Abstract: Ethnomedicinal plants have a significant role in the lives of people of rural and tribal areas. Thousands of medicinal plant species are used to treat various diseases, including jaundice, and are considered an important therapeutic resource to minimize these diseases. Jaundice (icterus) is a chronic disease that occurs when the amount of bilirubin in the blood increases. This review describes different ethnomedicinal plants used for curing jaundice by tribal and rural people of Himachal Pradesh. The study reveals 87 ethnomedicinal plant species belonging to 51 different families, which are used for treating jaundice in Himachal Pradesh. These plants are arranged in a systematic way, which includes a description of their common name, botanical name, along with its family, plant parts used, region, and mode of use in tabulated form. Some of the plant extracts have already been explored for their phytochemical and pharmacological significance and proved their potential in the preparation of new medicines or drugs against the treatment of jaundice. This review is an attempt to highlight the indigenous knowledge of medicinal plants, which are specifically used for the treatment of jaundice. The data mentioned in the present review is compiled from various sources like existing literature, books, Google Scholar, and Scopus publications. Among all the observed plant species, most used medicinal plants for the treatment of jaundice include Justicia adhatoda, Emblica officinalis, Ricinus communis, Saccharum officinarum, Terminalia chebula, Berberis aristata, Cuscuta reflexa, and Tinospora cordifolia. Plants that are mostly utilized for the treatment of jaundice need to be scientifically validated by pharmacological analysis and should be subsequently used for the preparation of new drugs, which may prove far more beneficial than the existing one.

Keywords: jaundice; bilirubin; ethnomedicinal plants; phytoconstituents; hepatoprotective

1. Introduction

Himachal Pradesh is one of the Himalayan states of India, which has been regarded as the richest resource of biodiversity. The area is rich in medicinal plants, which are widely used by the people of different tribal and rural areas. The state is divided into 12 districts and 169 tehsils and sub-tehsils, covering a total area of 55,673 km² with altitude variation from 200–7000 m above sea level [1]. Geographically, the state shows three different zones or regions, known as the outer Himalaya, mid-hills, and the greater Himalaya. The outer
Himalaya, also known as the Shiwalik hills, ranges from 350 m to 1500 m above sea level and includes districts, such as Bilaspur, Sirmour, Kangra, Una, Chamba, Mandi, Hamirpur, and some parts of Solan. Mid-hills (1500 to 3500 m above sea level) cover the area of Mandi, Kangra, Chamba, Solan, Shimla, Lahaul-Spiti, Kinnaur, and Kullu districts. The Greater Himalaya (ranges 3500 and above) covers the area of Lahaul-Spiti, Kullu, and Pangi tehsil of Chamba district, which is also known as the high-altitude alpine area [2,3]. Himachal Pradesh in the lap of western Himalaya is well-known for its floral diversity, including medicinal plants, which are used since ancient times for the treatment of jaundice. The dependency of human beings on plants is an age-old relationship, which is described as ‘ethnobotany’. Ethnobotany comes from the term ethnology, which means the study of culture, so ethnobotany or ethnobiology is a scientific study of plants and human relationship, which shows plants as a primary source of need. Ethnobotany deals with various aspects in which one of the most popular and common aspect is the study and use of ethnomedicines. Ethnomedicine involves the study of indigenous beliefs, concepts, knowledge, and practices among the ethnic groups of tribal and rural people for preventing, curing, and treating jaundice. For human existence, since ancient times, especially, the ethnic or tribal community has a great dependence on local flora for medicinal and other purposes [1,4]. The traditional medicine system represents the indigenous beliefs, skills, and practices of rural and tribal communities based on their experiences to maintain their health [5]. Traditional medicines play an efficient role in the preparation of herbal drugs for the betterment of people [6]. This system of medicines is used for curing diseases through the employment of agencies and forces of nature. Tribal people have their own system of medicines, which are age-old, and some of which are not documented in the literature. This tradition has been passed on from one generation to the other for treating jaundice. The information on medicinal and various other plants comes from the ancient people when they started learning and making use of these traditional plants for various purposes [7,8].

Medicinal plants are regarded as the gift of nature to humans. Various parts of medicinal plants, including herbs, shrubs, and trees, are used for curing jaundice and diseases like neurodegenerative, inflammatory, anthelmintic, diaphoretic, diuretic, etc. According to WHO (World Health Organization), “medicinal plant is a plant, within which one or more of its part contains the substances, which can be further used for various therapeutic purposes, and serves as a precursor for chemo-pharmaceutical semi-synthesis” [9]. Various bioactive compounds of plants called the secondary metabolites are the reason for their medicinal value and include glycosides, tannins, steroids, alkaloids, terpenoids, essential oils, etc. [10]. Himachal Pradesh is endowed with a rich diversity of plants, which includes 3500 higher plants, and of these, 1500 plants are identified with medicinal and aromatic properties [11]. Because of the geographical position and difficult means of transport and communication, people of some major tribes of Himachal Pradesh (Gaddi, Gujjar, Kinniura, Lahula, and Pangwals) mostly live in villages and rural areas and belongs to diverse cultures. These people, with their specific traditional knowledge, make use of different medicinal plants for curing jaundice [1]. Medicinal and ethnobotanical uses of different plant species are documented by various researchers or scientists from different areas of Himachal Pradesh based upon the information provided by the local ethnic people [12]. Ethnomedicines have made good contributions in the health care system in traditional medicines for the treatment of jaundice since ancient times. There are two broad categories for the use of medicinal plants; firstly, plants are used traditionally only by local physicians for getting relief from illness, and secondly, the plants are used by pharmaceutical companies for their active ingredients [13]. According to WHO, due to poverty and lack of modern medicines among different rural and tribal areas, it is estimated that about 70–80% of the world’s total population is totally dependent on the local medicinal plants for their primary healthcare system [8].

Ethnomedicinal plants are generally used for curing various ailments like diabetes, dysentery, typhoid, and jaundice. Different parts of the plant, including roots, leaves, fruits, and flowers, are used for the treatment of jaundice. Furthermore, jaundice is not just a
Ethnomedicinal plants are generally used for curing various ailments like diabetes, dysentery, typhoid, and jaundice. Different parts of the plant, including roots, leaves, fruits, and flowers, are used for the treatment of jaundice. Furthermore, jaundice is not just a disease rather a sign of a disease that occurs in the liver, which indicates impairment of the liver functioning [14,15]. The foremost ancient literature says that “icter” is a Latin word that was previously used to describe the term liver [16]. Basically, the term jaundice is taken from the French word “jaune”, which means “yellowness” and is characterized by yellow pigmentation [17]. Pigmentation is generally shown by the skin and eyes. It occurs due to the exceeding level of bilirubin. Bilirubin is synthesized in the body and is a natural product that is produced because of hemolysis through the action of liver cells, which further in the presence of biliverdin reductase leads to the production of bilirubin or unconjugated bilirubin. The metabolism of bilirubin describes the pathophysiology of jaundice, as shown in Figure 1.

![Figure 1. Bilirubin metabolism or pathophysiology of jaundice [15].](image)

Under normal circumstances, unconjugated bilirubin (lipid-soluble) in the presence of glucuronic acid gets converted into conjugated bilirubin (water-soluble), which is released in the small intestine. Removal of glucuronic acid in the presence of bacterial protease takes place in the small intestine, which further passes through the large intestine in the form of feces, and the remaining enters the kidney by the portal vein and passes out as urine, as shown in Figure 1 [15]. When this bilirubin accumulates in the blood, skin, sclera, and mucous membrane, it turns yellow in color. This yellowness of skin and other parts is generally called jaundice or icterus and is usually seen when the amount of plasma bilirubin is greater than its normal value, i.e., 2 mg/dL [18].

According to the pathophysiology of jaundice, it is mainly caused due to increased level of bilirubin and its overproduction in the liver, which may occur due to many reasons like acute or minor liver inflammation, obstruction of the bile duct, Gilbert’s syndrome, cholestasis, and hemolytic anemia [15]. Jaundice is usually found much more effective and serious in adults rather than in new-born children (neonates), and sometimes it causes even death of the adult individual [19].

Jaundice shows three different stages or types based on its pathophysiology: pre-hepatic jaundice that is caused due to the hemolysis of red blood cells, also called erythrocytes. Hepatic jaundice occurs due to the abnormal metabolism of the liver or dysfunction of the liver, and post-hepatic jaundice is caused due to less liver functioning or any obstruction in the bile duct, as described in Figure 2.

Jaundice can also be a viral disease, which can spread through contaminated water and food-related items or due to poor sanitization conditions or through several other diseases, such as hepatitis A, hepatitis B, hepatitis C, hepatitis D, liver cancer, and hemolytic
anemia, etc., which damage liver [14]. It has been estimated that more than two billion people worldwide are infected annually with the hepatitis B virus [20]. The history of jaundice is very long and shown in ancient Ayurveda and the Indian traditional system of medicines [21]. Jaundice is also known as Harimana disease in Rigveda (8000 BC). Herbal treatment is prescribed for jaundice because medicinal plants show a faster rate of reduction in cases when compared with western medicines [22]. This disease shows different kinds of symptoms like weakness, high fever, nausea, loss of appetite, vomiting, and the main symptom shown by this disease is the dark urine color. Sometimes, it also leads to serious conditions like coma, a sudden attack of illness or epileptic fits, psychosis (like having a severe mental disorder), and finally, death of the patient. Precautions or prevention for jaundice generally requires a low-fat diet, high water intake as much body requires, and mainly a healthy diet routine and proper nutrition [15].
| Botanical Name                  | Local Name          | Family          | Region                          | Data Source |

The study revealed that these 87 ethnomedicinal plants show variations among them and represent 51 different families of plants used for the treatment of jaundice in Himachal Pradesh. Most of these plant species used for treating jaundice were observed in different areas of Himachal Pradesh, including different districts, such as Kangra, Hamirpur, and Lahul and Spiti, as shown below in Figure 3. Among all these plant species, common medicinal plants belong to six major families, i.e., Asteraceae, Fabaceae, Euphorbiaceae, Gentianaceae, Lamiaceae, and Solanaceae.

The plant species most frequently used for the treatment of jaundice include Justicia adhatoda, Emblica officinalis, Ricinus communis, Saccharum officinarum, Terminalia chebula, Berberis aristata, Cuscuta reflexa, and Tinospora cordifolia, and this shows the richness of information regarding medicinal plants used by the people of Himachal Pradesh. Medicinal plants like Aloe vera contains many bioactive compounds, which are responsible for many medicinal properties, such as antibacterial, antioxidants, and immunity-boosting property [18]. Various plant parts have been used for curing jaundice, including stem, leaves, roots, bark, fruits, flowers, seeds, and sometimes even whole plant (described in Table 2). This also strengthens the use of these plants by local people. All ethnomedicinal plants contain some phytochemical constituents, which may be effective in showing an impact on the disease and its cure. The ethnomedicinal significance of plants has been proved by a reassessment of their efficiency potential in different regions. In all the reported plants, there is variation in the usage of plant parts for treating jaundice, which is also shown in Figure 4. This is similar to the work performed in south-western Nigeria, which shows the data analysis of different plant parts used for the treatment of various ailments, including jaundice [8, 43, 44].

Figure 3. Map of India, showing districts of Himachal Pradesh (district names are added in red font where maximum number of medicinal plants were reported for jaundice treatment).

Table 2. Mode of use of ethnomedicinal plants for treating jaundice.

| Botanical Name          | Plant Part Used       | Mode of Use                                                                 | Reference |
|------------------------|-----------------------|----------------------------------------------------------------------------|-----------|
| Aconitum rotundifolium | Whole plant           | Plant juice is taken orally along with an equal volume of water for five to seven days to cure jaundice. | [31]      |
| Adiantum capillus      | Leaves                | A decoction of fresh leaves is taken two times for seven days to cure jaundice. | [24]      |
| Aegle marmelos         | Leaves and fruit      | A decoction of leaves and unripe fruit is used to treat jaundice.           | [24]      |
| Ajania tibetica        | Leaves and flower     | Leaves and flowers are used to cure jaundice.                              | [28]      |
Table 2. Cont.

| Botanical Name          | Plant Part Used      | Mode of Use                                                                 | Reference |
|-------------------------|----------------------|-----------------------------------------------------------------------------|-----------|
| Aloe vera               | Fleshy leaves        | The pulp of the leaves is directly consumed by the patient for two weeks to cure jaundice. | [23]      |
| Argemone mexicana       | Whole plant          | Yellow sap of the plant is used to treat jaundice.                          | [24]      |
| Asparagus adscendens    | Roots                | A decoction of roots (10–15 mL) is given for eight to ten days to cure jaundice. | [23]      |
| Aquilegia fragrans      | Seeds                | A decoction of seeds is used to treat jaundice.                            | [34]      |
| Bauhinia variegata      | Leaves               | Leaves juice is taken for seven days for the treatment of jaundice.         | [23]      |
| Berberis aristata       | New leaves (twigs) and roots | New leaves are directly consumed, and a decoction of ground roots (100 mL) is taken to cure jaundice. Fresh roots are cut into small pieces and further “Kujja-Mishri” with water to cure jaundice. | [23]      |
| Berberis ceratophylla   | Roots                | shade-dried to make pills. These pills are consumed with “Kujja-Mishri” with water to cure jaundice. | [34]      |
| Berberis chitria        | Roots                | A decoction of roots is used to treat jaundice.                            | [27]      |
| Berberis lyrucium       | Roots                | A decoction of roots (80–100 mL) is given to cure jaundice.                | [23]      |
| Betula utilis           | Papery bark          | A decoction of the bark is given to the patient for ten to twelve days to cure jaundice. | [23]      |
| Boerhaavia diffusa     | Whole plant          | The whole plant is used to cure jaundice.                                  | [39]      |
| Cajanus cajan           | Leaves               | Leaf juice or leaf decoction is given with sugar (regularly in the morning) for about one month to cure jaundice. Flowers and betel leaf are taken with honey to treat jaundice. | [40]      |
| Calotropis procera     | Flowers              | Stem powder is taken with water at least for five to six days.             | [31]      |
| Capparis spinosa       | Shoot                | The stem is used for the treatment of jaundice.                            | [29]      |
| Capsella bursa-pastoris| Leaves               | Boiled leaves are used as a vegetable (saag) and given for two to three days to cure jaundice. | [23]      |
| Capsicum annuum        | Shoot                | Boiled vegetable of raw fruit is given to the patient to cure jaundice.    | [23]      |
| Carica papaya          | Raw fruit            | Roots are used for the treatment of jaundice.                             | [25]      |
| Carissa opaca          | Roots                | A decoction of seeds is consumed empty stomach for a week, daily in the morning. | [34]      |
| Cassia fistula         | Seeds                | The dried herb is crushed with kali mirch, and its paste (5–10 g) is taken for seven days to cure jaundice. Seeds are used for the treatment of jaundice. | [23]      |
| Centella asiatica      | Whole plant (entire herb) | The dried bulb in the powder form is used for the treatment of jaundice. | [24]      |
| Cicer microphyllum     | Seeds                | Corn (cooked or peeled) is kept in open places overnight.                  | [28]      |
| Colocasia antiquorum   | Corm                 | In the morning, chopped pieces are given with honey to the patient for five days. | [23]      |
| Colocasia esculenta    | Bulb                 | The dried bulb in the powder form is used for the treatment of jaundice.  | [24]      |
| Conyza japonica        | Leaves               | Leaf paste is used to cure jaundice.                                      | [29]      |
| Cucumis sativus        | Fruit                | Fresh fruit is cut into small pieces and taken thrice a day for three weeks to cure jaundice. | [24]      |
| Cuscuta reflexa        | Whole plant          | A decoction of the whole plant is used to treat jaundice.                  | [24]      |
| Crepis flexuosa        | Whole plant          | Whole plant juice is mixed with water in equal proportion and taken once a day to cure jaundice. | [31]      |
| Datura stramonium      | Leaves and fruit     | Fruits and leaves are used to cure jaundice.                              | [42]      |
| Emblica officinalis    | Roots                | A decoction of roots is recommended for two weeks to cure jaundice.        | [24]      |
| Elaeagnus rhamnoides   | Fruit                | Fruit juice is used to cure jaundice.                                     | [31]      |
| Euphorbia hirta        | Stem and leaves      | Stem and leaf extract is used to cure jaundice.                           | [24]      |
| Euphorbia tirucalli    | Leaves               | A decoction of leaves is used for the treatment of jaundice.              | [39]      |
| Equisetum arvense      | Young branch         | Young branches are dipped in the water overnight, and juice is (mix a small quantity of Kujja-Mishri and two and a half kali mirch seeds) taken daily empty stomach at least for seven days to cure jaundice. | [23]      |
| Flacourtia ramontchi   | Bark, fruits, and roots | Bark, fruits, and roots are used to treat jaundice.                   | [25]      |
| Gentiana kurroo        | Roots                | The root powder is used for treating jaundice.                            | [27]      |
| Botanical Name          | Plant Part Used | Mode of Use                                                                 | Reference |
|------------------------|-----------------|------------------------------------------------------------------------------|-----------|
| *Gentiana tubiflora*   | Whole plant     | The whole plant is ground with lazi (salted curd) to form a paste and given for forty to forty-five days to cure jaundice. | [30]      |
| *Gentiana leucomelaena*| Whole plant     | Plants are crushed with a small proportion of petals of *Polemonium caeruleum*, and this mixture is given with curd or cow milk empty stomach for fifteen to twenty-two days to cure jaundice. | [30]      |
| *Gentianopsis detonsa* | Whole plant     | Juice of fresh extracted aerial plant part is taken empty stomach to cure jaundice. | [31]      |
| *Gentianella moorcroftiana* | Aerial plant part | Root powder (2 g) is administered thrice a day to cure jaundice. | [42]      |
| *Gernaium nepalenses*  | Roots           | Leaves extract, mixed with cow milk or curd, is given for fifteen to twenty-two days to cure jaundice. | [30]      |
| *Geum elatum* Wallich | Leaves          | Fresh leaf juice is taken with Kujja-Mishri and given twice a day for two or more weeks. | [23]      |
| *Hedera helix*         | Leaves          | Crushed leaves’ juice is used to cure jaundice. | [27]      |
| *Hippophae tibetana*   | Fruit           | A decoction of the fruit is taken to cure jaundice. | [31]      |
| *Hordeum vulgare*      | Seeds           | Dried seed powder is mixed with a sugar solution to cure jaundice. | [37]      |
| *Justicia adhatoda*    | Roots           | A decoction of its roots is given to the patient for one month to cure jaundice. | [24]      |
| *Leucas cephalotes*    | Entire herb     | Juice of the entire herb (10–15 mL) is given to the patient for eight to ten days. | [23,36]   |
| *Mallotus philippinensis* | Seeds           | Seed powder is given for the treatment of jaundice. | [36]      |
| *Mentha spicata*       | Leaves          | Fresh leaf juice is used for treating jaundice. | [23]      |
| *Morus alba*           | Fruit           | Fruit juice is used for treating jaundice. | [24]      |
| *Morus nigra*          | Fruit           | Fresh fruit juice is given to the patients twice a day for two weeks. | [24]      |
| *Oroxylum indicum*     | Bark of the stem| Crushed bark is soaked in water overnight and given with a small amount of kapoor to cure jaundice. A decoction of the bark is also used for treating jaundice. | [23]      |
| *Persicaria amplexicaulis* | Whole plant | A decoction of the whole plant is given orally to treat jaundice. | [26]      |
| *Picris hieracioides*  | Whole plant     | Plant extract with salted curd is given to the patient for twenty to thirty days. | [30]      |
| *Pistacia integerrima* | Fruit           | Fresh fruit juice is given daily for seven days to curing jaundice. | [24]      |
| *Phyllanthus fraternus*| Whole plant, roots | A decoction of the entire herb and juice of fresh roots is given for seven days to cure jaundice. | [23]      |
| *Picrorhiza kurroa*    | Rhizome         | Rhizome powder is used to cure jaundice. | [24]      |
| *Polygonum tortuosum*  | Whole plant     | A paste of the whole plant is mixed with curd (prepared from goat’s milk) and given an empty stomach for fifteen to twenty-two days. | [30]      |
| *Podophyllum hexandrum*| Flower and leaves| The juice of flowers and leaves is mixed with butter and taken orally to cure jaundice. | [41]      |
| *Prunus domestica*     | Fruit           | The fruit extract is used for the treatment of jaundice. | [24]      |
| *Punica granatum*      | Fruit and seeds | Seeds and fruit powder is taken with water and sugar solution to cure jaundice. | [24]      |
| *Raphanus sativus*     | Root and fleshy part | A decoction of roots and juice of fleshy part is given to cure jaundice. | [24]      |
| *Ricinus communis*     | Leaves          | Leaf juice is given with cow’s milk early in the morning for seven days to treat jaundice. | [23]      |
| *Rosa webbiana*        | Fruit           | Fruit powder is mixed with little quantity of water and taken daily to cure jaundice. | [31]      |
| *Rubia manjith*        | Roots and stem  | Roots and stem paste is given to cure jaundice. | [42]      |
| *Saccharum officinarum*| Stem            | Stem juice is used to cure jaundice. | [24]      |
| *Saxifraga flagellaris*| Leaves and stem | Leaves and stems are used to cure jaundice. | [28]      |
| *Scorzonera divaricata*| Leaves and shoot| A decoction of leaves and shoots is taken orally to cure jaundice. | [31]      |
Table 2. Cont.

| Botanical Name       | Plant Part Used | Mode of Use                                                                 | Reference |
|----------------------|-----------------|-----------------------------------------------------------------------------|-----------|
| Sesamum indicum      | Leaves          | Powder made from fresh leaves is used to cure jaundice.                     | [24]      |
| Solanum nigrum       | Leaves          | Tablets are made from crushed leaves and taken with imli (tamarind) or curd for treating jaundice. | [23]      |
| Solanum surattense   | Fruit           | The fruit is directly consumed for the treatment of jaundice.               | [24]      |
| Tamarindus indica    | Fruit and root  | A decoction of its roots is used to treat jaundice.                        | [24]      |
| Taraxacum officinale | Root and leaves and whole herb | The entire herb in the crushed form (10 gm) is given to the patient for ten days to curing jaundice. | [23]      |
| Terminalia bellirica | Leaves          | A decoction of leaf powder is taken to cure jaundice.                       | [36]      |
| Terminalia chebula   | Fruit and rind  | Fruit powder is mixed with rock salt and taken with warm water for eight to ten days to cure jaundice. | [23]      |
| Thalictrum foliolosum| Roots           | A decoction of roots is used to treat jaundice.                            | [27]      |
| Tinospora cordifolia | Fresh stem      | The dried stem of the giloe is crushed with punarnava mool, and its juice is taken for seven to ten days. | [23]      |
| Trigonella emodi     | Leaves and flower | Leaves and flower powder is taken with water twice a day for seven to ten days. | [31]      |
| Urtica dioica        | Whole plant     | The whole plant is used to treat jaundice.                                | [42]      |
| Vernonia anthelmintica| Seeds and leaves | A decoction of seeds and leaves is given to cure jaundice.                | [27]      |
| Viola serpens        | Whole plant     | A decoction of dried plant is taken with sugar for more than fifteen days. | [24]      |
| Woodfortia fruticosa | Flowers         | Flower extract is used to cure jaundice.                                | [24]      |
| Youngia tenuifolia   | Leaves          | Leaves are used to treat jaundice.                                         | [28]      |

Figure 4. Analysis of the data showing a total estimation of plant parts used for the treatment of jaundice [8,44].

2.2. Mode of Plant Used for the Treatment of Jaundice in Himachal Pradesh

Traditionally, people of Himachal Pradesh use these plant species in appropriate dosages or amounts for curing jaundice. There are different methods of usage of these medicinal plants, like in district Hamirpur, bulb of Colocasia esculenta is cooked as a vegetable, the dried bulb is cut into pieces and then crushed to make powder and given orally to treat jaundice, and juice of fresh Pistacia integerrima is given daily to cure jaundice [24]. Uses of other ethnomedicinal plants are described in Table 2, which includes the plant’s botanical name, plant part used, and mode of use (route of administration) of these plants for treating jaundice. In most cases, these plants are taken alone as a decoction or with a combination of the talmishri or kali mirch. On the other hand, some plants are also taken in combination with other plants, e.g., Emblica officinalis fruit is taken along with
the *Terminalia chebula* and *Terminalia bellirica* fruits, grounded into powder form, and taken orally to cure jaundice [25].

The above pie-chart highlights the different plant parts commonly used for the treatment of jaundice, as analyzed from data in Table 2. It was observed that for jaundice treatment, leaves are highly utilized (31.03%), followed by fruits (20.68%), roots (19.54%), whole plant (19.54%), seeds (8.04%), stem (10.34%), flowers (5.74%), and bark (3.44%); the same pattern is also shown in Figure 3. This indicates that in most cases, the leaves of medicinal plants have more significance than any other plant part. Hence, it can be concluded that leaves are highly effective for curing jaundice, which may be due to more phytochemical accumulation in the plant leaves. However, fruits are the second most used to treat jaundice, root belongs to the third position for treating jaundice, and bark is utilized in the least cases.

Intake of these ethnomedicinal plant parts is suggested to be continued for a definite period or until full recovery. Thus, plants are suggested to be taken in the form of paste, decoction, extract, and dried powder form. Different plant parts contain various organic compounds within them, called secondary metabolites, which may be the reason behind the effectiveness of plant-based treatments and show various chemical and physiological actions against jaundice. These phytoconstituents include proteins, carbohydrates, steroids, terpenoids, alkaloids, phenols, flavonoids, vitamins, tannins, and essential oils, which show an inhibitory effect against hepatoprotective diseases, mainly against jaundice [45,46]. *T. chebula* contains a significant amount of phenolic and flavonoid compounds. The main constituents of the plant include 2,4-chebuloyl-β-D-glucopyranose, ellagic acid, gallic acid, and chebulic ellagitannins. *T. chebula* is one of the main components of the important Ayurvedic formulation “Triphala” (infusion of three fruits, i.e., *T. chebula*, *T. bellirica*, and *Emblica officinalis*). Ayurveda prescribes this formulation to cure kidney and liver dysfunctions. *T. chebula* extract ensures hepatoprotection against liver diseases, such as jaundice, due to its antioxidant activity and bilirubin level lowering effect. The reduction in serum bilirubin level is the most important evidence, which supports the traditional use of the plant against jaundice [47].

2.3. Phytochemical Constituents Present in the Ethnomedicinal Plants

The medicinal property of plants is mainly because of the formation or stimulation of various chemical compounds that occur naturally in the plants and hence used to cure jaundice and various other diseases. So, this review describes various phytochemical constituents present in the ethnomedicinal plants used by people of Himachal Pradesh for curing jaundice, and the data is taken from different sources. The plants are further used for the development of antimicrobial and antioxidant drugs [48], thus proving their medicinal worth. Plant like *Justicia adhatoda* consists of various organic [49] and bioactive compounds [50], which possess numerous biological activities, such as antitussive, abortifacient, cardiovascular protection, anti-inflammatory, and antimicrobial. *Berberis lycium* plant shows the presence of tannins, terpenoids, fats, resins, and many active alkaloids. The roots are the foremost important part of the *Berberis* species as they contain a variety of alkaloids, and the most prominent one is berberine. It has been found that the inhibitory activity of *Berberis lycium* is shown by the components present in its root extract [51]. Like this, many other plants are used in the treatment of jaundice, possessing various phytochemical constituents, out of which some predominant phytochemicals are described in Table 3.

| Plant Name                  | Phytochemical Constituent                                                                 | Data Source |
|-----------------------------|------------------------------------------------------------------------------------------|-------------|
| *Aconitum rotundifolium*    | Diterpenoid alkaloids (isoatisine, atisine chloride)                                       | [52]        |
| *Adiantum capillus-veneris* | Flavonoids, phenolic acids (sulfate esters of hydroxycinnamic acid), alkaloids, terpenoids (triterpenes), steroids, tannins, saponins | [53]        |
| *Aegle marmelos*            | Phenolic compounds (coumarins, such as marmelosin, marmesin, imperatorin, scopoletin, and esculetin), alkaloids (aeglin, aegelenine, skimmianine), tannins | [54]        |
| Plant Name           | Phytochemical Constituent                                                                 | Data Source |
|---------------------|------------------------------------------------------------------------------------------|-------------|
| *Ajania tibetica*   | Terpenoids (bornyl acetate 60.7%, β-caryophyllene 9.1%, β-eudesmol 5.3%, methyl thymol 4.3% and bornol 2.2%) | [55]        |
| *Aloe vera*         | Fatty acids (such as n-hexadecanoic acid 20.47%, oleic acid 14.53%, tetradecanoic acid 1.04%, 1,2-benzenedicarboxylic acid, diisooctyl ester 13.60%, squalene 6.60%, butyl octyl ester 2.30%) Alkaloids (argemexicaine A, argemexicaine B, protoamine, columbamin, muramine, cryptopine, isocorydine), carbohydrates (arabinose, lactose), steroids (β-sitosterol, stigmaster-4-en-3,β-dione), terpenoids (β-amyrin, trans-phytol), flavonoids (eriodictyol, luteolin, quercetin, rutin), tannins, phenolic acids (vanillic acid) | [56]        |
| *Argemone mexicana* | Alkaloids (argemexicaine A, argemexicaine B, protoamine, columbamin, muramine, cryptopine, isocorydine), carbohydrates (arabinose, lactose), steroids (β-sitosterol, stigmaster-4-en-3,β-dione), terpenoids (β-amyrin, trans-phytol), flavonoids (eriodictyol, luteolin, quercetin, rutin), tannins, phenolic acids (vanillic acid) | [57]        |
| *Asparagus adscendens* | Saponins and steroids (stigmasterol glycosides)                                           | [26]        |
| *Aquilegia fragrans* | Steroids (β-sitosterol), 2,4-dihydroxyphenylacetic acid methyl ester, aquilegiolide, glocidione lactone-A, and alkaloids (magnoflorine) | [58]        |
| *Bauhinia variegata* | Terpenoids, flavonoids, tannins, saponins, steroids, and cardiac glycosides               | [26]        |
| *Berberis aristata* | Phenolic acids (e-caffeic acid, chlorogenic acid), flavonoids (quercetin, rutin), and alkaloids (berberine, berbamine, palmatine, colubamine, jatrohhrizine, oxyacanthine) | [59]        |
| *Berberis lycium*   | Terpenoids (bornyl acetate 60.7%, β-caryophyllene 9.1%, β-eudesmol 5.3%, methyl thymol 4.3% and bornol 2.2%) | [26]        |
| *Betula utilis*     | Flavonoids (rotenoids, quercetin, kaempferol, borhaavone), lignans, steroids, phenolic glycosides, phenolic compounds (trans-caftaric acid, xanthones), fatty acids, and hydrocarbons | [61]        |
| *Boerhavia diffusa* | Flavonoids, saponins, sterols, carbohydrates (pentosans), and saponin                     | [31]        |
| *Capsella bursa-pastoris* | Fatty acids (dodecanoic acid 5.66 ± 1.17, tetradecanoic acid 29.63 ± 5.79, pentadecanoic acid 18.05 ± 3.06, hexadecanoic acid 284.48 ± 41.06, heptadecanoic acid 7.11 ± 1.60, octadecanoic acid 53.20 ± 0.68, eicosanoic acid 2.52 ± 0.33), steroids (phytosterol, cholesterol, campesterol, stigmasterol, β-sitosterol), amino acids (glycine, histidine), and flavonoids (tricin, kaempferol, quercetin) | [63]        |
| *Capsicum annum*    | Cardiac glycosides (digoxigenin-3-O-β-d-digitoxoside), phenolic compounds, lignans, terpenoids (17-hydroxy-11-oxo-nor-β-amyrone, urs-12-ene-3β, 22β-diol-17-carboxylic acid), steroids (stigmasterol, campesterol, β-sitosterol), flavonoids (rutin, quercetin), essential oils (hydroxyacetophenone 89.5%, benzyl salicylate 6.0%, benzyl benzoate 4.6%, (E,E)-α-farnesene 3.5%), protein (1.3%), and carbohydrates (17.39%) | [64]        |
| *Cassia fistula*    | Terpenoids (lupeol), steroids (β-sitosterol), fatty acid alcohols (hexacosanol), flavonoids (kaempferol, leucopelargonidin, rhamnatin-3-O-gentiobioside), phenolic acids (rhein, 3-formyl-1-hydroxy-8-methoxy anthaquinone), and alkaloids | [26]        |
| *Centella asiatica* | Alkaloids, glycosides, terpenoids, steroids, flavonoids, tannins, and reducing sugars     | [66]        |
| *Cicer microphyllum* | Steroids (phytosterols), flavonoids, phenolic compounds, tannins, carbohydrates, proteins, and amino acids | [68]        |
| *Colocasia esculenta* | Flavonoids (flavones, apigenin, luteolin, anthocyanins), carbohydrate (starch 0.23–0.52%, and lipids 0.017–0.025%) | [69]        |
| *Conyza japonica*  | Terpenoids (sesquiterpenoids, conyterpenols A–D, strictic acids), flavonoids, and their glycosides | [70]        |
| *Crepis flexuosa*   | Phenolic acids (p-hydroxybenzoic acid, ethyl p-hydroxybenzoate, esculetin), terpenoids (taraxast-20(30)-ene-3β, 21a-diol, ursolic acid, oleanolic acid), flavonoids (apigenin, luteolin, luteolin-7-O-β-D-glucoside), fatty acids (octacosanoic acid, 2,3-dihydroxypropyl pentacosanoate), and steroids (daucosterol) | [71]        |
Table 3. Cont.

| Plant Name               | Phytochemical Constituent                                                                 | Data Source |
|--------------------------|------------------------------------------------------------------------------------------|-------------|
| Cuscuta reflexa          | Flavonoids (aromandendrin), glycosides, carotenoids (lutein-10–22%, lycopene), alkaldoids, steroids (campesterol, stigmasterol, stigmast-5-en-3-O-β-D-glucopyranoside), lignin (sesamin), and terpenoids (lupeol, maragagen) | [72]        |
| Cucumis sativus          | Steroids, glycosides, flavonoids, alkaloids, saponins, and tannins (except gums and reducing sugars) | [73]        |
| Datura stramonium        | Alkaloids (atropine, hyoscyamine, scopolamine), glycosides, saponins, and tannins         | [74]        |
| Elaeagnus rhamnoides     | Alkaloids (carboline), terpenoids (ursolic acid, uvaol, amyrin), flavonoids (quercetin, myricetin, isorhamnetin, glucosides, rutin), carotenoids, fatty oil, and steroids (sitosterol, citrostandienol) | [31]        |
| Emblica officinalis      | Phenolic acids (propyl 3,4,5-trihydroxybezonate, 2,3,7,8-tetrahydroxy chromeno[5,4,3-cde]chromene-5,10-dione, chlorogenic acid, ellagic acid), flavonoids (rutin, quercetin), tannins, amino acids, fixed oils | [75]        |
| Euphorbia hirta          | Terpenoids (diterpenes, triterpenes), phenolic acids (coumarins), and lignans              | [76]        |
| Euphorbia tirucalli      | Fatty acids (palmitic acid, linoleic acid), steroids (sitosterol, stigmasterol, campesterol), flavonoids (anthocyanin, cyanidin glycoside) | [77]        |
| Equisetum arvense        | Phenolic acids 0.6–0.9% (such as apigenin-5-O-glocuside, genknvain-5-O-glocuside, kaempferol-3,7-d-O-glocuside, kaempferol-3-O-(6′-O-malonylglucosidose)-7-O-glocuside), terpenoids (cis-geranyl acetone 13.74%, thymol 12.09%, trans-phytol 10.06%, triterpenes), alkaloids, carbohydrates, proteins, amino acids, steroids (phytosterols), saponins, and tannins | [78]        |
| Flacourtia ramontchi     | Saponins, steroids, sugar, lignans, and terpenoids (triterpenes)                          | [79]        |
| Geranium nepalenses      | Steroids (β-sitosterol, β-sitosterol-glactoside, stigmasterol) and terpenoids (ursolic acid) | [80]        |
| Gentiana kurroo           | Terpenoids (iridoids, triterpenoids), flavonoids, alkaloids                              | [81]        |
| Gentianopsis paludosa    | Phenolics-1-hydroxy-3,7,8-trimethoxyxanthone), terpenoids (ursolic acid), dicarboxylic acid–succinic acid | [31]        |
| Gentianopsis detonsa     | Flavonoids (luteolin), dicarboxylic acid–succinic acid, xanthones (gentiacaulene, 1-hydroxy-3,7,8-trimethoxyxanthone), terpenoids (ursolic acid) | [31]        |
| Geum elatum              | Fatty acid alcohols (hentriacontanol, hentriacontanone), sterols (β-sitosterol), phenolic acids (teta-O-methyl ellagic acid, ellagic acid), and flavonoids (isouqueretin) | [82]        |
| Hedera helix             | Phenolic acids (gallic acid 131.25 ± 1.54), flavonoids (quercetin 18.61 ± 0.37), alkaloids (emetine), amino acids, and saponins (hederacoside C, α-hederin, hederagenin) | [83]        |
| Hippophae tibetana       | Flavonoids (isorhamnetin, quercetin, kaempferol, rhamnetin, quercetin-3-O-rutinoside, quercetin-3-O-galactoside), fatty acids (2-hydroxydecanoic acid, nona-7-enolic acid, undec-9-en-7-ynolic acid, 13-phenyl tridecanoic acid, 5,9,21-nonacosatrienoic acid, 1,3-dicarboxyl-2-linoleoylglycerol, oleic, linoleic, linolenic acids and fats 3.5–4.8%) | [84]        |
| Hordeum vulgare          | Flavonoids, phenolic acids, terpenoids, glycosides, and saponins                          | [85]        |
| Justicia adhatoda        | Alkaloids (vasicine, vasicol, vasicinone, peganine, adhatonine, vasicinol, vasicinolone), flavonoids (kaempferol, quercetin), and steroids (β-sitosterol) | [26,86]     |
| Leucas cephalotes        | Phenolic acids (gallic acid, protocatechuc acid, chlorogenic acid, caffeic acid, and ferulic acid) | [26]        |
| Mentha spicata           | Fatty acids (methyl esters, methyl acetate 2–11%), terpenoids (menthol 33–60%, menthone 15–32%, isomenthone 2–8%, 1,8 cineole eucalyptol 5–13%, menthofoaran 1–10%, limonene 1–7%), flavonoids, alkaloids, and sugars | [87]        |
| Morus alba               | Phenolic acids (coumarins, benzofurans), flavonoids (chalcones, flavones, flavane derivative, (2S)-4′-hydroxy-7-methoxy-8-prenylflavan) | [88]        |
| Morus nigra              | Phenolic acids, alkaloids, terpenoids (oleanolic acid), and flavonoids (quercetin, luteolin, apigenin, kuwanon, kaempferol) | [89]        |
| Oroxylum indicum         | Steroids, tannins, alkaloids, glycosides, and flavonoids                                  | [90]        |
| Plant Name                  | Phytochemical Constituent                                                                 | Data Source |
|----------------------------|------------------------------------------------------------------------------------------|-------------|
| *Persicaria amplexicaulis* | Flavonoids (quercetin), steroids (β-sitosterol), phenolic compounds (methyl-4-hydroxy cinnamate, gallic acid, protocatechuic acid, methyl gallate, vanicoside A, vanicoside B), terpenoids (arborinone), 25-hydroxycholesterol-5-en-3β-yl acetate | [91]        |
| *Phyllanthus niruri*      | Alkaloids, terpenoids (triterpenes), phenols, flavonoids (quercetin, kaempferol), lignin glycoside, tannins, and fatty acids | [92]        |
| *Picrorhiza kurroa*       | Terpenoids (iridoid glycoside, triterpenoids, kutkin, picotroside 1 3.66 ± 0.11%, kutsolide 4.44 ± 0.02%), steroids, tannins, and saponins | [93]        |
| *Pistacia integerrima*    | Phenolic acids, carotenoids, terpenoids (monoterpens 91%, triterpenes), flavonoids (catechins), saponins, tannins, and steroids | [94]        |
| *Podophyllum hexandrum*   | Terpenoids, steroids, flavonoids, saponins, tannins, glycosides, and amino acids           | [95]        |
| *Punica granatum*         | Flavonoids, saponins, tannins, phenolic acids, glycosides, steroids (phytosterols), terpenoids, carbohydrates, and proteins | [96]        |
| *Prunus domestica*        | Flavonoids, phenylpropanoid esters, phenolic acids (caffeoylquinic acids), steroids, and terpenoids | [97]        |
| *Raphanus sativus*        | Tannins (phlobatannins), saponins, flavonoids, phenolic acids (anthraquinones), steroids (phytosterol), alkaloids, terpenoids, cardiac glycosides, glucosinolates, isothiocyanates, protein 28.57%, carbohydrates 39.82% and fats 27.76% | [98]        |
| *Ricinus communis*        | Alkaloids, steroids, glycosides, flavonoids (quercetin, vitexin, rutin, kaempferol), epicatechin, terpenoids, phenolic acids (gentisic acid, ellagic acid, gallic acid, coumarins), and essential oils 37% | [99]        |
| *Rosa webbiana*           | Phenolic acids (quinoines like glycosides, including rubiadin,1-hydroxy,2-methoxy anthraquinone, 3-dimethoxy 2 carboxy anthraquinone, monjistin, purpurin, pseudopurpurin, mollenin, fumomollenin), fatty acids (rubiprasin A,B,C), ruiearbons, and terpenoids (aborane, triterpenes) | [100]       |
| *Rubia manjith*           | Steroids (phytosterols), terpenoids, flavonoids, -O- and -C-glycosides, phenolic acids, fatty acid alcohols (policosanoles 2.5–80%, octacosanol 50–80% of the total policosanoles) | [101]       |
| *Saccharum officinarum*   | Phenolic acids (anthraquinone) and tannins                                                | [102]       |
| *Sesamum indicum*         | Flavonoids (catechin, epicatechin, rutin), phenolic acids (caffeic acid, gallic acid, protocatechuic acid), fatty acids (linoic acid 67.9%), carbohydrates (polysaccharides), and proteins content 17% | [103]       |
| *Solanum nigrum*          | Alkaloids, tannins, saponins, phenolic acids (phenolic methyl caffeate, caffeic acid, coumarins like imperatorin, scopoletin and esculetin), steroids (β-sitosterol), tri-terpenoids, and other major constituents like solasonine, solamargine, solasurine, torvoside K and L, hiasianine, aculeatiside A, and solamargine | [104]       |
| *Solanum surattense*      | Free amino acids, terpenoids (germacranolide, taraxacin, taraxacetoxy, diester of taraxanthin, lactupicrin, triterpenes), carbohydrates (glucans, manann), phenolic acids (scopoletin, esculetin), steroids (phytosterols, taraxasterol, homotaraxasterol), eudesmanolic-tetrahydrodridentin B, eudesmanolide-d-glucopyranoside, and proteins | [105]       |
| *Taraxacum officinale*    | Fatty acids (n-heptadecanoate 13.00%, n-octadecanoic 6.1%, methyl-n-pentacosanoic 4.45%, nonanoic acid 1.92%, nonadecanoic acid 9.2%, 10-octadecenoicacid 7.8%, heptadecanoate 3.3%, n-pentacosenoic acid 2.54%, hexacosioic acid 0.7%) and proteins 7.5–6.6% | [106]       |
| *Tamarindus indica*       | Fatty acids (stearic acid 14.93%, myristic acid 17.70%, palmitic acid 21.6%, oleic acid 45.67%), proteins, carbohydrates, steroids (β-sitosterol), tannins (chebulanic acid, galloyl glucose), phenolic acids (gallic, ellagic acid, ethyl gallate), alkaloids, flavonoids, saponins, and terpenoids | [107]       |
| *Terminalia bellirica*    | Tannins (chebulic acid, chebulagic acid, corilagin), phenolic acids (gallic acid, ellagic acid), steroids (β-sitosterol), terpenoids (triterpenes), and flavonoids (flavonol glycosides) | [108]       |
| *Terminalia chebula*      | Alkaloids (berberine, jatrohhizine, palmitate, thalrugosidine, thalrusosaminine, thalilopine thaligosine, thalirugidine, thalirugine, 8-oxyoxyberine, berlambine, noroxyhydrastinine, N, O, O-trimethylsarsiflorine, thalicarpine, thalidamine, thalifoliosamines A, and thalifoliosamines B) | [109]       |
Table 3. Cont.

| Plant Name              | Phytochemical Constituent                                                                                                                                                                                                 | Data Source |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| Tinospora cordifolia    | Phenolic acids, flavonoids, glycosides, saponins, and alkaloids                                                                                                                                                          | [111]       |
| Trigonella emodi Ben    | Flavonoids (quercetin, luteolin, vitexin, orientin, isoorientin, vicenin-1, vicenin-2, naringenin, kaempferol, 7,4′-dimethoxyflavanone), protein, and carbohydrates, Alkaloids (betaine, choline), amino acids, carbohydrates, protein polymer (neutral and acidic), carotenoids (carotenes), and saponins | [112]       |
| Urtica dioica           | Alkaloids (betaine, choline), amino acids, carbohydrates, protein polymer (neutral and acidic), carotenoids (carotenes), and saponins                                                                                           | [31]        |
| Vernonia anthelmintica  | Fatty acids (vernolic acid) and terpenoids (vernodalin, vernodalol)                                                                                                                                                       | [113]       |
| Viola serpens           | Tannins, amino acids, reducing sugars, flavonoids (rutin), organic ester (methyl salicylate), glycosides (quercitrin), alkaloids (violin), terpenoids (monoterpenes, sesquiterpenes), saponin, bis (2-ethylhexyl) maleate 15.62%, 2,4,4,6-tetramethyl-2-heptene 11.52%, hexen-3-ol 6.56% and cis verbenol 4.77% | [114,115]  |
| Woodfordia fruticosa    | Phenolic acids, tannins (hydrolyzable tannins, such as woodfordsins A, B, C), flavonoids (quercetin glycosides, naringenin 7-glucoside, kaempferol flavonoids (quercetin glycosides, naringenin 7-glucoside, kaempferol, and terpenoids (lupeol, betulin, ursolic acid, oleanolic acid) | [116]       |

Ethnomedicinal documentation combined with the screening of various biological properties of plants is one of the convincing ways of discovering new drugs against drug-resistant pathogens in the modern era or against the diseases related to oxidative stress, including jaundice. The effectiveness of these phytochemicals used in treating jaundice and other diseases has been seen in their biological activities, such as antimicrobial, antibacterial, antitumor, antiviral, or antioxidant activity. The oxidative stress of free radicals is directly associated with the presence of pathogenic organisms or due to disease-causing mechanisms of different ailments like cancer, diabetes, and inflammatory diseases [117].

2.4. Ethnopharmacological Evidence of Some Plant Species Used for the Treatment of Jaundice

As described in Table 3, the beneficial effects of medicinal plants are due to the presence of different bioactive compounds that are responsible for the treatment of jaundice. Ethnomedicinal studies combined with phytochemicals are one of the convincing approaches for ethnopharmacological studies [118]. The medicinal effect of different plant parts shows various hepatoprotective activities, including the curing of various liver diseases in which one of the major diseases is jaundice. Various ethnomedicinal plants are traditionally used for the treatment of jaundice, while some plants promote the discovery of active compounds, which further aids in the development of synthetic drugs against jaundice. Although some epidemiological studies are required for the practical implementation of the plants for jaundice treatment [47]. To assess the ethnomedicinal significance of the hepatoprotective plants used, particularly for treating jaundice, different plant species have been reported to be used in various in vivo experiments (Table 4). Table 4 includes various plant species, plant parts used/extracts taken, toxicant and its dose, experimental model (the animal model used for study), constituents that may be responsible for hepatoprotective activities, and their effectiveness against jaundice [15].

In vivo experimental studies with these plants (Table 4) have shown effective results in the treatment of jaundice and confer scientific evidence regarding plant use in the same. In most of the in vivo studies, hepatotoxicity is introduced with CCl$_4$ or with paracetamol; however, in few cases, gentamycin, thioacetamide, t-BHP, and ethanol are also used for the same. Phytochemicals observed for curing hepatotoxicity are phenolic and flavonoid compounds as a major factor in curing hepatotoxicity in most of the in vivo studies. In some cases, hepatotoxicity is reduced by the decrease in serum bilirubin level and an increase in the antioxidant defense system.
Table 4. In vivo evidence of ethnomedicinal plants used for the treatment of jaundice/hepatoprotective activity.

| Plant Species       | Plant Part Used (Extract Taken/Total Amount or Dose Required)                                                                 | Test Dose/Experimental Model                                                                 | Constituents Responsible for (May/May Not Be Present) | Data Source |
|---------------------|----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|------------------------------------------------------|------------|
| Aegle marmelos      | Pulp/seeds (aq. extract/NA)                                                                                                 | CCl\(_4\)-induced hepatotoxicity/albino Wistar rat                                          | NA                                                   | [15]       |

As few plants are evaluated with their experimental studies, so this study needs to be intensified more on those plant extracts, which are used extensively for jaundice treatment. Further, nano-formulation of plant extracts enhances their medicinal significance [143,144], so nano-formulation of herbal plants can also be used as an alternative for curing jaundice in the future. At the same time, farmers should be encouraged for the commercial production of important medicinal plants and should further have support from industry and government.

3. Conclusions

Ethnomedicinal knowledge is respected by rural people and has been shown to be useful in the treatment of various diseases and the production of medicines in the Western Himalaya from time to time. Traditional or folk-based plant medicines have shown great potential to form the basis of jaundice-curing drugs. The purpose of the present study was to record the ethnomedicinal knowledge of plants used for the treatment of jaundice by the rural and tribal communities of Himachal Pradesh in western Himalaya. The other aims of this research were to discuss the different important phytochemicals and active compounds present in these plants and to discuss the different in vivo studies performed in support of their medicinal uses, with specific reference to the treatment of jaundice. The outcome of this research showed that the rural people of Himachal Pradesh used 87 different plant species with 51 different families to treat jaundice and contribute to healthcare. These plants demonstrated the presence of several phytochemicals in them and displayed phenolic and flavonoid compounds with hepatoprotective properties in most of the experimental studies (in vivo) performed with these plants. With antioxidant potential, the phenolic and flavonoid compounds are recognized, and due to this property, these plants have been shown to be important in curing jaundice. Aloe vera, Bauhinia variegata, Berberis aristata, Emblica officinalis, and Terminalia chebula are some of these herbs, which suggest the ethnopharmacological approach to treating jaundice with the hepatoprotective operation.

There is a lot of knowledge in the latest literature on the use of various plants for treating jaundice. Nevertheless, very few studies are carried out on the scientific validation of medicinal plants by means of biochemical, clinical, and pharmacological screening to validate the jaundice healing folklore medicine. In the future, it is, therefore, very important to pursue steps that do not deviate from shifting the view of tribal people toward their indigenous belief in the treatment of jaundice to develop successful drugs or to discover new potential sources of drugs. In addition, nano-formulation of plant extracts also improves their therapeutic significance [143,144], and it is also possible to use nano-formulation of herbal plants as an alternative and refining conventional knowledge for the potential cure of jaundice.

Author Contributions: D.R., R.D. and A.S. wrote the first draft of the manuscript. R.D. and H.K. contributed to making the figures and providing the literature. R.V., D.K., M.V., K.K. and S.P. revised and improved the first draft. All authors have seen and agreed on the final submitted version of the manuscript.

Funding: It was supported by the UHK project VT2019-2021. This study was also partially supported by grants from the Ministry of Health of the Czech Republic (FN HK 00179906) and the Charles University in Prague, Czech Republic (PROGRES Q40).

Conflicts of Interest: The authors declare no conflict of interest.
