A rare complication of a common procedure: Undiagnosed subcapsular renal hematoma after double-J stent insertion

Zehra Akkaya, Nurettin Oksuz, Aysegul Gursoy Coruh

ABSTRACT

Introduction: Subcapsular renal hematoma is a very rare complication of double-J stenting in urology practice. Infection, malposition and migration are well known stent complications, which may be monitored by blood and urine analyses and kidney ureter bladder radiographs. However, follow-up of patients with regular ultrasound examinations is crucial as unexpected and potentially fatal complications may take place at any time during or after stent insertion.

Case Report: We present a rare case with chronic subcapsular renal hematoma diagnosed by ultrasonography, two weeks after the removal of double-J stent.

Conclusion: Ultrasonography is important to rule out stent malposition or other serious stent complications.

International Journal of Case Reports and Images (IJCRI)

International Journal of Case Reports and Images (IJCRI) is an international, peer reviewed, monthly, open access, online journal, publishing high-quality, articles in all areas of basic medical sciences and clinical specialties.

Aim of IJCRI is to encourage the publication of new information by providing a platform for reporting of unique, unusual and rare cases which enhance understanding of disease process, its diagnosis, management and clinico-pathologic correlations.

IJCRI publishes Review Articles, Case Series, Case Reports, Case in Images, Clinical Images and Letters to Editor.

INTRODUCTION

Double-J ureteral stents, which were described by Finny in 1978, are commonly used in urologic practice for the relief of obstructive uropathy or postoperatively [1–3]. Besides relatively harmless and common complications such as inadequate relief of obstruction or infection, the rare but important complications such as ureteral perforation or subcapsular renal hematoma should not be underestimated [3]. Previous cases of life-threatening perirenal hematoma soon after stent insertion have been reported [4, 5]. This report emphasizes the importance of thorough radiologic evaluation in a case of undiagnosed chronic subcapsular renal hematoma due to double-J ureter stent.

CASE REPORT

A 21-year-old male with left sided flank pain presented to urology department with a history of having bilateral ureteral double-J stent insertions two months ago via retrograde route in another hospital. He declined having any kind of radiologic work-up for control visits but he mentioned that his previous complaints subsided, except for vague right sided flank pain and persistent hematuria for one week after the insertion procedure. Two weeks prior to admission to our clinic, both of his stents were removed in another hospital. Soon after the removal of double-J stents, he started having left sided flank pain and a brief course of mild hematuria. Physical examination revealed costovertebral angle tenderness on both the sides. Blood work-up showed no significant finding other than moderately elevated erythrocyte sedimentation rate and C-reactive protein. Urine analysis revealed urinary tract infection along with erythrocyturia. On kidney ureter bladder X-ray of the abdomen stones were observed in both kidneys (Figure 1). He was then referred to the ultrasonography unit for further evaluation.
On ultrasonography examination, left kidney demonstrated grade 2–3 hydronephrosis and an obstructing proximal ureter stone was noticed. On the right side, however, the right kidney showed a 5.6 x 1.6 cm sized lentiform shaped perirenal collection with debris and internal septa, following the renal contour. The normal right kidney parenchyma was displaced and indented because of the mass effect (Figure 2A). On color Doppler ultrasound, there was no vascular signal within this collection (Figure 2B).

On computed tomography (CT) scan of the upper abdomen, the centrally hypodense collection and its mass effect on the neighboring renal cortex was confirmed (Figure 3). Additionally, the proximal left ureter stone was confirmed by CT scan (Figure 3).

The patient was put on antibiotic therapy and re-stenting of the left kidney to relieve the dilatation by double-J stent after the antibiotherapy and close weekly ultrasonography follow-up for the right perirenal collection were planned.

**Figure 1:** Kidney ureter bladder radiograph of abdomen showing the borders of enlarged right kidney (arrows), and radio-opaque kidney stones on both the sides (arrow heads).

**Figure 2:** (A) Gray scale, and (B) Color Doppler ultrasound images of the right kidney showing the lentiform-shaped subcapsular hematoma (arrows) and the stone (arrowhead). Note the indentation of the renal cortex by the hematoma (thick arrow). The avascular structure of the subcapsular collection and the partially observed twinkle artifact (arrow in B) of the stone are noteworthy.

**DISCUSSION**

Ureteral stenting is a common urologic procedure which provides near-physiologic drainage of the kidney without external diversion. Memon et al. and Richter et al. report the most common indication of stent insertion as obstructive uropathy and Nawaz et al. report prophylactic stenting as the most common indication [6–8]. Although the reported complication rates may be as high as 79.2% among different studies, the most common complications of double-J stents include irritative voiding symptoms, flank pain, suprapubic discomfort, and hematuria [8–10]. Stent migration or encrustation, infection, hematuria, forgotten stents, bladder erosions and misplaced stents are other complications [10]. In literature, there are case reports on renal parenchymal perforation and hematoma formation following double-J stent insertion [4]. Complications associated with the use of ureteral stents are basically mechanical in nature and are related to stent material [3]. The safe window period of stenting is probably 6–8 weeks. If left for a long time, nearly all stents will encrust [3, 6]. Hence, Pansota et al. recommend stent monitoring with regular monthly urine cultures, kidney ureter bladder X-ray [3]. For complicated cases close, individualized radiologic follow up by CT scan and ultrasonography scan are recommended [4, 5]. However, as indicated in this report we believe that ultrasonography should be regarded as a more valuable tool to give unequivocal information not only about the pelvicalyceal system but also about the renal parenchymal changes, perirenal space diseases and when coupled with color Doppler imaging, renal vasculature too. We think
that because of the increased intrarenal pressure in a hydronephrotic kidney, renal parenchyma would be more fragile than normal. As a result even minor pelvicalyceal trauma may not be well tolerated and may lead to capsule-cortex detachment without necessarily direct parenchymal penetration by the stent or guide wire. The precise time of development of subcapsular hematoma in this patient was not known. It is possible that the hematoma developed during or soon after initial stenting due to direct trauma by stent malposition, or within the two months time the patient spent with bilateral double-J stents without radiologic workup for control, due to stent migration. We believe that this was a lucky patient whose hematoma was self-limiting but catastrophic outcomes could have taken place. The patient was hemodynamically stable when he was diagnosed, invasive surgical procedures or minimally invasive percutaneous drainage was avoided. However, we recommend that such procedures should be promptly employed in cases with infected collections, perirenal abscesses or in acute massive hematomas which may lead to hypovolemic shock. Follow-up ultrasonography revealed shrunken hematoma by the end of first month.

CONCLUSION

Possible stent complications should come to mind in patients with unexpected flank pain or hematuria. Ultrasonography both in early postoperative period and later with regular intervals is the best way to rule out stent malposition or other serious complications such as subcapsular renal hematoma in patients with double-J ureteral stents.

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.

Mentored Review Articles (MRA)
Our academic program “Mentored Review Article” (MRA) gives you a unique opportunity to publish papers under mentorship of international faculty. These articles are published free of charges.

Most Favored Author program
Join this program and publish any number of articles free of charge for one to five years.

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

We welcome you to interact with us, share with us, join us and of course publish with us.
