General Information

Malabaricol plant resin was collected from Karnataka state, India. Solvents and chemicals were purchased from local vendors, and used as received. Reactions were monitored using thin-layer chromatography (TLC) with 0.25 mm E. Merck pre-coated silica gel plates (60 F254) and visualization was accomplished with either UV light, iodine adsorbed on silica gel or immersion in an ethanolic solution of p-anisaldehyde stain followed by heating. The column chromatography was carried out on silica gel (60-120 mesh). All $^1$H NMR spectra were recorded on Bruker at 400 or 500 MHz and All $^{13}$C NMR spectra recorded on Bruker at 100 or 125 MHz, respectively. Chemical shifts ($\delta$) were reported in parts per million (ppm) and calibrated to the residual proton and carbon resonance of the CDCl$_3$ ($\delta_H = 7.26$ and $\delta_C = 77.0$ ppm). The coupling constants ($J$) were given in Hz. High-Resolution mass spectrometry (HRMS) was recorded using electrospray ionization (ESI)-Time-off light techniques. FTIR spectra were recorded with a Bruker Alpha spectrophotometer and were reported in cm$^{-1}$. Cellular viability in the presence of test compounds was determined by MTT-microcultured tetrazolium assay. The cells seeded to flat bottom 96 (10000 cells/100 µL) well plates cultured in the medium containing 10% serum and allowed to attach and recover for 24 hours in a humid chamber containing 5% CO$_2$. MTT (3-(4, 5-dimethylthiazol-2yl)-2,5-diphenyl tetrazolium bromide was dissolved in PBS at 5mg/ml and filtered to sterilize and remove a small amount of insoluble residue present MTT. Different concentrations of compounds were added to the cells. After 48 hours, stock MTT solution (10 µL) was added to the culture plate. Cells were again kept in CO$_2$ incubator for 2 hours. After incubation 100 µL of DMSO was added and mixed. The absorbance was read at 562 nm in a plate reader. The results were represented as percentage of cytotoxicity/viability. All the experiments were carried out in duplicates. From the percentage of cytotoxicity the IC$_{50}$ value calculated.
General Experimental Methods:

Synthesis of 2-arylidene derivatives

To the stirred solution of malabaricol 1 (100 mg, 218 µmol) in ethanol (3 ml) was added KOH (73.3 mg, 1.30 mmol) at room temperature. After half an hour benzaldehyde (67 µL, 654 µmol) was added to reaction mixture. The resulting mixture was stirred at room temperature for 12 h. The solvent was removed and extracted with diethyl ether (3 x 50 mL), washed with brine and dried over Na$_2$SO$_4$. The obtained residue was purified by column chromatography (9/91, EtOAc/hexane) to get desired product 2a (79.8 mg, 67%) as a light green viscous liquid.
