Costus speciosus is an important medicinal plant widely used in several indigenous medicinal formulations. The present study was conducted to evaluate the in vitro anti-inflammatory, antioxidant and anti-angiogenic activities of diosgenin isolated from C. speciosus. The diosgenin isolated from C. speciosus by HPTLC and study its biological activities by different protocols. The results demonstrated that LPS stimulated TNF-\(\alpha\) generation in RAW 264.7 macrophages culture supernatant up to 3.7-fold of the control and that sample treatment (50 \(\mu\)g/mL) resulted in a highly significant inhibitory effect on LPS-stimulated TNF-\(\alpha\) (\(P<0.01\)) in a similar manner to methotrexate inhibitory effect. The tested sample possessed an effective antioxidant scavenging affinity against DPPH radicals as compared with the standard antioxidant activity of vitamin C. The results presented here may suggest that diosgenin isolated from C. speciosus possess anticancer, apoptotic and inhibitory effects on cell proliferation.

Key words: Anti-inflammatory; antioxidant; anti-angiogenic; Diosgenin; C. speciosus
Supplementary Results

Figure S1. The level of nitrites in RAW 264.7 cells lysate after the treatment with the samples (50 µg/mL) and LPS for 24 h compared LPS treated cells, as measured by Griess assay. The data are presented as nmole/mg protein (mean ±SE)

Figure S2. The level of TNF-α protein in RAW 264.7 macrophages culture supernatant after the treatment with the samples (50 µg/mL) and LPS for 24 h compared LPS treated cells, as measured by ELISA assay. The data are presented as ng/mg protein (mean ±SE)
Figure S3. The level of COX-2 protein in RAW 264.7 macrophages lysate after the treatment with the samples (50 µg/mL) and LPS for 24 h compared LPS treated cells, as measured by ELISA assay. The data are presented as absorbance (mean ±SE).

Figure S4. The level of 5-LO protein in RAW 264.7 macrophages lysate after the treatment with the samples (50 µg/mL) and LPS for 24 h compared LPS treated cells, as measured by ELISA assay. The data are presented as absorbance (mean ±SE)
Figure S5. Antioxidant activity of tested sample against DPPH radicals as compared with ascorbic acid activity. DPPH assay is a non-cellular colorimetric assay. The data are presented as SC$_{50}$ (µg/mL, mean ±SE).

Figure S6. The level of glutathione protein in Hep-G2 cell lysate after the treatment with the tested sample (30% of the IC$_{50}$) for 24 h compared NAC-treated cells (100 µg/mL), as measured by Ellman’s assay. The data are presented as µmole/mg protein (mean ±SE).
Figure S7. The activity of superoxide dismutase enzyme in Hep-G2 cell lysate after the treatment with the tested sample (30% of the IC$_{50}$) for 24 h compared NAC-treated cells (100 μg/mL), as measured by colorimetric assay. The data are presented as U/mg protein (mean ±SE).

Figure S8. The activity of catalase enzyme in Hep-G2 cell lysate after the treatment with the tested sample (30% of the IC$_{50}$) for 24 h compared NAC-treated cells (100 μg/mL), as measured by colorimetric assay. The data are presented as U/mg protein (mean ±SE)
Figure S9. The activity of glutathione peroxidase enzyme in Hep-G2 cell lysate after the treatment with the tested sample (30% of the IC₅₀) for 24 h compared NAC-treated cells (100 μg/mL), as measured by colorimetric assay. The data are presented as mU/mg protein (mean ±SE).

Figure S10. The concentration of VEGF and PDGF in MCF-7 cell lysate after the treatment with the tested sample (30% of the IC₅₀) for 24 h compared thalidomide-treated cells (100 μg/mL), as measured by ELISA. The data are presented as pg/mL (mean ±SE).
Supplementary Materials

Experimental

Chemical reagents and cells
Diosgenin was obtained from Sigma-Aldrich Co. LLC. (MO, USA) and dissolved in ethanol. All cell maintaining materials was obtained from Cambrex, BioScience (Copenhagen, Denmark), while all other fine chemicals were from Sigma-Aldrich (CT, USA).

Raw material and HPTLC analysis
C. speciosus was procured from a fixed vendor in the local market of Al Jouf, KSA. Specimens were identified at the Aljouf University (Aljouf, Saudi Arabia) and voucher specimen (No. 13) was deposited at the Herbarium of the Department in the cited university. Consents and all ethical relevant procedures were designed according to Aljouf University bioethics committee guidelines. Dried tuber powder (5 gms) was treated with slightly modified method described by Drapeau et al. (1986). Samples were hydrolyzed in 150 mL of refluxing 20% H$_2$SO$_4$ in 70% isopropanol for 8 h. The extract was filtered and extracted with hexane (50 mL×3). The three hexane extracts were combined and rinsed thrice times with 5% alkali and then rinsed thrice with distilled water. The extract was then passed through a column of Na$_2$SO$_4$ to eliminate any remaining water. The samples were concentrated to dryness by evaporating the solvent at 40°C in a Rotary evaporator. The dried crude extract was solubilized in 0.5 mL of chloroform prior to the quantitative determination of diosgenin by thin layer chromatography. To begin the analysis, mobile phase T:EA:FA:GAA in the ratio 2:1:1:0.75 v/v reported by Kshirsagar et al. (2008) was preferred.

Anti-inflammatory activity
Nitrite accumulation was used as an indicator of NO production using a microplate assay based on the Griess reaction (Green et al. 1982). A standard curve relating NO in µm to the absorbance is constructed, from which the NO level in the cell homogenate is computed by interpolation. The levels of Tumor necrosis factor (TNF-α), cyclooxygenase-2 (COX-2) and 5-lipoxygenase (5-LO) were measured in the cell lysate by ELISA.

Estimation of Antioxidant Activity
In a flat bottom 96 well-microplate, a total test volume of 200 µl was used. In each well, 20µl of different concentrations of tested sample (0 - 40 µg/mL final concentration) of tested sample were mixed with 180µl of ethanolic DPPH were mixed and incubated for 30 min at 37°C. Triplicate wells were prepared for each concentration and the average was calculated. The total thiol concentrations (mainly GSH) were measured by an enzymatic cycling procedure based on the oxidation of thiols by 5,5'-dithiobis- (2-nitrobenzoic acid) (DTNB) and their reduction by NADPH in the presence of glutathione reductase (GR) (Griffith 1981). The SOD activity was estimated in macrophages lysate using the nitroblue tetrazolium/phenazine methosulfate (NBT/PMS) assay (Ewing & Janero 1995). Cell lysates were assayed to measure CAT activity at 25°C, based on the disappearance of H₂O₂ at 240 nm, but with some modifications for the detection in 96 well-microplates (Aebi 1983). GPx activity was determined by quantifying the rate of oxidation of GSH by cumene hydroperoxide as catalyzed by GPx present in the cell lysate samples (Lawrence & Burk 1976).

Anti-angiogenic activity
The level of vascular epidermal growth factor (VEGF) and platelets-derived growth factor (PDGF) in supernatant of cell lysates was quantified using Sandwich ELISA as described by Adolf and Apfler (1991).

Statistical Analysis
Data were statistically analyzed using IBM computer supplied with Statistical Package for Social Scientists (SPSS) 10.00 for windows (SPSS Inc., Chicago, IL., USA). The student's unpaired t-test as was used to detect the statistical significance. P value was considered insignificant if more than 0.05.
