₂O₆₃: 4141.0227, found: 4141.0252.
Supplementary figure S53 - Analytical HPLC profile of crude glycopeptide 8 released from solid supported peptide 15. Column: Nucleosil®; gradient: from 10% to 25% B over 30 min.
G.3 Enzymatic glycosylation of 15 with GalNAc-T1

Solid supported glycopeptide 15 (20 nmol) was introduced in a 2 mL microcentrifuge tube and washed with de-ionized water (2 x 500 µL). To the solid was added 100 µL of an aqueous solution containing GalNAc-T1 (6 mU), MES (50 mM, pH 6.5), MnCl₂ (15 mM), BSA (100 ng), DTT (1 mM) and UDP-GalNAc (2 mM). The resulting suspension was mixed at 37 °C for 48 h under moderate agitation. Beads were then washed with de-ionized water (2 x 500 µL), in order to remove the UDP formed during the transfer reaction since it inhibits GalNAc-T1 activity. Solid supported glycopeptide was then incubated under the same conditions as above for another 48 h and the resin was washed with de-ionized water. The resulting solid supported glycopeptide was released under typical procedure (p S53) to give crude glycopeptide S21'. Glycopeptide was purified by semi-preparative HPLC and lyophilized to yield glycopeptide S21' as a white fluffy powder (Yield: 48.3%; estimated by integration of the HPLC peak at λ = 214 nm)

ESI-HRMS (m/z): [M+H]** calcd for C_{225}H_{357}N_{58}O_{93}: 5359.4989, found: 5359.5029.
Supplementary figure S54 - Analytical HPLC profile of crude mixture containing glycopeptide S21’. Column: Nucleosil®; gradient: from 10% to 25% B over 30 min. B) Total-ion chromatogram C) Extracted-ion chromatogram of glycopeptides containing 9, 8, 7 and 6 O-GalNAc, respectively. Column: Zorbax 300; gradient: from 3% to 50% B over 20 min.

G.4 Enzymatic sialylation of 15 with ST6GalNAc I

Supplementary scheme S30 - Enzymatic sialylation of 15 with ST6GalNAc I

The catalytic domain of human ST6GalNAc I \[^{[13]}\] was expressed in Sf9 insect cells transduced by a recombinant baculovirus and secreted into the medium and was a kind gift of A. Harduin-Lepers. The medium was concentrated 25-fold and the enzymatic activity kept at -20 °C in 30% (v/v) aqueous glycerol.

Solid supported glycopeptide 15 (20 nmol) was introduced in a 2 mL microcentrifuge tube and washed with de-ionized water (2 x 500 µL). To the solid was added 100 µL of an aqueous solution containing recombinant ST6GalNAc I (8 mU),\[^{[14]}\] MES (50 mM, pH 6.8), Triton-X100 (0.8% v/v), BSA (50 µg), DTT (1 mM) and CMP-NeuAc (4 mM).

The resulting suspension was mixed at 37 °C for 24 h under moderate agitation. Beads were washed with de-ionized water (2 x 500 µL) and were then incubated for another 24 h with a fresh enzyme and substrate mixture. Beads were extensively washed with de-ionized water. The resulting solid supported glycopeptide was released under typical procedure (p S53) to give a mixture of disialylated glycopeptide 16 (65%) and monosialylated glycopeptide S22 (30%). No trace of degradation of the sialyl moiety was observed, even under much prolonged cleavage reaction. The disialylated glycopeptide 16 was purified by semi-preparative HPLC and lyophilized to yield glycopeptide 16 as a white fluffy powder (Yield: 38.1%; estimated by integration of the HPLC peak at \( \lambda = 214 \) nm).

H Chemical ligation to introduce a biotin probe

H.1 Introduction of a biotin probe on solid supported peptide 10c through CuAAc

Supplementary scheme S.31 - Introduction of a biotin probe on solid supported peptide 10c

Solid supported peptide 10c (100 nmol) was introduced in a 2 mL microcentrifuge tube and washed with de-ionized water (2 x 500 µL). A solution of N3-PEG3-biotin (450 µg, 1 µmol, 10 equiv.) dissolved in 100 µL of a 1:1 mixture of NMP and 200 mM HEPES buffer pH 7.5 was then added. To the suspension were subsequently added a 1 M aqueous aminoguanidine solution (3 µL, 30 equiv.), a 1 M aqueous tert-butanol solution (3 µL, 30 equiv.). The tube was sealed with a rubber septum and the resulting mixture was further deoxygenated through several successive vacuum (15 mbar) / argon cycles. Then, a mixture containing copper(I) bromide-dimethyl sulfide complex (30 equiv.) and THPTA (40 equiv.) dissolved under argon in 10 µL of deoxygenated NMP was added, the resulting suspension was further deoxygenated and was stirred for 5 h at 37 °C. The resin was then extensively washed with NMP, de-ionized water, then repeatedly treated (3x) with a pH 7 aqueous buffer containing 6 M guanidinium chloride, 0.1 M EDTA and 0.1 M sodium dihydrogenophosphate for a few minutes then drained and finally extensively washed with de-ionized water.

A few beads of the resulting solid supported peptide were cleaved to give crude peptide S23' which was analyzed by RP-HPLC and HRMS.

ESI-HRMS (m/z): [M+H]^+ calcd for C_{179}H_{285}N_{56}O_{58}S: 4179.0794, found: 4179.0760.

I  **Fluorescence labeling of CPG supported peptides**

All the differently substituted beads (9c, 10c, S23, S21 and 17) were washed with water (2x), PBS containing BSA (2 mg/mL). Substituted beads were subsequently incubated with labelling agent at room temperature, with moderate agitation. At the end of the incubation periods, all beads were washed in PBS, mounted on glass slides in a 1:1 mixture of PBS/ mounting medium (Vectashield, Vector Laboratories, Burlingame, CA, USA) and observed with a Zeiss Axiovert 200 M microscope coupled with a Zeiss LSM 510 scanning device (Carl Zeiss Co. Ltd., Jena, Germany). Mouse anti human MUC1 antibodies (clones C595 and CB2, Serotec, Cergy, France) were used together at 0.5 µg/mL in PBS. After 45 min incubation followed by 3 washes in PBS, a secondary antibody (FITC-conjugated goat anti mouse IgG, Jackson ImmunoResearch, West Grove, PA, USA) diluted 7 µg/mL in PBS-BSA was added to the beads for 45 min. Incubations with the GalNAc-specific *Vica villosa* lectin (VVL) were routinely carried out for 45 min in PBS-BSA with 20 µg/mL biotin-labeled lectin or FITC-conjugated lectin (Vector Laboratories). The beads were washed in PBS and for the biotin-VVL treatment, further incubated with streptavidin Alexa-fluor 568 (Molecular Probes, Eugene, OR, USA) at 4 µg/mL in PBS-BSA for 45 min. Biotin-substituted beads were incubated with streptavidin Alexa-fluor 568 (Molecular Probes) at 4 µg/mL in PBS-BSA for 45 min. Whenever they were doubly labeled, the beads were incubated in the same conditions as above first with the antibodies and then with the couple biotin-VVL / streptavidin-Alexa-fluor 568, or first with FITC-VVL and then streptavidin-Alexa-fluor 568, or with the antibodies and then streptavidin-Alexa-fluor 568. For an extensive labeling of the beads, FITC- VVL was used at 2 mg/mL for 18 h, followed by washes in PBS (6x).

Demonstration that presence of a triazole as amide surrogate does not alter enzymatic glycosylation efficiency

J.1 Synthesis of 20mer Muc1 peptide S24 containing N₃-Dtpp

The backbone amide linker 4-(4-formyl-3,5-dimethoxyphenoxy)butyric acid, (34 mg, 125 µmol, 2.5 equiv.) was loaded on Rink amide ChemMatrix® resin (96 mg, 0.52 mmol/g, 50 µmol) using HATU (47 mg, 125 µmol, 2.5 equiv.) and iPr₂NEt (43 µL, 250 µmol, 5 equiv.) in DMF for 2 h at room temperature. The resin was then thoroughly washed with DMF. In case of incomplete reaction (positive Kaiser’s test), was repeated once.

3-(Triisopropylsilyl)prop-2-yn-1-amine (53 mg, 250 µmol, 5 equiv.) and NaBH₃CN (16 mg, 250 µmol, 5 equiv.) dissolved in 5 mL of DMF/MeOH/AcOH (7:2:1) were added to the resin (1 equiv., swelled in DMF prior to the reaction), and the resulting suspension was mixed overnight at 50 °C with N₂ bubbling.

Fmoc-His(Trt)-OH (310 mg, 0.5 mmol, 10 equiv.) was coupled onto the resulting resin with HATU (190 mg, 0.5 mmol, 10 equiv.) and iPr₂NEt (175 µL, 1 mmol, 20 equiv.) in DMF overnight at room temperature.

The elongation of the peptide was performed by standard automated solid phase synthesis (pS4) up to ²Thr. Prolines 4 and 5 were coupled twice following the automated program for double couplings. A 85% elongation yield was obtained, determined by the titration of the first (BAL) and last (²Thr) Fmoc group deprotection (UV, 301 nm).

At this point, the resin was divided in two equal portions, for the production of both S24 and S25.

Compound S6 (2 equiv., dissolved in DMF), HATU (2 equiv.) and iPr₂NEt (3 equiv.) were added to the peptide resin (25 µmol, 1 equiv., swelled in DMF prior to the reaction), and the resulting suspension was stirred overnight at room temperature. The resin was thoroughly washed with DMF. The resin was further washed with CH₂Cl₂, and treated with TFA/iPr₃SiH/1.3 dimethoxybenzene (90:5:5) for 2 h. Peptide S24 was precipitated by dilution with ice-cold diethyl ether, recovered by centrifugation, washed 3 times with diethyl ether, dried under reduced pressure and lyophilized to yield crude peptide S24 as a white fluffy powder (42.7 mg, 17 µmol, 68%* isolated yield based on the original resin loading).

This peptide was used without any further purification.

*: estimated considering a MW = 2514 g/mol taking into account 4 trifluoroacetate counter-ions, as predicted from the sequence: 1Arg, 1His = +2 overall charge. Water content is not taken into account.

J.7 Solid supported enzymatic glycosylation of S29

Supplementary scheme S37 - Enzymatic glycosylation and release of solid supported peptide S29

Solid supported glycopeptide S29 (20 nmol) was glycosylated under rigorously identical conditions as used for peptide 10c not containing any triazole as amide bond surrogate. It was introduced in a 2 mL microcentrifuge tube and washed with de-ionized water (2 x 500 µL). To the solid was added 100 µL of an aqueous solution containing GalNAc-T1 (6 mU), MES (50 mM, pH 6.5), MnCl₂ (15 mM), BSA (100 ng), DTT (1 mM) and UDP-GalNAc (2 equiv. per glycosylation sites). The resulting suspension was mixed at 37 °C for 48 h under moderate agitation. Beads were then washed with de-ionized water (2 x 500 µL), in order to remove the UDP formed during the transfer reaction since it inhibits GalNAc-T1 activity. Solid supported glycopeptide was then incubated under the same conditions as above for another 48 h and the resin was washed with de-ionized water.

The resulting solid supported peptide was released under typical procedure (p S53) to give crude mixture containing glycopeptides S30g and S30f which were analyzed by RP-HPLC and HRMS.

No difference in glycosylation rate could be observed between 10c and S29, demonstrating that presence of a triazole did not alter the enzymatic glycosylation efficiency.
Supplementary figure S79 - Analytical HPLC profile of crude mixture containing glycopeptide S30g. Column: Nucleosil®; gradient: from 10% to 25% B over 30 min.

K.2 Typical procedures for multiple successive solid phase peptidomimetic triazole ligations

i) Typical procedure for solid-supported peptidomimetic triazole ligations:

Solid supported alkyne peptide (1 µmol) was introduced in a 2 mL microcentrifuge tube and washed with de-ionized water (2 x 500 µL). A solution of crude 19 (6.6 mg, 1.5 µmol, 1.5 equiv) dissolved in 100 µL of a 1:1 mixture of NMP and 200 mM HEPES buffer pH 7.5 was then added. To the suspension were subsequently added a 1 M aqueous aminoguanidine solution (3 µL, 30 equiv.) and a 1 M aqueous tert-butanol solution (3 µL, 30 equiv.). The tube was sealed with a rubber septum and the resulting mixture was further deoxygenated through several successive vacuum (15 mbar) / argon cycles. Then, a mixture containing copper(I) bromide-dimethyl sulfide complex (30 equiv.) and THPTA (40 equiv.) dissolved under argon in 10 µL of deoxygenated NMP was added, the resulting suspension was further deoxygenated and was stirred for 5 h at 37 °C. The resin was then extensively washed with NMP, de-ionized water, then repeatedly treated (3x) with a pH 7 aqueous buffer containing 6 M guanidinium chloride, 0.1 M EDTA and 0.1 M sodium dihydrogenophosphate for a few minutes then drained and finally extensively washed with de-ionized water.

ii) Typical procedure for solid-supported deprotection of the TIPS group:

The solid supported TIPS-alkyne peptide was introduced in a syringe fitted with a polypropylene frit and a teflon stopcock and was washed with anhydrous DMF (4x). A mixture of TBAF (100 equiv.) and phenol\textsuperscript{[15]} (110 equiv.) dissolved in anhydrous DMF (final TBAF concentration: 100 mM) was added and the reaction mixture was stirred by syringe rotation for 2 h at room temperature. This protocol was repeated once and the resin was then extensively washed with DMF, a 0.1% aqueous TFA solution and finally de-ionized water to give the solid supported alkyne peptide.

\textsuperscript{[15]} Phenol was introduced to reduce the basic condition of the reaction. Better results in term of purity were observed with an equimolar addition of phenol during TIPS deprotection.
**Supplementary scheme S39** - Introduction of a biotin probe on solid supported peptide 10c

The N-to-C elongation of 10c (1 µmol) through multiple solid phase PTLs was performed by repeating three times a succession of i) solid-supported peptidomimetic triazole ligations with azido alkyne 19 and ii) solid-supported deprotection of the TIPS group.

After each step, a few beads of the resulting solid supported peptide were cleaved using the general procedure (p S53) and the released peptide was analyzed by RP-HPLC and HRMS.
• Analysis of S31’

L  Subsequent solid supported enzymatic glycosylation

Supplementary scheme S40 - Enzymatic glycosylation and release of solid supported peptide

Solid supported glycopeptides S32, S34 and 20 (20 nmol) were introduced in a 2 mL microcentrifuge tube and washed with de-ionized water (2 x 500 µL). To the solid was added 100 µL of an aqueous solution containing GalNAc-T1 (6 mU), MES (50 mM, pH 6.5), MnCl₂ (15 mM), BSA (100 ng), DTT (1 mM) and UDP-GalNAc (2 equiv. per glycosylation sites). The resulting suspension was mixed at 37 °C for 48 h under moderate agitation. Beads were then washed with de-ionized water (2 x 500 µL), in order to remove the UDP formed during the transfer reaction since it inhibits GalNAc-T1 activity. Solid supported glycopeptide was then incubated under the same conditions as above for another 48 h and the resin was washed with de-ionized water.

The resulting solid supported glycopeptides were released under typical procedure (p S53) to give glycopeptide mixture which was purified by semi-preparative HPLC and lyophilized to yield pure homogeneous glycopeptide containing 3 O-GalNAc per Muc1 tandem repeat.
Analysis of S36
