Size of data in implicit function problems and singular perturbations for nonlinear Schrödinger systems

Pietro Baldi and Emanuele Haus

Abstract. We investigate a general question about the size and regularity of the data and the solutions in implicit function problems with loss of regularity. First, we give a heuristic explanation of the fact that the optimal data size found by Ekeland and Séré with their recent non-quadratic version of the Nash-Moser theorem can also be recovered, for a large class of nonlinear problems, with quadratic schemes. Then we prove that this heuristic observation applies to the singular perturbation Cauchy problem for the nonlinear Schrödinger system studied by Métivier, Rauch, Texier, Zumbrun, Ekeland, Séré. Using a “free flow component” decomposition and applying an abstract Nash-Moser-Hörmander theorem, we improve the existing results regarding both the size of the data and the regularity of the solutions.

1 Introduction

This paper is motivated by a general question concerning the size and regularity of the data and the solutions in implicit function problems with loss of regularity. In the recent work [4], Ekeland and Séré introduce a new iteration scheme in Banach spaces for solving nonlinear functional equations of the form

\[ F(u) = v \]

where the linearized operator \( F'(u) \) admits a right inverse that loses derivatives. In such situations, a well-established strategy for constructing a solution \( u \) consists in applying a Nash-Moser iteration, essentially based on a quadratic Newton scheme combined with smoothing operators. The scheme in [4] differs from the standard Nash-Moser approach.
in that it is not quadratic, and it consists in solving a sequence of Galerkin problems by a topological argument (Ekeland’s variational principle). This gives two main improvements with respect to the standard quadratic approach: the map $F$ needs not be twice differentiable, and a larger ball for the datum $v$ is covered.

The first point of the present paper is the observation that, for operators of the form

$$F(u) = Lu + N(u)$$

where $L$ is linear and $N(u) = O(\|u\|^\alpha)$ for some $\alpha > 1$ in a ball $\|u\| \leq R$, the same size of the ball for the datum $v$ as in [4] can also be obtained by quadratic Nash-Moser schemes. In Section 2 we explain the heuristics behind this simple, general observation.

In Sections 3-6 we consider the singular perturbation Cauchy problem for the nonlinear Schrödinger system studied by Métivier and Rauch [8], Texier and Zumbrun [9] and Ekeland and Séré [4], and we rigorously prove that the observation of Section 2 applies to this PDE problem. The result of Sections 3-6 is stated in Theorem 3.4 which improves the results in [9] and [4] regarding the size of the data and also the regularity of the solution: for initial data in a Sobolev space $H^s(\mathbb{R}^d)$ we prove that the solution of the Cauchy problem belongs to $C([0, T], H^s(\mathbb{R}^d))$ with the same regularity $s$, as it is expected, and we give the corresponding estimate for the solution in terms of its initial datum. For initial data of a special “concentrating” form, see (3.5), Theorem 3.4 also improves the size of the ball for the data with respect to [9] and [4], see Remark 3.7.

For initial data of the other special form considered in [9] and [4] (“fast oscillating” data, see (3.5)), we improve the size of initial data in Theorem 3.5 which is proved in Sections 7-8. With respect to Theorem 3.4 the new ingredient is a “free flow decomposition” of the unknown, which is a natural way of exploiting the interplay between the linear and nonlinear part of the system and the better $L^\infty$ embedding properties of concentrating or highly oscillating free flows (see Lemma 7.2), inspired by the “shifted map” trick of [9]. The price to pay for this improvement on the size of data is a loss of one derivative: for data in $H^s(\mathbb{R}^d)$, the solution belongs to $C([0, T], H^{s-1}(\mathbb{R}^d))$. Theorem 3.5 improves the results of [9] and [4] both regarding the regularity of the solution and the size of the data, see Remark 3.7.

We point out that the loss of regularity in Theorem 3.5 is not due to the Nash-Moser iteration: the loss of one derivative is introduced when solving the linearized Cauchy problem as a triangular system (see (7.14)) in two components, which are the “free flow” component of the unknown and its correction — the Nash-Moser-Hörmander Theorem 9.1 just replicates the loss of one derivative for the nonlinear problem, without introducing additional losses. The loss of regularity in Theorem 3.5 equals exactly the amount of derivatives in the nonlinearity, which is 1 in system (3.1).

The main difference between our “free flow decomposition” and the “shifted map” trick of [9] is that we treat the free flow as an unknown, although it is already completely determined by the initial datum of the problem. In this way, Theorem 9.1 regularizes the free flow, introducing just one new dyadic Fourier packet at each step of the iteration. This is the key ingredient for preserving the regularity of the linearized problem in the nonlinear one, and it is somewhat reminiscent of a similar idea in Hörmander [5].

The technical details of the fact that the heuristic observation of Section 2 rigorously applies to Theorems 3.4 and 3.5 are contained in Remarks 6.1 and 8.1. Other general observations about the optimization of the data size in Nash-Moser schemes are in Remarks 7.3 and 7.4.
Acknowledgements. We warmly thank Ivar Ekeland and Eric Séré for many interesting discussions, in Naples and Paris, which have motivated this work.

2 Large radius with quadratic schemes: an informal explanation

Consider a nonlinear problem of the kind
\[ F(u) = v, \]
where \( v \) is given, \( u \) is the unknown, and \( F \) is a twice differentiable nonlinear operator in some Banach spaces satisfying \( F(0) = 0 \). Assume that for all \( u \) in a ball \( \|u\| \leq R \) the linearized operator \( F'(u) \) admits a right inverse \( \Psi(u) \) satisfying
\[ \|\Psi(u)h\| \leq A\|h\| \quad \forall \|u\| \leq R, \tag{2.1} \]
and the second derivative \( F''(u) \) satisfies
\[ \|F''(u)[h, w]\| \leq B\|h\|\|w\| \quad \forall \|u\| \leq R \tag{2.2} \]
(in this discussion we ignore completely the questions about loss of derivatives, and we only care about size). As explained in [4], the quadratic Newton scheme gives a solution \( u \) of the equation \( F(u) = v \) for all \( v \) of size
\[ \|v\| \lesssim \min \left\{ \frac{1}{A^2B}, \frac{R}{A} \right\}, \]
while, with topological arguments, one can prove the existence of a solution \( u \) for all \( v \) in the larger ball
\[ \|v\| \lesssim \frac{R}{A}. \]
Our observation is that, for operators \( F \) in some large class, the two radii are of the same order.

Indeed, assume that \( F \) is given by the sum of a linear part \( \mathcal{L} \) and a nonlinear one \( \mathcal{N} \),
\[ F(u) = \mathcal{L}u + \mathcal{N}(u). \]
Assume that \( \mathcal{N} \) satisfies
\[ \|\mathcal{N}(u)\| \lesssim \|u\|^{p+1}, \]
\[ \|\mathcal{N}'(u)h\| \lesssim \|u\|^p\|h\|, \]
\[ \|\mathcal{N}''(u)[h, w]\| \lesssim \|u\|^{p-1}\|h\|\|w\| \tag{2.3} \]
(2.4)
for some \( p \geq 1 \), for all \( u \) in the ball \( \|u\| \leq 1 \), so that
\[ \|F''(u)[h, w]\| \lesssim \|u\|^{p-1}\|h\|\|w\|. \]
Suppose that $L$ has a right inverse $L^{-1}$ (namely $LL^{-1} = I$) and that
\[
\|L^{-1}N'(u)\| \leq \frac{1}{2}
\] (2.5)
for $u$ sufficiently small, say $\|u\| \leq R$, so that, by Neumann series, the linearized operator
\[
F'(u) = L + N'(u) = L(I + L^{-1}N'(u))
\]
has the right inverse
\[
\Psi(u) = (I + L^{-1}N'(u))^{-1}L^{-1},
\]
with
\[
\|\Psi(u)\| \leq 2\|L^{-1}\|.
\]
Hence (2.1) holds with
\[
A := 2\|L^{-1}\|.
\]
What is the “intrinsic” size of $R$? By (2.3), condition (2.5) holds for
\[
\|L^{-1}\|\|u\|^p \leq \frac{1}{2}, \quad \text{i.e.} \quad \|u\| \leq \left(\frac{1}{2\|L^{-1}\|}\right)^{\frac{1}{p}},
\]
therefore we fix
\[
R := \left(\frac{1}{2\|L^{-1}\|}\right)^{\frac{1}{p}} = A^{-\frac{1}{p}}. \tag{2.6}
\]
Moreover, by (2.4), condition (2.2) holds with
\[
B := R^{p-1} = A^{-1+\frac{1}{p}}.
\]
Thus
\[
\frac{1}{A^2B} = A^{-1-\frac{1}{p}}, \quad \frac{R}{A} = A^{-1-\frac{1}{p}},
\]
namely the two balls have the same size.

**Remark 2.1.** Even when $L^{-1}N'(u)$ is an unbounded operator, so that the right invertibility of $F'(u)$ cannot be directly obtained by Neumann series, the heuristic argument above still catches the right size of $R$, provided that the invertibility of $F'(u)$ is obtained by a perturbative procedure.

### 3 Application to a singular perturbation problem

Like Ekeland and Séré in [4], we consider the Cauchy problem studied by Métivier and Rauch [8] and Texier and Zumbrun [9], which is a nonlinear system of Schrödinger equations arising in nonlinear optics. In [8], Métivier and Rauch prove the existence of local solutions of the Cauchy problem, with existence time $T$ converging to 0 when the Sobolev $H^s(\mathbb{R}^d)$ norm of the initial datum goes to infinity. In [9], Texier and Zumbrun use a Nash-Moser scheme to improve this result, giving a uniform lower bound for $T$ for two classes of initial data (concentrating and highly oscillating) whose $H^s(\mathbb{R}^d)$ norm goes to infinity. In [4], Ekeland and Séré apply their non-quadratic version of the Nash-Moser theorem, extending the result in [9] to even larger initial data.
Like in the aforementioned papers, we consider the system

$$\partial_t v_j + i\lambda_j \Delta v_j = \sum_{k=1}^{N} \left( b_{jk}(v, \partial_x) v_k + c_{jk}(v, \partial_x) \overline{v_k} \right), \quad j = 1, \ldots, N, \quad (3.1)$$

where $v = v(t, x) = (v_1, \ldots, v_N) \in \mathbb{C}^N$ is the unknown, $(t, x) \in [0, T] \times \mathbb{R}^d$, $\lambda_1, \ldots, \lambda_N$ are constants, and $b_{jk}(v, \partial_x), c_{jk}(v, \partial_x)$ are first order differential operators

$$b_{jk}(v, \partial_x) = \sum_{\ell=1}^{d} b_{\ell jk}(v) \partial_{x\ell}, \quad c_{jk}(v, \partial_x) = \sum_{\ell=1}^{d} c_{\ell jk}(v) \partial_{x\ell}, \quad (3.2)$$

with $b_{\ell jk}, c_{\ell jk}$ complex-valued $C^\infty$ functions of $\text{Re}(v_1), \ldots, \text{Re}(v_N), \text{Im}(v_1), \ldots, \text{Im}(v_N)$ of order $b_{\ell jk}(v) = O(|v|^p), \quad c_{\ell jk}(v) = O(|v|^p) \quad (3.3)$

in a ball around the origin, for some integer $p \geq 1$.

Following [8], [9] and [1], we assume these “transparency conditions”:

**Assumption 3.1.** We assume that

(i) $\lambda_1, \ldots, \lambda_N$ are real and pairwise distinct;

(ii) for all $j, k$ such that $\lambda_j + \lambda_k = 0$ there holds $c_{jk} = c_{kj}$;

(iii) for all $j, b_{jj}$ is real.

Under these assumptions, the Cauchy problem for (3.1) is locally wellposed in the Sobolev space $H^s(\mathbb{R}^d)$ for $s > 1 + d/2$ (Theorem 1.5 in [8]). As is natural in the case of general initial data, the result in [8] gives an existence time $T$ going to 0 as the initial datum goes to $\infty$ in $H^s(\mathbb{R}^d)$. In [9] and [1] it is assumed that $p \geq 2$, and special initial data

$$v(0, x) = \varepsilon^\sigma a_\varepsilon(x) \quad (3.4)$$

are considered, either concentrating or fast oscillating

$$a_\varepsilon(x) = a_0(x/\varepsilon) \quad (\text{concentrating}); \quad a_\varepsilon(x) = a_0(x)e^{ix\xi_0/\varepsilon} \quad (\text{oscillating}), \quad (3.5)$$

with $\xi_0 \in \mathbb{R}^d$, and in both cases $0 < \varepsilon \leq 1, \sigma > 0$, $a_0 \in H^{s_1}(\mathbb{R}^d)$ for some large $s_1$.

In [9] and [1] the following results are proved.

**Theorem 3.2** (Theorem 4.6 in [9]). Under the assumptions above, let $d, p \geq 2$ and

$$\sigma > k_c - \sigma_a - 1 \quad (\text{3.6})$$

where $\sigma_a = d/2$ in the concentrating case, $\sigma_a = 0$ in the oscillating case, and $k_c$ is a constant depending on $(d, p)$. For $s_1$ large enough, $T > 0$. If $a_0 \in H^s(\mathbb{R}^d)$ for $s$ large enough, and $\|a_0\|_{H^s}$ is small enough, then, for all $\varepsilon \in (0, 1]$, the Cauchy problem (3.1)-(3.4)-(3.5) has a unique solution in the space $C^1([0, T], H^{s_1-2}(\mathbb{R}^d)) \cap C^0([0, T], H^{s_1}(\mathbb{R}^d))$.

The constant $k_c$ in (3.6) satisfies $k_c \geq \max\{6, k_c \geq 3 + \frac{dp}{2(p-1)}\}$, see Remark 3.7.
Theorem 3.3 (Theorem 6 in [4]). Under the assumptions above, let \( d, p \geq 2 \) and

\[
\sigma > \frac{d}{2p - 1} - \sigma_a
\]

where \( \sigma_a = d/2 \) in the concentrating case, and \( \sigma_a = 0 \) in the oscillating case. Let \( s_1 > d/2 + 4 \) and \( T > 0 \). If \( a_0 \in H^{s_1}(\mathbb{R}^d) \) for \( s \) large enough, and \( \|a_0\|_{H^{s_1}} \) is small enough, then, for all \( \varepsilon \in (0, 1) \), the Cauchy problem \((3.1)-(3.4),(3.5)\) has a unique solution in the space \( C^1([0, T], H^{s_1-2}(\mathbb{R}^d)) \cap C^0([0, T], H^{s_1}(\mathbb{R}^d)) \).

Following [9], we introduce the “semi-classical” Sobolev norms

\[
\|f\|_{H^s} := \|(-\varepsilon^2 \Delta + 1)^{s/2}f\|_{L^2(\mathbb{R}^d)} = \|1 + |\xi|^2|/2(\mathcal{F}f)(\xi)\|_{L^2(\mathbb{R}^d)}, \quad s \in \mathbb{R},
\]

where \( \mathcal{F} \) is the Fourier transform on \( \mathbb{R}^d \), and \( 0 < \varepsilon \leq 1 \). The first theorem we prove in this paper is the following.

Theorem 3.4. (i) (Existence) In the assumptions above, let \( T > 0, p \geq 1, d \geq 1, \) and \( s_1 > d/2 + 4 \). Then there exist constants \( C, C' > 0, \varepsilon_0 \in (0, 1), \) depending on \( T, p, d, s_1 \) and on \( \lambda_j, b_{jk}, c_{jk} \) in system \((3.1)\), such that for all \( \varepsilon \in (0, \varepsilon_0) \), for all initial data \( v_0 \in H^{s_1}(\mathbb{R}^d) \) in the ball

\[
\|v_0\|_{H^{s_1}} \leq C\varepsilon^q, \quad q := \frac{1}{p} + \frac{d}{2},
\]

the Cauchy problem for system \((3.1)\) with initial data \( v(0, x) = v_0(x) \) has a solution

\[
v \in C^0([0, T], H^{s_1}(\mathbb{R}^d)) \cap C^1([0, T], H^{s_1-2}(\mathbb{R}^d)),
\]

which satisfies

\[
\sup_{t \in [0, T]} \|v(t)\|_{H^{s_1}} + \varepsilon^2 \sup_{t \in [0, T]} \|\partial_t v(t)\|_{H^{s_1-2}} \leq C'\|v_0\|_{H^{s_1}}.
\]

(ii) (Higher regularity) If, in addition, \( v_0 \in H^s(\mathbb{R}^d) \) for \( s > s_1 \), then

\[
\sup_{t \in [0, T]} \|v(t)\|_{H^s} + \varepsilon^2 \sup_{t \in [0, T]} \|\partial_t v(t)\|_{H^{s-2}} \leq C_s\|v_0\|_{H^s}
\]

where \( C_s \) depends on \( s \) (and it is independent of \( \varepsilon, v_0, v \)).

(iii) (Initial data of special form) In particular, initial data \( v_0 \) of the form \((3.4)-(3.5)\), with \( \|a_0\|_{H^{s_1}(\mathbb{R}^d)} \leq 1 \), belong to the ball \((3.3)\) for all \( \varepsilon \) sufficiently small if \( \sigma + \sigma_a > q \), namely

\[
\sigma > \frac{1}{p} + \frac{d}{2} - \sigma_a,
\]

where \( \sigma_a = d/2 \) in the concentrating case and \( \sigma_a = 0 \) in the oscillating case.

In the next theorem we deal with the case \( p \geq 2 \), where the power \( p \) of the nonlinearity is used to improve the lower bound for \( \sigma \), at the price of a loss of 1 derivative in the solution with respect to the regularity of the datum.

Theorem 3.5. (i) (Existence) In the assumptions above, let \( T > 0, p \geq 2, d \geq 1, s_1 > \max\{d + 4, 6\} \), and

\[
\sigma > \frac{1 + d/2 - \sigma_a}{p},
\]
where $\sigma_a = d/2$ in the concentrating case and $\sigma_a = 0$ in the oscillating case.

Then there exist constants $C > 0$, $\varepsilon_0 \in (0,1]$, depending on $T, p, d, s_1$, on $\lambda_j, b_{jk}, c_{jk}$ in system (3.1), and on the difference $\sigma - (1 + d/2 - \sigma_a)/p$, such that for all $\varepsilon \in (0,\varepsilon_0]$, for all functions $a_0 \in H^{s_1}(\mathbb{R}^d)$ in the ball

$$
\|a_0\|_{H^{s_1}} \leq 1,
$$

(3.12)

the Cauchy problem for system (3.1) with initial data of the form (3.4)-(3.5) has a solution

$$
v \in C^0([0,T], H^{s_1-1}(\mathbb{R}^d)) \cap C^1([0,T], H^{s_1-3}(\mathbb{R}^d))
$$

on the time interval $[0,T]$. Such a solution $v$ is the sum

$$
v = y + \tilde{v}
$$

of a “free flow” component $y(t,x)$, which is the solution of the Cauchy problem for the free Schrödinger system

$$
\begin{aligned}
\partial_t y_j + i\lambda_j \Delta y_j &= 0, \quad j = 1, \ldots, N, \\
y(0,x) &= \varepsilon^a a_0(x),
\end{aligned}
$$

and a “correction” term $\tilde{v}(t,x)$ satisfying $\tilde{v}(0,x) = 0$ and

$$
\sup_{t \in [0,T]} \|\tilde{v}(t)\|_{H^{s_1-1}_\varepsilon} + \varepsilon^2 \sup_{t \in [0,T]} \|\partial_t \tilde{v}(t)\|_{H^{s_1-3}_\varepsilon} \leq C \varepsilon^{\sigma + d/2} \|a_0\|_{H^{s_1}}.
$$

(ii) (Higher regularity) If, in addition, $a_0 \in H^s(\mathbb{R}^d)$ for $s > s_1$, then

$$
\sup_{t \in [0,T]} \|\tilde{v}(t)\|_{H^{s-1}_\varepsilon} + \varepsilon^2 \sup_{t \in [0,T]} \|\partial_t \tilde{v}(t)\|_{H^{s-3}_\varepsilon} \leq C_s \varepsilon^{\sigma + d/2} \|a_0\|_{H^s}
$$

where $C_s$ depends on $s$ (and it is independent of $\varepsilon, a_0$).

Remark 3.6 (Smallness in low norm). In the higher regularity case, the smallness assumptions (3.9) in Theorem 3.4 and (3.12) in Theorem 3.5 are only required in the low norm $s_1$, with radii independent of the high regularity $s$.

Remark 3.7 (Comparison with previous results). As observed in [9] and [4], Métivier and Rauch [8] already provide existence for a fixed positive $T$, uniformly in $\varepsilon$, when

$$
\sigma \geq \sigma_{MR} := 1 + d/2 - \sigma_a.
$$

Hence [9], [4] and Theorems 3.4, 3.5 give something new only for $\sigma < \sigma_{MR}$.

The result of Texier and Zumbrun holds for $d \geq 2$, $p \geq 2$, and $\sigma$ above the threshold

$$
\sigma_{TZ} := \frac{k_c - \sigma_a - 1}{p + 1}
$$

(Theorem 4.6 in [9]), where the constant $k_c$ satisfies some conditions; in particular, $k_c \geq 6$ and

$$
k_c \geq 3 + \frac{d}{2} \frac{p}{p - 1},
$$

whence

$$
\sigma_{TZ} \geq \frac{1}{p + 1} \left(2 + \frac{d}{2} \frac{p}{p - 1} - \sigma_a\right) =: c.
$$
The threshold for $\sigma$ in our Theorem 3.5 is

$$\sigma_1 := \frac{1 + d/2 - \sigma_a}{p} = \frac{\sigma_{MR}}{p}.$$  

For all pairs $(d, p)$ covered by [9] (namely $d, p \geq 2$), one has $\sigma_1^* < c \leq \sigma_{TZ}$, therefore we get a larger ball for the initial data. More precisely, regarding the data size, the improvement of Theorem 3.5 with respect to [9] corresponds to the exponent $\sigma$ in the interval $\sigma_1^* < \sigma \leq \min\{\sigma_{TZ}, \sigma_{MR}\}$. Note that for some pairs $(d, p)$ one has $\sigma_{TZ} \geq \sigma_{MR}$ (see Examples 4.8-4.9 in [9]), so that [9] gives no improvements with respect to [8]; our result improves [8] also in those cases.

The result of Ekeland and Séré holds for $d, p \geq 2$, and $\sigma$ above the threshold $\sigma_{ES} := \frac{d}{2} - \frac{1}{p} - \sigma_a$ (Theorem 6 in [4]). The threshold for $\sigma$ in our Theorem 3.4 is

$$\sigma_0^* := \frac{1}{p} + \frac{d}{2} - \sigma_a.$$  

Since $\sigma_0^* < \sigma_{ES}$ for all $d, p \geq 2$, we get a larger ball for the initial data also with respect to [4].

With respect to [9] and [4] we also improve the regularity of the solution with respect to that of the initial data: using Theorem 3.5, the solution is one derivative less regular than the data (the loss of regularity is one), while with Theorem 3.4 the solution has the same regularity as the data (the loss is zero). In [9] and [4], instead, the loss of regularity depends in a nontrivial way on several parameters of the iteration scheme, it blows up to $+\infty$ in certain parameter regimes, and, in particular, can never be zero.

4 Functional setting

In this section we introduce weighted Sobolev norms and recall the basic inequalities that will be used in the rest of the paper.

For $s \in \mathbb{R}$, we define

$$\|u\|_{H^s(\mathbb{R}^d)} := \|\Lambda^s u\|_{L^2(\mathbb{R}^d)}, \quad \|u\|_{H^s_{\varepsilon}(\mathbb{R}^d)} := \|\Lambda^s_{\varepsilon} u\|_{L^2(\mathbb{R}^d)},$$  

where $\Lambda^s = (1 - \Delta)^{s/2}$ is the Fourier multiplier of symbol $(1 + |\xi|^2)^{s/2}$ and $\Lambda^s_{\varepsilon} = (1 - \varepsilon^2 \Delta)^{s/2}$ is that of symbol $(1 + \varepsilon^2 |\xi|^2)^{s/2}$, namely, following [9],

$$\|u\|_{H^s_{\varepsilon}(\mathbb{R}^d)} = \|(1 - \varepsilon^2 \Delta)^{s/2} u\|_{L^2(\mathbb{R}^d)} = \|(1 + \varepsilon^2 |\xi|^2)^{s/2} \hat{u}(\xi)\|_{L^2(\mathbb{R}^d)}, \quad s \in \mathbb{R},$$  

where $\hat{u}$ is the Fourier transform of $u$ on $\mathbb{R}^d$, and $0 < \varepsilon \leq 1$. For all $u \in H^s(\mathbb{R}^d)$, one has

$$\overline{(R_{\varepsilon} u)}(\xi) = \varepsilon^{-d} \hat{u}(\varepsilon^{-1} \xi), \quad (R_{\varepsilon} u)(x) := u(\varepsilon x),$$  

whence

$$\Lambda^s R_{\varepsilon} = R_{\varepsilon} \Lambda^s_{\varepsilon}, \quad \|u\|_{H^s_{\varepsilon}(\mathbb{R}^d)} = \varepsilon^{d/2} \|R_{\varepsilon} u\|_{H^s(\mathbb{R}^d)}.$$  

We define the scalar product

$$\langle u, v \rangle_{H^s_{\varepsilon}(\mathbb{R}^d)} := \langle \Lambda^s_{\varepsilon} u, \Lambda^s_{\varepsilon} v \rangle_{L^2(\mathbb{R}^d)}.$$  

8
To shorten the notation, we write $\|u\|_{H^s}$ instead of $\|u\|_{H^s(\mathbb{R}^d)}$, and so on. Using (4.4), it is immediate to obtain the Sobolev embedding and the standard tame estimates for products and compositions of functions in terms of the rescaled norms (4.2): for the Sobolev embedding, one has

$$\|u\|_{L^\infty} = \|R_\epsilon u\|_{L^\infty} \leq C_{s_0} \|R_\epsilon u\|_{H^{s_0}} = C_{s_0} \epsilon^{-d/2} \|u\|_{H^{s_0}}$$

(4.6)

for all $s_0 > d/2$, all $u \in H^{s_0}(\mathbb{R}^d)$, for some constant $C_{s_0}$ depending on $s_0, d$; for the product, one has

$$\|uv\|_{H^s} \leq C_s (\|u\|_{L^\infty} \|v\|_{H^s} + \|u\|_{H^s} \|v\|_{L^\infty})$$

(4.7)

for all $u, v \in H^s(\mathbb{R}^d)$, all $s \geq 0$, for some constant $C_s$ depending only on $s, d$; for the composition, given any $C^\infty$ function $f$ such that $f(y) = O(y^p)$ around the origin for some integer $p \geq 1$, one has

$$\|f(u)\|_{H^s} \leq C_{s, M} \|u\|_{L^\infty} \|u\|_{H^s}$$

(4.8)

for all $M > 0$, all $u \in H^s(\mathbb{R}^d)$ in the ball $\|u\|_{L^\infty} \leq M$, all $s \geq 0$, for some constant $C_{s, M}$ depending only on $s, M, d, f$. Moreover,

$$\epsilon^{|\alpha|} \|\partial^\alpha_x u\|_{H^s} \leq \|u\|_{H^{s+|\alpha|}}$$

(4.9)

for all multi-indices $\alpha \in \mathbb{N}^d$.

For $m \geq 0$ integer, we define

$$\|u\|_{W^{m, \infty}} := \sum_{|\alpha| \leq m} \|\partial^\alpha_x u\|_{L^\infty}, \quad \|u\|_{W^{m, \infty}} := \sum_{|\alpha| \leq m} \epsilon^{|\alpha|} \|\partial^\alpha_x u\|_{L^\infty}.$$  

(4.10)

One has

$$\partial^\alpha_x R_\epsilon = \epsilon^{|\alpha|} R_\epsilon \partial^\alpha_x, \quad \|u\|_{W^{m, \infty}} = \|R_\epsilon u\|_{W^{m, \infty}}.$$ 

(4.11)

Similarly as (4.8), given any $C^\infty$ function $f$ such that $f(y) = O(y^p)$ around the origin for some positive integer $p$, one has

$$\|f(u)\|_{W^{m, \infty}} \leq C_{m, M} \|u\|_{L^\infty} \|u\|_{W^{m, \infty}}$$

(4.12)

for all $M > 0$, all $u \in W^{m, \infty}(\mathbb{R}^d)$ in the ball $\|u\|_{L^\infty} \leq M$, all integers $m \geq 0$, for some constant $C_{m, M}$ depending on $m, M, d, f$. For the product of two functions, we also have

$$\|uv\|_{H^s} \leq \epsilon^{-d/2} (C_{s_0} \|u\|_{H^{s_0}} \|v\|_{H^s} + C_s \|u\|_{H^s} \|v\|_{H^{s_0}})$$

(4.13)

for all $s \geq 0, s_0 > d/2$, all $u, v \in H^s(\mathbb{R}^d) \cap H^{s_0}(\mathbb{R}^d)$, and

$$\|uv\|_{H^s} \leq 2 \|u\|_{L^\infty} \|v\|_{H^s} + C_s \|u\|_{W^{m, \infty}} \|v\|_{L^2}$$

(4.14)

for all $s \geq 0, v \in H^s(\mathbb{R}^d)$, all $u \in W^{m, \infty}(\mathbb{R}^d)$, where $m$ is the smallest positive integer such that $m \geq s$, and $C_s$ depends on $s, d$. Estimate (4.14) is proved in the Appendix (see (H,0,8) in Lemma [0.2]). We remark that the constants $C_{s_0}, C_s, C_{s, M}, C_{m, M}$ in (4.10), (4.7), (4.8), (4.12), (4.13), (4.14) are independent of $\epsilon$, and $C_{s_0}$ is also independent of $s$.

For time-dependent functions $u(t, x)$, $t \in [0, T)$, we denote, in short,

$$\|u\|_{C^0_t H^s_t} := \|u\|_{C([0,T], H^s_t)}, \quad \|u\|_{C^1_t H^s_t} := \|u\|_{C^0_t H^s_t} + \epsilon^2 \|\partial_t u\|_{C^0_t H^{s-2}},$$

(4.15)

$$\|u\|_{C^0_t W^m_t} := \|u\|_{C([0,T], W^m_t)}, \quad \|u\|_{C^1_t W^m_t} := \|u\|_{C^0_t W^m_t} + \epsilon^2 \|\partial_t u\|_{C^0_t W^{m-2}}.$$ 

(4.16)

The notation $a \lesssim b$ means $a \leq C_s b$ for some constant $C_s$, independent of $\epsilon$, possibly depending on $s$; also, $a \preceq b$ means $a \leq C b$ for some constant $C$ independent of $\epsilon$ and $s$. 

5 Analysis of the singular perturbation problem

In [9] and [4], system (3.1) is written as
\begin{equation}
\partial_t u + iA(\partial_x)u = B(u, \partial_x)u
\end{equation}

where \( u = (v, \overline{v}) = (v_1, \ldots, v_N, \overline{v}_1, \ldots, \overline{v}_N) \) is the unknown, \( A(\partial_x) \) is the constant coefficients operator of second order
\[
A(\partial_x) = \text{diag} (\lambda_1, \ldots, \lambda_n, -\lambda_1, \ldots, -\lambda_n). \Delta,
\]

\( B(u, \partial_x) \) is the operator matrix
\[
B = \begin{pmatrix} B & C \\ \overline{C} & \overline{B} \end{pmatrix},
\]

\( B, C \) are the operator matrices with entries \( b_{jk}(v, \partial_x), c_{jk}(v, \partial_x) \) respectively, and \( \overline{B}, \overline{C} \) have conjugate entries coefficients. To deal with concentrating or highly oscillating initial data in [9] and [4], system (3.1) is written as
\[
A(\varepsilon \partial_x) := \varepsilon^2 A(\partial_x) \quad \text{and} \quad B(u, \varepsilon \partial_x) := \varepsilon B(u, \partial_x).
\]

In this way \( A(\varepsilon \partial_x) \) and \( B(u, \varepsilon \partial_x) \) satisfy estimates that are uniform in \( \varepsilon \) as separate factors, writing (5.1) as
\begin{equation}
\partial_t u + i\varepsilon^{-2} A(\varepsilon \partial_x)u = \varepsilon^{-1} B(u, \varepsilon \partial_x)u
\end{equation}

for all \( s \in \mathbb{R} \), all \( u \in H^s(\mathbb{R}^d) \), with \( C_0 = \max \{|\lambda_1|, \ldots, |\lambda_N|\} \);
\[
\|B(u, \varepsilon \partial_x)h\|_{H^s} \leq C_\varepsilon (\|u\|_{L^\infty}^{p-1}\|h\|_{H^s} + \|u\|_{L^\infty}^{p-1}\|u\|_{H^s}\|\varepsilon \partial_x h\|_{L^\infty})
\]

for all \( s \geq 0 \), all \( h \in H^{s+1}(\mathbb{R}^d) \), all \( u \in H^s(\mathbb{R}^d) \) in the ball \( \|u\|_{L^\infty} \leq 1 \); also, by (4.11) and (4.12),
\[
\|B(u, \varepsilon \partial_x)h\|_{H^s} \leq C\|u\|_{L^\infty}\|h\|_{H^{s+1}} + C_s\|u\|_{L^\infty}\|u\|_{W^{[s]+1, \infty}}\|h\|_{H^s},
\]

for all \( s \geq 0 \), all \( h \in H^{s+1}(\mathbb{R}^d) \), all \( u \in W^{[s]+1, \infty}(\mathbb{R}^d) \) in the ball \( \|u\|_{L^\infty} \leq 1 \), where \([s]\) is the integer part of \( s \); and, by (10.13) and (4.12),
\[
\|B(u, \varepsilon \partial_x)h\|_{H^s} \leq C\|u\|_{L^\infty}\|u\|_{L^{p-1}}\|h\|_{H^{s+1}},
\]

for all \(-1 \leq s \leq 0 \), all \( h \in H^{s+1}(\mathbb{R}^d) \), all \( u \in W^{1, \infty}(\mathbb{R}^d) \) in the ball \( \|u\|_{L^\infty} \leq 1 \). The constants in (5.3), (5.4), (5.5), (5.6) do not depend on \( \varepsilon \in (0, 1) \); \( C_0, C \) in (5.3), (5.5) and (5.6) are also independent of \( s \).

We consider the Cauchy problem for (5.2) with initial data (3.1), namely
\[
\begin{aligned}
\partial_t u + P(u) &= 0, \\
u(0) &= u_0
\end{aligned}
\]

where
\[
P(u) := i\varepsilon^{-2} A(\varepsilon \partial_x)u - \varepsilon^{-1} B(u, \varepsilon \partial_x)u, \quad u_0(x) := \varepsilon^\sigma(a_\varepsilon(x), \overline{a_\varepsilon(x)}).
\]
To apply our Nash-Moser theorem, we need to construct a right inverse for the linearized problem and to estimate the second derivative of the nonlinear operator. Let us begin with the linear inversion problem.

**Analysis of the linearized problem.** Given $u(t, x), f_1(t, x)$ and $f_2(x)$, consider the linear Cauchy problem for the unknown $h(t, x)$

\[
\begin{aligned}
\partial_t h + P'(u)h &= f_1, \\
h(0) &= f_2,
\end{aligned}
\]  

(5.9)

where

\[
P'(u)h = i\varepsilon^{-2} A(\varepsilon \partial_x)h - \varepsilon^{-1} B(u, \varepsilon \partial_x)h + R_0(u)h, \quad (5.10)
\]

\[
R_0(u)h := -\varepsilon^{-1}(\partial_u B)(u, \varepsilon \partial_x)[h]u. \quad (5.11)
\]

Following [9], let

\[J := \{(j, k) : \lambda_j + \lambda_k = 0\},\]

and let $\chi \in C^\infty_c(\mathbb{R}^d, \mathbb{R})$ be a frequency truncation such that $0 \leq \chi(\xi) \leq 1$, $\chi(\xi) = 1$ for $|\xi| \leq 1/2$, and $\chi(\xi) = 0$ for $|\xi| \geq 1$. Like in [9], we decompose $B$ into the sum of a resonant term, a non-resonant term, and a low-frequency term: $B = B_r + B_{nr} + B_{lf}$, where

- the resonant term is

\[
B_r := \begin{pmatrix} B_d & C_J \\ C_J & B_d \end{pmatrix}
\]

where $B_d := \text{diag}(b_{11}, \ldots, b_{NN})$, $(C_J)_{jk} := c_{jk}$ if $(j, k) \in J$ and $(C_J)_{jk} := 0$ otherwise. By Assumption 3.1, the matrix $B_r(v, \xi)$ is Hermitian;

- the nonresonant term is

\[
B_{nr} := \begin{pmatrix} B_{11} & C_{1} \\ C_{1} & B_{11} \end{pmatrix}
\]

where $(B_{11})_{jk} := (1 - \chi)b_{jk}$ if $j \neq k$, and $(B_{11})_{jk} := 0$ if $j = k$; $(C_{1})_{jk} := (1 - \chi)c_{jk}$ if $(j, k) \notin J$, and $(C_{1})_{jk} := 0$ if $(j, k) \in J$;

- the low-frequency term is

\[
B_{lf} := \begin{pmatrix} B_{00} & C_{0} \\ C_{0} & B_{00} \end{pmatrix}
\]

where $(B_{00})_{jk} := \chi b_{jk}$ if $j \neq k$, and $(B_{00})_{jk} := 0$ if $j = k$; $(C_{0})_{jk} := \chi c_{jk}$ if $(j, k) \notin J$, and $(C_{0})_{jk} := 0$ if $(j, k) \in J$.

We recall the normal form transformation of [9] (see the proof of Lemma 4.5 in [9]): define the pseudo-differential matrix symbol $M(u(t, x), \xi)$ as

\[
M_{jk}(u(t, x), \xi) := \begin{cases} 
\frac{(B_{nr})_{jk}(u(t, x), i\xi)}{i|\xi|^2(\omega_j - \omega_k)} & \text{if } \omega_j \neq \omega_k, \\
0 & \text{if } \omega_j = \omega_k,
\end{cases}
\]  

(5.12)

where

\[
\omega_j := \begin{cases} 
-\lambda_j & \text{for } j = 1, \ldots, N, \\
\lambda_j - N & \text{for } j = N + 1, \ldots, 2N.
\end{cases}
\]
Since the commutator of $A$ and $M$ is the matrix
\[ [A(i\xi), M(u, \xi)] = \left( |\xi|^2 (\omega_j - \omega_k) M_{jk}(u, \xi) \right)_{j,k=1,\ldots,2N}, \tag{5.13} \]
one has
\[ B_{nr}(u(t, x), i\xi) - i[A(i\xi), M(u(t, x), \xi)] = 0. \]
Like in [9], we introduce the following semiclassical quantization of a symbol $\sigma(x, \xi)$
\[ \text{op}_\varepsilon(\sigma) h(x) := (2\pi)^{-d/2} \int_{\mathbb{R}^d} \sigma(x, \varepsilon\xi) \hat{h}(\xi) e^{i\varepsilon x} d\xi. \]
By (5.12) and (5.5), one has
\[ \| \text{op}_\varepsilon(M) h \|_{H^s} \leq C \| u \|_{L^\infty} \| h \|_{H^{s-1}}, \tag{5.14} \]
\[ \| \text{op}_\varepsilon(M) h \|_{L^2} \leq C \| u \|_{L^\infty} \| h \|_{H^{s-1}} \tag{5.15} \]
for all $s \geq 0$, all $\| u \|_{L^\infty} \leq 1$, all $h$. Hence there exists $\rho_0 > 0$, independent of $\varepsilon$, such that, for $u$ in the ball
\[ \varepsilon \| u \|_{L^\infty} \leq \rho_0, \tag{5.16} \]
one has
\[ \| \text{op}_\varepsilon(M) h \|_{H^{s-1} \varepsilon} \leq \| \text{op}_\varepsilon(M) h \|_{L^2} \leq C \varepsilon \| u \|_{L^\infty} \| h \|_{H^{s-1}}, \tag{5.17} \]
Therefore, by Neumann series, $I + \varepsilon \text{op}_\varepsilon(M)$ is invertible in $H^{s-1}_{\varepsilon}$ and in $L^2$, and
\[ \| (I + \varepsilon \text{op}_\varepsilon(M))^{-1} h \|_{H^{s-1}_{\varepsilon}} \leq C \| h \|_{H^{s}_{\varepsilon}} + C_s \varepsilon \| u \|_{L^\infty} \| h \|_{H^{s-1}_{\varepsilon}} \tag{5.18} \]
for all $s \geq 0$, for $u \in W^{[s],+1,\infty}(\mathbb{R}^d)$ in the ball (5.16) (where $\rho_0$ is independent of $s$).
Under the change of variable
\[ h = (I + \varepsilon \text{op}_\varepsilon(M)) \varphi, \tag{5.19} \]
the linear Cauchy problem (5.9) becomes
\[ \begin{cases} \partial_t \varphi + Q(u) \varphi = g_1 \\ \varphi(0) = g_2 \end{cases} \tag{5.20} \]
where
\[ g_1 := (I + \varepsilon \text{op}_\varepsilon(M))^{-1} f_1, \quad g_2 := (I + \varepsilon \text{op}_\varepsilon(M))^{-1}_{_{\varepsilon=0}} f_2, \tag{5.21} \]
and, by (5.13),
\[ \partial_t + Q(u) := (I + \varepsilon \text{op}_\varepsilon(M))^{-1} (\partial_t + P'(u))(I + \varepsilon \text{op}_\varepsilon(M)) = \partial_t + i\varepsilon^{-2} A(\varepsilon \partial_x) - \varepsilon^{-1} B_{r}(u, \varepsilon \partial_x) + G(u), \tag{5.22} \]
with
\[ G(u) := (I + \varepsilon \text{op}_\varepsilon(M))^{-1} \left( \varepsilon \text{op}_\varepsilon(M) \varepsilon^{-1} B_{r}(u, \varepsilon \partial_x) - \varepsilon^{-1} B_{lf}(u, \varepsilon \partial_x) + \varepsilon \text{op}_\varepsilon(\partial_t M) - \varepsilon^{-1} B(u, \varepsilon \partial_x) \varepsilon \text{op}_\varepsilon(M) + R_0(u)(I + \varepsilon \text{op}_\varepsilon(M)) \right) \tag{5.23} \]
(we have used the trivial identity $I - (I + K)^{-1} = (I + K)^{-1}K$ for $K = \varepsilon \text{op}_x(M)$.)

Now we prove an energy estimate for (5.22), and we start with the term $G(u)$. By (5.18), (5.14), (5.17), (5.5), (5.6), the first term in (5.23) satisfies, for $s \geq 0$,

$$\|(I + \varepsilon \text{op}_x(M))^{-1}\varepsilon \text{op}_x(M)\varepsilon B_r(u, \varepsilon \partial_x)\varphi\|_{H^s} \lesssim_s \|u\|_{L^\infty}^{2p+2} \|\varphi\|_{H^s} + \|u\|_{L^\infty}^{2p-2} \|\varphi\|_{H^s} + \|\varphi\|_{W^{1,\infty}} \|u\|_{W^{1,\infty}} \|\varphi\|_{L^2},$$

and

$$\|(I + \varepsilon \text{op}_x(M))^{-1}\varepsilon \text{op}_x(M)\varepsilon B_r(u, \varepsilon \partial_x)\varphi\|_{L^2} \lesssim \|u\|^{2p-1}_{L^\infty} \|\varphi\|_{L^2}.$$

The low-frequency term $B_{ij}$ satisfies, for $s \geq 0$,

$$\|\varepsilon^{-1}B_{ij}(u, \varepsilon \partial_x)\varphi\|_{H^s} \lesssim_s \|\varepsilon^{-1}u\|_{L^\infty}^{p-1} \|\varphi\|_{H^s} + \|\varphi\|_{L^\infty} \|\varphi\|_{H^s}.$$

The term containing the time derivative of the symbol $M$ is estimated, for $s \geq 0$, by

$$\|\varepsilon^{op}(\partial_t M)\varphi\|_{H^s} \lesssim_s \|\varepsilon u\|_{L^\infty}^{p-1} \|\partial u\|_{L^\infty} \|\varphi\|_{H^s}^{-1} + \varepsilon \left(\|u\|_{L^\infty}^{p-1} \|\partial u\|_{W^{1,\infty}} + \|u\|_{L^\infty} \|\partial u\|_{L^\infty} \right) \|\varphi\|_{H^s}^{-1}.$$

where

$$\nu := \max\{p - 2, 0\}, \quad (5.24)$$

and, by (5.14),

$$\|\varepsilon \text{op}_x(\partial_t M)\varphi\|_{H^s} \leq \|\varepsilon \text{op}_x(\partial_t M)\varphi\|_{L^2} \lesssim \|\varepsilon u\|_{L^\infty}^{p-1} \|\partial u\|_{L^\infty} \|\varphi\|_{H^s}^{-1}.$$

Next, $R_0$ defined in (5.11) satisfies, for $s \geq 0$,

$$\|R_0(u)\varphi\|_{H^s} \lesssim_s \|\varepsilon^{-1}u\|_{L^\infty}^{p-1} \left(\|u\|_{W^{1,\infty}} \|\varphi\|_{H^s} + \|u\|_{W^{1,\infty}} \|\varphi\|_{L^2}\right), \quad (5.25)$$

$$\|R_0(u)\varphi\|_{L^2} \lesssim \|\varepsilon^{-1}u\|_{L^\infty}^{p-1} \|\varphi\|_{L^2}. \quad (5.26)$$

Hence $G(u)$ in (5.23) satisfies, for all $s \geq 0$,

$$\|G(u)\varphi\|_{H^s} \lesssim_s \|\varepsilon^{-1}u\|_{L^\infty}^{p-1} \left(\|u\|_{W^{1,\infty}} + \varepsilon^2 \|\partial u\|_{L^\infty}\right) \|\varphi\|_{H^s} + \varepsilon \left(\|u\|_{L^\infty} \|\varphi\|_{H^s} + \varepsilon \|u\|_{W^{1,\infty}} \|\varphi\|_{L^2}\right), \quad (5.27)$$

$$\|G(u)\varphi\|_{L^2} \lesssim \|\varepsilon^{-1}u\|_{L^\infty}^{p-1} \|u\|_{W^{1,\infty}} + \varepsilon^2 \|\partial u\|_{L^\infty}\|\varphi\|_{L^2}. \quad (5.28)$$

The constant coefficient operator $A(\varepsilon \partial_x)$ in (5.22) satisfies

$$\text{Re} \left(\varepsilon^{-2}A(\varepsilon \partial_x)\varphi, \varphi\right)_{H^s} = 0 \quad (5.29)$$

because $\lambda_j$ are all real. To estimate the term with $B_r(u, \varepsilon \partial_x)$ in (5.22), we recall that

$$2\text{Re} \left(\langle X \varphi, \varphi\rangle_{H^s}\right) = \langle (X + X^*)\Lambda_x^s \varphi, \Lambda_x^s \varphi\rangle_{L^2} + 2\text{Re} \left(\langle \Lambda_x^s, X \rangle \varphi, \Lambda_x^s \varphi\right)_{L^2}$$

for any linear operator $X$, where $X^*$ is the adjoint of $X$ with respect to the $L^2$ scalar product and $[\cdot, \cdot]$ is the commutator, whence

$$2\text{Re} \left(\langle X \varphi, \varphi\rangle_{H^s}\right) \leq \|X + X^*\|_{L(L^2, L^2)} \|\varphi\|_{H^s}^2 + 2\|\Lambda_x^s, X \rangle \varphi, \Lambda_x^s \varphi\|_{L^2} \|\varphi\|_{H^s}. \quad (5.29)$$
By the Hermitian structure of \( B_r(u, \varepsilon \partial_x) \),

\[
\|X + X^*\|_{L^2(U^2, L^2)} \lesssim \varepsilon^{-1} \|u\|_{L_u}^p \|u\|_{W^{1,\infty}_{\xi}}, \quad X = \varepsilon^{-1} B_r(u, \varepsilon \partial_x), \tag{5.30}
\]

and, by \((10.18)\), for \( X = \varepsilon^{-1} B_r(u, \varepsilon \partial_x) \) one has

\[
\| [\Lambda_{\varepsilon}^s, X] \varphi \|_{L^2} \lesssim \varepsilon^{-1} \|u\|_{L_u}^p \|\varphi\|_{H_x^0} + \|u\|_{W^{1,\infty}_{\xi}} \|\varphi\|_{L^2}. \tag{5.31}
\]

Therefore

\[
|\Re \langle \varepsilon^{-1} B_r(u, \varepsilon \partial_x) \varphi, \varphi \rangle_{H_x^0} | \lesssim \varepsilon^{-1} \|u\|_{L_u}^p \|\varphi\|_{H_x^0} + \|u\|_{W^{1,\infty}_{\xi}} \|\varphi\|_{L^2},
\]

By \((5.21)\)–\((5.31)\), the solution \( \varphi \) of the linear equation \( \partial_t \varphi + Q(u) \varphi = g_1 \) (see \((5.20)\) and \((5.22)\)) satisfies

\[
\partial_t (\|\varphi\|_{H_x^0}^2) = 2 \Re \langle g_1 + \varepsilon^{-1} B_r(u, \varepsilon \partial_x) \varphi - G(u) \varphi, \varphi \rangle_{H_x^0} \lesssim \varepsilon^{-1} \|u\|_{L_u}^p \|\varphi\|_{H_x^0} + \|u\|_{W^{1,\infty}_{\xi}} \|\varphi\|_{L^2},
\]

\[
\partial_t (\|\varphi\|_{L^2}^2) \lesssim \varepsilon^{-1} \|u\|_{L_u}^p \|\varphi\|_{L^2} + \|u\|_{W^{1,\infty}_{\xi}} \|\varphi\|_{L^2}.
\]

If \( u \) satisfies

\[
\varepsilon^{-1} \|u\|_{L_u}^p \lesssim 1, \tag{5.34}
\]

on the time interval \([0, T]\), then for \( s \geq 0 \) the solution \( \varphi \) of \((5.20)\) satisfies, with the notation introduced in \((8.15)\), \((8.16)\),

\[
\|\varphi\|_{C^0 L^2} \lesssim |g_1|_{C^0 L^2} + |g_2|_{L^2}, \tag{5.35}
\]

\[
\|\varphi\|_{C^0 H_x^s} \lesssim |g_1|_{C^0 H_x^s} + |g_2|_{H_x^0} + \varepsilon^{-1} \|u\|_{C^0 L^\infty} \|u\|_{C^1 W^{1,\infty}} + \|u\|_{C^0 L^\infty} \|u\|_{C^0 W^{1,\infty}} \|g_1|_{C^0 L^2} + |g_2|_{L^2}, \tag{5.36}
\]

(first use \((5.33)\), \((5.34)\) and Gronwall to get \((5.35)\), then insert \((5.35)\) into \((5.32)\) and use Gronwall again).

By definitions \((5.19)\), \((5.21)\) and estimates \((5.14)\), \((5.15)\), \((5.18)\), we deduce that the solution \( h \) of the linear Cauchy problem \((5.9)\) satisfies the same estimates \((5.35)\), \((5.36)\) as \( \varphi \) with \( f_1, f_2 \) in place of \( g_1, g_2 \), namely, for all \( s \geq 0 \),

\[
\|h\|_{C^0 L^2} \lesssim |f_1|_{C^0 L^2} + |f_2|_{L^2}, \tag{5.37}
\]

\[
\|h\|_{C^0 H_x^s} \lesssim |f_1|_{C^0 H_x^s} + |f_2|_{H_x^0} + \varepsilon^{-1} \|u\|_{C^0 L^\infty} \|u\|_{C^1 W^{1,\infty}} + \|u\|_{C^0 L^\infty} \|u\|_{C^0 W^{1,\infty}} \|f_1|_{C^0 L^2} + |f_2|_{L^2}. \tag{5.38}
\]

From the equation \( \partial_t h + P'(u)h = f_1 \) one has, for all \( s \) real,

\[
\|\partial_t h\|_{H_x^s} \leq |f_1|_{H_x^s} + \|P'(u)h\|_{H_x^s}. \tag{5.39}
\]

By \((5.6)\), \((5.26)\), \((5.34)\), for \(-1 \leq s \leq 0 \) one has

\[
\|P'(u)h\|_{H_x^s} \lesssim \varepsilon^{-2} \|h\|_{H_x^{s+2}}, \tag{5.40}
\]
and, by (5.31), (5.25), (5.34), for $s \geq 0$ one has
\[
\|P'(u)h\|_{H^s_t} \lesssim_s \varepsilon^{-2}\|h\|_{H^{s+2}} + \varepsilon^{-1}\|u\|_{L^\infty}^{p-1}\|u\|_{W^{s+2,\infty}}\|h\|_{L^2}.
\] (5.41)

Hence, by (5.37)-(5.41), for all $s \geq -1$ one has
\[
\varepsilon^2\|\partial_t h\|_{H^s_t} \lesssim_s \|f_1\|_{C^0 H^{s+2} + 2} + \|f_2\|_{H^{s+2}} + \varepsilon^{-1}(\|u\|_{C^0 L^\infty}^{p-1}\|u\|_{C^1 W^{s+3} + 3}) + \|u\|_{C^0 L^\infty}^{p-1}\|u\|_{C^1 W^{s+3} + 3}\|h\|_{L^\infty} + \|f_2\|_{L^\infty}.
\]

Thus, recalling definition (4.15), $h$ satisfies, for all $s \geq 1$,
\[
\|h\|_{C^1_t H^s_x} \lesssim_s \|f_1\|_{C^0 H^{s+2} + 2} + \|f_2\|_{H^{s+2}} + \varepsilon^{-1}(\|u\|_{C^0 L^\infty}^{p-1}\|u\|_{C^1 W^{s+3} + 3}) + \|u\|_{C^0 L^\infty}^{p-1}\|u\|_{C^1 W^{s+3} + 3}\|h\|_{L^\infty} + \|f_2\|_{L^\infty}.
\] (5.42)

In conclusion, we have proved the following result.

**Lemma 5.1** (Right inverse of the linearized problem). Let $s \geq 1$ be real, and let $u$ belong to $C([0,T], W^{s+3}(\mathbb{R}^d)) \cap C^1([0,T], W^{s+1}(\mathbb{R}^d))$, with (5.31) and (5.16). Then for all $f_1 \in C([0,T], H^s(\mathbb{R}^d))$, all $f_2 \in H^s(\mathbb{R}^d)$, the linear Cauchy problem (5.9) has a (unique) solution $h$, which satisfies (5.42).

**Estimate for the second derivative.** By (8.4) and (8.8), the operator
\[
P''(u)[h_1, h_2] = -\varepsilon^{-1}(\partial_u B)(u, \varepsilon \partial_x)[h_1]h_2 - \varepsilon^{-1}(\partial_u B)(u, \varepsilon \partial_x)[h_2]h_1
\]
\[-\varepsilon^{-1}(\partial_u B)(u, \varepsilon \partial_x)[h_1, h_2]u
\]
is the sum of terms of the form
\[
\varepsilon^{-1}g'(u)h_1 \varepsilon \partial_x h_2 + \varepsilon^{-1}g'(u)h_2 \varepsilon \partial_x h_1 + \varepsilon^{-1}g''(u)h_1 h_2 \varepsilon \partial_x u,
\] (5.43)

where $g(u)$ is a vector of components $b_{ij}(u)$ or $c_{ijk}(u)$. By (5.31), $g(u) = O(|u|^p)$ with $p \geq 1$ integer. For $p \geq 3$, by (1.8) one has for all $u$ in the ball $\|u\|_{L^\infty} \leq 1$, for all $s \geq 0$,
\[
\|g'(u)\|_{L^\infty} \lesssim \|u\|_{L^\infty}^{p-1}, \quad \|g'(u)\|_{H^s_t} \lesssim_s \|u\|_{H^2_t} \|u\|_{L^\infty}^{p-2},
\] (5.44)
\[
\|g''(u)\|_{L^\infty} \lesssim \|u\|_{L^\infty}^{p-2}, \quad \|g''(u)\|_{H^s_t} \lesssim_s \|u\|_{H^2_t} \|u\|_{L^\infty}^{p-3}.
\] (5.45)

For $p = 2$, $g(u) = g_2(u) + \tilde{g}(u)$ where $g_2(u)$ is homogeneous of degree 2 in $u$ and $\tilde{g}(u) = O(|u|^3)$ (we do not distinguish whether $\tilde{g}$ is of order 3 or higher). Thus $\tilde{g}(u)$ satisfies (5.44)+(5.45) with $3$ in place of $p$, and $g_2$ satisfies (5.44) with $2$ in place of $p$, while $g_2(u)$ is a constant, independent of $u$. For $p = 1$, one has $g(u) = g_1(u) + g_2(u) + \tilde{g}(u)$ where $g_1(u)$ is linear in $u$ and $g_2(u)$ are as above. Thus $g_1'(u)$ is a constant, independent of $u$, and $g_1''(u) = 0$.

By (5.44), (5.47) and (1.8), for all $u$ in the ball $\|u\|_{L^\infty} \leq 1$, for all real $s \geq 0$, all integer $p \geq 1$, one has
\[
\|P''(u)[h_1, h_2]\|_{H^s_t} \lesssim_s \varepsilon^{-1}\|u\|_{L^\infty}^{p-1}(\|h_1\|_{H^{s+1}} + \|h_1\|_{H^s_t} + h_2 \|h_2\|_{W^{1,\infty}})
\]
\[+ \|h_1\|_{W^{s,\infty}} \|h_2\|_{H^s_t} + \|h_1\|_{L^\infty} \|h_2\|_{H^{s+1}})
\]
\[+ \varepsilon^{-1}\|u\|_{L^\infty}^{p-1}\|u\|_{W^{s,\infty}}(\|h_1\|_{H^s_t} + \|h_1\|_{L^\infty} \|h_2\|_{H^s_t})
\]
\[+ \varepsilon^{-1}\|u\|_{L^\infty}^{p-1}\|u\|_{H^{s+1}} + \|u\|_{L^\infty}^{p-2}\|u\|_{W^{s,\infty}} \|h_1\|_{H^s_t} \|h_2\|_{L^\infty},
\] (5.46)
where \( \nu = \max\{ p - 2, 0 \} \) has been defined in (5.24), and \( \nu_3 := \max\{ p - 3, 0 \} \).

**Estimates in \( H^s_\varepsilon \) spaces only.** For the result in the concentrating case, it is convenient to work directly in \( H^s_\varepsilon \) class, avoiding the \( W^{m, \infty}_\varepsilon \) spaces. Thus, by (5.4), one has
\[
\|B(u, \varepsilon \partial_x)h\|_{H^s_\varepsilon} \leq \varepsilon^{-p/2}(C_{s0}\|u\|_{H^p_{\varepsilon_0}}\|h\|_{H^{s+1}_\varepsilon} + C_s\|u\|_{H^p_{\varepsilon_0}}\|u\|_{H^s_\varepsilon}\|h\|_{H^{s+1}_{\varepsilon_0}}) \tag{5.47}
\]
for all \( s \geq s_0 > d/2 \), all \( u \) in the ball
\[
C_{s0}\varepsilon^{-d/2}\|u\|_{H^s_{\varepsilon_\varepsilon}} \leq 1, \tag{5.48}
\]
so that \( \|u\|_{L^\infty} \leq 1 \). By (5.17) and (5.12),
\[
\|\text{op}_\varepsilon(M)h\|_{H^s_\varepsilon} \leq \varepsilon^{-p/2}(C_{s0}\|u\|_{H^p_{\varepsilon_0}}\|h\|_{H^{s-1}_\varepsilon} + C_s\|u\|_{H^p_{\varepsilon_0}}\|u\|_{H^s_\varepsilon}\|h\|_{H^{s-1}_{\varepsilon_0}}) \tag{5.49}
\]
for \( s \geq s_0 > d/2 \), \( u \) in the ball (5.48). Thus there exists \( \rho_3 > 0 \), independent of \( \varepsilon \), such that for \( u \) in the ball
\[
\varepsilon^{1-p/2}\|u\|_{H^s_{\varepsilon_0}} \leq \rho_3, \tag{5.50}
\]
one has
\[
\|\text{op}_\varepsilon(M)h\|_{H^s_{\varepsilon_0}} \leq C_{s0}\varepsilon^{1-p/2}\|u\|_{H^p_{\varepsilon_0}}\|h\|_{H^{s+1}_{\varepsilon_0}} \leq H^s_{\varepsilon_0}. \tag{5.51}
\]
Therefore, by Neumann series, \( I + \text{op}_\varepsilon(M) \) is invertible in \( H^{s_0}(\mathbb{R}^d) \), and
\[
||(I + \text{op}_\varepsilon(M))^{-1}h\|_{H^s_\varepsilon} \leq C_{s0}\|h\|_{H^s_\varepsilon} + C_s\varepsilon^{1-p/2}\|u\|_{H^p_{\varepsilon_0}}\|u\|_{H^s_{\varepsilon_0}}\|h\|_{H^{s-1}_{\varepsilon_0}} \tag{5.52}
\]
for \( s \geq s_0 > d/2 \) and \( u \) in the ball (5.50). For \( u \) in the ball (5.50), for \( s \geq s_0 > d/2 \), we deduce the following estimates:
\[
||(I + \text{op}_\varepsilon(M))^{-1}\text{op}_\varepsilon(M)\varepsilon^{-1}B_\varepsilon(u, \varepsilon \partial_x)\varphi\|_{H^s_\varepsilon} \leq s \varepsilon^{-p/2}\|u\|^{p-1}_{H^p_{\varepsilon_0}}\|\varepsilon^{-1}B_\varepsilon(u, \varepsilon \partial_x)\varphi\|_{L^2} \tag{5.53}
\]
(to prove (5.53), we have used (10.22)),
\[
\|\text{op}_\varepsilon(\partial_t M)\varphi\|_{H^s_\varepsilon} \leq \varepsilon^{1-p/2}\|u\|^{p-1}_{H^p_{\varepsilon_0}}\|\partial_t u\|_{H^s_{\varepsilon_0}}\|\varphi\|_{H^{s-1}_\varepsilon} \tag{5.54}
\]
\[
+ \{(\|u\|^{p-1}_{H^p_{\varepsilon_0}}\|\partial_t u\|_{H^s_{\varepsilon_0}} + \|\varepsilon^{s-1/2}u\|_{H^s_{\varepsilon_0}}\|\partial_t u\|_{H^{s-1}_{\varepsilon_0}})\} \tag{5.55}
\]
with \( \nu \) defined in (5.24), and
\[
\|R_\varepsilon(u)\varphi\|_{H^s_\varepsilon} \leq s \varepsilon^{-p/2}\|u\|^{p-1}_{H^p_{\varepsilon_0}}\|\varphi\|_{H^{s+1}_\varepsilon} \tag{5.56}
\]
Hence
\[
\|G(u)\varphi\|_{H^s_\varepsilon} \leq s \varepsilon^{-p/2}\|u\|^{p-1}_{H^p_{\varepsilon_0}}\|\varphi\|_{H^{s+1}_\varepsilon} + \varepsilon^2\|\partial_t u\|_{H^{s+1}_{\varepsilon_0}}\|\varphi\|_{H^s_\varepsilon} \tag{5.57}
\]
Define the smoothing operators and, recalling the notation in (4.15), define

\[ (5.48) \]

with Lemma 5.2.

Linear Cauchy problem \( \varphi \)

the solution \( \varphi \) of the linear Cauchy problem (5.20) satisfies

\[ \|X\|_{H^s} \leq \|X\|^a \|X\|^b, \quad (5.50) \]

for all \( s \geq s_0 \). Hence, following the same argument as above, the solution \( h \) of the Cauchy problem (5.9) satisfies, for \( s \geq s_0 + 2 \),

\[ \|h\|_{C^1 H^s} \leq \|f_1\| \|C^0 H^s + \|f_2\| H^s \]

+ \( \varepsilon \) \( \|f\|_{C^1 H^{s+2}} \|f\|_{C^1 H^{s+2}} (s \|g_1\| \|C^0 H^s + \|g_2\| H^s) \) \( 5.61 \)

We have obtained the following inversion for the linear problem.

**Lemma 5.2.** Let \( s_0 > d/2, s \geq s_0 + 2 \), and \( u \in C([0, T], H^{s+2}(\mathbb{R}^d)) \cap C^1([0, T], H^s(\mathbb{R}^d)) \), with (5.48), (5.50) and (5.59). Then for all \( f_1 \in C([0, T], H^s(\mathbb{R}^d)) \), all \( f_2 \in H^s(\mathbb{R}^d) \), the linear Cauchy problem (5.9) has a (unique) solution \( h \), which satisfies (5.62).

Also, by (5.40) and (5.48), for \( s \geq s_0 \),

\[ \|P''(u) h_1, h_2 \|_{H^s} \leq \varepsilon \|u\|_{H^0} \|h_1\|_{H^s} + \|h_2\|_{H^s} \]

+ \( \varepsilon \) \( \|u\|_{H^0} \|h_1\|_{H^s} \|h_2\|_{H^s} \) \( 5.63 \)

6 Proof of Theorem 3.4

For \( a \geq 0 \) real, let

\[ E_a := C([0, T], H^{s_0+a}(\mathbb{R}^d)) \cap C^1([0, T], H^{s_0+a-2}(\mathbb{R}^d)), \]

\[ F_a := C([0, T], H^{s_0+a}(\mathbb{R}^d)) \times H^{s_0+a}(\mathbb{R}^d), \]

and, recalling the notation in (4.15), define

\[ \|u\|_{E_a} := \|u\|_{C^1 H^{s_0+a}}, \quad \|f\|_{F_a} := \|f_1, f_2\|_{F_a} := \|f_1\|_{C^0 H^{s_0+a}} + \|f_2\|_{H^{s_0+a}}. \]

Define the smoothing operators \( S_j \), \( j \in \mathbb{N} \), as the “semi-classical” crude Fourier truncations

\[ S_j u(x) := (2\pi)^{-d/2} \int_{|\xi| \leq 2^j} \hat{u}(\xi) e^{i\xi x} d\xi, \]

(6.4)
which satisfy all (9.2)-(9.8) with constants independent of $\varepsilon$. Define

$$\Phi(u) := \left( \partial_t u + P(u) \right), \tag{6.5}$$

where $P(u)$ is defined in (5.8). For $\|u\|_{E_2} \leq 1$, the second derivative of $\Phi$ satisfies (5.63), which gives, for all $a \geq 0$,

$$\|\Phi''(u)[h_1, h_2]\|_{F_a} \lesssim_s \varepsilon^{1-\rho/2} \|u\|_{E_0}^{p-1} \left( \|h_1\|_{E_{a+1}} \|h_2\|_{E_0} + \|h_1\|_{E_0} \|h_2\|_{E_{a+1}} \right) + \varepsilon^{1-(\nu+2)d/2} \|u\|_{E_0}^{p} \|u\|_{E_{a+1}} \|h_1\|_{E_0} \|h_2\|_{E_0}. \tag{6.6}$$

For $u$ in the ball

$$\|u\|_{E_2} \leq \varepsilon^q, \quad q := \frac{1}{p} + \frac{d}{2}, \tag{6.7}$$

the conditions (5.48), (5.50), (5.59) are all satisfied for $\varepsilon$ sufficiently small — more precisely, for $\varepsilon \in (0, \varepsilon_0]$, where $\varepsilon_0 := \min\{1, C_{s_0} \rho_3^{1/2}\}$, and $C_{s_0}, \rho_3$ are the constants in (5.48), (5.50), independent of $\varepsilon$. Then, for $u$ in the ball (6.7), Lemma 5.2 defines a right inverse $\Psi(u)$ of the linearized operator $\Phi'(u)$ (namely $h = \Psi(u)f$ solves the linear Cauchy problem $\Phi'(u)h = f$, which is (5.9)), with bound (5.62), which is

$$\|\Psi(u)f\|_{E_a} \lesssim_s \|f\|_{F_a} + \varepsilon^{1-\rho/2} \|u\|_{E_2}^{p-1} \|u\|_{E_{a+2}} \|f\|_{F_0}, \quad a \geq 2. \tag{6.8}$$

To reach the best radius for the initial data (see Remark 7.3 and Remark 7.4), we introduce the rescaled norm

$$\|u\|_{E_a} := \varepsilon^{-q} \|u\|_{E_2}. \tag{6.9}$$

Thus (6.7) becomes

$$\|u\|_{E_a} \leq 1. \tag{6.10}$$

By (6.6) and (6.8), for all $u$ in the unit ball (6.10) one has

$$\|\Phi''(u)[h_1, h_2]\|_{F_a} \lesssim_s \varepsilon^{q}(\|h_1\|_{E_{a+1}} \|h_2\|_{E_0} + \|h_1\|_{E_0} \|h_2\|_{E_{a+1}}) + \|u\|_{E_{a+1}} \|h_1\|_{E_0} \|h_2\|_{E_0}) \tag{6.11}$$

for $a \geq 0$, because $-1 - (\nu + 2)d/2 + q(\nu + 3) \geq q$ (recall that $\nu = \max\{p-2, 0\}$), and

$$\|\Psi(u)f\|_{E_a} \lesssim_s \varepsilon^{-q}(\|f\|_{F_a} + \|u\|_{E_{a+2}} \|f\|_{F_0}) \tag{6.12}$$

for $a \geq 2$. Hence $\Phi$ satisfies the assumptions of Theorem 9.11 with

$$a_0 = 0, \quad \mu = a_1 = 2, \quad \beta = \alpha > 4, \quad a_2 > 2\beta - 2, \quad U = \{u \in E_2 : \|u\|_{E_2} \leq 1\},$$

$$\delta_1 = 1, \quad M_1(a) = M_2(a) = C_a \varepsilon^q, \quad L_1(a) = L_2(a) = C_a \varepsilon^{-q}, \quad M_3(a) = L_3(a) = 0. \tag{6.13}$$

For any function $u_0 = u_0(x) \in H_{s_0+\beta}(\mathbb{R}^d)$, the pair $g = (0, u_0) \in F_\beta$ trivially satisfies the first inequality in (9.12) with $A = 1$ (in fact, the inequality is an identity), because $g$ does not depend on the time variable.

Hence, by Theorem 9.11 if $\|g\|_{F_\beta} \leq \delta$, with $\delta = C \varepsilon^q$ given by (9.13), there exists $u \in E_a$ such that $\Phi(u) = \Phi(0) + g = g$. This means that we have solved the nonlinear Cauchy problem (5.7), i.e. $\Phi(u) = (0, u_0)$, on the time interval $[0, T]$ for all initial data $u_0$ in the ball

$$\|u_0\|_{H_{s_0+\beta}} \leq \delta = C \varepsilon^q, \tag{6.14}$$

18
for all \( \varepsilon \in (0, \varepsilon_0] \). By (9.13), the solution \( u \) satisfies
\[
\|u\|_{E^{\alpha}} \leq C\varepsilon^{-q}\|g\|_{F^{\beta}}, \quad \text{i.e.} \quad \|u\|_{C^1H^{\delta_0+\beta}_\varepsilon} \leq C\|u_0\|_{H^{\delta_0+\beta}_\varepsilon}.
\]
The higher regularity part of Theorem 3.4 is also deduced from Theorem 9.1.

For data \( u_0 \) of the form
\[
u_0(x) = \varepsilon^{\sigma}(a_\varepsilon(x), a_\varepsilon(x)),
\]
see (5.8), where \( a_\varepsilon \) is defined in (3.5), one has
\[
\|u_0\|_{H^{\delta_0+\beta}_\varepsilon} \leq C\|a\|_{H^{\delta_0+\beta}_\varepsilon} \lesssim \varepsilon^{\sigma+\sigma_a} \|a\|_{H^{\delta_0+\beta}_\varepsilon} \leq C\varepsilon^q.
\]

Finally, given \( s_1 > d/2+4 \), we define \( \gamma := s_1 - (d/2+4) \), \( s_0 := d/2 + \gamma/2 \), \( \beta := 4 + \gamma/2 \), so that \( s_0 > d/2, \beta > 4, \) and \( s_1 = s_0 + \beta \). This concludes the proof of Theorem 3.4.

**Remark 6.1** *(Confirmation of the heuristics discussion of Section 2 in Theorem 3.4)*

The radius \( \delta \) given by the Nash-Moser Theorem 9.1 is the minimum among \( 1/L, \delta_1/L, 1/(L^2M) \); here (see (6.13)) these three quantities are all of order \( \varepsilon^q \). In particular, the “quadratic condition” \( \delta \leq 1/(L^2M) \), coming from the use of the second derivative \( \Phi''(u) \) in the Nash-Moser iteration, does not modify \( \delta \). This is a confirmation of the heuristic discussion of Section 2.

## 7 Free flow component decomposition

The “shifted map” trick used in [9] and [4] consists in choosing the solution of the linear part of the PDE as a starting point for the Nash-Moser iteration. The reason for which that trick works is that the free flow of functions of special structure (3.5) satisfies better estimates in \( L^\infty \) norm than the free flow of general Sobolev functions. This, combined with the power \( p \) of the nonlinearity in the equation, makes it possible to obtain solutions of larger size, which are the sum of a free flow and a correction of smaller size.

Here we use this property in a different way, splitting the problem into components of special structure (3.5) and corrections, introducing non-isotropic norms to catch the different size effect.

For any function \( a \in H^s(\mathbb{R}^d) \) we define \( \mathcal{T}_\varepsilon a \), \( 0 < \varepsilon \leq 1 \), as
\[
(\mathcal{T}_\varepsilon a)(x) := \begin{cases} a(x/\varepsilon) & (\text{concentrating case}), \\ e^{ix\cdot\xi/\varepsilon}a(x) & (\text{oscillating case}), \end{cases}
\]
so that, in both cases, (3.5) becomes \( a_\varepsilon = \mathcal{T}_\varepsilon a_0 \). To deal with conjugate pairs, define
\[
\mathcal{T}_{\varepsilon,c} a := (\mathcal{T}_\varepsilon a, \mathcal{T}_\varepsilon^{-1} b), \quad \mathcal{T}_{\varepsilon,c}^{-1}(b, \overline{b}) := \mathcal{T}_\varepsilon^{-1} b.
\]
Hence the initial datum \( u_0 \) defined in (5.8) can be written as \( u_0 = \varepsilon^{\sigma}\mathcal{T}_{\varepsilon,c} a_0 \).
Lemma 7.1. Let $a \in H^s(\mathbb{R}^d)$, $s \geq 0$. Then the Fourier transform of $T_\varepsilon a$ is
\[ \hat{(T_\varepsilon a)}(\xi) = \varepsilon^d \hat{a}(\varepsilon \xi) \quad \text{(concentrating)}, \]
\[ \hat{(T_\varepsilon a)}(\xi) = \hat{a}(\xi - \xi_0/\varepsilon) \quad \text{(oscillating)}, \]
and one has
\[ \|T_\varepsilon a\|_{H^s} \leq \varepsilon^s (2\|a\|_{H^s} + C_s \|a\|_{L^2}) \]  
\[ \|T_\varepsilon a\|_{H^s} \leq \varepsilon^s (2\|a\|_{H^s} + C_s \|a\|_{L^2}) \]
where
\[ \sigma_a = d/2 \quad \text{(concentrating)}, \quad \sigma_a = 0 \quad \text{(oscillating)}. \]

Proof. Formula (7.2) is a direct calculation. Then, in the concentrating case, $\|T_\varepsilon a\|_{H^s} = \varepsilon^{d/2} \|a\|_{H^s}$. In the oscillating case, using the change of variable $\xi - \xi_0/\varepsilon = \eta$ and applying (10.10), one has $\|T_\varepsilon a\|_{H^s} \leq 2\|a\|_{H^s} + C_s \|a\|_{L^2}$. \qed

Formula (7.2) is a direct calculation. Then, in the concentrating case, $\|T_\varepsilon a\|_{H^s} = \varepsilon^{d/2} \|a\|_{H^s}$. In the oscillating case, using the change of variable $\xi - \xi_0/\varepsilon = \eta$ and applying (10.10), one has $\|T_\varepsilon a\|_{H^s} \leq 2\|a\|_{H^s} + C_s \|a\|_{L^2}$.

Given any $y_0 \in H^s(\mathbb{R}^d)$, let $y = S y_0$ denote the solution of the linear Cauchy problem
\[ \begin{cases}
\partial_t y + i\varepsilon^{-2} A(\varepsilon \partial_x) y = 0, \\
y(0, x) = y_0(x),
\end{cases} \]  
(7.5)
so that $S$ is the free Schrödinger solution map. For initial data of type $T_\varepsilon a$, the flow $ST_\varepsilon a$ has special properties, which are used in the proof of Theorem 4.6 in [9], that we recall in the following lemma.

Lemma 7.2. For all real $s \geq 0$, $s_0 > d/2$, all multi-indices $\alpha \in \mathbb{N}^d$, for all $t \in \mathbb{R}$ the solution
\[ y = ST_\varepsilon a \]
of the linear Cauchy problem (7.5) with initial datum $y_0 = T_\varepsilon a$ satisfies
\[ \|y(t)\|_{L^\infty} \leq C_{s_0} \|a\|_{H^{s_0}}, \]  
(6.1)
\[ \varepsilon^2 \|\partial_t y(t)\|_{L^\infty} \leq C_{s_0} \|a\|_{H^{s_0} + 2}, \]  
(7.6)
\[ \varepsilon^{|\alpha|} \|\partial_x^\alpha y(t)\|_{L^\infty} \leq C_{|\alpha|, s_0} \|a\|_{H^{s_0} + |\alpha|}, \]  
(7.7)
\[ \|y(t)\|_{H^s} = \|T_\varepsilon a\|_{H^s}. \]  
(7.8)

Proof. At each time $t$ one has $|y(t, x)| \leq \|\hat{y}(t, \cdot)\|_{L^1}$ by inverse Fourier formula, and $|\hat{y}(t, \xi)| = |\hat{y}(0, \xi)| = \|\hat{T_\varepsilon a}\|_{L^1}$ for all $t, \xi$ because $y$ solves (7.5). By (7.2), one has $\|\hat{T_\varepsilon a}\|_{L^1} = \|a\|_{L^1}$ in both cases. This proves (7.6) because, by Hölder’s inequality, $\|\hat{a}\|_{L^1} \lesssim s_0 \|a\|_{H^{s_0}}$.

To prove (7.7) we use the equation in (7.5) recalling that $\varepsilon^{-2} A(\varepsilon \partial_x) = A(\partial_x)$. Proceeding as above, we get $|\partial_t y(t, x)| \leq \int |\xi|^2 |\hat{T_\varepsilon a}(\xi)| d\xi$, then we use (7.2) to conclude. Similarly, (7.8) follows from $|\partial_x^\alpha y(t, x)| \leq \int |\xi|^{|\alpha|} |\hat{T_\varepsilon a}(\xi)| d\xi$. Finally, (7.9) is trivial. \qed

We look for a solution of the Cauchy problem (5.7) by decomposing the unknown $u$ into the sum of the solution of the free Schrödinger equation with initial datum $u_0$ of the form (5.8) and a “correction” $\tilde{u}(t, x)$ of smaller size.

For any pair $(a, \tilde{u})$ where $a = a(x) \in H^s(\mathbb{R}^d)$ and $\tilde{u} = \tilde{u}(t, x) \in C^0([0, T], H^s(\mathbb{R}^d)) \cap C^1([0, T], H^{s-2}(\mathbb{R}^d))$ with $\tilde{u}(0, x) = 0$, we define
\[ \Phi(a, \tilde{u}) := \left( \partial_t u + P(u) \right)_a \]
where $u = \varepsilon^s ST_\varepsilon a + \tilde{u}$.  
(7.10)
At time $t = 0$ the function $u$ in (7.10) satisfies $u(0) = \varepsilon^{\sigma} T_{e,c} a$. Hence the Cauchy problem (5.7) becomes

$$\Phi(a, \tilde{u}) = (0, a_0).$$

(7.11)

We solve (7.11) by applying our Nash-Moser-Hörmander theorem; therefore we have to construct a right inverse for the linearized operator and to estimate the second derivative. We only have to adapt the general analysis of Section 5 to functions $u$ of the form (7.10).

**Right inverse of the linearized operator.** The differential of $\Phi$ at the point $(a, \tilde{u})$ in the direction $(b, \tilde{h})$ is

$$\Phi'(a, \tilde{u})(b, \tilde{h}) = \left( \begin{array}{c} \partial h + P'(u) \tilde{h} \\ b \end{array} \right)$$

where $u = \varepsilon^{\sigma} ST_{e,c} a + \tilde{u}$, $h = \varepsilon^{\sigma} ST_{e,c} b + \tilde{h}$ (7.12)

and $\tilde{u}(0) = 0$, $\tilde{h}(0) = 0$. Given $(a, \tilde{u})$ and $g = (g_1, g_2)$, with $g_1 = g_1(t, x)$ and $g_2 = g_2(x)$, the right inversion problem for the linearized operator $\Phi'(a, \tilde{u})$ consists in finding $(b, \tilde{h})$ such that

$$\Phi'(a, \tilde{u})(b, \tilde{h}) = g,$$

i.e.

$$\begin{cases} \partial h + P'(u) \tilde{h} = g_1, \\ b = g_2 \end{cases}$$

(7.13)

with $u, h$ as in (7.12). Since the free flow $\varepsilon^{\sigma} ST_{e,c} b = \varepsilon^{\sigma} ST_{e,c} g_2$ solves (7.5), and $\tilde{h}(0) = 0$ by construction, (7.13) is equivalent to the following problem for $h$:

$$\begin{cases} \partial_t h + P'(u) \tilde{h} = g_1 + \varepsilon^{-1} B(u, \varepsilon \partial_x) \varepsilon^{\sigma} ST_{e,c} g_2 - R_0(u) \varepsilon^{\sigma} ST_{e,c} g_2, \\ \tilde{h}(0) = 0, \end{cases}$$

(7.14)

namely $\tilde{h}$ has to solve the linear Cauchy problem (5.9) with

$$f_1 = g_1 + \varepsilon^{-1} B(u, \varepsilon \partial_x) \varepsilon^{\sigma} ST_{e,c} g_2 - R_0(u) \varepsilon^{\sigma} ST_{e,c} g_2, \quad f_2 = 0.$$  

(7.15)

The solution of (5.9) is estimated in Lemma 5.1. To apply that lemma, we check that $u$ satisfies its hypotheses. By Lemma 7.2, (4.6), (4.9), (4.15), (4.16), the function $u = \varepsilon^{\sigma} ST_{e,c} a + \tilde{u}$ satisfies

$$\|u\|_{C^1_l W^m_x} \lesssim s_0 m \varepsilon^{\sigma} \|a\|_{H^{\alpha_0 + m}} + \varepsilon^{-d/2} \|\tilde{u}\|_{C^1_l H^{\alpha_0 + m}}, \quad m \in \mathbb{N}.$$  

(7.16)

For all $s$, let

$$\|(a, \tilde{u})\|_{X^s} := \varepsilon^{\sigma} \|a\|_{H^{s}} + \varepsilon^{-d/2} \|\tilde{u}\|_{C^1_l H^{s}}.$$  

(7.17)

By (7.16), one has, in particular,

$$\|u\|_{W^{2,\infty}} + \varepsilon^2 \|\partial_t u\|_{L^\infty} \lesssim s_0 \|(a, \tilde{u})\|_{X^{\alpha_0 + 2}},$$  

(7.18)

and therefore there exists $\rho_1 \in (0, 1)$, depending only on $s_0$ and on the nonlinearity of the problem, such that, for $(a, \tilde{u})$ in the ball

$$\varepsilon^{-1} \|(a, \tilde{u})\|_{X^{\alpha_0 + 2}}^p \leq \rho_1,$$

(7.19)

the function $u = \varepsilon^{\sigma} ST_{e,c} a + \tilde{u}$ satisfies (5.31) and (5.13). Hence Lemma 5.1 applies, and $\tilde{h}$ satisfies bound (5.42). Moreover, assuming (7.19), the factor in $u$ appearing in (5.42) satisfies

$$\begin{align*}
\|(a, \tilde{u})\|_{X^{\alpha_0 + 2}}^p &\lesssim \|(a, \tilde{u})\|_{X^{\alpha_0 + 2}}^p \\
\|(a, \tilde{u})\|_{X^{\alpha_0 + 2}}^p &\lesssim s \|(a, \tilde{u})\|_{X^{\alpha_0 + 2}}^p \|(a, \tilde{u})\|_{X^{\alpha_0 + 2}}^p \\
\|v\|_{C^1_l W^m_x} &\lesssim \|v\|_{C^1_l W^m_x} + \|v\|_{W^{2,\infty}} \lesssim s \|(a, \tilde{u})\|_{X^{\alpha_0 + 2}}^p \|(a, \tilde{u})\|_{X^{\alpha_0 + 2}}^p
\end{align*}$$

(7.20)
because $|s| \leq s$, $\nu + 1 = \max\{p - 2, 0\} + 1 \geq p - 1$ and $\|(a, \tilde{u})\|_{X^{\nu + 2}} \leq 1$.

Thus we have to estimate $f_1$ in (7.20). By (5.20) and (7.26), using (7.18), (7.19), (7.17), (7.9) and Lemma 7.1 for all $s \geq 0$ one has

$$
\|e^{-1}B(u, \varepsilon \partial_x)\varepsilon^{\gamma} \mathcal{S} T_{\varepsilon, x}g_2 \|_{H^s_x} \lesssim \varepsilon^{\sigma + \sigma_2 - 1} \|(a, \tilde{u})\|^p_{X^{\nu + 2}} \|g_2\|_{H^{\nu + 1}}
$$

(7.21)

$$
\|R_0(u)\varepsilon^{\gamma} \mathcal{S} T_{\varepsilon, x}g_2 \|_{H^s_x} \lesssim \varepsilon^{\sigma + \sigma_2 - 1} \|(a, \tilde{u})\|^p_{X^{\nu + 2}} \|g_2\|_{H^{\nu + 1}}
$$

(7.22)

By (7.16), (7.24), (7.22), (7.20) and Lemma 7.1 for $(a, \tilde{u})$ in the ball (7.19), for $s \geq 1$ we obtain

$$
\|\tilde{h}\|_{C^0_t H^s_x} \lesssim \|(a, \tilde{u})\|_{X^{\nu + 2}} \|g_1\|_{C^0_t H^s_x} + \varepsilon^{\sigma + \sigma_2 - 1} \|(a, \tilde{u})\|^p_{X^{\nu + 2}} \|g_2\|_{H^{\nu + 1}}
$$

(7.23)

For all $(a, \tilde{u})$ in the ball (7.19). As explained in Remark 7.3 in general, and in Remark 7.4 for our specific problem, for $p > 1$ it is convenient

(i) to consider $(a, \tilde{u})$ in the ball

$$
\|(a, \tilde{u})\|_{X^{\nu + 2}} \leq \rho_2 \varepsilon^{(p - 1)/2 - \sigma_2}
$$

(7.25)

which is smaller than the ball (7.19) if $\sigma_2 = 0$, and it is the same ball if $\sigma_2 = d/2$;

(ii) to rescale $\|\cdot\|_{X^s}$ so that (7.20) becomes a ball with radius $O(1)$ (i.e., independent of $\varepsilon$) in the rescaled norm.

Thus we define

$$
\|(a, \tilde{u})\|_{Z^s} := \varepsilon^{(p - 1)/2} \|(a, \tilde{u})\|_{X^s},
$$

(7.26)

and (7.24) becomes

$$
\|(b, \tilde{h})\|_{Z^s} \lesssim \varepsilon^{(p - 1)/2} \|(a, \tilde{u})\|_{Z^{\nu + 2}} \|g_1\|_{C^0_t H^s_x} + \varepsilon^{(p - 1)/2} \|(a, \tilde{u})\|_{Z^{\nu + 2}} \|g_2\|_{H^{\nu + 1}}
$$

(7.27)

for all $s \geq 1$, all $(a, \tilde{u})$ in the ball

$$
\|(a, \tilde{u})\|_{Z^{\nu + 2}} \leq \rho_2.
$$

(7.28)
Therefore, in the case \( p > 1 \),
\[
\| (b, \tilde{h}) \|_{Z^s} \lesssim s \varepsilon^{\sigma + (\sigma_n - 1 - d/2)/p} \left\{ \varepsilon^{\sigma - d/2} \| g_1 \|_{C^0 H_x^s} + \| g_2 \|_{H^{s+1}} \right\} + \| (a, \tilde{u}) \|_{Z^{s+\sigma_n+3}} \varepsilon^{\sigma - \sigma_n} \| g_1 \|_{C^0 L^2} + \| g_2 \|_{H^1} \}
\] (7.29)
for all \( s \geq 1 \), all \((a, \tilde{u})\) in the ball \( B \).

For \( p = 1 \), the restriction to the ball \( B \) is not convenient (see Remark 7.23 and Remark 7.31), and we take, instead, \( u \) in the entire ball \( B \). Hence, for \( p = 1 \), we define
\[
\| (a, \tilde{u}) \|_{Z^s} := \varepsilon^{-1} \| (a, \tilde{u}) \|_{X^s},
\] (7.30)
and (7.24) becomes
\[
\| (b, \tilde{h}) \|_{Z^s} \lesssim s \varepsilon^{-1} \| g_1 \|_{C^0 H_x^s} + \varepsilon^{-1} \| (a, \tilde{u}) \|_{Z^{s+\sigma_n+3}} \| g_1 \|_{C^0 L^2} \left\{ 1 + \varepsilon^{\sigma_n - d/2} \| (a, \tilde{u}) \|_{Z^{s+\sigma_n+2}} \right\} \| g_2 \|_{H^{s+1}} + \varepsilon^{\sigma + \sigma_n - d/2} \| (a, \tilde{u}) \|_{Z^{s+\sigma_n+3}} \| g_2 \|_{H^1}
\] (7.31)
for all \((a, \tilde{u})\) in the ball \( B \).

Therefore, in the case \( p = 1 \),
\[
\| (b, \tilde{h}) \|_{Z^s} \lesssim s \varepsilon^{\sigma + \sigma_n - 1 - d/2 \| g_1 \|_{C^0 H_x^s} + \| g_2 \|_{H^{s+1}}} + \| (a, \tilde{u}) \|_{Z^{s+\sigma_n+3}} \varepsilon^{\sigma - \sigma_n} \| g_1 \|_{C^0 L^2} + \| g_2 \|_{H^1} \}
\] (7.33)
for all \( s \geq 1 \), all \((a, \tilde{u})\) in the ball \( B \).

Note that we have used norms \( \| \cdot \|_{Z} \) for \( p = 1 \) and norms \( \| \cdot \|_{Z^s} \) for \( p > 1 \).

**Estimate for the second derivative.** By (7.10), (7.11), (7.19), and Lemma 7.21, any function \( u = \varepsilon^{\sigma_n} \mathcal{S}_{\varepsilon, a} + \tilde{u} \) satisfies
\[
\| u \|_{H^s} \lesssim s \varepsilon^{\sigma_n} \| a \|_{H^s} + \| \tilde{u} \|_{H^s} \lesssim s \varepsilon^{\sigma_n} \| (a, \tilde{u}) \|_{X^s},
\]
\[
\| u \|_{L^\infty} \lesssim \| (a, \tilde{u}) \|_{X^{s}},
\]
\[
\| u \|_{W^{1,\infty}} \lesssim \| (a, \tilde{u}) \|_{X^{s+1}}.
\]

From (5.46) we deduce that
\[
\| P^n(u)[h_1, h_2] \|_{H^s} \lesssim s \varepsilon^{\sigma_n - 1} \| (a, \tilde{u}) \|_{X^{s+1}} \| (b_1, \tilde{h}_1) \|_{X^s} \| (b_2, \tilde{h}_2) \|_{X^s} \| (b_1, \tilde{h}_1) \|_{X^{s+1}} \| (b_2, \tilde{h}_2) \|_{X^{s+1}} + \varepsilon^{\sigma_n - 1} \| (a, \tilde{u}) \|_{Z^{s+1}} \| (b_1, \tilde{h}_1) \|_{X^{s+1}} \| (b_2, \tilde{h}_2) \|_{X^{s+1}}
\] (7.34)
for \( u = \varepsilon^{\sigma_n} \mathcal{S}_{\varepsilon, a} + \tilde{u}, h_i = \varepsilon^{\sigma_n} \mathcal{S}_{\varepsilon, b_i} + \tilde{h}_i, i = 1, 2, \) and \( s \geq 0 \).

With the norms \( \| \cdot \|_{Z^s} \) defined in (7.26), which we use in the case \( p > 1 \), from (7.33) we get
\[
\| P^n(u)[h_1, h_2] \|_{H^s} \lesssim s \varepsilon^{d/2 + (1 - d/2 + \sigma_n)/p} \| (a, \tilde{u}) \|_{Z^{s+1}} \| (b_1, \tilde{h}_1) \|_{Z^{s+1}} \| (b_2, \tilde{h}_2) \|_{Z^{s+1}} + \| (b_1, \tilde{h}_1) \|_{Z^{s+1}} \| (b_2, \tilde{h}_2) \|_{Z^{s+1}}
\]
Hence, for \((a, \tilde{u})\) in the ball \((7.28)\), for \(s \geq 0\), in the case \(p > 1\), one has
\[
\|P''(u)[h_1, h_2]\|_{H^s}\nonumber \\
\lesssim s \varepsilon^d/2+(1+d/2-\sigma s)/p \left\{ \|b_1, \tilde{h}_1\|_{Z^{s+1}} \|b_2, \tilde{h}_2\|_{Z^{s+1}} \right. \\
\left. + \|a, \tilde{u}\|_{Z^{s+1}} \|b_1, \tilde{h}_1\|_{Z^s} \|b_2, \tilde{h}_2\|_{Z^s} \right\}. \quad (7.35)
\]
For \(p = 1\), with the norms \(\| \|_{Z^s}\) defined in \((7.30)\), for \((a, \tilde{u})\) in the ball \((7.32)\), for \(s \geq 0\), one has
\[
\|P''(u)[h_1, h_2]\|_{H^s} \lesssim s \varepsilon^s + 1 \left\{ \|b_1, \tilde{h}_1\|_{Z^{s+1}} \|b_2, \tilde{h}_2\|_{Z^{s+1}} \right. \\
\left. + \|a, \tilde{u}\|_{Z^{s+1}} \|b_1, \tilde{h}_1\|_{Z^s} \|b_2, \tilde{h}_2\|_{Z^s} \right\}. \quad (7.36)
\]

**Remark 7.3 (Best rescaling for Nash-Moser application).** In this remark we discuss a general, simple way to choose the best rescaling to obtain the largest size ball for the solution when applying the Nash-Moser Theorem \(9.1\) (or essentially any other Nash-Moser theorem).

Suppose we have a nonlinear operator \(\Phi\) and a right inverse \(\Psi(u)\) of its linearized operator \(\Phi'(u)\), satisfying an estimate of the form
\[
\|\Psi(u)g\|_{X^s} \leq (A + B\|u\|_{X^s}^P)\|g\|_{Y^s} + C\|u\|_{X^s}^{p-1}\|u\|_{X^s}\|g\|_{Y^{s+1}} \quad (7.37)
\]
for all \(u\) in a low norm ball
\[
\|u\|_{X^0} \leq R \quad (7.38)
\]
for some positive constants \(A, B, C, R\), where \(\|\|_{X^s}\) are the norms on the domain of \(\Phi\), \(\|\|_{Y^s}\) are those on its codomain, and \(s\) denotes high norms, while \(s_0\) denotes low norms (we ignore any possible loss of regularity, which is not the point in this discussion). From \((7.37), (7.38)\) we deduce bound
\[
\|\Psi(u)g\|_{X^s} \leq (A + BR^p)\|g\|_{Y^s} + CR^{p-1}\|u\|_{X^s}\|g\|_{Y^{s+1}} \quad (7.39)
\]
for \(u\) in the ball \((7.38)\). Then Theorem \(9.1\) gives a solution of the problem \(\Phi(0) + g\) for all data \(g\) in the ball
\[
\|g\|_{Y^{s+1}} \leq \delta \quad (7.40)
\]
where (ignoring, at least for the moment, the contribution to \(\delta\) coming from the second derivative \(\Phi''(u)[h_1, h_2]\) of the operator \(\Phi\) the radius \(\delta\) is essentially given by
\[
\delta = \min \left\{ \frac{1}{L}, \frac{R}{L} \right\}, \quad L = A + BR^p + CR^{p-1}. \quad (7.41)
\]
Our goal is to find the best (i.e. the largest possible) radius \(\delta\) that we can obtain in this situation.

First, we consider a rescaling of the norm \(\|\|_{X^s}\): for any \(\lambda\) positive, let
\[
\lambda \|u\|_{X^s} =: \|u\|_{Z^s}. \quad (7.42)
\]
Then \((7.37), (7.38)\) become
\[
\|\Psi(u)g\|_{Z^s} \leq (A\lambda + B\lambda^{1-p}\|u\|_{Z^s}^P)\|g\|_{Y^s} + C\lambda^{1-p}\|u\|_{Z^s}^{p-1}\|u\|_{Z^s}\|g\|_{Y^{s+1}} \quad (7.43)
\]
for all \(u\) in the rescaled ball
\[
\|u\|_{Z^s} \leq R\lambda. \quad (7.44)
\]
From (7.43), (7.44) we get the bound
\[ \| \Psi(u)g \|_{Z^s} \leq (A\lambda + B\lambda R^p)\|g\|_{Y^s} + CR^p - 1 \|u\|_{Z^s}\|g\|_{Y^s} \]  
(7.45)
for \( u \) in the ball (7.44). Then Theorem 9.1 solves the nonlinear problem for all data \( g \) in the ball
\[ \|g\|_{Y^s} \leq \delta(\lambda), \]  
(7.46)
where now the radius is
\[ \delta(\lambda) = \min \left\{ \frac{R\lambda}{L(\lambda)}, \frac{1}{L(\lambda)} \right\}, \quad L(\lambda) = \lambda(A + BR^p) + CR^p - 1. \]  
(7.47)
For \( \lambda \geq 1/R \), one has
\[ \delta(\lambda) = \frac{1}{L(\lambda)} = \frac{1}{\lambda(A + BR^p) + CR^p - 1}, \]  
(7.48)
which is a decreasing function of \( \lambda \), so that \( \delta(\lambda) \leq \delta(1/R) \) for all \( \lambda \geq 1/R \). For \( 0 < \lambda \leq 1/R \), one has
\[ \delta(\lambda) = \frac{R\lambda}{L(\lambda)} = \frac{R\lambda}{\lambda(A + BR^p) + CR^p - 1} = \frac{R}{A + BR^p + CR^p - 1\lambda - 1}, \]  
(7.49)
which is an increasing function of \( \lambda \), so that \( \delta(\lambda) \leq \delta(1/R) \) for all \( \lambda \in (0, 1/R] \). In other words, the largest radius \( \delta(\lambda) \) we can get by the rescaling (7.42) is attained at \( \lambda = 1/R \). Note that \( \lambda = 1/R \) is the value of \( \lambda \) corresponding to the unit ball \( \|u\|_{Z^s} \leq 1 \) in the rescaled norm (7.44). For \( \lambda = 1/R \) we get the radius
\[ \delta_R := \delta(1/R) = \frac{1}{AR^{-1} + (B + C)R^{p-1}}. \]  
(7.50)
Second, we check if taking \( u \) in a smaller ball can give a better balance among the constants, and therefore a larger radius for the data. From (7.37), (7.38) we deduce that, for every \( r \in (0, R] \),
\[ \| \Psi(u)g \|_{X^s} \leq (A + Br^p)\|g\|_{Y^s} + Cr^p - 1 \|u\|_{X^s}\|g\|_{Y^s} \]  
(7.51)
for all \( u \) in the ball
\[ \|u\|_{X^s} \leq r. \]  
(7.52)
Apply the best rescaling of the form (7.42), which is
\[ \frac{1}{r}\|u\|_{X^s} =: \|u\|_{Z^s}. \]  
(7.53)
Then, by the discussion above, we obtain the radius
\[ \delta_r = \delta(1/r) = \frac{1}{Ar^{-1} + (B + C)r^{p-1}}. \]  
(7.54)
To maximize the radius \( \delta_r \) in (7.54), we minimize its denominator \( \varphi(r) := Ar^{-1} + (B + C)r^{p-1} \) over \( r \in (0, R] \). For \( p = 1 \), \( \varphi \) is decreasing in \((0, \infty)\), and then the largest \( \delta_r \) is
heuristic discussion of Section 2 shows that, in many situations, this is the case.

Introducing this additional constrain to the radius $\delta$ is a condition of the form $r_0 \leq R$, and at $r = R$ if $R \leq r_0$, namely at $r = \min\{r_0, R\}$ in both cases. Therefore the best radius is

$$\max_{r \in (0, R]} \delta_r = \begin{cases} \delta_R & \text{for } p = 1, \\ \delta_R & \text{for } p > 1 \text{ and } R \leq r_0, \\ \delta_{r_0} & \text{for } p > 1 \text{ and } r_0 \leq R. \end{cases}$$

In fact, to apply the result of this discussion to a specific operator, the only point one has to check is whether $r_0 \leq R$ or vice versa.

In this way we get the best radius ignoring the contribution coming from $\Phi''(u)$, which is a condition of the form $\delta \leq M^{-1}L^{-2}$ (see Theorem 9.1). Then one has to check if introducing this additional constrain to the radius $\delta$ does not change its optimal size. The heuristic discussion of Section 2 shows that, in many situations, this is the case.

Remark 7.4. We see how the discussion of Remark 7.3 applies to our specific problem.

By (7.19) (ignoring the harmless constant $\rho_1$) and (7.24) (ignoring $g_1$, which will be zero in the datum of the original nonlinear problem) one has

$$A \sim \varepsilon^\sigma, \quad B \sim C \sim \varepsilon^\sigma + \sigma_1 - 1 - d/2, \quad R \sim \varepsilon^{1/p}.$$ 

This gives $r_0 \sim \varepsilon^{1 + d/2 - \sigma_1/p} \lesssim R$, and therefore the best choice is to restrict $u$ to the smaller ball $\|u\|_{X_{\sigma_0 + 2}} \lesssim r_0$ and then to rescale as in (7.26), corresponding to $\lambda = 1/r_0$.

In the previous case, by (7.59) and (6.02) one has

$$A \sim 1, \quad B + C \sim \varepsilon^{-pq}, \quad R \sim \varepsilon^q,$$

with $q = 1/p + d/2$. This gives $r_0 \sim \varepsilon^q \sim R$, and therefore the best rescaling for the linearized operator is (6.9), corresponding to $\lambda = 1/R$.

8 Proof of Theorem 3.5

Let $p > 1$, and define

$$E_{a,1} := H^{\sigma_0 + a}(\mathbb{R}^d),$$

$$E_{a,2} := \{ \tilde{u} \in C([0, T], H^{\sigma_0 + a}(\mathbb{R}^d)) \cap C^1([0, T], H^{\sigma_0 + a - 2}(\mathbb{R}^d)) : \tilde{u}(0, x) = 0\},$$

$$E_a := E_{a,1} \times E_{a,2},$$

$$F_{a,1} := C([0, T], H^{\sigma_0 + a}(\mathbb{R}^d)),$$

$$F_{a,2} := H^{\sigma_0 + a + 1}(\mathbb{R}^d),$$

$$F_a := F_{a,1} \times F_{a,2}.$$ (8.6)

We consider norms (7.26) on $E_a$, namely

$$\|(a, \tilde{u})\|_{E_a} := \varepsilon^{(\sigma_0 - 1 - d/2)/p} (\varepsilon^\sigma \|a\|_{H^{\sigma_0 + a}} + \varepsilon^{-d/2} \|\tilde{u}\|_{C^1 H^{\sigma_0 + a}}),$$

(8.7)
and, on $F_a$, we define
\[
\|g\|_{F_a} = \|(g_1, g_2)\|_{F_a} := \varepsilon^{-\sigma-d/2} \|g_1\|_{C^0 H^s_{\alpha+a}} + \|g_2\|_{H^{s_0+a+1}}
\] (8.8)
(note that $\|a\|_{H^s_{\alpha+a}}$ and $\|g_2\|_{H^{s_0+a+1}}$ in (8.7) and (8.8) are the standard Sobolev norms, without $\varepsilon$). For $(a, \bar{u}) \in E_a$ and $g = (g_1, g_2) \in F_a$, we define
\[
S_j(a, \bar{u}) := (S^j_1 a, S^j_2 \bar{u}), \quad S_j g := (S^j_1 g_1, S^j_2 g_2),
\] (8.9)
where $S^j_1$, $S^j_2$ are the crude Fourier truncations $\varepsilon |\xi| \leq 2^j$, $|\xi| \leq 2^j$ respectively, namely
\[
S^j f(x) := (2\pi)^{-d/2} \int_{|\xi| \leq 2^j} \hat{f}(\xi) e^{i\xi \cdot x} d\xi, \quad S^j f(x) := (2\pi)^{-d/2} \int_{|\xi| \leq 2^j} \hat{f}(\xi) e^{i\xi \cdot x} d\xi.
\]
Thus $S_j$ in (8.9) satisfy all (9.2)-(9.8) with constants independent of $\varepsilon$.

We consider the operator $\Phi$ defined in (7.10). The ball (7.28) becomes
\[
\|a\|_{E_2} \leq \rho_2.
\] (8.10)
For all $(a, \bar{u})$ in the ball (8.10), by (7.29) the linearized problem $\Phi'(a, \bar{u})(b, \bar{h}) = g$ has the solution $(b, \bar{h}) =: \Psi(a, \bar{u}) g$, which satisfies, for all $a \geq 0$,
\[
\|
\Psi(a, \bar{u}) g\|_{E_a} \lesssim \varepsilon^{\sigma+(\sigma_a-1-d/2)\rho} \|g\|_{F_a} + \|a\|_{E_{a+s_0+1}} \|g\|_{F_0},
\] (8.11)
where we assume that $s_0 \geq 1$ and $s_0 > d/2$. The second derivatives of $\Phi$ is
\[
\Phi''(a, \bar{u})((b_1, \bar{h}_1), (b_2, \bar{h}_2)) = \begin{pmatrix} P''(u)[h_1, h_2] & 0 \\ 0 & 0 \end{pmatrix}
\]
where $u = \varepsilon^\sigma S T_{e,a} + \bar{u}$ and $h_i = \varepsilon^\sigma S T_{e,a} b_i + \bar{h}_i$, $i = 1, 2$. By (7.35) and (8.8), for $(a, \bar{u})$ in the ball (8.10), one has, for $a \geq 0$,
\[
\|
\Phi''(a, \bar{u})((b_1, \bar{h}_1), (b_2, \bar{h}_2))\|_{F_a} = \varepsilon^{-\sigma-d/2} \|P''(u)[h_1, h_2]\|_{C^0 H^s_{\alpha+a}} 
\lesssim \varepsilon^{-\sigma+(1+d/2-\sigma_a)\rho} \{ \|b_1, \bar{h}_1\|_{E_{a+1}} \|b_2, \bar{h}_2\|_{E_0} + \|b_1, \bar{h}_1\|_{E_0} \|b_2, \bar{h}_2\|_{E_{a+1}} 
+ \|a, \bar{u}\|_{E_{a+1}} \|b_1, \bar{h}_1\|_{E_0} \|b_2, \bar{h}_2\|_{E_0} \}
\] (8.12)
Hence $\tilde{\Phi}$ satisfies the assumptions of Theorem 9.1 with
\[
a_0 = 0, \quad \mu = a_1 = 2, \quad \beta = \alpha = s_0 + 3 > 4, \quad a_2 > 2\beta - 2, \\
U = \{ (a, \bar{u}) \in E_2 : \|a, \bar{u}\|_{E_2} \leq \rho_2 \}, \quad \delta_1 = \rho_2, \quad M_3(a) = L_3(a) = 0, \\
M_1(a) = M_2(a) = C_a \varepsilon^{-\sigma+(1+d/2-\sigma_a)/p}, \quad L_1(a) = L_2(a) = C_a \varepsilon^{(1+d/2-\sigma_a)/p}. 
\] (8.13)
For any function $a_0 = a_0(x) \in H^{s_0+\beta+1}(\mathbb{R}^d)$, the pair $g = (0, a_0) \in F_\beta$ trivially satisfies the first inequality in (9.12) with $A = 1$ (in fact, the inequality is an identity), because $a_0$ does not depend on the time variable. Hence, by Theorem 9.1 for every $g = (0, a_0)$ in the ball
\[
\|a_0\|_{H^{s_0+\beta+1}} = \|g\|_{F_\beta} \leq \delta,
\] (8.14)
with
\[
\delta = C_\varepsilon^{-\sigma+(1+d/2-\sigma_a)/p}
\] (8.15)
given by (9.13), there exists \((a, \tilde{u}) \in E \alpha\) such that \(\tilde{\Phi}(a, \tilde{u}) = \tilde{\Phi}(0, 0) + g = (0, a_0)\). By (7.10), this means that \(a = a_0\) and the sum \(u = \varepsilon \sigma ST_{\varepsilon,\sigma}a_0 + \tilde{u}\) solves the nonlinear Cauchy problem (5.7) on the time interval \([0, T]\) with initial datum \(u(0) = u_0 = \varepsilon \sigma T_{\varepsilon,\sigma}a_0\). By (9.13),
\[
\|(a, \tilde{u})\|_{E_\alpha} \leq C\varepsilon^{\sigma-(1+d/2-\sigma_\alpha)/p}\|g\|_{F_\beta},
\]
namely
\[
\varepsilon^{\sigma}\|a_0\|_{H^{\alpha_0+\beta}} + \varepsilon^{-d/2}\|\tilde{u}\|_{C_1^1H^{\alpha_0+\beta}} \leq C\varepsilon^{\sigma}\|a_0\|_{H^{\alpha_0+\beta+1}},
\]
whence
\[
\|\tilde{u}\|_{C_1^1H^{\alpha_0+\beta}} \leq C\varepsilon^{\sigma+d/2}\|a_0\|_{H^{\alpha_0+\beta+1}}.
\]
All \(\|a_0\|_{H^{\alpha_0+\beta+1}} \leq 1\) belong to the ball (8.14) if \(1 \leq \delta\), and this holds for \(\varepsilon\) sufficiently small if
\[
\sigma > \frac{1+d/2-\sigma_\alpha}{p}
\]
The higher regularity part of Theorem 3.5 is also deduced from Theorem 9.1.

Finally, given \(s_1 > \max\{6, d+4\}\), we define \(s_0 := (s_1-4)/2\), so that \(s_0 > \max\{1, d/2\}\), and the proof of Theorem 3.5 is complete.

Remark 8.1 (Confirmation of the heuristics discussion of Section 2 in Theorem 3.5) The radius \(\delta\) given by the Nash-Moser Theorem 9.1 is the minimum among \(1/L, \delta_1/L, 1/(L^2M)\); here (see (8.13)) these three quantities are all of order \(\varepsilon^{-\sigma+(1+d/2-\sigma_\alpha)/p}\). In particular, the “quadratic condition” \(\delta \leq 1/(L^2M)\), coming from the use of the second derivative \(\Phi''(u)\) in the Nash-Moser iteration, does not modify \(\delta\). This is a confirmation of the heuristic discussion of Section 2.

For completeness, now we perform the same analysis in the case \(p = 1\). We consider the same function spaces (8.14)-(8.6) as above, but now we use norms (7.30) on \(E_\alpha\), namely (see also (7.17))
\[
\|(a, \tilde{u})\|_{E_\alpha} := \varepsilon^{\sigma-1}\|a\|_{H^{\alpha_0+a}} + \varepsilon^{-1-d/2}\|\tilde{u}\|_{C_1^1H^{\alpha_0+a}},
\]
and, on \(F_\alpha\), we define
\[
\|g\|_{F_\alpha} = \|(g_1, g_2)\|_{F_\alpha} := \varepsilon^{-\sigma-\sigma_\alpha}\|g_1\|_{C_0^0H^{\alpha_0+a}} + \|g_2\|_{H^{\alpha_0+a+1}}.
\]
By (7.32), (7.33) and (7.36), for \((a, \tilde{u})\) in the ball
\[
\|(a, \tilde{u})\|_{E_\alpha} \leq \rho_2,
\]
for \(\rho_2 \geq 0\) one has
\[
\|\tilde{\Phi}(a, \tilde{u})g\|_{E_\alpha} \leq \varepsilon^{\sigma+\sigma_\alpha-1-d/2}(\|g\|_{F_\alpha} + \|(a, \tilde{u})\|_{E_{\alpha_0+a}}\|g\|_{F_0})
\]
and
\[
\|\tilde{\Phi}''(a, \tilde{u})[(b_1, \tilde{h}_1), (b_2, \tilde{h}_2)]\|_{F_\alpha} = \varepsilon^{-\sigma-\sigma_\alpha}\|P''(u)[h_1, h_2]\|_{C_0^0H^{\alpha_0+a}}
\leq \varepsilon^{-\sigma}\{\|(b_1, \tilde{h}_1)\|_{E_{\alpha_0+1}}\|(b_2, \tilde{h}_2)\|_{E_0} + \|(b_1, \tilde{h}_1)\|_{E_0}\|(b_2, \tilde{h}_2)\|_{E_{\alpha_0+1}}
+ \|(a, \tilde{u})\|_{E_{\alpha+1}}\|(b_1, \tilde{h}_1)\|_{E_0}\|(b_2, \tilde{h}_2)\|_{E_0}\}.
\]
Hence $\tilde{\Phi}$ satisfies the assumptions of Theorem 9.1 with

$$a_0 = 0, \quad \mu = a_1 = 2, \quad \beta = \alpha = s_0 + 3 > 4, \quad a_2 > 2\beta - 2,$$

$$U = \{(a, \tilde{u}) \in E_2 : \|(a, \tilde{u})\|_{E_2} \leq \rho_2\}, \quad \delta_1 = \rho_2, \quad M_3(a) = L_3(a) = 0,$$

$$M_1(a) = M_2(a) = C_a \varepsilon^{1-\sigma}, \quad L_1(a) = L_2(a) = C_a \varepsilon^{\sigma + \sigma_a - 1 - d/2}.$$

Hence, by Theorem 9.1 for every $g = (0, a_0)$ in the ball

$$\|a_0\|_{H^{s_0 + \beta + 1}} = \|g\|_{F_0} \leq \delta$$

with

$$\delta = C\varepsilon^{-\sigma + 1 + d - 2\sigma_a}$$

given by (9.14), there exists $(a, \tilde{u}) \in E_\alpha$ such that $\tilde{\Phi}(a, \tilde{u}) = (0, a_0)$. By (9.13), the solution $(a, \tilde{u})$ satisfies

$$\|(a, \tilde{u})\|_{E_\alpha} \leq C\varepsilon^{\sigma + \sigma_a - 1 - d/2}\|g\|_{F_0},$$

namely

$$\varepsilon^\sigma \|a_0\|_{H^{s_0 + \beta}} + \varepsilon^{-d/2}\|\tilde{u}\|_{C_1^1 H^{s_0 + \beta}} \leq C\varepsilon^{\sigma + \sigma_a - d/2}\|a_0\|_{H^{s_0 + \beta + 1}},$$

whence

$$\|\tilde{u}\|_{C_1^1 H^{s_0 + \beta}} \leq C\varepsilon^{\sigma + \sigma_a}\|a_0\|_{H^{s_0 + \beta + 1}}.$$

All $\|a_0\|_{H^{s_0 + \beta + 1}} \leq 1$ belong to the ball (8.21) if $1 \leq \delta$, and this holds for $\varepsilon$ sufficiently small if

$$\sigma > 1 + d - 2\sigma_a.$$

9 Appendix A. Nash-Moser-Hörmander implicit function theorem

In this section we state the Nash-Moser-Hörmander theorem of [1].

Let $(E_a)_{a \geq 0}$ be a decreasing family of Banach spaces with continuous injections $E_b \hookrightarrow E_a$,

$$\|u\|_{E_a} \leq \|u\|_{E_b} \quad \text{for a \leq b}. \quad (9.1)$$

Set $E_{\infty} = \cap_{a \geq 0} E_a$ with the weakest topology making the injections $E_{\infty} \hookrightarrow E_a$ continuous. Assume that there exist linear smoothing operators $S_j : E_0 \to E_{\infty}$ for $j = 0, 1, \ldots$, satisfying the following inequalities, with constants $C$ bounded when $a$ and $b$ are bounded, and independent of $j$,

$$\|S_j u\|_{E_a} \leq C\|u\|_{E_a} \quad \text{for all } a; \quad (9.2)$$

$$\|S_j u\|_{E_b} \leq C2^{j(b-a)}\|S_j u\|_{E_a} \quad \text{if } a < b; \quad (9.3)$$

$$\|u - S_j u\|_{E_b} \leq C2^{-j(a-b)}\|u - S_j u\|_{E_a} \quad \text{if } a > b; \quad (9.4)$$

$$\|(S_{j+1} - S_j)u\|_{E_b} \leq C2^{j(b-a)}\|(S_{j+1} - S_j)u\|_{E_a} \quad \text{for all } a, b. \quad (9.5)$$

Set

$$R_0 u := S_1 u, \quad R_j u := (S_{j+1} - S_j)u, \quad j \geq 1. \quad (9.6)$$

Thus

$$\|R_j u\|_{E_a} \leq C2^{j(b-a)}\|R_j u\|_{E_a} \quad \text{for all } a, b. \quad (9.7)$$
Bound \([9.7]\) for \(j \geq 1\) is \([9.5]\), while, for \(j = 0\), it follows from \([9.1]\) and \([9.3]\). We also assume that
\[
\|u\|^2_{E_\alpha} \leq C \sum_{j=0}^{\infty} \|R_j u\|^2_{E_\alpha} \quad \forall \alpha \geq 0,
\]
with \(C\) bounded for a bounded (“orthogonality property” for the smoothing operators).

Suppose that we have another family \(F_\alpha\) of decreasing Banach spaces with smoothing operators having the same properties as above. We use the same notation also for the smoothing operators.

**Theorem 9.1** \([11]\). (Existence) Let \(a_1, a_2, \alpha, \beta, a_0, \mu\) be real numbers with
\[
0 \leq a_0 \leq \mu \leq a_1, \quad a_1 + \frac{\beta}{2} < \alpha < a_1 + \beta, \quad 2\alpha < a_1 + a_2.
\]

Let \(U\) be a convex neighborhood of 0 in \(E_\mu\). Let \(\Phi\) be a map from \(U \cap E_{a+\mu}\) to \(F_\alpha\) of class \(C^2\) for all \(\alpha \in [0, a_2 - \mu]\), with
\[
\|
\Phi(u)[v, w]\|_{F_\alpha} \leq M_1(\alpha)(\|v\|_{E_{a+\mu}}\|w\|_{E_{a_0}} + \|v\|_{E_{a_0}}\|w\|_{E_{a+\mu}})
+ \{M_2(\alpha)\|u\|_{E_{a+\mu}} + M_3(\alpha)\}\|v\|_{E_{a_0}}\|w\|_{E_{a_0}}
\]
for all \(u \in U \cap E_{a+\mu}\), \(v, w \in E_{a+\mu}\), where \(M_i : [0, a_2 - \mu] \to \mathbb{R}, \ i = 1, 2, 3,\) are positive, increasing functions. Assume that \(\Phi'(v), \) for \(v \in E_\infty \cap U\) belonging to some ball \(\|v\|_{E_{a_1}} \leq \delta_1\), has a right inverse \(\Psi(v)\) mapping \(F_\infty\) to \(E_{a_2}\), and that
\[
\|
\Psi(v)g\|_{E_{\alpha}} \leq L_1(\alpha)\|g\|_{E_{a_1}} + L_3(\alpha)\|\|v\|_{E_{a_1}} + L_3(\alpha)\|g\|_{F_0} \quad \forall \alpha \in [a_1, a_2],
\]
where \(L_i : [a_1, a_2] \to \mathbb{R}, \ i = 1, 2, 3,\) are positive, increasing functions.

Then for all \(A > 0\) there exists \(\delta > 0\) such that, for every \(g \in F_\beta\) satisfying
\[
\sum_{j=0}^{\infty} \|R_j g\|^2_{F_\beta} \leq A^2 \|g\|^2_{F_\beta}, \quad \|g\|_{F_\beta} \leq \delta,
\]
there exists \(u \in E_{a}\) solving \(\Phi(u) = \Phi(0) + g\). The solution \(u\) satisfies
\[
\|u\|_{E_{\alpha}} \leq C L_{123}(a_2)(1 + A)\|g\|_{F_\beta},
\]
where \(L_{123} = L_1 + L_2 + L_3\) and \(C\) is a constant depending on \(a_1, a_2, \alpha, \beta\). The constant \(\delta\) is
\[
\delta = 1/B, \quad B = C'L_{123}(a_2) \max\{1/\delta_1, 1 + A, (1 + A)L_{123}(a_2)\}
\]
where \(M_{123} = M_1 + M_2 + M_3\) and \(C'\) is a constant depending on \(a_1, a_2, \alpha, \beta\).

**(Higher regularity)\)** Moreover, let \(c > 0\) and assume that \([9.10]\) holds for all \(\alpha \in [0, a_2 + c - \mu]\), \(\Psi(v)\) maps \(F_\infty\) to \(E_{a_2 + c}\), and \([9.11]\) holds for all \(\alpha \in [a_1, a_2 + c]\). If \(g\) satisfies \([9.12]\) and, in addition, \(g \in F_{\beta + c}\) with
\[
\sum_{j=0}^{\infty} \|R_j g\|^2_{F_{\beta + c}} \leq A^2 \|g\|^2_{F_{\beta + c}}
\]
and assume that \(\Phi'(v), \) for \(v \in E_\infty \cap U\) belonging to some ball \(\|v\|_{E_{a_1}} \leq \delta_1\), has a right inverse \(\Psi(v)\) mapping \(F_\infty\) to \(E_{a_2}\), and that
for some $A_c$, then the solution $u$ belongs to $E_{\alpha+c}$, with

$$\|u\|_{E_{\alpha+c}} \leq C_c \{ G_1(1 + A) \|g\|_{F_9} + G_2(1 + A_c) \|g\|_{F_{9+c}} \} \quad (9.16)$$

where

$$G_1 := \tilde{L}_3 + \tilde{L}_{12}(\tilde{L}_3 \tilde{M}_1 + L_{123}(a_2) \tilde{M}_3)(1 + z^N), \quad G_2 := L_{12}(1 + z^N), \quad z := L_{123}(a_1)M_{123}(0) + \tilde{L}_{12}M_{12}, \quad (9.17)$$

$$\tilde{L}_{12} := \tilde{L}_1 + \tilde{L}_2, \quad \tilde{L}_i := L_i(a_2 + c), \quad i = 1, 2, 3; \quad \tilde{M}_i := \tilde{M}_1 + \tilde{M}_2, \quad \tilde{M}_i := M_i(a_2 + c - \mu), \quad i = 1, 2, 3; \quad N \text{ is a positive integer depending on } c, a_1, \alpha, \beta; \text{ and } C_c \text{ depends on } a_1, a_2, \alpha, \beta, c.$$

10 Appendix B. Commutator and product estimates

In the next lemmas we give “asymmetric” inequalities for the Sobolev norm of commutators and products of functions on $\mathbb{R}^d$, with $W^{m,\infty}$ norms ($m$ integer) on one function and $H^s$ norms ($s$ real) on the other function. Estimate (10.1) is related to the Kato-Ponce inequality (see, e.g., [6], [2], [3]), but it is not clear how to deduce (10.1) directly from Kato-Ponce. Hence we give here a proof of (10.1), entirely based on well-known estimates.

**Lemma 10.1.** Let $s \geq 0$ be real, and let $m$ be the smallest positive integer such that $m \geq s$. Then there exists $C_s$ such that

$$\|\Lambda^s(uv) - u\Lambda^s v\|_{L^2} \leq C_s(\|u\|_{W^{1,\infty}} \|v\|_{H^{s-1}} + \|u\|_{W^{m,\infty}} \|v\|_{L^2}) \quad (10.1)$$

for all $u \in W^{m,\infty}(\mathbb{R}^d)$, all $v \in H^{s-1}(\mathbb{R}^d) \cap L^2(\mathbb{R}^d)$. The constant $C_s$ is increasing in $s$, and it is bounded for $s$ bounded.

The same estimate holds with $\Lambda^s$ replaced by $\Lambda^{s-1}\partial_x^\alpha$, $|\alpha| = 1$, namely

$$\|\Lambda^{s-1}\partial_x^\alpha(uv) - u\Lambda^{s-1}\partial_x^\alpha v\|_{L^2} \leq C_s(\|u\|_{W^{1,\infty}} \|\partial_x^\alpha v\|_{H^{s-1}} + \|u\|_{W^{m,\infty}} \|\partial_x^\alpha v\|_{L^2}). \quad (10.2)$$

**Proof.** We use the standard paraproduct decomposition $uv = T_u v + (u - T_u)v$ (following Métivier [2]), and split

$$\Lambda^s(uv) - u\Lambda^s v = [\Lambda^s, T_u] v + \Lambda^s((u - T_u)v) - (u - T_u)\Lambda^s v.$$  

The commutator $[\Lambda^s, T_u]$ satisfies

$$\|[T_u, \Lambda^s] v\|_{L^2} \leq C_s \|u\|_{W^{1,\infty}} \|v\|_{H^{s-1}} \quad (10.3)$$

by Theorem 6.1.4 of [7]. The second term satisfies

$$\|\Lambda^s((u - T_u)v)\|_{L^2} = \|(u - T_u)v\|_{H^s} \leq \|(u - T_u)v\|_{H^m} \leq C_m \|u\|_{W^{m,\infty}} \|v\|_{L^2} \quad (10.4)$$

by Theorem 5.2.8 of [7]. By duality, the third term is also bounded by the r.h.s. of (10.4): for all $h \in L^2$, by Cauchy-Schwarz,

$$\langle (u - T_u)\Lambda^s v, h \rangle_{L^2} = \langle v, \Lambda^s(u - T_u)^* h \rangle_{L^2} \leq \|v\|_{L^2} \|(u - T_u)^* h\|_{H^s} \leq \|v\|_{L^2} \|(u - T_u)^* h\|_{H^m}$$

where $(u - T_u)^*$ is the adjoint of $(u - T_u)$ with respect to the $L^2$ scalar product. Split

$$\langle (u - T_u)^* = (u^* - T_u^*) + (T_u^* - (u - T_u)^*). \quad (10.5)$$
The first component in the r.h.s. of (10.3) satisfies
\[ \|(u^* - T_u^*)h\|_{H^m} \leq C_m \|u^*\|_{W^{m,\infty}} \|h\|_{L^2} = C_m \|u\|_{W^{m,\infty}} \|h\|_{L^2} \]
by Theorem 5.2.8 of [7]. The second component in the r.h.s. of (10.3) satisfies
\[ \|(T_u^* - (T_u)^*)h\|_{H^m} \leq C_m \|u\|_{W^{m,\infty}} \|h\|_{L^2} \]
by Theorem 6.2.4 of [7]. Hence \( \|(u - T_u)^*h\|_{H^m} \) is bounded by \( C_m \|u\|_{W^{m,\infty}} \|h\|_{L^2} \), and
\[ \langle (u - T_u)\Lambda^s v, h \rangle_{L^2} \leq C_m \|u\|_{W^{m,\infty}} \|v\|_{L^2} \|h\|_{L^2} \]
for all \( h \in L^2 \). This implies that
\[ \|(u - T_u)\Lambda^s v\|_{L^2} \leq C_m \|u\|_{W^{m,\infty}} \|v\|_{L^2}. \] (10.6)

The sum of (10.3), (10.4) and (10.6) gives (10.1).

Similarly, one proves that (10.3), (10.4) and (10.6) also hold with \( \Lambda^s \) in the l.h.s. replaced by \( \Lambda^s - \partial_\alpha^s \), \( |\alpha| = 1 \). Then (10.2) follows.

**Lemma 10.2.** Let \( s \geq 0 \) be real, and let \( m \) be the smallest positive integer such that \( m \geq s \). Then
\[ \|uv\|_{H^s} \leq 2\|u\|_{L^\infty} \|v\|_{H^s} + C_s \|u\|_{W^{m,\infty}} \|v\|_{L^2} \] (10.7)
for all \( u \in W^{m,\infty}(\mathbb{R}^d) \), all \( v \in H^s(\mathbb{R}^d) \). The constant \( C_s \) is increasing in \( s \), and it is bounded for \( s \) bounded.

Moreover, for all \( 0 < \varepsilon \leq 1 \),
\[ \|uv\|_{H^s_\varepsilon} \leq 2\|u\|_{L^\infty} \|v\|_{H^s_\varepsilon} + C_s \|u\|_{W^{m,\infty}_\varepsilon} \|v\|_{L^2} \] (10.8)
with the same constant \( C_s \) as in (10.7) (in particular, \( C_s \) is independent of \( \varepsilon \)).

**Proof.** By triangular inequality and (10.1),
\[ \|uv\|_{H^s} = \|\Lambda^s(uv)\|_{L^2} \leq \|\Lambda^s(uv) - u\Lambda^s v\|_{L^2} + \|u\Lambda^s v\|_{L^2} \]
\[ \leq C_s(\|u\|_{W^{1,\infty}} \|v\|_{H^{s-1}} + \|u\|_{W^{m,\infty}} \|v\|_{L^2}) + \|u\|_{L^\infty} \|v\|_{H^s}. \] (10.9)

By standard interpolation, with \( \lambda = 1/m \), for all \( K \geq 1 \) one has
\[ \|u\|_{W^{1,\infty}} \|v\|_{H^{s-1}} \leq \|u\|_{L^\infty} \|v\|_{H^s} \]
\[ = \frac{1}{K}(\|u\|_{L^\infty} \|v\|_{H^s})^{1-\lambda}(\|u\|_{W^{m,\infty}} \|v\|_{H^{s-m}} K^m)^\lambda \]
\[ \leq \frac{1}{K}(\|u\|_{L^\infty} \|v\|_{H^s} + \|u\|_{W^{m,\infty}} \|v\|_{H^{s-m}} K^m) \]
\[ \leq \frac{1}{K}\|u\|_{L^\infty} \|v\|_{H^s} + K^{m-1} \|u\|_{W^{m,\infty}} \|v\|_{L^2} \]
\( ([\|v\|_{H^{s-m}} \leq \|v\|_{L^2} \) because \( s - m \leq 0 \). We fix \( K \) larger or equal to the constant \( C_s \) in (10.9), and we obtain (10.7).

Inequality (10.8) is a straightforward consequence of (10.7), (4.4), (4.11) and the trivial rescaling identity for the product \( R_\varepsilon(uv) = (R_\varepsilon u)(R_\varepsilon v) \).
Remark 10.3. Let \( s, m \) be as in Lemmas 10.1, 10.2 Then \( m \leq [s] + 1 \), where \([s]\) is the integer part of \( s \) (it is \( m = [s] \) for \( s \) positive integer, and \( m = [s] + 1 \) otherwise). As a consequence, (10.1), (10.7) and (10.8) hold with \([s] + 1\) in place of \( m \).

We prove here some elementary inequalities we have used above.

Lemma 10.4. For every real \( s > 0 \) there exists \( C_s \geq 1 \) such that

\[
(a + b)^s \leq 2a^s + C_s b^s \quad \forall a, b \geq 0.
\]

The constant \( C_s \) is increasing in \( s \), with \( C_s = 1 \) for \( 0 < s \leq 1 \), and \( C_s \to \infty \) as \( s \to \infty \).

Proof. For \( b = 0 \) the inequality is trivial. For \( b > 0 \), divide by \( b^s \) and set \( \lambda = a/b \). The inequality holds with best constant \( C_s = \max \{(1 + \lambda)^s - 2\lambda^s : \lambda \geq 0\} \), which is \( C_s = 1 \) for \( 0 < s \leq 1 \), and \( C_s = 2 \cdot (2^{1/s} - 1)^{-s} \) for \( s > 1 \).

Lemma 10.5. For every \( s > 0 \) there exists \( C_s \geq 1 \) (increasing in \( s \)) such that

\[
(1 + (a + b)^2)^s \leq 4(1 + a^2)^s + C_s b^s \quad \forall a, b \geq 0.
\]

Proof. For all \( \lambda > 0 \) one has \( 2ab = 2(a\lambda^{1/2})(b\lambda^{-1/2}) \leq a^2\lambda + b^2/\lambda \), whence

\[
1 + a^2 + 2ab + b^2 \leq 1 + a^2(1 + \lambda) + b^2(1 + 1/\lambda) \leq (1 + a^2)(1 + \lambda) + b^2(1 + 1/\lambda).
\]

By Lemma 10.4

\[
(1 + (a + b)^2)^s \leq 2(1 + \lambda)^s(1 + a^2)^s + C_s(1 + 1/\lambda)^s b^s.
\]

Then we fix \( \lambda = 2^{1/s} - 1 \), so that \((1 + \lambda)^s = 2 \) and \((1 + 1/\lambda)^s = 2 \cdot (2^{1/s} - 1)^{-s} \).

In the proof of Lemma 7.1 we have used Lemma 10.5 in the form

\[
(1 + |\eta|^2 + 2|\eta||\xi_0| + |\xi_0|^2)^s \leq 4(1 + |\eta|^2)^s + C_s|\xi_0|^{2s}, \quad \eta, \xi_0 \in \mathbb{R}^d.
\]

(10.10)

Also, by (10.10) one directly proves the inequality

\[
\|uv\|_{H^s} \leq C_{s_0}\|u\|_{H^{s_0}}\|v\|_{H^s} + C_s\|u\|_{H^s}\|v\|_{H^{s_0}},
\]

(10.11)

for \( s \geq 0, s_0 > d/2 \), which, by rescaling, implies inequality (4.13).

Lemma 10.6. For all \( s \geq 0 \) real, all functions \( u, v \) on \( \mathbb{R}^d \), one has

\[
\|u\partial_x v\|_{H^{s-1}} \lesssim \|u\|_{L^\infty}\|v\|_{H^s} + \|u\|_{W^{[s]+1,\infty}}\|v\|_{L^2},
\]

(10.12)

\[
\|u\xi\partial_x v\|_{H^{s-1}} \lesssim \|u\|_{L^\infty}\|v\|_{H^s} + \|u\|_{W^{[s]+1,\infty}}\|v\|_{L^2},
\]

(10.13)

where \( \partial_x \) denotes any \( \partial_x^a, |\alpha| = 1 \).

Proof. Write \( u\partial_x v \) as \( \partial_x(uv) - (\partial_x u)v \). For \( s \geq 0 \), by (10.7) and Remark 10.3

\[
\|\partial_x(uv)\|_{H^{s-1}} \lesssim \|uv\|_{H^s} \lesssim \|u\|_{L^\infty}\|v\|_{H^s} + \|u\|_{W^{[s]+1,\infty}}\|v\|_{L^2}.
\]

(10.14)

For \( s \geq 1 \), by (10.7) and Remark 10.3

\[
\|\partial_x u\|_{H^{s-1}} \lesssim \|\partial_x u\|_{L^\infty}\|v\|_{H^{s-1}} + \|\partial_x u\|_{W^{[s-1]+1,\infty}}\|v\|_{L^2} \lesssim \|u\|_{W^{1,\infty}}\|v\|_{H^{s-1}} + \|u\|_{W^{[s]+1,\infty}}\|v\|_{L^2},
\]

(10.15)

33
while for $0 \leq s \leq 1$

$$\| (\partial_x u) v \|_{H^{s-1}} \leq \| (\partial_x u) v \|_{L^2} \leq \| \partial_x u \|_{L^\infty} \| v \|_{L^2} \leq \| u \|_{W^{1,\infty}} \| v \|_{L^2}. \tag{10.16}$$

The sum of (10.14) and (10.16) gives (10.12) for $s \in [0, 1]$. For $s \geq 1$, the sum of (10.14) and (10.15) gives (10.12) because, by interpolation,

$$\| u \|_{W^{1,\infty}} \| v \|_{H^{s-1}} \leq \| u \|_{L^\infty} \| v \|_{H^s} + \| u \|_{W^{[s]+1,\infty}} \| v \|_{H^{s-1-[s]}}$$

and $\| v \|_{H^{s-1-[s]}} \leq \| v \|_{L^2}$. Inequality (10.13) can be proved similarly, or it can be deduced from (10.12) by rescaling. \hfill \square

**Lemma 10.7.** For all $s \geq 0$ real, one has

$$\| [\Lambda^s, u] \partial_x v \|_{L^2} \lesssim_s \| u \|_{W^{1,\infty}} \| v \|_{H^s} + \| u \|_{W^{[s]+2,\infty}} \| v \|_{L^2}, \tag{10.17}$$

$$\| [\Lambda^s, u] \varepsilon \partial_x v \|_{L^2} \lesssim_s \| u \|_{W^{1,\infty}} \| v \|_{H^s} + \| u \|_{W^{[s]+2,\infty}} \| v \|_{L^2}, \tag{10.18}$$

where $\partial_x$ denotes any $\partial^\alpha_x$, $|\alpha| = 1$.

**Proof.** Write

$$[\Lambda^s, u] \partial_x v = [\Lambda^s \partial_x, u] v - \Lambda^s ((\partial_x u) v).$$

By (10.2), $\| [\Lambda^s \partial_x, u] v \|_{L^2}$ is bounded by the r.h.s. of (10.17); by (10.7), $\| (\partial_x u) v \|_{H^s}$ is bounded by the r.h.s. of (10.17). Thus (10.17) is proved. Inequality (10.18) follows from (10.17) by rescaling. \hfill \square

**Lemma 10.8.** For all $s \geq 0$, $s_0 > d/2$, one has

$$\| [\Lambda^s, u] v \|_{L^2} \lesssim_s \| u \|_{H^{s_0+1}} \| v \|_{H^{s-1}} + \| u \|_{H^s} \| v \|_{H^{s_0}}, \tag{10.19}$$

$$\| [\Lambda^s, u] v \|_{L^2} \lesssim_s \varepsilon^{-d/2} \| u \|_{H^{s_0+1}} \| v \|_{H^{s-1}} + \| u \|_{H^s} \| v \|_{H^{s_0}}. \tag{10.20}$$

The same inequalities also hold for $\Lambda^{s-1} \partial_x^\alpha, \Lambda^{s-1} \varepsilon \partial_x^\alpha$, $|\alpha| = 1$, in place of $\Lambda^s, \Lambda^s_x$ respectively.

**Proof.** In the Fourier transform of $[\Lambda^s, u] v$ one has $\hat{u}(\xi) \hat{v}(\eta) \sigma(\xi, \eta)$, where

$$\sigma(\xi, \eta) = (\xi + \eta)^s - (\eta)^s = (1 + |\xi + \eta|^2)^{\frac{s}{2}} - (1 + |\eta|^2)^{\frac{s}{2}}.$$

For $|\xi| \leq \frac{1}{2} |\eta|$ one has $|\sigma(\xi, \eta)| \lesssim_s \langle \eta \rangle^{s-1} |\xi|$, leading to the term $\| u \|_{H^{s_0+1}} \| v \|_{H^{s-1}}$ in (10.19). For $|\eta| < 2|\xi|$ one has $|\sigma(\xi, \eta)| \lesssim_s \langle \xi \rangle^{s}$, leading to the term $\| u \|_{H^s} \| v \|_{H^{s_0}}$ in (10.19). Inequality (10.20) follows by rescaling. \hfill \square

**Lemma 10.9.** For all $s \geq 0$ real, all functions $u, v$ on $\mathbb{R}^d$, one has

$$\| u \partial_x v \|_{H^{s-1}} \lesssim_s \| u \|_{H^{s_0}} \| v \|_{H^s} + \| u \|_{H^s} \| v \|_{H^{s_0}} + \| u \|_{H^{s_0+1}} \| v \|_{L^2} \tag{10.21}$$

$$\| u \varepsilon \partial_x v \|_{H^{s_0-1}} \lesssim_s \varepsilon^{-d/2} \{ \| u \|_{H^{s_0}} \| v \|_{H^s} + \| u \|_{H^s} \| v \|_{H^{s_0}} + \| u \|_{H^{s_0+1}} \| v \|_{L^2} \}. \tag{10.22}$$

where $\partial_x$ denotes any $\partial^\alpha_x$, $|\alpha| = 1$. 

34
Proof. We adapt the proof of Lemma 10.6. Write $u \partial_x v$ as $\partial_x (uv) - (\partial_x u)v$. For $s \geq 0$, by (10.11),
\[
\| \partial_x (uv) \|_{H^{s-1}} \lesssim_s \| u \|_{H^s} \| v \|_{H^0} + \| u \|_{H^s} \| v \|_{H^0}.
\] (10.23)
For $s \geq 1$, by (10.11),
\[
\| (\partial_x u) v \|_{H^{s-1}} \lesssim_s \| \partial_x u \|_{H^s} \| v \|_{H^0} + \| \partial_x u \|_{H^{s-1}} \| v \|_{H^0} \lesssim_s \| u \|_{H^{s+1}} \| v \|_{H^s} + \| u \|_{H^s} \| v \|_{H^0},
\] (10.24)
while for $0 \leq s \leq 1$
\[
\| (\partial_x u) v \|_{H^{s-1}} \leq \| (\partial_x u) v \|_{L^2} \lesssim \| \partial_x u \|_{L^\infty} \| v \|_{L^2} \lesssim \| u \|_{H^{s+1}} \| v \|_{L^2}. \] (10.25)
Inequality (10.22) is deduced from (10.21) by rescaling.

Lemma 10.10. For all $s \geq 0$ real, one has
\[
\| [\Lambda^s, u] \partial_x v \|_{L^2} \lesssim_s \| u \|_{H^{s+1}} \| v \|_{H^s} + \| u \|_{H^{s+1}} \| v \|_{H^0}, \] (10.26)
\[
\| [\Lambda^s, u] \partial_x v \|_{L^2} \lesssim s^{d/2} (\| u \|_{H^{s+1}} \| v \|_{H^s} + \| u \|_{H^{s+1}} \| v \|_{H^0}) \] (10.27)
where $\partial_\alpha$ denotes any $\partial_\alpha^\alpha$, $|\alpha|=1$.

Proof. Write $[\Lambda^s, u] \partial_x v = [\Lambda^s \partial_\alpha, u] v - \Lambda^s ((\partial_x u)v)$. By Lemma 10.8 $\| [\Lambda^s \partial_\alpha, u] v \|_{L^2}$ is bounded by the r.h.s. of (10.26); by (10.11), $\| (\partial_x u) v \|_{H^s}$ is also bounded by the r.h.s. of (10.26). Thus (10.26) is proved. Inequality (10.27) follows by rescaling.
