Experimental Section
All the substrates and reagents were commercial available from Sann Chemical Technology (Shanghai) Co. Ltd. All the photo reactions were carried out using purple LED (1 m strip × 2, Greethink 5050, 12 V/m) at a distance of 8-10 cm at rt under air atmosphere unless stated otherwise. IR spectra were recorded on an Avatar 360 FT-IR spectrometer. UV-Vis spectroscopies were recorded on an Evolution 220 UV-Visible spectrophotometer. Cyclic voltammogram (CV) was measured by using an electrochemical analyser (CHI 660E, Chenhua, Shanghai, China). A Pt wire and Hg/Hg₂Cl₂ (SCE) electrode were used as the auxiliary and reference electrodes, respectively. In the 0.05 mol/L KCl as the electrolyte. An initial potential of –0.2 V was applied for 2 s, and subsequently cyclic scans to a final potential of –1.2 V were done for 10 cycles. The CV curves and data reported in the present work were the 10th cycle. 1H (400 MHz) NMR spectra of samples in CDCl₃ or d₆-DMSO at 298 K were recorded on an AVANCE III 400 spectrometer. The apparent molecular weight (MW) and molecular weight distribution (Mw/Mn) of polymers were analyzed by size exclusion chromatography (SEC) measurement, which was performed in LiBr-added N,N-dimethylformamide (DMF) ([LiBr] = 14 mM) at 55 °C with an elution rate of 1.0 mL/min on an Agilent 1260 equipped with a G1310B pump, a G1362A refractive index detector, and a G1314F variable wavelength detector. Two 5 μm LP gel columns (500 Å, molecular range 500-1.2 × 10⁵ Da and 200-1.0 × 10⁶ Da) were calibrated using poly (methyl methacrylate) (PMMA) standards.

Synthesis and characterization of AQ-PHEMA
The AQ-PHEMA was prepared by reaction of PHEMA with AQ-2-COCl (Scheme S1). At first, AQ-2-COCl was synthesized as the following procedure. In a dry 250 mL of Schlenk flask, under argon atmosphere, AQ-2-COOH (2.704 g, 10.7 mmol) was refluxed with SOCl₂ (2.5 mL) in anhydrous dichloroethane (20 mL). After 4 hours, the mixture was concentrated under vacuum and the residue was stripped twice with anhydrous dichloroethane (10 mL × 2). Subsequently, the residue was dissolved in anhydrous DMF (20 mL) and transferred into another dry 100 mL of Schlenk flask containing precursor PHEMA (2.792 g) which was previously dried by azeotropic distillation with toluene (100 mL). After that, anhydrous DMF (20 mL) was added. Anhydrous Et₃N (16 mL) as acid-binding agent was syringed into the flask. The mixture was stirred for 62 hours at rt. The mixture was precipitated with water (500 mL) twice and methanol (500 mL) once. The obtained AQ-PHEMA was further dried under vacuum at 60 °C to a constant weight. 1H NMR (400 MHz, d₆-DMSO, δ, ppm,
TMS): 1.00-0.65 (m, -CH2C(CH3)-), 2.15-1.47 (m, -CH2C(CH3)-), 4.23-3.41 (m, AQCOOC2H5), 8.75-7.93 (m, Ar-H). $M_n$/GPC = 43,000, $M_w$/$M_n$ = 1.53.

Scheme S1. The synthetic procedure for AQ-PHEMA.

The $^1$H NMR spectra for AQ-2-COOH, PHEMA and AQ-PHEMA were shown in Figure S3. According to our previous work, the structure of AQ could be confirmed by the characteristic resonance signal on phenyl at 8.73-7.92 ppm. The characteristic resonance signals for methylene protons (HOCH2CH2-) of PHEMA could be clearly discriminated at 4.05-3.42 ppm, and signal for methyl protons (-CH2CBr(CH3)-) could be observed at 1.00-0.65 ppm. The characteristic resonance signals for the alkyl and phenyl groups were substantially identical to that of PHEMA and AQ-2-COOH. We also performed IR spectrum characterization of AQ-PHEMA and found that hydroxyl groups were not all modified (Figure S4).

Figure S3. $^1$H NMR spectra for AQ-2-COOH, PHEMA and AQ-PHEMA in $d_6$-DMSO.
The apparent molecular weight of PHEMA was calibrated as 27,800 g/mol by SEC instrument using PMMA as calibration. Obviously, the GPC curve of AQ-PHEMA is significantly shift to the higher molecular weight region (43,000 g/mol) (Figure S5). The above results indicated that the AQ functional group was successfully attached to PHEMA.

Figure S5. The GPC traces of PHEMA and AQ-PHEMA.
Calculate the ratio of AQ in AQ-PHEMA by UV-Vis spectrophotometer

Next, AQ-2-COOH, PHEMA and AQ-PHEMA DMF solutions were measured by UV-Vis spectrophotometer to determine the ratio of AQ in AQ-PHEMA. As shown in Figure S6, at the range of 250-700 nm wavelengths, PHEMA had no absorption, AQ-PHEMA had two absorption peaks at 268 nm and 330 nm, which was identical with AQ-2-COOH. However, the absorption at 268 nm was significantly interfered by solvent. Therefore, 330 nm was selected as the maximum absorption wavelength. Five different concentrations of AQ-2-COOH DMF standard solutions were prepared to obtain a calibration curve (Figure S7). Finally, a DMF solution of AQ-PHEMA (0.044 mg/mL) was measured at 330 nm with the absorbance as 0.772. Since PHEMA had no absorption at 330 nm, the absorption signal in the AQ-PHEMA solution was solely from its AQ functional group. According to the linear regression equation from the calibration curve of AQ-2-COOH, the concentration of AQ in AQ-PHEMA DMF solution (0.044 mg/mL) was calculated as $1.302 \times 10^{-4}$ mmol/mL. Thus, the ratio of AQ in AQ-PHEMA was calculated as 2.959 mmol/g.

The reaction of 1x (180 mg, 1 mmol), AQ-PHEMA (10 mg, 3 mol%), i-Pr₂NEt (330 μL, 2 mmol), and 1,4-dioxane (5 mL) afforded 2x as a solid (149 mg, 98%); ¹H NMR (400 MHz, CDCl₃) δ 7.96 (d, J = 8.4 Hz, 2H), 6.86 (d, J = 8.4 Hz, 2H), 5.44 (brs, 1H), 3.89 (s, 3H).

4-Carboxyphenol (2y)⁵

The reaction of 1y (166 mg, 1 mmol), AQ-PHEMA (10 mg, 3 mol%), i-Pr₂NEt (330 μL, 2 mmol), and 1,4-dioxane (5 mL) afforded 2y as a solid (127 mg, 92%); ¹H NMR (400 MHz, DMSO) δ 12.41 (brs, 1H), 10.21 (brs, 1H), 7.80 (d, J = 8.0 Hz, 2H), 6.82 (d, J = 8.0 Hz, 2H).

Naphthalen-1-ol (2z)²

The reaction of 1z (172 mg, 1 mmol), AQ-PHEMA (10 mg, 3 mol%), i-Pr₂NEt (330 μL, 2 mmol), and 1,4-dioxane (5 mL) afforded 2z as a solid (133 mg, 92%); ¹H NMR (400 MHz, CDCl₃) δ 8.22 – 8.13 (m, 1H), 7.84 – 7.75 (m, 1H), 7.53 – 7.41 (m, 3H), 7.31 (t, J = 7.8 Hz, 1H), 6.82 (d, J = 7.2 Hz, 1H), 5.20 (brs, 1H).

Naphthalen-2-ol (2aa)²
The reaction of 1aa (172 mg, 1 mmol), AQ-PHEMA (10 mg, 3 mol%), i-Pr₂NEt (330 μL, 2 mmol), and 1,4-dioxane (5 mL) afforded 2aa as a solid (138 mg, 96%); ¹H NMR (400 MHz, CDCl₃) δ 7.75 (t, J = 8.0 Hz), 7.67 (d, J = 8.4 Hz), 7.42 (t, J = 7.2 Hz), 7.32 (t, J = 7.4 Hz), 7.17 – 7.07 (m), 5.13 (brs, 1H).

**Cyclohexanol (4a)**

The reaction of 3a (128 mg, 1 mmol), AQ-PHEMA (10 mg, 3 mol%), i-Pr₂NEt (330 μL, 2 mmol), and 1,4-dioxane (5 mL) afforded 4a as a liquid (80 mg, 80%); ¹H NMR (400 MHz, CDCl₃) δ 3.66 – 3.54 (m, 1H), 1.94 – 1.82 (m, 2H), 1.77 – 1.69 (m, 2H), 1.59 – 1.48 (m, 2H), 1.36 – 1.09 (m, 5H).

**Hexanal (4b)**

The reaction of 3b (128 mg, 1 mmol), AQ-PHEMA (10 mg, 3 mol%), i-Pr₂NEt (330 μL, 2 mmol), and 1,4-dioxane (5 mL) afforded 4b as a liquid (83 mg, 83%); ¹H NMR (400 MHz, CDCl₃) δ 9.77 (s, 1H), 2.42 (t, J = 7.4 Hz, 2H), 1.69 – 1.58 (m, 2H), 1.38 – 1.25 (m, 4H), 0.90 (t, J = 6.4 Hz, 3H).

**3-Phenylpropanal (4c)**

The reaction of 3c (162 mg, 1 mmol), AQ-PHEMA (10 mg, 3 mol%), i-Pr₂NEt (330 μL, 2 mmol), and 1,4-dioxane (5 mL) afforded 4c as a liquid (109 mg, 81%); ¹H NMR (400 MHz, CDCl₃) δ 9.81 (s, 1H), 7.29 (t, J = 7.2 Hz, 2H), 7.20 (t, J = 7.6 Hz, 3H), 2.96 (t, J = 7.2 Hz, 2H), 2.78 (t, J = 7.6 Hz, 2H).

**Phenol (2j)**
The reaction of 3d (204 mg, 1 mmol), AQ-PHEMA (10 mg, 3 mol%), i-Pr$_2$NEt (330 μL, 2 mmol), and 1,4-dioxane (5 mL) afforded 2j as a solid (86 mg, 91%); $^1$H NMR (400 MHz, CDCl$_3$) δ 7.24 (t, $J$ = 7.4 Hz, 2H), 6.93 (t, $J$ = 7.4 Hz, 1H), 6.83 (d, $J$ = 7.6 Hz, 2H), 5.18 (brs, 1H).

**Benzyl alcohol (4e)$^2$**

$$
\text{Benzyl alcohol (4e)} \xrightarrow{\text{purple LED, AQ-PHEMA, i-Pr}_2\text{NEt}} \text{4e}
$$

The reaction of 3e (218 mg, 1 mmol), AQ-PHEMA (10 mg, 3 mol%), i-Pr$_2$NEt (330 μL, 2 mmol), and 1,4-dioxane (5 mL) afforded 4e as a liquid (103 mg, 95%); $^1$H NMR (400 MHz, CDCl$_3$) δ 7.30 – 7.14 (m, 5H), 4.43 (d, $J$ = 5.2 Hz, 2H), 3.83 (t, $J$ = 5.0 Hz, 1H).

Gram scale reaction of 2x under Condition A.

1x (1.824g, 10.1 mmol), AQ-PHEMA (101 mg, 3 mol%), i-Pr$_2$NEt (3.3 mL, 20.2 mmol), and 1,4-dioxane (50 mL) were added to a dry 100 mL Schlenk bottle. The mixture was irradiated by purple LED at rt under air atmosphere. The photoreaction was completed after 30 h as monitored by TLC (eluent: petroleum ether/ethyl acetate = 2/1). The solvent was removed and the residue was purified by flash column chromatography on silica gel (eluent: petroleum ether/ethyl acetate = 10/1→5/1) to afforded 2x as a solid (1.475g, 96%). $^1$H NMR (400 MHz, CDCl$_3$) δ 7.95 (d, $J$ = 8.8 Hz, 2H), 6.89 (d, $J$ = 8.8 Hz, 2H), 6.48 (brs, 1H), 3.90 (s, 3H).
