On the global well-posedness and decay of a free boundary problem of the Navier-Stokes equation in unbounded domains

Kenta Oishi * and Yoshihiro Shibata †

Abstract

In this paper, we establish the unique existence and some decay properties of a global solution of a free boundary problem of the incompressible Navier-Stokes equations in \( L^p \) in time and \( L^q \) in space framework in a uniformly \( H^2_{\infty} \) domain \( \Omega \subset \mathbb{R}^N \) for \( N \geq 4 \). We assume the unique solvability of the weak Dirichlet problem for the Poisson equation and the \( L^q-L^r \) estimates for the Stokes semigroup. The novelty of this paper is that we do not assume the compactness of the boundary, which is essentially used in the case of exterior domains proved by Shibata [17]. The restriction \( N \geq 4 \) is required to deduce an estimate for the nonlinear term \( G(u) \) arising from \( \text{div} \, \mathbf{v} = 0 \). However, we establish the results in the half space \( \mathbb{R}^N_+ \) for \( N \geq 3 \) by reducing the linearized problem to the problem with \( G = 0 \), where \( G \) is the right member corresponding to \( G(u) \).

Keywords: free boundary problem; Navier-Stokes equation; global well-posedness, general domain.

1 Introduction

A free boundary problem for the viscous incompressible Navier-Stokes equations describes the motion of a fluid in time-dependent domains, such as a drop of...
we define Div $M$ surface tension. This result was also obtained in Hölder spaces by Padula and $\partial$ $\sum$ $N$ $H$ where $L$ $solution$ $globally$ $in$ $time$ $and$ $decay$ $properties$ $of$ $the$ $solution$ $by$ $assuming$ $the$ $N$ $∑$ $V$ $by$ $I$ $coefficient$ $of$ $viscosity$, $and$ $∂$ $∂$ $v$ $j$ $k$ $vc$ $t$ $N$ $∂$ $D$ $Ω$ $= Ω(0)$.

for a given initial velocity field $v_0 = (v_{01}(x),\ldots,v_{0N}(x))^T$. Here, the initial domain $Ω$ is a general uniformly $H^{2,\infty}$ domain. We denote the unit outer normal vector to the boundary $∂Ω(t)$ by $ν_t$, and the velocity of the evolution of $∂Ω(t)$ by $V_n$. The stress tensor $S(v,q)$ is given by $S(v,q) = \rho D(v) - qI$, where $D(u)$ is the doubled deformation tensor $D(v)$ whose $(j,k)$ component is defined by $\partial_k v_j + \partial_j v_k$ with $\partial_j = \partial/∂x_j$, $\mu > 0$ is a positive constant representing the coefficient of viscosity, and $I$ is the $N \times N$ identity matrix. We set $v = \sum_{j=1}^N \partial_j v_j$ and, for an $N \times N$ matrix field $M$ whose $(j,k)$ component is $M_{jk}$, we define $Div M$ as the $N$ component vector the $j$-th component of which is $\sum_{k=1}^N \partial_k M_{jk}$. In this paper, we establish the unique existence theorem of a solution globally in time and decay properties of the solution by assuming the $L_p$-$L_q$ regularity for the time-shifted Stokes problem due to [17]. Moreover, we obtain the global well-posedness and decay properties in the half-space $R^N_+$ with $N \geq 3$.

The free boundary problem [13] has been studied extensively in the following two cases:

1. the motion of an isolated liquid mass, and
2. the motion of the incompressible fluid occupying an infinite ocean.

We mention the studies on the well-posedness globally in time and decay properties in order. In case (1), where the initial domain $Ω$ is bounded, the unique existence of a global solution was established under the assumptions that the initial velocity $v_0$ is small and orthogonal to the rigid space $\{Ax+b \mid A+A^T = O\}$ in the frameworks by Solonnikov [23], in $L_p$ framework, and by Shibata [16] in $L_p$-$L_q$ framework. When surface tension is taken into account, the same result was also proved by Solonnikov [24] in $L_2$ framework under the same assumptions and the additional assumption that the domain $Ω$ is close to a ball. In this case, the boundary condition should be

$$S(v,q)ν_t = c_σ \mathcal{H}ν_t, \quad v \cdot ν_t = V_n \quad \text{on } ∂Ω(t),$$

where $\mathcal{H}$ is the doubled mean curvature of $∂Ω(t)$ and $c_σ > 0$ is the coefficient of surface tension. This result was also obtained in Hölder spaces by Padula and

water, an ocean of infinite extent and finite or infinite depth, or liquid around a bubble. The present paper is concerned with the unique existence and decay of a global solution to these problems without taking account of surface tension. The mathematical problem is defined as finding a time-dependent domain $Ω(t)$ in the $N$-dimensional Euclidean space $R^N$ where $t \geq 0$ is the time variable, and the velocity field $v = (v_1(x,t),\ldots,v_N(x,t))^T$, where $M^T$ is the transposed $M$, and the pressure $q = q(x,t)$ satisfying the incompressible Navier-Stokes equation

$$\begin{cases}
\partial_t v + (v \cdot ∇)v - \text{Div } S(v,q) = 0, & \text{in } Ω(t), \quad 0 < t < T; \\
S(v,q)ν_t = 0, & v \cdot ν_t = V_n \quad \text{on } ∂Ω(t), \quad 0 < t < T,(1.1) \\
v|_{t=0} = v_0 & \text{in } Ω = Ω(0)
\end{cases}$$

and the velocity field $v$ $j$ $k$ $vc$ $t$ $N$ $∂$ $D$ $Ω$ $= Ω(0)$.

for a given initial velocity field $v_0 = (v_{01}(x),\ldots,v_{0N}(x))^T$. Here, the initial domain $Ω$ is a general uniformly $H^{2,\infty}$ domain. We denote the unit outer normal vector to the boundary $∂Ω(t)$ by $ν_t$, and the velocity of the evolution of $∂Ω(t)$ by $V_n$. The stress tensor $S(v,q)$ is given by $S(v,q) = \rho D(v) - qI$, where $D(u)$ is the doubled deformation tensor $D(v)$ whose $(j,k)$ component is defined by $\partial_k v_j + \partial_j v_k$ with $\partial_j = \partial/∂x_j$, $\mu > 0$ is a positive constant representing the coefficient of viscosity, and $I$ is the $N \times N$ identity matrix. We set $v = \sum_{j=1}^N \partial_j v_j$ and, for an $N \times N$ matrix field $M$ whose $(j,k)$ component is $M_{jk}$, we define $Div M$ as the $N$ component vector the $j$-th component of which is $\sum_{k=1}^N \partial_k M_{jk}$. In this paper, we establish the unique existence theorem of a solution globally in time and decay properties of the solution by assuming the $L_p$-$L_q$ regularity for the time-shifted Stokes problem due to [17]. Moreover, we obtain the global well-posedness and decay properties in the half-space $R^N_+$ with $N \geq 3$.

The free boundary problem [13] has been studied extensively in the following two cases:

1. the motion of an isolated liquid mass, and
2. the motion of the incompressible fluid occupying an infinite ocean.

We mention the studies on the well-posedness globally in time and decay properties in order. In case (1), where the initial domain $Ω$ is bounded, the unique existence of a global solution was established under the assumptions that the initial velocity $v_0$ is small and orthogonal to the rigid space $\{Ax+b \mid A+A^T = O\}$ in the frameworks by Solonnikov [23], in $L_p$ framework, and by Shibata [16] in $L_p$-$L_q$ framework. When surface tension is taken into account, the same result was also proved by Solonnikov [24] in $L_2$ framework under the same assumptions and the additional assumption that the domain $Ω$ is close to a ball. In this case, the boundary condition should be

$$S(v,q)ν_t = c_σ \mathcal{H}ν_t, \quad v \cdot ν_t = V_n \quad \text{on } ∂Ω(t),$$

where $\mathcal{H}$ is the doubled mean curvature of $∂Ω(t)$ and $c_σ > 0$ is the coefficient of surface tension. This result was also obtained in Hölder spaces by Padula and
Solonnikov [11] and, in $L_p$ in time and $L_q$ in space setting by Shibata [18]. In case (2), the domain is the layer-like domain given by the form

$$\Omega(t) = \{ x = (x', x_N)^T \in \mathbb{R}^N \mid x' = (x_1, \ldots, x_{N-1})^T \in \mathbb{R}^{N-1}, -b(x') < x_N < \eta(x', t) \},$$

with a free surface on the upper boundary $x_N = \eta(x', t)$ and a fixed bottom on the lower one $x_N = -b(x')$. Here, the boundary condition on the lower boundary is zero-Dirichlet:

$$v = 0 \quad \text{on} \quad x_N = -b(x').$$

In this domain, in $L_2$ framework, the global well-posedness was established by Beale [1] with surface tension and by Sylvester [27], Tani and Tanaka [28], and Guo and Tice [4] without surface tension. Moreover, Beale and Nishida [2] and Hataya and Kawashima [6] proved some decay properties of the solution constructed in [1]. In $L_p$-$L_q$ framework, Saito [12] showed the global well-posedness without surface tension. Hataya [7] and Guo and Tice [5] obtained the unique existence and decay properties of a global solution periodic in the horizontal direction in an $L_2$ framework.

The unique existence of a global solution to (1.1) has been studied also in other domains. In exterior domains, Shibata [17] proved the global well-posedness without surface tension in $L_p$-$L_q$ setting. In the half-space, the global well-posedness was obtained by Ogawa and Shimizu [10] without surface tension in $\dot{W}_1(0, \infty; \dot{B}^{1+\frac{n}{p}}_{p,1}(\mathbb{R}^N)) \cap L_1(0, \infty; \dot{B}^{1+\frac{n}{p+1}}_{p,1}(\mathbb{R}^N))$. This result and decay properties were developed by Saito and Shibata [13] with surface tension in $L_p$-$L_q$ framework. However, in the half-space and without taking account of surface tension, similar results in the $L_p$-$L_q$ framework have not been shown because of the noncompactness of the boundary $\partial \Omega$. The analysis in $L_p$-$L_q$ framework seems more convenient than that in $L_1$-$\dot{B}^{1+\frac{n}{p}}_{p,1}$ framework to address the lower derivative terms when we show the global well-posedness in other domains such as cylinder, which remain as subject for further study. This is the key motivation of this paper.

In the present paper, in $L_p$-$L_q$ framework, we establish the global well-posedness and decay properties of (1.1) in the half space for a sufficiently small initial velocity $v_0$. Moreover, we obtain the same results in general domains by using the maximal $L_p$-$L_q$ regularity for the time-shifted Stokes problem, which was developed due to Shibata [17], and by assuming the $L_q$-$L_r$ estimates for the Stokes semigroup. We also assume that the initial domain $\Omega \subset \mathbb{R}^N$ is a uniformly $H^2_{\infty}$ domain and that the weak Dirichlet problem for the Poisson equation admits a unique solution, which are satisfied in the domains mentioned above. Because the domain is not compact, we cannot expect an exponential decay of the solution of the Stokes problem and the decay should be only of polynomial order. This forces us to restrict the dimension $N$ and the exponents $p$ and $q$ of the framework $L_p$-$L_q$, especially, when estimating a nonlinear term $G(u)$ arising from $\text{div} \ v = 0$. In exterior domains, the global well-posedness was
shown by relaxing the restriction from the compactness of the boundary $\partial \Omega$. Nevertheless, we find the global well-posedness is valid even if the boundary $\partial \Omega$ is not compact. Moreover, in general domains, we obtain this result for $N \geq 4$ if the Stokes semigroup decays as in the half space. Moreover, we establish the same result for $N \geq 3$ in the half space by some reduction of the Stokes problem to the case $G = 0$, where $G$ is the right member corresponding to $G(u)$. Here, we take advantage of a good estimate obtained only in half space. (The further details, the reader is referred to Lemma 4.1.)

The remainder of this paper is organized as follows. In the next section, we state our main results on the global well-posedness of (1.1) and decay properties of the solution in general domains with $N \geq 4$ and in the half-space with $N \geq 3$. Section 3 is devoted to the proof of the results in general domains. The strategy is to prolong the local solution by use of the a priori estimate. To obtain this estimate, we show an estimate for the Stokes problem in Subsection 3.1 and estimates for nonlinear terms in Subsection 3.2. In Section 4, we show that the reduction mentioned above allows us to take $N = 3$ in these results if $\Omega = \mathbb{R}^N_+$. The reduction will be performed in Subsection 4.2 while Subsection 4.1 and Subsection 4.3 are devoted to the proof of $L^q_L^r$ estimates and estimates of the nonlinearities, respectively. Finally, Section 5 concludes the paper.

2 Main results

In this section, we introduce notation and several functional spaces and then present the statements of our main results.

We denote the set of all natural numbers and real numbers by $\mathbb{N}$ and $\mathbb{R}$, respectively. Let

$$< t > = (1 + t^2)^{1/2}$$

for $t \in \mathbb{R}$. Given a scalar function and an $N$-vector function $f = (f_1(x), \cdots, f_N(x))$, let

$$\nabla f = (\partial_1 f, \cdots, \partial_N f)^T, \quad \nabla^2 f = (\partial^\alpha f \mid |\alpha| = 2),$$

$$\nabla^2 f = (\partial^\alpha f \mid |\alpha| = 2, j = 1, \cdots, N).$$

For a domain $D$, scalar functions $f, g$ and $N$-vector functions $f, g$, we define the normal part $f_\nu$ and tangential part $f_\tau$ of $f$ as

$$f_\nu = \nu \cdot f, \quad f_\tau = f - f_\nu \nu$$

and let

$$(f, g)_D = \int_D f(x) g(x) \, dx, \quad (f, g)_D = \int_D f(x) \cdot g(x) \, dx,$$

where $a \cdot b = \sum_{i=1}^N a_i b_i$ for $a = (a_1, \cdots, a_N)^T$ and $b = (b_1, \cdots, b_N)^T$. For a Banach space $X$ with a norm $\| \cdot \|_X$ and $d \in \mathbb{N}$, the $d$-product of $X$ is denoted
by $X^d$, and the norm is expressed as $\| \cdot \|_X$ instead of $\| \cdot \|_{X^d}$ for brevity. The space of all bounded linear operators from $X$ to $X$ is denoted by $\mathcal{L}(X)$.

Let $p, q \in [1, \infty]$, $m \in \mathbb{N} \cup \{0\}$ and $s \in \mathbb{R}$, and let $D$ be a domain and $X$ a Banach space. The symbols $L_q(D; X)$, $H^m_q(D; X)$ and $B^s_{p,q}(D)$ denote the $X$-valued Lebesgue space, $X$-valued Sobolev spaces and Besov space, respectively, and we set $L_q(D) = L_q(D; \mathbb{R})$ and $H^m_q(D) = H^m_q(D; \mathbb{R})$. Note that $H^0_q(D; X) = L_q(D; X)$ and $H^0_q(D) = L_q(D)$. By $C^\infty_0(D)$, denote the set of all $C^\infty$ functions whose supports are compact and contained in $D$. We define the functional spaces

$$ H^1_{q,0}(D) = \{ \theta \in H^1_q(D) \mid \theta|_{\partial \Omega} = 0 \}, $$

$$ \hat{H}^1_{q,0}(D) = \{ \theta \in L_{q,\text{loc}}(\Omega) \mid \nabla \theta \in L_q(\Omega)^N, \theta|_{\partial \Omega} = 0 \}, $$

$$ \hat{H}^{-1}_q(\Omega) = \text{dual of } \hat{H}^1_{q,0}(\Omega), $$

$$ H^{1/2}_p(\mathbb{R}; X) = \{ G \in L_p(\mathbb{R}; X) \mid \partial^{1/2}_t G \in L_p(\mathbb{R}; X) \}.$$ 

Here,

$$ \partial^{1/2}_t f(t) = \mathcal{F}^{-1}[|\tau|^{1/2} \mathcal{F}[f](\tau)] $$

and the Fourier transform $\mathcal{F}$ and its inverse transform $\mathcal{F}^{-1}$ are defined by

$$ \mathcal{F}[f](\tau) = \int_{-\infty}^{\infty} e^{-i\tau t} f(t) \, dt, \quad \mathcal{F}^{-1}[f](t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{i\tau t} f(\tau) \, d\tau $$

for a function $f$ defined on $\mathbb{R}$.

To describe the nonlinear terms, for $m$-vector $u = (u_1, \ldots, u_m)$ and $n$-vector $v = (v_1, \ldots, v_n)$, we let $(u, v) = (u_1, \ldots, u_m, v_1, \ldots, v_n)$ and define $u \otimes v$ as the $mn$ vector whose $k$-th component is given by $u_i v_j$, where $(i, j)$ is the $k$-th couple of the set $\{ (i', j') \mid 1 \leq i' \leq m, 1 \leq j' \leq n \}$ in lexicographical order. Similarly, for $\ell \in \mathbb{N} \cup \{0\}$, we regard $\nabla^\ell u$ as the $N^\ell m$-vector the $k$-th component of which is given by $\partial_{j_1} \cdots \partial_{j_\ell} u_i$, where $(j_1, \ldots, j_\ell, i)$ is the $k$-th couple of the set $\{ (j_1', \ldots, j_\ell', i') \mid 1 \leq j_1' \cdots, j_\ell' \leq N, 1 \leq i' \leq m \}$ in lexicographical order. Then, for example, for an $\ell \times N^\ell mn$ matrix

$$ V = (V_{(k, j_1, j_2, j_3, i, j)})_{1 \leq k \leq \ell, 1 \leq j_1, j_2, j_3 \leq N, 1 \leq i \leq m, 1 \leq j \leq m}, $$

we can regard $V(\nabla^2 u \otimes \nabla v)$ as the $\ell$-vector, with $k$-th component being

$$ \sum_{j_1, j_2, j_3, i, j} V_{(k, j_1, j_2, j_3, i, j)} \partial_{j_1} \partial_{j_2} u_i \partial_{j_3} v_j. $$

Finally, the letter $C$ denotes generic constants and $C_{a,b,\cdots}$ stands for constants depending on the quantities $a, b, \cdots$. Both constants $C$ and $C_{a,b,\cdots}$ may vary from line to line.

We reduce the free boundary problem \[ \text{1.1} \] in the time-dependent domain $\Omega(t)$ to a quasilinear problem in the fixed domain $\Omega$. Then, we provide our
main results for the latter problem. To do so, we formulate the problem (1.1) in Lagrange coordinates instead of Euler coordinates by employing the Lagrange transformation.

\[ x = y + \int_0^t u(y, s) \, ds \equiv X_u(y, t) \quad (2.1) \]

\[ u = (u_1(y, t), \cdots, u_N(y, t)) = v(X_u(y, t), t), \quad p(y, t) = \pi(X_u(y, t), t). \]

By the argument in [21, Appendix A], the functions \( u, p \) satisfies the following equation:

\[
\begin{cases}
\partial_t u - \text{Div} \, S(u, p) = f(u), & \text{div} \, u = g(u) = \text{div} \, g(u) \quad \text{in } \Omega \times (0, T), \\
S(u, p)\nu = h(u)\nu & \text{on } \partial \Omega \times (0, T) \quad (2.2) \\
u|_{t=0} = v_0 & \text{in } \Omega.
\end{cases}
\]

where the nonlinearities \( f(u), g(u), g(u) \) and \( h(u) \) are defined by

\[
\begin{align*}
f(u) &= V^1 \left( \int_0^t \nabla u \, ds \right) (\partial_t u, \nabla^2 u) + W \left( \int_0^t \nabla^2 u \, ds \otimes \nabla u \right), \\
g(u) &= V^2 \left( \int_0^t \nabla u \, ds \right) u, \\
g(u) &= V^3 \left( \int_0^t \nabla u \, ds \right) \nabla u, \\
h(u) &= V^4 \left( \int_0^t \nabla u \, ds \right) \nabla u,
\end{align*}
\]

with some matrix-valued polynomials \( V^1, V^2, V^3, V^4 \) and \( W \) with \( V^i(O) = O \). The symbol \( O \) stands for the zero matrix.

To establish the global well-posedness of (2.2) and the decay of the solution, the appropriate decay properties of the solution must be proven for the linearized problem associated with (2.2), which is called the Stokes initial value problem.

\[
\begin{cases}
\partial_t U - \text{Div} \, S(U, \mathfrak{B}) = F, & \text{div} \, U = G = \text{div} \, G \quad \text{in } \Omega \times (0, T), \\
S(U, \mathfrak{B})\nu = H & \text{on } \partial \Omega \times (0, T), \\
U|_{t=0} = v_0 & \text{in } \Omega. \quad (2.4)
\end{cases}
\]

Nevertheless, the decay properties have not been developed in general domains. In this paper, we focus on the case

\[ \{ \lambda \in \mathbb{C} \setminus \{0\} \mid |\arg \lambda| < \pi - \varepsilon \} \subset \rho(A_q) \text{ but } 0 \notin \rho(A_q) \]

with \( \varepsilon \in (0, \pi/2) \), where \( \rho(A_q) \) is the resolvent set of the Stokes operator \( A_q \), and we assume the \( L_q-L_r \) estimates for the Stokes semigroup. To obtain decay properties, we consider a time-shifted problem, (2.10) below, whose solution decays sufficiently fast, and then compensate it by estimating the difference of solutions to (2.4) and the time-shifted problem from the \( L_q-L_r \) estimates.

Below, we state the assumptions of our main theorem in order. We begin with the assumption that the domain \( \Omega \) is a uniform \( H^2 \) domain.
Assumption 2.1. There exist positive constants $\alpha$, $\beta$ and $K$ such that for any $x_0 = (x_{0,1}, \ldots, x_{0,N}) \in \partial \Omega$, there exist a coordinate number $j$ and a function $h \in H^2_\infty(B_{\alpha}^j(x_0))$ with $\|h\|_{H^2_\infty(B_{\alpha}^j(x_0))} \leq K$ satisfying

$$\Omega \cap B_\beta(x_0) = \{x \in \mathbb{R}^N \mid x_j > h(x'), \ \forall x' \in B_{\alpha}^j(x_0)\} \cap B_\beta(x_0),$$

$$\partial \Omega \cap B_\beta(x_0) = \{x \in \mathbb{R}^N \mid x_j = h(x'), \ \forall x' \in B_{\alpha}^j(x_0)\} \cap B_\beta(x_0),$$

where

$$x' = (x_1, \ldots, x_{j-1}, x_{j+1}, \ldots, x_N), \ x'_0 = (x_{0,1}, \ldots, x_{0,j-1}, x_{0,j+1}, \ldots, x_{0,N}),$$

$$B_{\alpha}(x'_0) = \{x' \in \mathbb{R}^{N-1} \mid |x' - x'_0| < \alpha\}, \ B_\beta(x_0) = \{x \in \mathbb{R}^N \mid |x - x_0| < \beta\}.$$

Remark 2.1. The unique solvability of the weak Dirichlet problem for the Poisson equation to reduce the linearized problem to a problem without the divergence condition. This unique solvability is known only for $q = 2$. Hence, we assume it in the present paper. This assumption is reasonable because the resolvent estimate for the Stokes resolvent problem cannot be obtained if the unique solvability does not hold. (See [14, Remark 1.7].)

Assumption 2.2. The following assertion holds for $W^1_q(\Omega) = \hat{H}^1_q(\Omega)$ or $W^1_q(\Omega) = H^1_q(\Omega)$. For any $q \in (1, \infty)$ and $f \in L^q(\Omega)^N$, the problem

$$(\nabla \theta, \nabla \varphi)_\Omega = (f, \nabla \varphi)_\Omega \text{ for all } \varphi \in W^1_q(\Omega)$$

(2.5)

admits a unique solution $\theta \in W^1_q(\Omega)$ satisfying the estimate

$$\|\nabla \theta\|_{L^q(\Omega)} \leq C\|f\|_{L^q(\Omega)}.$$  

(2.6)

Moreover, for any $r \in (1, \infty)$, if $f \in L^r(\Omega)^N$ as well as $f \in L^q(\Omega)^N$, then, $\mathbf{u}$ satisfies

$$(\nabla \theta, \nabla \varphi)_\Omega = (f, \nabla \varphi)_\Omega, \text{ for all } \varphi \in W^1_r(\Omega)$$

and the estimate $\|\nabla \theta\|_{L^r(\Omega)} \leq C\|f\|_{L^r(\Omega)}$.

Remark 2.1. The unique existence of the weak Dirichlet problem (2.5) is obtained in the half-space, bounded domains, exterior domains, perturbed half-spaces, and layer domains. For details and more examples of domains in which the problem (2.5) is uniquely solvable, see [14, Example 1.6].

Define the solution operator $\Pi^0_q$ of the weak Dirichlet problem (2.5) by

$$\Pi^0_q : L^q(\Omega) \to W^1_q(\Omega) : \Pi^0_q f = \theta.$$  

(2.7)

Note that $\Pi^0_q f = \Pi^0_q f$ if $f \in L^q(\Omega)^N \cap L^r(\Omega)^N$.

We now introduce the Stokes semigroup by following the arguments in [3, Section 4], see also [22, p. 159, 160]. We assume that Assumptions 2.1 and 2.2 hold. We consider the Stokes initial value problem

$$\begin{cases}
\partial_t U - \text{Div } S(U, Q) = F, & \text{div } U = 0 \quad \text{in } \Omega \times (0, \infty), \\
S(U, Q)\nu = 0 & \text{on } \partial \Omega \times (0, \infty), \quad (2.8) \\
U|_{t=0} = v_0 & \text{in } \Omega
\end{cases}$$
for $F \in L^q(0, \infty; J_q(\Omega))$ and $v_0 \in J_q(\Omega)$, where $J_q(\Omega)$ is the solenoidal space

$$J_q(\Omega) = \{ U \in L^q(\Omega)^N \mid (U, \nabla \varphi)_\Omega = 0 \text{ for any } \varphi \in W^1_q(\Omega) \}. $$

Then, $\text{div } F(t) = 0$ a.e. $t \in (0, \infty)$ and $\text{div } v_0 = 0$. By multiplying $\text{div}$ to the first equation, by the normal component of the boundary condition and by applying $\text{div } U = 0$, we obtain a system for the pressure $\Psi$, as given below.

$$\begin{cases}
\Delta \Psi = 0 & \text{in } \Omega, \\
\Psi = 2\mu \partial_\nu U_\nu - \text{div } U & \text{on } \partial \Omega,
\end{cases}$$

where $f_\nu = \nu \cdot f$, $\partial_\nu f = \nu \cdot \nabla f$ for given functions $f = (f_1(x), \cdots, f_n(x))$ and $f = f(x)$. The solution operator of this system is given by (2.7). In fact, $\theta = \Psi - (2\mu \partial_\nu U_\nu - \text{div } U)$ obeys

$$\begin{cases}
\Delta \theta = -\Delta (2\mu \partial_\nu U_\nu - \text{div } U) & \text{in } \Omega, \\
\theta = 0 & \text{on } \partial \Omega,
\end{cases}$$

whose weak formulation is given by (2.5) with $f = -\nabla (2\mu \partial_\nu U_\nu - \text{div } U)$. Then, the Stokes initial value problem (2.8) can be reduced to the problem

$$\begin{cases}
\partial_t U - \text{Div } S(U, \Pi(U)) = F & \text{in } \Omega \times (0, \infty), \\
S(U, \Pi(U))\nu = 0 & \text{on } \partial \Omega \times (0, \infty), \\
U|_{t=0} = v_0 & \text{in } \Omega.
\end{cases}$$

Note that the second equation $\text{div } u = 0$ can be recovered by the uniqueness of solutions to the initial value problem for the heat equation subject to the Dirichlet boundary condition obeyed by $\text{div } u$. (see [3, p. 243].) We now define the Stokes operator on $J_q(\Omega)$ as

$$D(A_q) = \{ U \in J_q(\Omega) \cap H^2_q(\Omega)^N \mid S(U, \Pi(U))\nu = 0 \text{ on } \partial \Omega \},$$

$$A_q U = -\text{Div } S(U, \Pi(U)).$$

Then, (2.10) is rewritten to the Cauchy problem

$$\partial_t U + A_q U = F, \quad U|_{t=0} = v_0.$$

Note that, for any $q, r \in (1, \infty)$, $A_q U = A_r U$ if $U \in D(A_q) \cap D(A_r)$.

The following proposition on the generation of the Stokes semigroup is guaranteed by [15, Theorem 2.5]. For the details of the proof, the reader is referred to [22, Lemma 3.7].

**Proposition 2.1** ([15]). Assume that Assumptions 1 and 2 hold. Then, the Stokes operator $A_q$ generates an analytic semigroup $\{ e^{-tA_q} \}_{t \geq 0}$ of class $C^0$ on $J_q(\Omega)$ for $1 < q < \infty$. 

8
We often write $e^{-tA_ef}$ even for $f \in J_r(\Omega)$ instead of $e^{-tA_r}f$ because $e^{-tA_ef} = e^{-tA_r}f$ for $q, r \in (1, \infty)$ and $f \in J_q(\Omega) \cap J_r(\Omega)$. In fact, by repeating the argument in [14] in $J_q(\Omega) \cap J_r(\Omega)$ instead of $J_q(\Omega)$, we obtain $(\lambda + A_q)^{-1}f = (\lambda + A_r)^{-1}f$. Then, the formula

$$e^{-tA_ef} = \frac{1}{2\pi i} \int_\Gamma (\lambda + A_q)^{-1}f \, ds,$$

concludes $e^{-tA_ef} = e^{-tA_r}f$.

The $L_q$-L$_r$ estimates are stated as follows. Because the decay rate changes according to the domain, (see Remark 2.2) we consider the general rate and, in the statement of the main theorem, state the type of rate needed to obtain the global well-posedness.

**Definition 2.1.** Let the decay rate $\sigma_m(q, r)$ be a function defined for $m = 0, 1, 2$ and $q, r \in (1, \infty]$ with $q \leq r$. We say that the $L_q$-L$_r$ estimates hold for the decay rate $\sigma_m(q, r)$ if, for $(q, r)$ satisfying $1 < q \leq r \leq \infty$ and $q \neq \infty$, there exists $C = C(q, r) > 0$ such that

$$\|\langle \partial_t e^{-tA_ef}, \nabla^2 e^{-tA_ef} \rangle\|_{L_r(\Omega)} \leq C t^{-\sigma(q, r)}\|f\|_{L_q(\Omega)} \quad (r \neq \infty)$$

$$\|\nabla^m e^{-tA_ef}\|_{L_r(\Omega)} \leq C t^{-\sigma_m(q, r)}\|f\|_{L_q(\Omega)} \quad (m = 0, 1)$$  \hspace{1cm} (2.13)

for $t \geq 1$ and $f \in J_q(\Omega)$.

**Remark 2.2.** (1) In $\mathbb{R}^N$ and $\mathbb{R}_+^N$, the $L_q$-L$_r$ estimates hold for the decay rate

$$\sigma_m(q, r) = \frac{N}{2} \left( \frac{1}{q} - \frac{1}{r} \right) + \frac{m}{2}. \hspace{1cm} (2.14)$$

The second inequality of (2.13) was studied in [8, equation (2.3)] in $\mathbb{R}^N$, and, in $\mathbb{R}_+^N$, is proven in Subsection 4.1 below from the resolvent estimates for the resolvent Stokes problem provided by to Shibata and Shimizu [20]. The first inequality is obtained as in Subsection 4.1.

(2) In exterior domain, the $L_q$-L$_r$ estimates hold for the decay rate

$$\sigma_m(q, r) = \begin{cases} \frac{N}{2} \left( \frac{1}{q} - \frac{1}{r} \right) + \frac{m}{2} & m = 0, 1, \\ \min \left\{ \frac{N}{2} \left( \frac{1}{q} - \frac{1}{r} - \delta_0 \right) + 1, \frac{m}{2} + \frac{1}{2} \right\} & m = 2 \end{cases} \hspace{1cm} (2.15)$$

for sufficiently small $\delta_0 > 0$. The second inequality was proven by Shibata [19, Theorem 1] and first one is shown as in Subsection 4.1 from the resolvent estimates by Shibata [19, Theorem 2].

The sufficiently fast decay of the solution to the time-shifted Stokes problem

$$\begin{cases} \partial_t U + \lambda_0 U - \text{Div} S(U, \partial_t \Omega) = F, \quad \text{div} U = G = \text{div} G & \text{in } \Omega \times (0, T), \\ S(U, \partial_t \Omega) = H & \text{on } \partial \Omega \times (0, T), \\ U|_{t=0} = v_0 & \text{in } \Omega \end{cases} \hspace{1cm} \text{(2.16)}$$
is justified by [17], equation (3.600)], which is valid for general domains satisfying Assumptions 2.1 and 2.2. To provide a statement of it, we define the space for initial velocity by

$$D_{q,p}(\Omega) = (J_q(\Omega), D(A_q))_{1-1/p,p} \subset B^{2(1-1/p)}_{q,p}(\Omega)$$

for \( p, q \in (1, \infty) \), where \((\cdot, \cdot)_{1-1/p,p} \) is real interpolation functor.

**Remark 2.3.** The space \( D_{q,p}(\Omega) \) is characterized as follows. (see [20], Lemma 2.4)

$$D_{q,p}(\Omega) \phi \begin{cases} 
\{ v_0 \in J_q(\Omega) \cap B^{2(1-1/p)}_{q,p}(\Omega) \mid [\mathbf{D}(v_0)]_{r,\Omega} = 0 \} 
& \text{if } 2(1-1/p) - 1/q > 1, \\
J_q(\Omega) \cap B^{2(1-1/p)}_{q,p}(\Omega) & \text{if } 2(1-1/p) - 1/q < 1.
\end{cases}$$

**Theorem 2.1** ([17]). Let \( 1 < p, q < \infty \) and \( T \in (0, \infty] \). Assume Assumptions 1 and 2. For the right members \( \mathbf{F}, \mathbf{G}, \mathbf{G}, \mathbf{v}_0 \), assume that \( \mathbf{F}, \mathbf{v}_0 \), and some extensions \( G_b, G_b, \mathbf{H}_b \) respectively of \( < t > G, < t > G, G \) satisfy

$$v_0 \in D_{q,p}(\Omega), \quad < t > G \in L_p(0,T; L_q(\Omega)^N), \quad G_b \in H^1_p(\mathbb{R}; L_q(\Omega)^N),$$
$$G_b \in H^{1/2}_p(\mathbb{R}; L_q(\Omega)) \cap L_p(\mathbb{R}; H^1_q(\Omega)), \quad \mathbf{H}_b \in H^{1/2}_p(\mathbb{R}; L_q(\Omega)^N) \cap L_p(\mathbb{R}; H^1_q(\Omega)^N),$$

the compatibility condition

$$(G_b(t), \varphi)_{\Omega} = (G_b(t), \nabla \varphi)_{\Omega} \quad \text{a.e. } t \in \mathbb{R} \text{ for any } \varphi \in W^1_q(\Omega)$$

and \((\mathbf{G}, \mathbf{G}, \mathbf{H})|_{t=0} = (0, 0, 0)\). Then, the problem (2.10) admits unique solutions

$$\mathbf{U} \in H^1_p(0,T; L_q(\Omega)^N) \cap L_p(0,T; H^2_q(\Omega)^N), \quad \mathbf{P} \in L_p(0,T; W^1_q(\Omega) + H^1_q(\Omega)).$$

Moreover, for \( b \geq 0 \), the solution satisfies the following estimate.

$$\| < t > \mathbf{U} \|_{L_p(0,T; L_q(\Omega)^N)} + \| < t > \mathbf{U} \|_{L_p(0,T; H^2_q(\Omega)^N)} + \| \nabla \mathbf{P} \|_{L_p(0,T; L_q(\Omega))} \leq C(\| < t > \mathbf{F} \|_{L_p(0,T; L_q(\Omega)^N)} + \| (G_b, \partial_t G_b) \|_{L_p(\mathbb{R}; L_q(\Omega))}$$
$$+ \| \partial_t^{1/2}(G_b, \mathbf{H}_b) \|_{L_p(\mathbb{R}; L_q(\Omega))} + \| (G_b, \mathbf{H}_b) \|_{L_p(\mathbb{R}; H^1_q(\Omega))} + \| \mathbf{v}_0 \|_{B^{2(1-1/p)}_{q,p}(\Omega)})$$

where the constant \( C \) is independent of \( T \) and dependent on \( b \).

The following theorem on the global well-posedness of (2.2) in general domain is one of our main results.

**Theorem 2.2.** Let \( 2 < p < \infty, 1 < q_0 < N < q_2 < \infty \) and \( b > 1/p' \). Assume that \( \Omega \) is a uniformly \( H^2_q(\Omega) \) domain and that the weak Dirichlet problem is uniquely solvable in \( W^1_q(\Omega) \) for \( q \in (1, \infty) \) as stated in Assumptions 1 and 2. Also, assume that the \( L_q - L_r \) estimates hold for a decay rate \( \sigma_m(q,r) \) defined for \( m = 0, 1, 2 \) and \((q,r) \in (1,\infty)\) with \( q \geq r \) and satisfying the following conditions.
(C1) $\sigma_m(q_0, r)$ and $\sigma_0(q_2, r)$ is non-negative and non-decreasing with respect to $m$ and $r$.

(C2) $\sigma_0(q_0, q_{04}) > b + \frac{1}{p}$, $\sigma_1(q_0, q_{03}) > 1$ for some $q_{03}, q_{04} \in [q_0, q_2]$ with $\frac{1}{q_0} = \frac{1}{q_{03}} + \frac{1}{q_{04}}$.

Then there exists $\varepsilon > 0$ such that for any $v_0 \in \bigcap_{i=0,2} D_{q_i,p}(\Omega) \subset \bigcap_{i=0,2} B_{q_{i,p}}^{2(1-1/p)}(\Omega)$ with smallness $\sum_{i=0,2} \|v_0\|_{B_{q_{i,p}}^{2(1-1/p)}(\Omega)} \leq \varepsilon$, the transformed problem (2.2) admits unique solutions $u \in H^1_p(0, \infty; L_{q_2}(\Omega)^N) \cap L_p(0, \infty; H^2_q(\Omega)^N)$, $p \in L_p(0, \infty; W^4_{q_2}(\Omega) + H^4_{q_2}(\Omega))$ possessing the estimate $|u|(0, \infty) \leq C\varepsilon$. Here, for an interval $(a, b)$, we let

$$
|u|(a,b) = \sup_{(\tilde{p}_2, \tilde{q}_2) \in E_2} \|(1+t)^{b_2(\tilde{p}_2, \tilde{q}_2)} \partial_t u\|_{L_{\tilde{p}_2}(a, b; L_{\tilde{q}_2}(\Omega))} + \sum_{m=0,1,2} \sup_{(\tilde{p}_m, \tilde{q}_m) \in I_m} \|(1+t)^{b_m(\tilde{p}_m, \tilde{q}_m)} \nabla^m u\|_{L_{\tilde{p}_m}(a, b; L_{\tilde{q}_m}(\Omega))},
$$

where the power $b_m(\tilde{p}_m, \tilde{q}_m)$ of the weight is defined as

$$
b_m(\tilde{p}_m, \tilde{q}_m) = \begin{cases} 
\min\{\sigma_m(q_0, \tilde{q}_m) - \frac{1}{\tilde{p}_m} - \delta, b\} & (\tilde{p}_m < \infty) \\
\min\{\sigma_m(q_0, \tilde{q}_m), b\} & (\tilde{p}_m = \infty)
\end{cases} \quad (2.18)
$$

with $\delta > 0$ satisfying

$$
\delta < \min\{\sigma_0(q_0, q_{04}) - (b + 1/p), \sigma_1(q_0, q_{03}) - 1, b - 1/p'\}
$$

and the index set $I_m$ is the set of all $(\tilde{p}_m, \tilde{q}_m) \in \{p, \infty\} \times [q_0, \infty]$ satisfying

$$
(\tilde{p}_2, \tilde{q}_2) \in \{p\} \times [q_0, q_2],
(\tilde{p}_1, \tilde{p}_0) \in \{(p) \times [q_0, \infty]\} \cup \{(\infty) \times [q_0, q_2]\},
(\tilde{p}_0, \tilde{p}_0) \in \{(p) \times [q_0, \infty]\} \cup \{(\infty) \times [q_0, \infty]\). \quad (2.19)
$$

Moreover, the solution has the decay property

$$
\|\nabla^m u(t)\|_{L_r(\Omega)} = O(t^{-\min\{\sigma_m(q_0, r), b\}}) \quad (2.20)
$$

for all $r \in [q_0, \infty]$ $(m = 0)$ and $r \in [q_0, q_2]$ $(m = 1)$.

**Remark 2.4.** In the exterior domain, Shibata [17] developed the global well-posedness for the dimension $N \geq 3$ by the compactness of the boundary $\partial \Omega$ of the domain. In fact, he changed the transformation from (2.4) so that the supports of the nonlinear terms lay near $\partial \Omega$. Then, the supports are bounded thanks to the compactness of $\partial \Omega$. This improves the decay of the nonlinear terms from the $L_q$-$L_r$ estimates by lifting up the exponent $r$ of $L_r(\Omega)$. In this paper, we make full use of the decay arising from the derivative $(m/2$ appearing in (2.1) or (2.11) ) instead and obtain the global well-posedness.
The condition (C2) in Theorem 2.2 requires us to take \( N \geq 4 \) even if the decay rate \( \sigma_m(\tilde{p}, \tilde{q}) \) is as fast as that in the half-space, or more specifically satisfies (2.14). This condition is required to estimate the nonlinear term \( G(u) \) arising from \( \text{div} \, v = 0 \), see Remark 3.2. However, by reducing the Stokes equation (2.4) to the problem with \( (G, G) = (0, 0) \) (see Subsec. 4.2), we establish the results also for \( N = 3 \) in the half-space.

**Theorem 2.3.** Let \( 2 < p < \infty, \, 1 < q_0 < N < q_2 < \infty, \, b > 1/p' \). Assume

\[
b + \frac{1}{p} < \frac{N}{2q_0}.
\]

Then, the global well-posedness and decay property stated in Theorem 2.2 hold with \( \Omega = \mathbb{R}_+^N \) and with \( \delta > 0 \) in the definition (2.18) of \( b_m(\tilde{p}_m, \tilde{q}_m) \) being

\[
\delta < \frac{1}{2} \left( \frac{N}{2q_0} - (b + \frac{1}{p}) \right). \quad (2.21)
\]

### 3 Proof of Theorem 2.2

In this section, we develop the global well-posedness and decay properties of the solution of the transformed problem (2.2) in general domains stated in Theorem 2.2.

The strategy to prove the global well-posedness is to prolong the local solution by proving an a priori estimate. The unique existence of the local solution, which is stated as follows, is guaranteed by a similar argument to that in [16, Theorem 2.4].

**Theorem 3.1 ([16]).** Let \( 2 < p < \infty, \, N < q < \infty \) and \( T > 0 \). Assume Assumptions 1 and 2 hold. Then, there exists an \( \epsilon > 0 \) depending on \( T \) such that, for any \( v_0 \in D_{q,p}(\Omega) \subset B^{2(1-1/p)}_{q,p}(\Omega) \) with smallness condition \( \|v_0\|_{B^{2(1-1/p)}_{q,p}(\Omega)} \leq \epsilon \), the quasilinear problem (2.2) admits a unique solution

\[
u \in H^1_p(0, T; L_q(\Omega)) \cap L_p(0, T; H^2_q(\Omega)), \ p \in L_p(0, T; W^{1,1}_q(\Omega) + H^1_q(\Omega))
\]

possessing the estimate

\[
\|\partial_t u\|_{L_p(0, T; L_q(\Omega))} + \|u\|_{L_p(0, T; H^2_q(\Omega))} + \|\nabla p\|_{L_p(0, T; L_q(\Omega))} \leq C\epsilon,
\]

with some positive constant \( C > 0 \) independent of \( T \) and \( \epsilon \).

Then, by the same argument as in, e.g., [17, Subsec. 3.8.6], it suffices to prove that the a priori estimate

\[
\|v\|_{(0, T)} \leq C(\mathcal{I} + |v|_{(0, T)}) \quad (3.1)
\]

holds for any fixed \( T > 0 \) when the transformed problem (2.2) admits a unique solution \( u \) on \((0, T)\) sufficiently small in the norm \(|\cdot|_{(0, T)}\). Here, we have defined

\[
\mathcal{I} = \sum_{i=0, 2} \|v_0\|_{B^{2(1-1/p)}_{q_i, p}(\Omega)} \quad (3.2)
\]
and $C > 0$ is a constant independent of $u$ and $T$.

To prove the a priori estimate (3.1), we show

$$[u]_{(0, T)} \leq CN(f(u), g(u), h(u)ν, v_0)$$ (3.3)

in Subsection 3.1 and

$$N(f(u), g(u), g(u), h(u)ν, v_0) \leq C(I + [u]_{(0, T)}^2)$$ (3.4)

in Subsection 3.2. Then, we obtain the global well-posedness of the transformed problem (2.2) and the estimate

$$[u]_{(0, T)} \leq C\epsilon$$

of the solution $u$. Here, we have let

$$N(F, G, H, v_0) = \sum_{i=0,2} \left( \| < t >^b F \|_{L_p(0, T; L_{q_i}(Ω))} + \| (ET[< t >^b G], \partial t ET[< t >^b G]) \|_{L_p(\mathbb{R}; L_{q_i}(Ω))} \right. \left. + \| \partial_1^{1/2} ET[< t >^b (G, H)] \|_{L_p(\mathbb{R}; L_{q_i}(Ω))} + \| ET[< t >^b (G, H)] \|_{L_p(\mathbb{R}; H^1_{q_i}(Ω))} + \| v_0 \|_{B^{2(1-1/p)}_{q_i, p}(Ω)} \right)$$

where the extension operator $E_T$ is defined by

$$E_T f(t) = \begin{cases} f(t) & 0 < t < T, \\ f(2T - t) & T \leq t < 2T, \\ 0 & \text{otherwise} \end{cases}$$ (3.5)

for a function $f$ defined on $[0, T)$ with $f|_{t=0} = 0$. Note that

$$\| \partial_1^{1/2} ET[f] \|_{L_p(\mathbb{R}; L_{q_i}(Ω))} \leq C\| \partial_1^{1/2} \nabla_m f \|_{L_p(0, T; L_{q_i}(Ω))}$$ (3.6)

for $p, q \in [1, \infty]$ by

$$\partial_t ET[f](t) = \begin{cases} \partial_t f(t) & 0 < t < T, \\ -\partial_t f(2T - t) & T < t < 2T, \\ 0 & \text{otherwise}. \end{cases}$$

The decay properties (2.20) are obtained by

$$\| < t >^{b_m(\infty, \tilde{q}_m)} \nabla^m u \|_{L_p(0, T; L_{\tilde{q}_m}(Ω))} \leq C[u]_{(0, T)} \leq C\epsilon$$ (3.7)

if $m = 0, 1$ and $(\infty, \tilde{q}_m)$ satisfies (2.19).
3.1 Estimate for the Stokes problem in the general domain

In this subsection, we prove the estimate (3.3). Because \( u \) can be regarded as the solution to the Stokes problem (2.4) with

\[
(v_0, F, G, H) = (v_0, f(u), g(u), h(u)),
\]

it suffices to prove the corresponding estimate (3.8) in the following theorem. To do so, we combine the maximal regularity Theorem 2.1 with it suffices to prove the corresponding estimate (3.8) in the following theorem. To do so, we combine the maximal regularity Theorem 2.1 with

\[
(G_b, G_b, H_b) = (E_T[< t >^b G], E_T[< t >^b G], E_T[< t >^b H])
\]

and \( L_q - L_r \) estimates (2.13) for the decay rate \( \sigma_m(\tilde{p}, \tilde{q}) \) with the condition (C1) in Theorem 2.2.

Theorem 3.2. Let \( 1 < p, q < \infty \) and \( T \in (0, \infty) \). Assume that Assumptions 1 and 2 hold and that the \( L_q - L_r \) estimates holds for the decay rate \( \sigma_m(q, r) \) defined for \( m = 0, 1, 2 \) and for \( (q, r) \in (1, \infty) \) with \( q \geq r \) and satisfying the condition (C1) in Theorem 2.2. For any \( v_0 \in D_{q,p}(\Omega) \) and right members \( (F, G, G, H) \) defined on \((0, T)\) satisfying

\[
< t >^b F \in L_p(0, T; L_q(\Omega)^N), \quad E_T[< t >^b G] \in H^1_p(\mathbb{R}; L_q(\Omega)^N),
\]

\[
E_T[< t >^b G] \in H^{1/2}_p(\mathbb{R}; L_q(\Omega)) \cap L_p(\mathbb{R}; H^1_q(\Omega)),
\]

\[
E_T[< t >^b H] \in H^{1/2}_p(\mathbb{R}; L_q(\Omega)^N) \cap L_p(\mathbb{R}; H^1_q(\Omega)^N)
\]

and the compatibility condition

\[
(G(t), \varphi)_{\Omega} = (G(t), \nabla \varphi)_{\Omega} \text{ for any } \varphi \in W^1_q(\Omega),
\]

the Stokes problem (2.4) admits unique solutions

\[ U \in H^1_p(0, T; L_q(\Omega)^N) \cap L_p(0, T; H^2_q(\Omega)^N), \quad \mathcal{P} \in L_p(0, T; W^1_q(\Omega) + H^2_q(\Omega)). \]

Moreover, the solutions possess the estimate

\[
[U]_{(0, T)} \leq C_b \mathcal{N}(F, G, H, v_0) \tag{3.8}
\]

for \( b \geq 0 \), where \( C_b > 0 \) is a constant independent of \( T \).

To prove Theorem 3.2, it suffices to construct a solution to (2.4) with the estimate

\[
\|< t >^{b_2(\tilde{p}_2, \tilde{q}_2)} \partial_t U\|_{L_{p_2}(0, T; L_{q_2}(\Omega))} \leq C_b \mathcal{N}(F, G, H, v_0),
\]

\[
\|< t >^{b_m(\tilde{p}_m, \tilde{q}_m)} \nabla^m U\|_{L_{p_m}(0, T; L_{q_m}(\Omega))} \leq C_b \mathcal{N}(F, G, H, v_0) \tag{3.9}
\]

for any \( m = 0, 1, 2 \) and \( (\tilde{p}_m, \tilde{q}_m) \) satisfying (2.19) because the uniqueness is obtained by [10] Theorem 3.2 and because (3.8) can be obtained by (3.9) and the definition (2.17) of \( [u] \). To this end, we consider the time-shifted Stokes system (2.14) to deduce a sufficient decay of the solution and, then consider the...
system for the difference of the solutions to (2.16) and the Stokes system (2.4).
We estimate the solution to the former system by the maximal L_p-L_q regularity stated in Theorem 2.1 and, to the latter, by the L_q-L_r estimates (2.13) of the Stokes semigroup for the decay rate σ_m(q, r) with condition (C1).

Divide the solutions U and P of the Stokes equation (2.4) into three parts as

\[ U = U^1 + U^2 + U^3 \quad \text{and} \quad P = P^1 + P^2 + P^3 \]  

so that each part satisfies the following equation for sufficiently large \( \lambda_1 \).

\[
\begin{align*}
\begin{cases}
\partial_t U^1 + \lambda_1 U^1 - \text{Div} \ S(U^1, P^1) = F, & \text{in } \Omega \times (0, \infty), \\
\text{div} \ U^1 = G & \text{on } \partial \Omega \times (0, \infty), \\
U^1|_{t=0} = v_0 & \text{in } \Omega,
\end{cases}
\end{align*}
\]

\[
\begin{align*}
\begin{cases}
\partial_t U^2 + \lambda_1 U^2 - \text{Div} \ S(U^2, P^2) = \lambda_1 U^1, & \text{in } \Omega \times (0, \infty), \\
\text{div} \ U^2 = 0 & \text{on } \partial \Omega \times (0, \infty), \\
U^2|_{t=0} = 0 & \text{in } \Omega,
\end{cases}
\end{align*}
\]

\[
\begin{align*}
\begin{cases}
\partial_t U^3 - \text{Div} \ S(U^3, P^3) = \lambda_1 U^2, & \text{in } \Omega \times (0, \infty), \\
\text{div} \ U^3 = 0 & \text{on } \partial \Omega \times (0, \infty), \\
U^3|_{t=0} = 0 & \text{in } \Omega.
\end{cases}
\end{align*}
\]

**Remark 3.1.** Note that the right-hand side of the first equation of (3.13), \( \lambda_1 U^2 \), belongs to \( D(A_q) \) while that of (3.12), \( \lambda_1 U^1 \), in general does not. This is why we divide the solutions into three parts rather than two parts as in Shibata [17, p. 448], which is important in estimating

\[ \nabla^2 U^3(t) = \int_0^t \nabla^2 e^{-(t-s)A_q \lambda_1} U^2(s) \, ds. \]

In fact, the right-hand side will have a singularity on \( s = t \) if we estimate it only by the pointwise estimate of the semigroup as

\[
\left\| \int_0^t \nabla^2 e^{-(t-s)A_q \lambda_1} U^2(s) \, ds \right\|_{L_q(\Omega)} \leq \int_0^t \| \nabla^2 e^{-(t-s)A_q \lambda_1} U^2(s) \|_{L_q(\Omega)} \, ds \\
\leq C \int_0^t (t-s)^{-1} \| U^2(s) \|_{L_q(\Omega)} \, ds.
\]

We overcome this difficulty by the observations that \( \nabla^2 \) and \( A_q \) are comparable and that we can exchange \( A_q \) and \( e^{-tA_q} \) thanks to \( U^2 \in D(A_q) \).

\[ A_q e^{-tA_q} U^2 = e^{-tA_q} A_q U^2. \]  

**Estimate for U^3.**
First, we prove the estimate for the solution $U^3$ to (3.13) for $m = 0, 1, 2$ and $(\tilde{p}_m, \tilde{q}_m)$ with (2.10).

\[
\begin{align*}
\| < t > ^{b_2(\tilde{p}_2, \tilde{q}_2)} \partial_t U^3 \|_{L_{p_2}(0; T; L_{q_2}(\Omega))} & \leq C \sum_{i=0, 2} \| < t > ^{b_i} U^2 \|_{L_{p_i}(0; T; H_{q_i}^2(\Omega))}, \\
\| < t > ^{b_m(\tilde{p}_m, \tilde{q}_m)} \nabla^m U^3 \|_{L_{p_m}(0; T; L_{q_m}(\Omega))} & \leq C \sum_{i=0, 2} \| < t > ^{b_i} U^2 \|_{L_{p_i}(0; T; H_{q_i}^2(\Omega))}.
\end{align*}
\]

(3.15)

Let us decompose the domains of the norms in the left-hand side as $(0, T) = (0, 2) \cup (2, T)$. Then, it suffices to show

\[
\begin{align*}
\| < t > ^{b_2(\tilde{p}_2, \tilde{q}_2)} \partial_t U^3 \|_{L_{p_2}(0; 2; L_{q_2}(\Omega))} & \leq C \sum_{i=0, 2} \| < t > ^{b_i} U^2 \|_{L_{p_i}(0; 2; H_{q_i}^2(\Omega))}, \\
\| < t > ^{b_m(\tilde{p}_m, \tilde{q}_m)} \nabla^m U^3 \|_{L_{p_m}(0; 2; L_{q_m}(\Omega))} & \leq C \sum_{i=0, 2} \| < t > ^{b_i} U^2 \|_{L_{p_i}(0; 2; H_{q_i}^2(\Omega))},
\end{align*}
\]

(3.16)

\[
\begin{align*}
\| < t > ^{b_2(\tilde{p}_2, \tilde{q}_2)} \partial_t U^3 \|_{L_{p_2}(2; T; L_{q_2}(\Omega))} & \leq C \sum_{i=0, 2} \| < t > ^{b_i} U^2 \|_{L_{p_i}(2; T; H_{q_i}^2(\Omega))}, \\
\| < t > ^{b_m(\tilde{p}_m, \tilde{q}_m)} \nabla^m U^3 \|_{L_{p_m}(2; T; L_{q_m}(\Omega))} & \leq C \sum_{i=0, 2} \| < t > ^{b_i} U^2 \|_{L_{p_i}(2; T; H_{q_i}^2(\Omega))}.
\end{align*}
\]

(3.17)

Estimate for $U^3$ on $(2, T)$.

We first prove the estimate (3.17) of $U^3$ on $(2, T)$. Initially, we prove the second inequality of (5.17) and we show the first inequality in (3.29) below. For this purpose, we decompose $U^3$ as

\[
U^3(t) = \int_0^t e^{-A(t-s)} \lambda_1 U^2(s) \, ds
\]

\[
= \left( \int_0^{t/2} + \int_{t/2}^{t-1} + \int_{t-1}^t \right) e^{-A(t-s)} \lambda_1 U^2(s) \, ds
\]

(3.18)

by setting

\[
U^{31}(t) = \int_0^{t/2} e^{-A(t-s)} \lambda_1 U^2(s) \, ds, \quad U^{32}(t) = \int_{t/2}^{t-1} e^{-A(t-s)} \lambda_1 U^2(s) \, ds,
\]

\[
U^{33}(t) = \int_{t-1}^t e^{-A(t-s)} \lambda_1 U^2(s) \, ds
\]

to use the relation

\[
\begin{align*}
s &< t - s \sim t \quad \text{when } 0 < s < t/2, \; t > 2, \\
t - s &< t - s \sim t - s > 1 \quad \text{when } t/2 < s < t - 1, \; t > 2, \\
t - s &< t - s \sim t - s < 1 \quad \text{when } t - 1 < s < t, \; t > 2.
\end{align*}
\]

(3.19)
Thus, by the uniqueness and the estimate for (3.20) due to [14, Theorem 1.5 (1)] and by desired estimate.

Proof. 0 Π f = (u derive the reduced Stokes equation (2.10), because Definition (2.18) of t. Because

Let C > are equivalent, that is, there exists ∥b m ∥ < t >, which is obtained owing to U 2 ∈ D(A q).

Lemma 3.1. Let 1 < q < ∞. The norms associated with D(A q) and H q 2(Ω) are equivalent, that is, there exists C > 0 satisfying

\[ C^{-1} \|u\|_{H_q^2(Ω)} \leq \|(u, A_q u)\|_{L_q(Ω)} \leq C \|u\|_{H_q^2(Ω)} \quad \text{for any } u \in D(A_q). \]

Proof. By the definition (2.11) of A q and (2.3) of Π q, and the estimate (2.6) for Π q, we get \( \|(u, A_q u)\|_{L_q(Ω)} \leq C \|u\|_{H_q^2(Ω)} \). To prove the other estimate, we set \( f = (\lambda_0 + A_q)u \) for sufficiently large \( \lambda_0 > 0 \). Then, similarly to the argument to derive the reduced Stokes equation (2.11), \( u \) and \( p = \Pi_q u \) satisfy

\[
\begin{align*}
\lambda_0 u - \text{Div} S(u, p) &= f, \quad \text{div} u = 0 \quad \text{in } Ω \\
S(u, p)\nu &= 0 \quad \text{in } \partial Ω.
\end{align*}
\]

Thus, by the uniqueness and the estimate

\[ \|u\|_{H_q^2(Ω)} \leq C \|f\|_{L_q(Ω)} \]

for (3.20) due to [14] Theorem 1.5 (1)] and by \( f = (\lambda_0 + A_q)u \), we obtain the desired estimate. \( \square \)

Estimate for \( U^{33} \).

Now, we show the estimate for the third part \( U^{33} \) of the solution formula (3.18) of \( U^3 \): for \( m = 0, 1, 2 \) and \( (\bar{p}_m, \bar{q}_m) \) satisfying (2.19),

\[
\| < t >^{b_m(\bar{p}_m, \bar{q}_m)} \nabla^m U^{33} \|_{L_{\bar{p}_m}(2; T; L_{\bar{q}_m}(Ω))} \leq C \sum_{i=0, 2} \| < t >^b U^2 \|_{L_p(0; T; H_{\bar{q}_m}^2(Ω))}.
\]

(3.21)

Because \( t - s < s \sim t \) and \( b_m(\bar{p}_m, \bar{q}_m) \leq b \), see the relation (3.19) and the definition (2.18) of \( b_m(\bar{p}_m, \bar{q}_m) \), we obtain

\[
\begin{align*}
\| < t >^{b_m(\bar{p}_m, \bar{q}_m)} \nabla^m U^3 \|_{L_{\bar{p}_m}(2; T; L_{\bar{q}_m}(Ω))} &= \| < t >^{b_m(\bar{p}_m, \bar{q}_m)} \nabla^m \int_{t-1}^t e^{-A_{\bar{q}_m}(t-s)\lambda_1} U^2(s) \, ds \|_{L_{\bar{p}_m}(2; T; L_{\bar{q}_m}(Ω))} \\
&\leq C \| \nabla^m \int_{t-1}^t e^{-A_{\bar{q}_m}(t-s)\lambda_1} < s >^b U^2(s) \, ds \|_{L_{\bar{p}_m}(2; T; L_{\bar{q}_m}(Ω))} \\
&\leq C \| \int_{t-1}^t \nabla^m e^{-A_{\bar{q}_m}(t-s)\lambda_1} < s >^b U^2(s) \, ds \|_{L_{\bar{p}_m}(2; T; L_{\bar{q}_m}(Ω))} \\
&\leq C \sum_{i=0, 2} \| \int_{t-1}^t e^{-A_{\bar{q}_m}(t-s)\lambda_1} < s >^b U^2(s) \|_{H_{\bar{q}_m}^2(Ω)} \, ds \|_{L_{\bar{p}_m}(2; T; L_{\bar{q}_m}(Ω))}.
\end{align*}
\]

17
where we have used the Sobolev embedding and \([2.19]\) in the last inequality. We apply Lemma \([3.1]\) and the formula \([3.14]\) to estimate the right-hand side as follows.

\[
\left\| \int_{t-1}^{t} \| e^{-A_{q_{i}}(t-s)} < s >^{b} U^{2}(s) \|_{H_{q_{i}}^{2}(\Omega)} \, ds \right\|_{L_{\tilde{p}_{m}}(2,T)} \\
\leq C \left\| \int_{t-1}^{t} \| (e^{-A_{q_{i}}(t-s)} < s >^{b} U^{2}(s), A_{q_{i}} e^{-A_{q_{i}}(t-s)} < s >^{b} U^{2}(s)) \|_{L_{q_{i}}(\Omega)} \, ds \right\|_{L_{\tilde{p}_{m}}(2,T)} \\
= C \left\| \int_{t-1}^{t} \| (e^{-A_{q_{i}}(t-s)} < s >^{b} U^{2}(s), e^{-A_{q_{i}}(t-s)} < s >^{b} A_{q_{i}} U^{2}(s)) \|_{L_{q_{i}}(\Omega)} \, ds \right\|_{L_{\tilde{p}_{m}}(2,T)},
\]
and this term is estimated as follows from \(\| e^{-A_{q_{i}}t} \|_{L_{q_{i}}(\Omega)} \leq C (0 \leq t \leq 1)\), Young’s inequality, and Lemma \([3.1]\).

\[
\left\| \int_{t-1}^{t} \| (e^{-A_{q_{i}}(t-s)} < s >^{b} U^{2}(s), e^{-A_{q_{i}}(t-s)} < s >^{b} A_{q_{i}} U^{2}(s)) \|_{L_{q_{i}}(\Omega)} \, ds \right\|_{L_{\tilde{p}_{m}}(2,T)} \\
\leq C \left\| \int_{t-1}^{t} \| (\langle s >^{b} U^{2}(s), < s >^{b} A_{q_{i}} U^{2}(s)) \|_{L_{q_{i}}(\Omega)} \, ds \right\|_{L_{\tilde{p}_{m}}(2,T)} \\
\leq C \left\| \int_{1(0,1)} \| (\langle s >^{b} U^{2}(s), A_{q_{i}} U^{2}(s)) \|_{L_{q_{i}}(\Omega)} \, ds \right\|_{L_{\tilde{p}_{m}}(2,T)} \\
\leq C \| 1_{(0,1)} \|_{L_{r}(\mathbb{R})} \| 1_{(0,T)}(s) \| < s >^{b} (U^{2}(s), A_{q_{i}} U^{2}(s)) \|_{L_{p}(\mathbb{R}; L_{q_{i}}(\Omega))} \\
= C \| 1_{(0,1)} \|_{L_{r}(\mathbb{R})} \| < s >^{b} (U^{2}(s), A_{q_{i}} U^{2}(s)) \|_{L_{p}(0,T; L_{q_{i}}(\Omega))} \\
\leq C \sum_{i=0,2} \| < t >^{b} U^{2} \|_{L_{p}(0,T; H_{q_{i}}^{2}(\Omega))},
\]
(3.22)

where the exponent \(r\) is defined by \(1/r + 1/p = 1/\tilde{p}_{m} + 1\) and \(1_{A}\) is the characteristic function on a set \(A\). In this way, we obtain the estimate \([3.21]\).

**Estimate for \(U^{31}\).**

We next prove the estimate for the first part \(U^{31}\) of the solution formula \([3.18]\) of \(U^{3}\): for \(m = 0, 1, 2\) and \((\tilde{p}_{m}, \tilde{q}_{m})\) with \([2.19]\),

\[
\| < t >^{b_{m}(\tilde{p}_{m}, \tilde{q}_{m})} \nabla^{m} U^{31} \|_{L_{\tilde{p}_{m}}(2,T; L_{q_{m}}(\Omega))} \leq C \sum_{i=0,2} \| < t >^{b} U^{2} \|_{L_{p}(0,T; H_{q_{i}}^{2}(\Omega))}.
\]
(3.23)

By the assumption on the \(L_{q_{i}} L_{r}\) estimate for the decay rate \(\sigma_{m}(q, r)\) with the conditions \((C1)\) in Theorem \([2.2]\) as well as by \(s \leq t - s \sim t\), see \([3.19]\), and
Hölder’s inequality,
\[ \| \nabla^m U_{31} \|_{L^{\tilde{q}_m} (\Omega)} = \| \nabla^m e^{-A_{\tilde{q}_m}(t-s)} \lambda_1 U^2(s) \|_{L^{\tilde{q}_m} (\Omega)} \]
\[ \leq \int_0^{t/2} \| \nabla^m e^{-A_{\tilde{q}_m}(t-s)} \lambda_1 U^2(s) \|_{L^{\tilde{q}_m} (\Omega)} ds \]
\[ \leq C \int_0^{t/2} (t-s)^{-\sigma_0(q_0, \tilde{q}_m)} \| U^2(s) \|_{L^{q_0} (\Omega)} ds \]
\[ \leq C < t >^{-\sigma_0(q_0, \tilde{q}_m)} \int_0^{t/2} < s >^{-b} \| < s >^{-b} U^2(s) \|_{L^{q_0} (\Omega)} ds \]
\[ \leq C < t >^{-\sigma_0(q_0, \tilde{q}_m)} \| < s >^{-b} \|_{L^{p_0}(0,T)} \| < s >^{-b} U^2(s) \|_{L^{p}(0,T;L^{q_0} (\Omega))} \]

for \( t \in (2, T) \). By multiplying each term by \( < t >^{b_m(\tilde{p}_m, \tilde{q}_m)} \) and taking \( L^{\tilde{p}_m}(2, T) \) norm, we obtain
\[ \| < t >^{b_m(\tilde{p}_m, \tilde{q}_m)} \nabla^m U_{31} \|_{L^{\tilde{p}_m}(2, T;L^{\tilde{q}_m} (\Omega))} \]
\[ \leq C \| < t >^{b_m(\tilde{p}_m, \tilde{q}_m)} \|_{L^{\tilde{p}_m}(2, T)} \| < s >^{-b} \|_{L^{p_0}(0,T)} \| < s >^{-b} U^2(s) \|_{L^{p}(0,T;L^{q_0} (\Omega))} \]
\[ \leq C \| < s >^{-b} U^2(s) \|_{L^{p}(0,T;L^{q_0} (\Omega))} \]  

(3.25)

because
\[ \| < t >^{b_m(\tilde{p}_m, \tilde{q}_m)} \|_{L^{\tilde{p}_m}(2, T)} = \left\{ \begin{array}{l}
\| < t >^{\min(\sigma_0(q_0, \tilde{q}_m), b_0)} - \sigma_0(q_0, \tilde{q}_m) \|_{L^{p_0}(2, T)} \leq \| < t >^{-b_0} \|_{L^{p_0}(0, \infty)} \leq C \quad (\tilde{p}_m = p) \\
\| < t >^{\min(\sigma_0(q_0, \tilde{q}_m), b_0)} - \sigma_0(q_0, \tilde{q}_m) \|_{L^{\infty}(2, T)} \leq 1 \|_{L^{p_0}(0, T)} = 1 \quad (\tilde{p}_m = \infty)
\end{array} \right. \]

by the definition (3.18) and \( \| < s >^{-b} \|_{L^{p_0}(0,T)} < \infty \) from \( b > \frac{1}{p_0} \). Therefore, we obtain (3.23).

**Estimate for \( U_{32}^{32} \).**

Finally, we show the following estimate for the second part \( U_{32}^{32} \) of the solution formula (3.18) for \( m = 0, 1, 2 \) and \( (\tilde{p}_m, \tilde{q}_m) \) with (2.13).
\[ \| < t >^{b_m(\tilde{p}_m, \tilde{q}_m)} \nabla^m U_{32}^{32} \|_{L^{\tilde{p}_m}(2, T;L^{\tilde{q}_m} (\Omega))} \leq C \sum_{i=0,2} \| < t >^{b_i} U^2 \|_{L^{p}(0,T;H^2_q (\Omega))}. \]

(3.26)

This is obtained as follows. By the assumption on the \( L^q-L^r \) estimate (2.13) for
the decay rate \( \sigma_m(q, r) \) with the condition (C1) in Theorem 2.2

\[
|| t > b_m(\tilde{p}_m, \tilde{q}_m) \nabla^m U^3 ||_{L_{\tilde{p}_m}(2, T; L_{\tilde{q}_m}(\Omega))} = || t > b_m(\tilde{p}_m, \tilde{q}_m) \nabla^m \int_{t/2}^{t-1} e^{-A_q(t-s) \lambda_1} U^2(s) \, ds ||_{L_{\tilde{p}_m}(2, T; L_{\tilde{q}_m}(\Omega))}
\]

\[
\leq || t > b_m(\tilde{p}_m, \tilde{q}_m) \int_{t/2}^{t-1} \nabla^m e^{-A_q(t-s) \lambda_1} U^2(s) ||_{L_{\tilde{q}_m}(\Omega)} \, ds ||_{L_{\tilde{p}_m}(2, T)}
\]

\[
\leq C|| t > b_m(\tilde{p}_m, \tilde{q}_m) \int_{t/2}^{t-1} (t-s)^{-\sigma_m(q_0, \tilde{q}_m)} \| U^2(s) \|_{L_{q_0}(\Omega)} \, ds ||_{L_{\tilde{p}_m}(2, T)}
\]

By \( t-s \leq s \sim t \), (see (3.19)) we get

\[
< t > b_m(\tilde{p}_m, \tilde{q}_m) = < t > (b-b_m(\tilde{p}_m, \tilde{q}_m)) < t > b \leq C(t-s)^{-b} < t > b > s > b .
\]

(3.27)

Defining \( r \) by \( 1/r + 1/p = 1/\tilde{p}_m + 1 \) and denoting the characteristic function of a set \( A \) by \( 1_A \), by (3.27) and Young’s inequality, we have

\[
|| t > b_m(\tilde{p}_m, \tilde{q}_m) \int_{t/2}^{t-1} |(t-s)^{-\sigma_m(q_0, \tilde{q}_m)} || U^2(s) ||_{L_{q_0}(\Omega)} \, ds ||_{L_{\tilde{p}_m}(2, T)}
\]

\[
\leq C\int_{t/2}^{t-1} \| (t-s)^{-\sigma_m(q_0, \tilde{q}_m) + b_m(\tilde{p}_m, \tilde{q}_m) - b} \| < s > b \| U^2(s) \|_{L_{q_0}(\Omega)} \, ds ||_{L_{\tilde{p}_m}(2, T)}
\]

\[
\leq C\int_{\mathbb{R}} 1_{(1, \infty)}(t-s)(t-s)^{-\sigma_m(q_0, \tilde{q}_m) + b_m(\tilde{p}_m, \tilde{q}_m) - b} I_{(0, T)}(s) < s > b \| U^2(s) \|_{L_{q_0}(\Omega)} \, ds ||_{L_{\tilde{p}_m}(2, T)}
\]

\[
\leq C\| s^{-b + b_m(\tilde{p}_m, \tilde{q}_m) - \sigma_m(q_0, \tilde{q}_m)} \|_{L_r(1, \infty)} < s > b \| U^2(s) \|_{L_p(0, T; L_{q_0}(\Omega))}
\]

\[
\leq C\| < s > b \| U^2(s) \|_{L_p(0, T; L_{q_0}(\Omega))}
\]

(3.28)

because \( b_m(\tilde{p}_m, \tilde{q}_m) \leq \sigma_m(q_0, \tilde{q}_m) - \frac{1}{p_m} \frac{\delta}{r} \) and \( b > \frac{1}{p} \) yield

\[
-b + b_m(\tilde{p}_m, \tilde{q}_m) - \sigma_m(q_0, \tilde{q}_m) < - \left( 1 - \frac{1}{b} \right) - \frac{1}{p_m} = - \frac{1}{r},
\]

which implies \( || s^{-b + b_m(\tilde{p}_m, \tilde{q}_m) - \sigma_m(q_0, \tilde{q}_m)} \|_{L_r(1, \infty)} < \infty \). Thus, the desired estimate (3.26) is proven. Then, by (3.18), (3.23), (3.20) and (3.21), we obtain the second inequality of (3.17) as the estimate for \( U^3 \) on \( (2, T) \).

**Estimate of \( \partial_t U^3 \) on \( (2, T) \).**

Then, we prove the first inequality of (3.17) as the estimate for \( \partial_t U^3 \) on \( (2, T) \)

\[
|| < t > b_i(\tilde{p}_m, \tilde{q}_m) < \partial_t U^3 ||_{L_{\tilde{p}_m}(2, T; L_{\tilde{q}_m}(\Omega))} \leq C \sum_{i=0, 2} || < t > b \| U^2 ||_{L_p(0, T; H_{\tilde{q}_m}(\Omega))}^{(3.29)}
\]

20
for any \( m = 0, 1, 2 \) and \((\tilde{p}_2, \tilde{q}_2)\) satisfying (2.19). To do so, we use the fact \( U^3 \) satisfies the equation
\[
\partial_t U^3 + A_q U^3 = \lambda_1 U^2, \quad U^3|_{t=0} = 0,
\]
which is obtained by the same way we have reduced the Stokes problem (2.8) to (2.13), and obtain
\[
\| < t > b_2(\tilde{p}_2, \tilde{q}_2) \partial_t U^3 \|_{L_{p_2}(2,T; L_{q_2}(\Omega))} \\
\leq \| < t > b_2(\tilde{p}_2, \tilde{q}_2) A_{q_2} U^3 \|_{L_{p_2}(2,T; L_{q_2}(\Omega))} + \| < t > b_2(\tilde{p}_2, \tilde{q}_2) \lambda_1 U^2 \|_{L_{p_2}(2,T; L_{q_2}(\Omega))} \\
\leq \| < t > b_2(\tilde{p}_2, \tilde{q}_2) A_{q_2} U^3 \|_{L_{p_2}(2,T; L_{q_2}(\Omega))} + C \sum_{i=0,2} \| < t > b^2 U^2 \|_{L_{p_2}(0,\infty; L_{q_i}(\Omega))}
\]
by (2.19). Regarding the first term, by the solution formula (3.18) of \( U^3 \),
\[
\| < t > b_2(\tilde{p}_2, \tilde{q}_2) A_{q_2} U^3 \|_{L_{p_2}(2,T; L_{q_2}(\Omega))} \\
= \left\| < t > b_2(\tilde{p}_2, \tilde{q}_2) \int_0^{t/2} + \int_{t/2}^{t} + \int_{t-1}^{t} e^{-A_q(t-s)} \lambda_1 U^2(s) \, ds \right\|_{L_{p_2}(2,T; L_{q_2}(\Omega))} \\
\leq \left\| < t > b_2(\tilde{p}_2, \tilde{q}_2) \int_0^{t/2} e^{-A_q(t-s)} \lambda_1 U^2(s) \, ds \right\|_{L_{p_2}(2,T; L_{q_2}(\Omega))} + \left\| < t > b_2(\tilde{p}_2, \tilde{q}_2) \int_{t/2}^{t-1} e^{-A_q(t-s)} \lambda_1 U^2(s) \, ds \right\|_{L_{p_2}(2,T; L_{q_2}(\Omega))} + \left\| < t > b_2(\tilde{p}_2, \tilde{q}_2) \int_{t-1}^{t} e^{-A_q(t-s)} \lambda_1 U^2(s) \, ds \right\|_{L_{p_2}(2,T; L_{q_2}(\Omega))}.
\]
Because
\[
\partial_t e^{-tA_q} f + A_q e^{-tA_q} f = 0 \quad (f \in J_q(\Omega)),
\]
we write \( A_{q_2} e^{-A_{q_2}(t-s)} \lambda_1 U^2(s) = -\partial_t e^{-A_{q_2}(t-s)} \lambda_1 U^2(s) \) and use the \( L_q L_r \) estimate (2.13). Then, the first term and second term of the right-hand side of (3.30) are estimated by
\[
C \left\| < t > b_2(\tilde{p}_2, \tilde{q}_2) \int_0^{t/2} (t-s)^{-\sigma_3(q_0, \tilde{q}_2)} \lambda_1 U^2(s) \|_{L_{q_2}(\Omega)} \, ds \right\|_{L_{p_2}(2,T; L_{q_2}(\Omega))},
\]
\[
C \left\| < t > b_2(\tilde{p}_2, \tilde{q}_2) \int_{t/2}^{t-1} (t-s)^{-\sigma_3(q_0, \tilde{q}_2)} \lambda_1 U^2(s) \|_{L_{q_2}(\Omega)} \, ds \right\|_{L_{p_2}(2,T; L_{q_2}(\Omega))},
\]
respectively. We continue the estimate the first term of the right-hand side of (3.30) in the same way as in (3.24) and (3.25), the second term as in (3.25), and
the third term as in (3.14) and (3.22). Then, we obtain the desired estimate for \( \partial_t U^3 \), and summarizing the arguments above yields the estimate (3.17) for \( U^3 \) on \((2, T)\).

**Estimate for** \( U^3 \) **on** \((0, 2)\).

We now show the estimate (3.16) on \((0, 2)\) for \( U^3 \), which is defined as the solution of (3.13). We apply the maximal regularity locally in time, which is proven due to Shibata [16, Theorem 3.2]. We use this for the case \((G, G, H, v_0) = (0, 0, 0, 0)\):

**Theorem 3.3** ([16]). Let \(1 < p, q < \infty \) and \( T > 0\). Under Assumptions 1 and 2, for any

\[
F \in L_p(0, T; L_q(\Omega)^N)
\]

the Stokes problem (2.21) with \((G, G, H, v_0) = (0, 0, 0, 0)\) admits unique solutions

\[
U \in H^1_p(0, T; L_q(\Omega)^N) \cap L_p(0, T; H^2_q(\Omega)^N), \quad \Psi \in L_p(0, T; W^1_q(\Omega) + H^1_q(\Omega)).
\]

Moreover, the solutions possess the following estimate for some \(\gamma_0 > 0\): 

\[
\|\partial_t U\|_{L_p(0, T; L_q(\Omega))} + \|U\|_{L_p(0, T; H^2_q(\Omega))} + \|\nabla \Psi\|_{L_p(0, T; L_q(\Omega))} \leq C e^{\gamma_0 T} \|F\|_{L_p(0, T; L_q(\Omega))}.
\]

Also, we use the following embedding estimate for any \(m = 0, 1, 2\), \((\hat{p}_m, \hat{q}_m)\) satisfying (2.19) and \(u \in \bigcap_{i=0,2}^0 (H^1_{\hat{p}_m}(0, T; L_{\hat{q}_m}(\Omega)) \cap L_p(0, T; H^2_{\hat{q}_m}(\Omega)))\),

\[
\|\nabla^m u\|_{L^p_{\hat{p}_m}(0, T; L^q_{\hat{q}_m}(\Omega))} \leq \sum_{i=0,2} (\|\partial_t u\|_{L^p_{\hat{p}_m}(0, T; L^q_{\hat{q}_m}(\Omega))} + \|u\|_{L_p(0, T; H^m_{\hat{q}_m}(\Omega))} + \|u|_{t=0}\|_{L^p_{\hat{p}_m}(0, T; L^q_{\hat{q}_m}(\Omega))}^{(1 - 1/p)}).
\]

To prove this, consider the following cases.

(i) \(\hat{p}_m = p\) and \(\hat{q}_m \in [q_0, q_2]\) \((m = 0, 1, 2)\)

(ii) \(\hat{p}_m = p\) and \(\hat{q}_m \in (q_2, \infty)\) \((m = 0, 1\) by (2.19))

(iii) \(\hat{p}_m = \infty\) and \(\hat{q}_m \in [q_0, q_2]\) \((m = 0, 1\) by (2.19))

(iv) \(\hat{p}_m = \infty\) and \(\hat{q}_m \in (q_2, \infty)\) \((m = 0\) by (2.19))

The case (i) is clear. The case (ii) is obtained by the Sobolev embedding

\[
\|\nabla^m u\|_{L^p_{\hat{p}_m}(0, T; L^q_{\hat{q}_m}(\Omega))} \leq C \|u\|_{L^p_{\hat{p}_m}(0, T; H^{m+1}_{\hat{q}_m}(\Omega))}
\]

\[
\leq C \sum_{i=0,2} (\|\partial_t u\|_{L^p_{\hat{p}_m}(0, T; L^q_{\hat{q}_m}(\Omega))} + \|u\|_{L_p(0, T; H^m_{\hat{q}_m}(\Omega))} + \|u|_{t=0}\|_{L^p_{\hat{p}_m}(0, T; L^q_{\hat{q}_m}(\Omega))}^{(1 - 1/p)}).
\]

To show (3.31) for the case (iii) and (iv), we use the embedding

\[
H^1(0, \infty; X_0) \cap L_p(0, \infty; X_1) \subset C_b([0, \infty); (X_0, X_1)_{1-1/p,p})
\]

(3.32)
for two Banach spaces $X_0$ and $X_1$, where $C_b(I; X)$ stands for the space of the $X$-valued bounded continuous functions on $I$. (see e.g. [9] Corollary 1.14.) We also set

$$u^1 = e^{-tA_q}u|_{t=0}$$

so that $(u - u^1)|_{t=0} = 0$, $u = ET[u - u^1] + u^1$ on $(0, T)$ and

$$\|u^1\|_{L_p(0, T; H^2_q(\Omega))} + \|u^1\|_{L_p(0, T; H^2_q(\Omega))} \leq C\|u\|_{t=0} \|B^{(1-1/p)}_{p,q}(\Omega)\tag{3.33}$$

for $q \in (1, \infty)$, where $ET$ is the extension function defined by (3.34). Because $p > 2$ implies $B^{(1-1/p)}_{p,q}(\Omega) \subset H^2_{\bar{q}_m}(\Omega)$, by the embedding $3.32$ with $(X_0, X_1) = (L_{\bar{q}_m}(\Omega), H^2_{\bar{q}_m}(\Omega))$, the estimate (3.10) of $ET$ and (3.33), for the case (iii), we have

$$\|\nabla^m u\|_{L_{\bar{q}_m}(0, T; L_{\bar{q}_m}(\Omega))} = \|\nabla^m (ET[u - u^1] + u^1)\|_{L_{\infty}(0, T; L_{\bar{q}_m}(\Omega))} \leq C(\|ET[u - u^1] + u^1\|_{H^p_{\infty}(0, \infty; L_{\bar{q}_m}(\Omega))} + \|ET[u - u^1] + u^1\|_{L_p(0, \infty; H^2_{\bar{q}_m}(\Omega))}) + \|(ET[u - u^1] + u^1)\|_{t=0} \|B^{(1-1/p)}_{p,q}(\Omega)\)

$$\leq C(\|(u - u^1, u^1)\|_{H^p_{\infty}(0, T; L_{\bar{q}_m}(\Omega))} + \|(u - u^1, u^1)\|_{L_p(0, T; H^2_{\bar{q}_m}(\Omega))}) + \|u^1\|_{t=0} \|B^{(1-1/p)}_{p,q}(\Omega)\)$$

$$\leq C \sum_{i=0}^{2} (\|\partial^i u\|_{L_p(0, T; L_{\bar{q}_m}(\Omega))} + \|u\|_{L_p(0, T; H^2_{\bar{q}_m}(\Omega))} + \|u\|_{t=0} \|B^{(1-1/p)}_{p,q}(\Omega)\).$$

For the case (iv), by the Sobolev embedding and by the result for the case (iii),

$$\|u\|_{L_{\rho_0}(0, T; L_{\rho_0}(\Omega))} \leq C\|u\|_{L_{\infty}(0, T; H^2_q(\Omega))}$$

$$\leq C \sum_{i=0}^{2} (\|\partial^i u\|_{L_p(0, T; L_{\bar{q}_m}(\Omega))} + \|u\|_{L_p(0, T; H^2_{\bar{q}_m}(\Omega))} + \|u\|_{t=0} \|B^{(1-1/p)}_{p,q}(\Omega)\).$$

To summarize, (3.31) holds. Then, thanks to (3.31), $U^3|_{t=0} = 0$ and Theorem 3.3 we obtain the estimate (3.15) as follows.

$$\| < t >^{b_2(\bar{p}_2, \bar{q}_2)} \partial_t U^3\|_{L_{\rho_2}(0, T; L_{\bar{q}_2}(\Omega))} + \sum_{m=0,1,2} \| < t >^{b_2(\bar{p}_m, \bar{q}_m)} \nabla^m U^3\|_{L_{\rho_m}(0, T; L_{\bar{q}_m}(\Omega))} \leq 2 >^{b_2(\bar{p}_2, \bar{q}_2)} \|\partial_t U^3\|_{L_{\rho_2}(0, T; L_{\bar{q}_2}(\Omega))} + \sum_{m=0,1,2} \| < t >^{b_2(\bar{p}_m, \bar{q}_m)} \nabla^m U^3\|_{L_{\rho_m}(0, T; L_{\bar{q}_m}(\Omega))} \leq C \sum_{i=0,2} (\|\partial_t U^3\|_{L_p(0, T; L_{\bar{q}_m}(\Omega))} + \|U^3\|_{L_p(0, T; H^2_{\bar{q}_m}(\Omega))}$$

$$\leq C e^{2b_0} \sum_{i=0,2} \|U^2\|_{L_p(0, 2; L_{\bar{q}_m}(\Omega))} \leq C \sum_{i=0,2} \| < t >^b U^2\|_{L_p(0, T; H^2_{\bar{q}_m}(\Omega))}.$$
Estimate for $U^1$ and $U^2$.

Finally, we prove the estimate for $U^1$ and $U^2$, which are defined as the solution to (3.11) and (3.12), respectively. That is, for $m = 0, 1, 2$ and $(\hat{p}_m, \hat{q}_m)$ with (2.4),

$$
|| t > b_2(\hat{p}_2, \hat{q}_2) \partial_t U^1 \||_{L_{p_2}(0, T; L_{q_2}(\Omega))} \leq C \mathcal{N}(F, G, H, v_0),
$$

$$
|| t > b_m(\hat{p}_m, \hat{q}_m) \ \nabla^m U^1 \||_{L_{p_m}(0, T; L_{q_m}(\Omega))} \leq C \mathcal{N}(F, G, H, v_0),
$$

$$
|| t > b_2(\hat{p}_2, \hat{q}_2) \partial_t U^2 \||_{L_{p_2}(0, T; L_{q_2}(\Omega))} \leq C \sum_{i=0, 2} || t > b_i U^1 \||_{L_{p_i}(0, T; L_{q_i}(\Omega))},
$$

$$
|| t > b_m(\hat{p}_m, \hat{q}_m) \ \nabla^m U^2 \||_{L_{p_m}(0, T; L_{q_m}(\Omega))} \leq C \sum_{i=0, 2} || t > b_i U^1 \||_{L_{p_i}(0, T; L_{q_i}(\Omega))}.
$$

Let $k = 1, 2$. By $b_m(\hat{p}_m, \hat{q}_m) \leq b$ and (2.19),

$$
|| t > b_2(\hat{p}_2, \hat{q}_2) \partial_t U^k \||_{L_{p_2}(0, T; L_{q_2}(\Omega))} \leq || t > b \partial_t U^k \||_{L_p(0, T; L_{p_2}(\Omega))}.
$$

Also, noting that

$$
\partial_t (t > b U^k(t)) = bt < t > b^{-2} U^k(t) + < t > b \partial_t U^k(t),
$$

by $b_m(\hat{p}_m, \hat{q}_m) \leq b$ and (3.31), we obtain

$$
|| t > b_m(\hat{p}_m, \hat{q}_m) \ \nabla^m U^k \||_{L_{p_m}(0, T; L_{q_m}(\Omega))} \leq \sum_{i=0, 2} (|| \partial_t (t > b U^k) \||_{L_p(0, T; L_{p_2}(\Omega))} + || t > b U^k \||_{L_p(0, T; L_{q_2}(\Omega))} + || U^k \||_{L_p(0, T; H^2_{q_2}(\Omega))} + || U^k \||_{L_p(0, T; H^2_{q_2}(\Omega))})
$$

$$
\leq C \sum_{i=0, 2} (|| t > b \partial_t U^k \||_{L_p(0, T; L_{q_2}(\Omega))} + || t > b U^k \||_{L_p(0, T; H^2_{q_2}(\Omega))} + || U^k \||_{L_p(0, T; H^2_{q_2}(\Omega))}).
$$

Thus,

$$
|| t > b_2(\hat{p}_2, \hat{q}_2) \partial_t U^k \||_{L_{p_2}(0, T; L_{q_2}(\Omega))} + \sum_{m=0, 1, 2} || t > b_m(\hat{p}_m, \hat{q}_m) \ \nabla^m U^k \||_{L_{p_m}(0, T; L_{q_m}(\Omega))}
$$

$$
\leq C \sum_{i=0, 2} (|| t > b \partial_t U^k \||_{L_p(0, T; L_{q_2}(\Omega))} + || t > b U^k \||_{L_p(0, T; H^2_{q_2}(\Omega))} + || U^k \||_{L_p(0, T; H^2_{q_2}(\Omega))})
$$

and, by the maximal regularity stated in Theorem (2.1) and by $(U^1, U^2)|_{t=0} = (v_0, 0)$, the right-hand side is estimated as follows.

$$
\sum_{i=0, 2} (|| t > b \partial_t U^1 \||_{L_p(0, T; L_{q_1}(\Omega))} + || t > b U^1 \||_{L_p(0, T; H^2_{q_2}(\Omega))} + || U^1 \||_{L_p(0, T; H^2_{q_2}(\Omega))} + || U^1 \||_{L_p(0, T; H^2_{q_2}(\Omega))})
$$

$$
\leq C \mathcal{N}(F, G, H, v_0),
$$

$$
\sum_{i=0, 2} (|| t > b \partial_t U^2 \||_{L_p(0, T; L_{q_2}(\Omega))} + || t > b U^2 \||_{L_p(0, T; H^2_{q_2}(\Omega))} + || U^2 \||_{L_p(0, T; H^2_{q_2}(\Omega))})
$$

$$
\leq C \mathcal{N}(\lambda_1 U^1, 0, 0, 0, 0) = \lambda_1 \sum_{i=0, 2} || t > b U^1 \||_{L_p(0, T; L_{q_2}(\Omega))},
$$

(3.36)
Hence, we obtain (3.34) and (3.35).

Now, we can conclude (3.9) as follows. By (3.10), (3.34), (3.35) and (3.15),

\[ \| \mathbf{v} \|_{L^\infty(0,T;L^q_m(\Omega))} + \sum_{m=0,1,2} \| \mathbf{v} \|_{L^{p_m} L^{q_m}(\Omega)} \]

\[ \leq \sum_{k=1,2,3} \| \mathbf{v} \|_{L^\infty(0,T;L^q_m(\Omega))} + \sum_{m=0,1,2} \| \mathbf{v} \|_{L^{p_m} L^{q_m}(\Omega)} \]

\[ \leq C \left( \mathcal{N}(F,G,H,v_0) + \sum_{i=0,2} \| \mathbf{v} \|_{L^{p_i} L^{q_i}(\Omega)} \right) \]

and the second term and the third term of the right-hand side are estimated by \( C \mathcal{N}(F,G,H,v_0) \) from (3.36).

### 3.2 Estimate for the nonlinear terms in general domain

In this subsection, we prove (3.31).

We begin with the estimate of \( \mathbf{u} \) itself and the term \( \int_0^t \nabla \mathbf{u}(s) ds \).

**Lemma 3.2.** Let \( q_{03} \) and \( q_{04} \) be the exponents given in the condition (C2) in Theorem 2.3.

(a) The expression

\[ \| \nabla^m \mathbf{u} \|_{L^\infty(0,T;L^q_m(\Omega))} \leq \| \mathbf{u} \|_{L^\infty(0,T;L^q_m(\Omega))} \]

holds if \( m = 0, 1 \) and \( (\infty, \tilde{q}_m) \) satisfy (2.19).

(b) The statement

\[ \| t > b \mathbf{u} \|_{L^p L^q_m(\Omega)} \leq C \| \mathbf{u} \|_{L^\infty(0,T;L^q_m(\Omega))} \]

holds for \( m = 0, 1, 2 \) and \( (p, \tilde{q}_m) \in I_m \) satisfying (2.19) and \( \tilde{q}_m \geq q_{04} \).

(c) There holds

\[ \left\| \int_0^t \nabla^m \mathbf{u}(s) ds \right\|_{L^\infty(0,T;L^q_m(\Omega))} \leq C \| \mathbf{u} \|_{L^\infty(0,T;L^q_m(\Omega))} \]

if \( m = 1, 2 \) and \( (p, \tilde{q}_m) \in I_m \) satisfy (2.19) and \( \tilde{q}_m \geq \min\{q_{04}, q_{03}\} \).

(d) There holds \( \| \mathbf{W}(\int_0^t \nabla \mathbf{u}(s) ds) \|_{L^\infty(0,T;L^\infty(\Omega))} \leq C \) for any polynomial \( \mathbf{W} \).

**Proof.** (a) Because \( \sigma_m(q_0, \tilde{q}_m) \geq 0 \) and \( b > 1/p' > 0 \) implies

\[ b_m(\infty, \tilde{q}_m) = \min\{\sigma_m(q_0, \tilde{q}_m), b\} \geq 0, \]

25
by the definition (2.17) of $[u]_{0,T}$, we obtain
\[
\|\nabla^m u\|_{L_\infty(0,T;L_{\bar{q}_m}(\Omega))} \leq \left\| t > b_m(\infty, \bar{q}_m) \nabla^m u \right\|_{L_\infty(0,T;L_{\bar{q}_m}(\Omega))} \leq [u]_{0,T}.
\]
(b) By the conditions (C1) and (C2) in Theorem 2.2, (2.19) and $\bar{q}_m \geq q_{04}$
\[
b_m(p, \bar{q}_m) = \min\{\sigma_m(q_0, \bar{q}_m) - \frac{1}{p} - \delta, b\} \geq \min\{\sigma_0(q_0, q_{04}) - \frac{1}{p} - \delta, b\}
\]
\[
\geq \min\{(b + \frac{1}{p'}) - \frac{1}{p}, b\} = b \quad (if \; \bar{p}_m = p),
\]
\[
b_m(\infty, \bar{q}_m) = \min\{\sigma_m(q_0, \bar{q}_m), b\} \geq \min\{\sigma_0(q_0, q_{04}), b\}
\]
\[
\geq \min\{b + \frac{1}{p}, b\} \geq b \quad (if \; \bar{p}_m = \infty)
\]
and, so, by the definition (2.17) of $[u]_{0,T}$, we obtain the desired estimate.
(c) By the conditions (C1) and (C2) in Theorem 2.2, (2.19) and $\bar{q}_m \geq \min\{q_{03}, q_{04}\}$,
\[
-b_m(p, \bar{q}_m) \leq -\sigma_m(q_0, \bar{q}_m) + \frac{1}{p} + \delta \leq -\sigma_1(q_0, q_{03}) + \frac{1}{p} + \delta
\]
\[
< -1 + \frac{1}{p} = -\frac{1}{p'} \quad (if \; \bar{p}_m = p),
\]
\[
-b_m(\infty, \bar{q}_m) \leq \sigma_m(q_0, \bar{q}_m) \leq -\sigma_1(q_0, q_{03})
\]
\[
< -1 < -\frac{1}{p'} \quad (if \; \bar{p}_m = \infty)
\]
when $\bar{q}_m \geq q_{03}$ and, by (3.37) and $b > 1/p'$,
\[
-b_m(\bar{p}_m, \bar{q}_m) \leq -b < -1/p'
\]
when $\bar{q}_m \geq q_{04}$. This implies $\| < s > -b_m(p, \bar{q}_m) \|_{L_{p'}(0, \infty)} \leq C$ and thus, by Hölder’s inequality, we have
\[
\left\| \nabla^m \int_0^t u(s) \, ds \right\|_{L_\infty(0,T;L_{\bar{q}_m}(\Omega))} \leq \int_0^T \| \nabla^m u(s) \|_{L_{\bar{q}_m}(\Omega)} \, ds
\]
\[
= \int_0^T < s > -b_m(p, \bar{q}_m) \| u(s) \|_{L_{\bar{q}_m}(\Omega)} \, ds
\]
\[
\leq \| < s > -b_m(p, \bar{q}_m) \|_{L_{p'}(0, \infty)} \| u(s) \|_{L_p(0,T;L_{\bar{q}_m}(\Omega))}
\]
\[
\leq C[u]_{0,T}.
\]
(d) This property is immediately obtained from (c) with $m = 1$, $\bar{q}_1 = \infty$. \qed

The main step to estimate the nonlinear terms is to take the exponents $p_1, p_2, r_1$ and $r_2$ to apply Lemma 3.2 and Hölder’s inequality
\[
\|fg\|_{L_p(0,T;L_r(\Omega))} \leq \|f\|_{L_{p_1}(0,T;L_{r_1}(\Omega))}\|g\|_{L_{p_2}(0,T;L_{r_2}(\Omega))} \left( \frac{1}{p} = \frac{1}{p_1} + \frac{1}{p_2}, \frac{1}{r} = \frac{1}{r_1} + \frac{1}{r_2} \right).
\]
(3.38)
Estimate for $f(u)$.

By the definition (2.3) of the nonlinear terms and Lemma 3.2 (d), for $i = 0, 2$,

$$
\| < t >^b f(u) \|_{L_p(0,T;L_{q_i}(\Omega))} \leq C \left< t \right>^{b} \int_0^t \nabla u ds \otimes (\partial_t u, \nabla^2 u) \|_{L_p(0,T;L_{q_i}(\Omega))} + C \left< t \right>^{b} \int_0^t \nabla^2 u ds \otimes \nabla u \|_{L_p(0,T;L_{q_i}(\Omega))}. 
$$

(3.39)

The first term is estimated by $C[u]^2_{(0,T)}$ by Lemma 3.2 as follows. When $i = 0$, by Hölder’s inequality (3.38) and Lemma 3.2 we get,

$$
\left< t \right>^{b} \int_0^t \nabla u ds \otimes (\partial_t u, \nabla^2 u) \|_{L_p(0,T;L_{q_0}(\Omega))} \leq \int_0^t \nabla u ds \|_{L_{\infty}(0,T;L_{q_0}(\Omega))} \left< t \right>^{b} (\partial_t u, \nabla^2 u) \|_{L_p(0,T;L_{q_0}(\Omega))} 
$$

(3.40)

$$
\leq C[u]^2_{(0,T)}. 
$$

The estimate with $i = 2$ is obtained by replacing $q_0$ and $q_0$ respectively with $\infty$ and $q_2$ in (3.40) as follows. Bby Hölder’s inequality (3.38) and Lemma 3.2

$$
\left< t \right>^{b} \int_0^t \nabla u ds \otimes (\partial_t u, \nabla^2 u) \|_{L_p(0,T;L_{q_2}(\Omega))} \leq \int_0^t \nabla u ds \|_{L_{\infty}(0,T;L_{q_2}(\Omega))} \left< t \right>^{b} (\partial_t u, \nabla^2 u) \|_{L_p(0,T;L_{q_2}(\Omega))} 
$$

(3.41)

$$
\leq C[u]^2_{(0,T)}. 
$$

Next, we estimate the second term of the right-hand side in (3.39). When $i = 0$, Hölder’s inequality (3.38) and Lemma 3.2 yield

$$
\left< t \right>^{b} \int_0^t \nabla^2 u ds \otimes \nabla u \|_{L_p(0,T;L_{q_0}(\Omega))} \leq \int_0^t \nabla^2 u ds \|_{L_{\infty}(0,T;L_{q_0}(\Omega))} \left< t \right>^{b} \nabla u \|_{L_p(0,T;L_{q_0}(\Omega))} 
$$

(3.42)

$$
\leq C[u]^2_{(0,T)}. 
$$

The case $i = 2$ is proved by replacing $q_0$ and $q_0$ with $q_2$ and $\infty$ in (3.42), respectively. Thus, we conclude $\sum_{i=0}^{2} \| f(u) \|_{L_p(0,T;L_{q_i}(\Omega))} \leq C[u]_{(0,T)}$.

Estimate for $g(u)$.

27
By the estimate \[3.6\] for \(E_T\), the definition \[2.3\] of the nonlinear terms and Lemma \[3.2\] (d), for \(i = 0, 2,\)

\[\|E_T\|_{L^p(\mathbb{R}; L^q_t(\Omega))} \leq C \left\| < t >^b g(u) \right\|_{L^p(0, T; L^q_t(\Omega))} \quad (3.43)\]

When \(i = 0\), by Hölder’s inequality \[3.38\] and Lemma \[3.2\] the right-hand side can be estimated as

\[\left\| < t >^b \int_0^t \nabla u \ ds \otimes u \right\|_{L^p(0, T; L^q_t(\Omega))} \leq C|u(0)|^2_{(0, T)}.
\]

The estimate for \(i = 2\) can be obtained by replacing \(q_{03}\) and \(q_{04}\) respectively with \(q_2\) and \(\infty\).

**Remark 3.2.** We must assume

\[\sigma_1(q_{03}, q_{04}) > 1, \quad \sigma_0(q_{03}, q_{04}) > b + 1/p > 1 \quad (3.45)\]

for some \(q_{03}\) and \(q_{04}\) with \(1/q_0 = 1/q_0 + 1/q_{04}\) to estimate \(\| < t >^b g(u) \|_{L^p(0, T; L^q_t(\Omega))}\) independently of \(T\) at least simply by applying Hölder’s inequality. In fact, by Hölder’s inequality, the right-hand side of \[3.43\] is estimated by

\[\left\| < t >^b \int_0^t \|\nabla u\|_{L^q_t(\Omega)} \ ds \|u(t)\|_{L^{r_2}(\Omega)} \right\|_{L^p(0, T)} \leq C \quad (3.46)\]

for some \(r_1, r_2 \in [q_0, \infty]\) with \(1/q_0 = 1/r_1 + 1/r_2\). To estimate this term, we must show \(\| < t >^b \|u(t)\|_{L^{r_2}(\Omega)} \|_{L^p(0, T)} \leq C\) since \(\int_0^t \|\nabla u\|_{L^q_t(\Omega)} \ ds\) does not decay as \(t \to \infty\). To obtain this result and \(\int_0^t \|\nabla u\|_{L^{r_1}(\Omega)} \ ds \leq C\), roughly, we need

\[\|\nabla u(t)\|_{L^{r_1}(\Omega)} = o(t^{-1}), \quad (3.47)\]

as \(t \to \infty\). The same decay is needed for the solution \(U\) of \[2.4\] but, even if \((F, G, G, H) = (0, 0, 0, 0)\) i.e., \(U = e^{-tA_v}v_0\), we only have

\[\|\nabla U(t)\|_{L^{r_1}(\Omega)} = o(t^{-\sigma_1(q_0, v_1)}), \quad \|U(t)\|_{L^{r_2}(\Omega)} = o(t^{-\sigma_0(q_0, r_2)}). \quad (3.47)\]

Also, because we deal with the case \((F, G, G, H) \neq (0, 0, 0, 0)\) from the maximal regularity for the time-shifted Stokes problem \[2.16\], (see Theorem \[2.7\]) one can only expect that \(\| < t >^b \|\nabla U\|_{L^p(0, T; L^{r_1}(\Omega))} \leq C\) and \(\| < t >^b \|U\|_{L^p(0, T; L^{r_2}(\Omega))} \leq C\) which roughly means,

\[\| < t >^b \|\nabla U(t)\|_{L^{r_1}(\Omega)} \| = o(t^{-1}) \quad i.e. \quad \|U(t)\|_{L^{r_1}(\Omega)} = o(t^{-(b+1/p)}), \quad (3.47)\]
To summarize, we have by Hölder’s inequality (3.38) and Lemma 3.2, also, the estimate for the third term was obtained in the estimate of \( f \) (3.40) and (3.41). The second term can be estimated as follows for \( i \) th term, we find that
\[
2 < 1 + b + 1/p < \sigma_1(q_0, q_{03}) + \sigma_0(q_0, q_{04})
\]
\[
\leq N\left( \frac{1}{q_0} - \frac{1}{q_{03}} \right) + \frac{1}{2} + \frac{N}{2} \left( \frac{1}{q_0} - \frac{1}{q_{04}} \right) = \frac{N}{2} + \frac{1}{2} < \frac{N + 1}{2}.
\]

29
\[ + \|E_T[< t >^b \langle g(u), h(u)\nu \rangle]\|_{L_p(\mathbb{R}; H^1_{\text{loc}}(\Omega))} \leq C\|u\|_{H^1(0,T)}. \]

To estimate the first term of the left-hand side, we introduce an extension mapping \( \iota : L_{1,\text{loc}}(\Omega) \to L_{1,\text{loc}}(\Omega) \) satisfying

(c1) For any \( q \in (1, \infty) \) and \( f \in H^m_q(\Omega), \iota f \in H^m_q(\mathbb{R}^N) \) and \( \|f\|_{H^m_q(\mathbb{R}^N)} \leq C\|f\|_{H^m_q(\Omega)} \) hold for \( m = 0, 1 \).

(c2) For any \( q \in (1, \infty) \) and \( f \in H^1_q(\Omega) \), \( \|\xi^{-1}[1+|\xi|^2]^sF[f]\|_{L_p(\mathbb{R}; L_q(\Omega))} \leq C\|f\|_{L_p(\mathbb{R}; L_q(\Omega))} \), where the operator \( (1-\Delta)^s \) is defined by \( (1-\Delta)^s = F^{-1}[1+|\xi|^2]^sF[g] \), holds for \( s \in \mathbb{R} \).

Then, by the same fashion as in [16, Appendix A], for \( p, q \in (1, \infty) \), we have

\[
H^1_q(\mathbb{R}; H^{-1}_q(\Omega)) \cap L_p(\mathbb{R}; H^1_q(\Omega)) \subset H^1_{\text{loc}}(\mathbb{R}; L_q(\Omega)),
\]

\[
\|\partial_t^{1/2} f\|_{L_p(\mathbb{R}; L_q(\Omega))} \leq C\|\partial_t[(1-\Delta)^{-1/2}T\xi f]\|_{L_p(\mathbb{R}; L_q(\Omega))} + \|f\|_{L_p(\mathbb{R}; H^1_q(\Omega))},
\]

where

\[
H^{-1}_q(\Omega) = \text{dual of } H^1_{\text{loc}}(0,T). \]

Thus, by the embedding \( \text{[3.52]} \) and the estimate \( \text{[3.53]} \) of \( E_T \), for \( i = 0, 2 \),

\[
\|\partial_t^{1/2} E_T[< t >^b \langle g(u), h(u)\nu \rangle]\|_{L_p(\mathbb{R}; L_q(\Omega))} \leq C\|\partial_t[(1-\Delta)^{-1/2}T\xi E_T[< t >^b \langle g(u), h(u)\nu \rangle]\|_{L_p(\mathbb{R}; L_q(\Omega))}
+ \|E_T[< t >^b \langle g(u), h(u)\nu \rangle]\|_{L_p(\mathbb{R}; H^1_q(\Omega))} \leq C\|\partial_t[(1-\Delta)^{-1/2}T\xi E_T[< t >^b \langle g(u), h(u)\nu \rangle]\|_{L_p(\mathbb{R}; L_q(\Omega))}
+ \|< t >^b \langle g(u), h(u)\nu \rangle\|_{L_p(0,T; L_q(\Omega))}.
\]

and so, by \( \text{[3.6]} \) again,

\[
\sum_{i=0,2} (\|\partial_t^{1/2} E_T[< t >^b \langle g(u), h(u)\nu \rangle]\|_{L_p(\mathbb{R}; L_q(\Omega))} \leq C\|\partial_t[(1-\Delta)^{-1/2}T\xi E_T[< t >^b \langle g(u), h(u)\nu \rangle]\|_{L_p(\mathbb{R}; H^1_q(\Omega))}
+ \|< t >^b \langle g(u), h(u)\nu \rangle\|_{L_p(0,T; L_q(\Omega))}. \]

To estimate the first term, we apply the following lemma with \( (f_1, f_2, g) = (f_1^k, f_2^k, g^k) \) for \( k = 1, 2 \) by setting

\[
(f_1^k, f_2^k, g^k) = \left( < t >^b \mathbf{V}^3 \left( \int_0^t \nabla u \, ds \right), 1, u \right),
(f_2^k, f_2^k, g^k) = \left( < t >^b \mathbf{V}^4 \left( \int_0^t \nabla u \, ds \right), \nu, u \right)
\]

because \( g(u) = f_1^k f_2^k g^k \) and \( h(u)\nu = f_1^k f_2^k g^k \) owing to the definition \( \text{[2.3]} \) of the nonlinear terms.
Lemma 3.3. Let $1 < p, q, r_1, r_2, r_3 < \infty$ satisfy
\[
\frac{1}{q} \leq \frac{1}{r_i} \leq \frac{1}{q} + \frac{1}{N} \quad (i = 1, 2, 3)
\]
and $\iota$ be the extent map introduced above. Then, for $f_1, f_2, g \in L_{1, \text{loc}}(\Omega)$ and $f = f_1 f_2$, the following estimate holds.
\[
\begin{align*}
&\left\| \partial_t[(1 - \Delta)^{-1/2} \iota(f \nabla g)] \right\|_{L_p(0,T;L_q(\mathbb{R}^N))} \\
&\quad \leq C \left( \left\| \iota f \partial_t g \right\|_{L_p(0,T;L_q(\Omega))} + \left\| (\partial_t f) \nabla g \right\|_{L_p(0,T;L_{r_2}(\Omega))} \\
&\quad \quad + \left\| (\nabla f_1) f_2 \partial_t g \right\|_{L_p(0,T;L_{r_2}(\Omega))} + \left\| f_1 (\nabla f_2) \partial_t g \right\|_{L_p(0,T;L_{r_3}(\Omega))} \right).
\end{align*}
\]

Proof. We follow the idea in the proof of [16, Lemma 3.3]. We rewrite
\[
\partial_t[(1 - \Delta)^{-1/2} \iota(f \nabla g)]
\]
\[
= (1 - \Delta)^{-1/2} \iota(\partial_t f \nabla g) + (1 - \Delta)^{-1/2} \iota(f \nabla \partial_t g)
\]
\[
= (1 - \Delta)^{-1/2} \iota(\partial_t f \nabla g) + (1 - \Delta)^{-1/2} \iota(f \nabla \partial_t g) - (1 - \Delta)^{-1/2} \iota(f \nabla \partial_t g).
\]
\[
= (1 - \Delta)^{-1/2} \iota(\partial_t f \nabla g) + (1 - \Delta)^{-1/2} \iota(f \nabla \partial_t g) - (1 - \Delta)^{-1/2} \iota[f_1 (\nabla f_2) \partial_t g],
\]
and then we obtain
\[
\begin{align*}
\left\| \partial_t[(1 - \Delta)^{-1/2} \iota(f \nabla g)] \right\|_{L_p(0,T;L_q(\mathbb{R}^N))} \\
&\quad \leq C \left( \left\| (1 - \Delta)^{-1/2} \iota(\partial_t f \nabla g) \right\|_{L_p(0,T;L_q(\mathbb{R}^N))} \\
&\quad \quad + \left\| (1 - \Delta)^{-1/2} \iota(f \nabla \partial_t g) \right\|_{L_p(0,T;L_q(\mathbb{R}^N))} \\
&\quad \quad + \left\| (1 - \Delta)^{-1/2} \iota[(\nabla f_1) f_2 \partial_t g] \right\|_{L_p(0,T;L_{r_2}(\mathbb{R}^N))} \\
&\quad \quad + \left\| (1 - \Delta)^{-1/2} \iota[f_1 (\nabla f_2) \partial_t g] \right\|_{L_p(0,T;L_{r_3}(\mathbb{R}^N))} \right).
\end{align*}
\]
The second term is estimated by the property (e2) of the extension mapping $\iota$ as
\[
\left\| (1 - \Delta)^{-1/2} \iota(f \nabla \partial_t g) \right\|_{L_p(0,T;L_q(\Omega))} \leq \left\| f \partial_t g \right\|_{L_p(0,T;L_q(\Omega))}
\]
and, from Sobolev’s inequality, the other terms are estimated as follows.
\[
\begin{align*}
&\| (1 - \Delta)^{-1/2} \iota(\partial_t f \nabla g) \|_{L_p(0,T;L_q(\Omega))} \\
&\quad \leq C \left\| (1 - \Delta)^{-1/2} \iota(\partial_t f \nabla g) \right\|_{L_p(0,T;H^1_2(\mathbb{R}^N))} \leq C \left\| \partial_t f \nabla g \right\|_{L_p(0,T;L_{r_2}(\Omega))};
\end{align*}
\]
\[
\begin{align*}
&\| (1 - \Delta)^{1/2} \iota[(\nabla f_1) f_2 \partial_t g] \|_{L_p(0,T;L_q(\Omega))} \\
&\quad \leq C \left\| (1 - \Delta)^{1/2} \iota[(\nabla f_1) f_2 \partial_t g] \right\|_{L_p(0,T;H^1_2(\mathbb{R}^N))} \leq C \left\| (\nabla f_1) f_2 \partial_t g \right\|_{L_p(0,T;L_{r_2}(\Omega))};
\end{align*}
\]
\[
\begin{align*}
&\| (1 - \Delta)^{1/2} \iota[f_1 (\nabla f_2) \partial_t g] \|_{L_p(0,T;L_q(\Omega))} \\
&\quad \leq C \left\| (1 - \Delta)^{1/2} \iota[f_1 (\nabla f_2) \partial_t g] \right\|_{L_p(0,T;H^1_3(\mathbb{R}^N))} \leq C \left\| f_1 (\nabla f_2) \partial_t g \right\|_{L_p(0,T;L_{r_3}(\Omega))};
\end{align*}
\]
This completes the proof. □
Estimate for the first term of the right-hand side in (3.53).

Define \((f^k, j^k, g^k)\) for \(k = 1, 2\) so that \(g(u) = f^1 j^1 g^1\) and \(h(u) = f^2 j^2 g^2\). Set \(f^k = f^k j^k\). Then, by Lemma 5.3 with \((f_1, f_2, g, f) = (f^1, j^1, g^1, f^k)\), the first term of the right-hand side in (3.53) is estimated as

\[
\sum_{i=0,2} \left\| \partial_i [ (1 - \Delta)^{-1/2} \right\|_{L^p(0, T; L^q(\Omega))} < t >^b (g(u), h(u)\nu) \right\|_{L^p(0, T; L^q(\Omega))} \\
\leq C \sum_{k=1, 2, i=0, 2} \left( \left\| \partial_k f^k \right\|_{L^p(0, T; L^q(\Omega))} + \left\| \partial_k g^k \right\|_{L^p(0, T; L^q(\Omega))} \right) (3.55)
\]

Thus, for \(q \in [1, \infty]\) and \(k = 1, 2\), Hölder’s inequality (3.38) and Lemma 3.2 (d) yield

\[
\left\| \partial^k g^k \right\|_{L^p(0, T; L^q(\Omega))} \leq C \left\| \int_0^t \nabla u ds \right\|_{L^p(0, T; L^q(\Omega))} < t >^b \left\| \partial_t u \right\|_{L^p(0, T; L^q(\Omega))},
\]

\[
\left\| \left(\partial_t f^k\right) \nabla g^k \right\|_{L^p(0, T; L^q(\Omega))} \leq C \left\| \int_0^t \nabla u ds \right\|_{L^p(0, T; L^q(\Omega))} < t >^b \left\| \partial_t u \right\|_{L^p(0, T; L^q(\Omega))},
\]

\[
\left\| \left(\nabla f^k\right) \partial_k g^k \right\|_{L^p(0, T; L^q(\Omega))} \leq C \left\| \int_0^t \nabla u ds \right\|_{L^p(0, T; L^q(\Omega))} < t >^b \left\| \partial_t u \right\|_{L^p(0, T; L^q(\Omega))},
\]

and so, by combining these estimates with (3.55), we have

\[
\left\| \partial_t [ (1 - \Delta)^{-1/2} \right\|_{L^p(0, T; L^q(\Omega))} < t >^b (g(u), h(u)\nu) \right\|_{L^p(0, T; L^q(\Omega))} \\
\leq C \sum_{i=0,2} \left( \left\| \int_0^t \nabla u ds \right\|_{L^p(0, T; L^q(\Omega))} < t >^b \left\| \partial_t u \right\|_{L^p(0, T; L^q(\Omega))} \\
+ \left\| \int_0^t \nabla u ds \right\|_{L^p(0, T; L^q(\Omega))} < t >^b \left\| \nabla u \right\|_{L^p(0, T; L^q(\Omega))} \\
+ \left\| \int_0^t \nabla u ds \right\|_{L^p(0, T; L^q(\Omega))} < t >^b \left\| \partial_t u \right\|_{L^p(0, T; L^q(\Omega))} \right),
\]

(3.56)
The first term has been estimated by $C[u]^2_{[0,T]}$ in (3.40) and (3.41). Here, we estimate the second term. When $i = 0$, by Hölder’s inequality (3.38) and Lemma 3.2,

$$
\|< t >^b \int_0^t \nabla u \otimes \nabla u \|_{L_p(0,T;L_{q_0}(\Omega))} \leq \|< t >^b \nabla u \|_{L_p(0,T;L_{q_0}(\Omega))} \|\nabla u\|_{L_{\infty}(0,T;L_{q_0}(\Omega))} \leq C[u]^2_{[0,T]}.
$$

(3.57)

The estimate for $i = 2$ can be obtained by replacing $q_{03}$ and $q_{04}$ with $q_2$ and $\infty$, respectively. The third term of the right-hand side in (3.56) can be estimated by Hölder’s inequality (3.38) and Lemma 3.2 as follows: for $i = 0, 2$,

$$
\|< t >^b \nabla u \otimes \nabla u \|_{L_p(0,T;L_{q_2}(\Omega))} \leq C \|< t >^b \nabla u\|_{L_p(0,T;L_{q_2}(\Omega))} \|\nabla u\|_{L_{\infty}(0,T;L_{q_2}(\Omega))} \leq C[u]^2_{[0,T]}.
$$

(3.58)

We next estimate the fourth term of the right-hand side in (3.56). By Hölder’s inequality (3.38) and Lemma 3.2,

$$
\|< t >^b \int_0^t \nabla^2 u \otimes \partial_t u \|_{L_p(0,T;L_{q_0}(\Omega))} \leq \|< t >^b \nabla^2 u\|_{L_p(0,T;L_{q_0}(\Omega))} \|\partial_t u\|_{L_p(0,T;L_{q_4}(\Omega))} \leq C[u]^2_{[0,T]}.
$$

(3.59)

Finally, the fifth term of the right-hand side in (3.56) can be estimated by Hölder’s inequality (3.38) and Lemma 3.2 as

$$
\|< t >^b \int_0^t \nabla^2 u \otimes \partial_t u \|_{L_p(0,T;L_{q_2}(\Omega))} \leq \|< t >^b \nabla^2 u\|_{L_p(0,T;L_{q_2}(\Omega))} \|\partial_t u\|_{L_p(0,T;L_{q_2}(\Omega))} \leq C[u]^2_{[0,T]}.
$$

(3.60)

**Estimate of the second term in (3.53)**

It remains to show the estimate for the second term $\|< t >^b (g(u), h(u)u)\|_{L_p(0,T;H^1_q(\Omega))}$ of the right-hand side in (3.53) by the definition (2.3) of the nonlinear terms
and Lemma 3.2 (d), for \( i = 0, 2 \),

\[
\| < t >^b (g(u), h(u)\nu) \|_{L_p(0, T; H^1_{q_i}(\Omega))} 
\leq C \left( \| < t >^b \int_0^t \nabla u ds \otimes \nabla u \|_{L_p(0, T; L_{q_i}(\Omega))} 
+ \| < t >^b \int_0^t \nabla^2 u ds \otimes \nabla u \|_{L_p(0, T; L_{q_i}(\Omega))} 
+ \| < t >^b \int_0^t \nabla u ds \otimes \nabla^2 u \|_{L_p(0, T; L_{q_i}(\Omega))} \right),
\]

(3.61)

and so, since we have estimated these terms in (3.57), (3.42) and (3.40), we obtain

\[
\| < t >^b (g(u), h(u)\nu) \|_{L_p(0, T; H^1_{q_i}(\Omega))} \leq C\|u\|_{L_p(0, T)}^2.
\]

To summarize, we conclude (3.4).

4 Proof of Theorem 2.3

In this section, we prove the global well-posedness and the decay property in \( \mathbb{R}^N_+ \) with \( N \geq 3 \). To obtain the global well-posedness, for \( T > 0 \), assuming the unique existence of a solution \( u \) of (2.2) with \( \Omega = \mathbb{R}^N_+ \) on \( (0, T) \), we show an analogue of the estimate (3.9) for the Stokes problem and an analogue of the estimate (3.3) for the nonlinear term.

The difficulty in obtaining the result for \( N = 3 \) arises from the estimate of \( \| < t >^b g(u) \|_{L_p(0, T; L_{q_0}(\Omega))} \) because \( g(u) \) has the slowest decay of the nonlinear terms. However, this term is just an additional term appearing when we apply the maximal regularity to the time-shifted Stokes problem (2.10). This observation enables us to overcome this difficulty by reducing the Stokes problem to the problem with \( (G, G) = (0, 0) \) before applying it; we subtract a function \( K_0 G \) satisfying \( \text{div} K_0 G = C = \text{div} G \) from the solution. The function \( K_0 G \) is constructed by solving the Poisson equation and, thanks to \( \Omega = \mathbb{R}^N_+ \), \( K_0 G \) has homogeneous estimates with respect to the derivative order, see (4.7) below. Owing to this, in Subsection 4.2 we obtain the estimate

\[
\|u\|_{L_p(0, T)} \leq C(\mathcal{N}_{\mathbb{R}^N_+}(f(u), g(u), g(u)\nu, v_0) + [K_0(g(u))_{(0, T)}) (4.1)
\]

in \( \mathbb{R}^N_+ \), which corresponds to (3.3) but the first term of the right-hand side does not include the crucial norm \( \| < t >^b g(u) \|_{L_p(0, T; L_{q_0}(\Omega))} \). Here,

\[
\mathcal{N}_{\mathbb{R}^N_+}(f(u), g(u), g(u)\nu, v_0) = \sum_{i=0,2} \left( \| < t >^b f(u) \|_{L_p(0, T; L_{q_i}(\Omega))} + \| \partial_t E_T < t >^b g(u) \|_{L_p(\mathbb{R}; L_{q_i}(\Omega))} 
+ \| E_T < t >^b (g(u), h(u)\nu) \|_{L_p(\mathbb{R}; L_{q_i}(\Omega))} 
+ \| E_T < t >^b (g(u), h(u)\nu) \|_{L_p(\mathbb{R}; H^1_{q_i}(\Omega))} + \| v_0 \|_{L_p(\mathbb{R}; H^{2(1-1/p)}_{q_i}(\Omega)).}
\)

34
In Subsection 4.3 we show that the second term \([K_0g(u)]_{(0,T)}\) is harmless and obtain the analogue of (3.4).

\[ N_{\mathbb{R}^N}(f(u), g(u), h(u), v_0) + [K_0g(u)]_{(0,T)} \leq C(\mathcal{I} + |u|^2)_{(0,T)}, \quad (4.2) \]

where the norm \(\mathcal{I}\) of \(v_0\) is defined by (3.2). Then, we have

\[ |u|_{(0,T)} \leq C\epsilon \]

and, in the same way as in (3.7), we obtain the decay property (2.20).

**4.1 The \(L_q-L_r\) estimates**

In this subsection, to employ the same argument as in Section 3, we prove the \(L_q-L_r\) estimates for the decay rate

\[ \sigma_m(q, r) = \frac{N}{2} \left( 1 - \frac{1}{q} - \frac{1}{r} \right) + \frac{m}{2} \quad (4.3) \]

**Proposition 4.1.** Define \(\sigma_m(q, r)\) by (4.3). Then, for \((q, r)\) satisfying \(1 < q \leq r \leq \infty\) and \(q \neq \infty\), there exists \(C = C(q, r) > 0\) such that

\[ \| (\partial_t e^{-tA_\lambda} f, \nabla^2 e^{-tA_\lambda} f) \|_{L_r(\mathbb{R}^N)} \leq Ct^{-\sigma_2(q, r)} \| f \|_{L_q(\mathbb{R}^N)} \quad (r \neq \infty) \]

\[ \| \nabla^m e^{-tA_\lambda} f \|_{L_r(\mathbb{R}^N)} \leq Ct^{-\sigma_m(q, r)} \| f \|_{L_q(\mathbb{R}^N)} \quad (m = 0, 1) \quad (4.4) \]

for \(t \geq 1\) and \(f \in J_q(\mathbb{R}^N+)\).

**Proof. The case \(r = q\).** We first consider the case \(r = q\). Let \(\phi \in (0, \pi/2)\), \(1 < q < \infty\) and \(f \in J_q(\mathbb{R}^N+)\). By the resolvent estimates for the resolvent Stokes equation in \(\mathbb{R}^N\) obtained in [39], \(u_\lambda = (\lambda + A_\lambda)^{-1}f\) satisfies

\[ |\lambda| \| u_\lambda \|_{L_q(\mathbb{R}^N)} + |\lambda|^{1/2} \| \nabla u_\lambda \|_{L_q(\mathbb{R}^N)} + \| \nabla^2 u_\lambda \|_{L_q(\mathbb{R}^N)} \leq C \| f \|_{L_q(\mathbb{R}^N)} \quad (4.5) \]

for \(\lambda \in \mathbb{C} \setminus \{0\}\) with \(|\arg \lambda| < \pi - \phi/2\). By this and the properties of analytic semigroup, we obtain

\[ \| \partial_t e^{-tA_\lambda} f \|_{L_r(\mathbb{R}^N)} \leq Ct^{-\sigma_2(q, q)} \| f \|_{L_q(\mathbb{R}^N)} \]

\[ \| e^{-tA_\lambda} f \|_{L_r(\mathbb{R}^N)} \leq Ct^{-\sigma_0(q, q)} \| f \|_{L_q(\mathbb{R}^N)} \quad (4.6) \]

Also, the resolvent estimate (4.5) and the change of variable \(\lambda t = \lambda'\) in the formula

\[ e^{-tA_\lambda} f = \int e^{\lambda t} (\lambda + A_q)^{-1} f d\lambda, \]

where \(\Gamma\) is suitable contour from \(\infty e^{-(\pi - \phi)i}\) to \(\infty e^{(\pi - \phi)i}\), yield

\[ \| \nabla^m e^{-tA_\lambda} f \|_{L_r(\mathbb{R}^N)} \leq Ct^{-\sigma_m(q, q)} \| f \|_{L_q(\mathbb{R}^N)} \quad (m = 1, 2). \]
This and (4.6) imply (4.4).

The case $0 < 1/r - 1/q < 1/N$. We now show the result for the case $0 < 1/r - 1/q < 1/N$ from the Gagliardo-Nirenberg interpolation inequality. If we define the even extension operator $E^e : L_{1, loc}^{i} \rightarrow L_{1, loc}^{ii}$ as

$$E^e f(x', x_N) = \begin{cases} f(x', x_N) & x_N > 0, \\ f(x', -x_N) & x_N < 0 \end{cases}$$

and set

$$\alpha = N \left( \frac{1}{q} - \frac{1}{r} \right),$$

from the Gagliardo-Nirenberg interpolation inequality and the result for the case $r = q$,

$$\|\nabla^m e^{-tA_s}f\|_{L_r(\mathbb{R}^N)} \leq \|E^e \nabla^m e^{-tA_s}f\|_{L_r(\mathbb{R}^N)} \leq C\|E^e \nabla^m e^{-tA_s}f\|_{L_q(\mathbb{R}^N)}^{1-\alpha} \|E^e \nabla^m e^{-tA_s}f\|_{L_q(\mathbb{R}^N)}^{1+\alpha} \leq C_{t}^{\frac{m+1}{N} - \frac{m}{N}(1-\alpha)} \|f\|_{L_q(\mathbb{R}^N)}$$

for $m = 0, 1$. By combining this with the result for $r = q \neq \infty$, we also obtain

$$\|\partial_t e^{-tA_s}f\|_{L_r(\mathbb{R}^N)} + \|\nabla^2 e^{-tA_s}f\|_{L_r(\mathbb{R}^N)} \leq C_{t}^{1-\alpha} \|e^{-(t/2)A_s}f\|_{L_q(\mathbb{R}^N)} \leq C_{t}^{\frac{N}{4} - \frac{N}{4} - \frac{N}{4}} \|f\|_{L_q(\mathbb{R}^N)}.$$

The case $1/r - 1/q > 1/N$. The estimate for the case $1/r - 1/q > 1/N$ can be obtained by repeating use of the result for the case $1/r - 1/q \leq 1/N$. 

4.2 Estimate for the Stokes problem in the half space

In this subsection, we show a theorem analogous to Theorem 3.2 for $\Omega = \mathbb{R}^N_+$ by reducing the Stokes problem to the problem with $(\mathbf{G}, G) = (0, 0)$. To state the theorem and to execute the reduction, we introduce a solution operator $K_0$ to the divergence equation, which is proved for example in [28] Lemma 4.1 (1)] by solving the Poisson equation.

Lemma 4.1 (e.g. [28]). Let $1 < q < \infty$. There exists an operator $K_0 : H^1_q(\mathbb{R}^N_+) \cap \tilde{H}^{-1}_q(\mathbb{R}^N_+) \rightarrow H^1_q(\mathbb{R}^N_+) \cap \tilde{H}^{-1}_q(\mathbb{R}^N_+)$ such that, for $g \in H^1_q(\mathbb{R}^N_+) \cap \tilde{H}^{-1}_q(\mathbb{R}^N_+)$, $K_0 g$ satisfies the divergence equation $\div v = g$ and the estimate

$$\|K_0 g\|_{L_q(\mathbb{R}^N_+)} \leq C\|g\|_{\tilde{H}^{-1}_q(\mathbb{R}^N_+)}; \quad \|\nabla K_0 g\|_{L_q(\mathbb{R}^N_+)} \leq C\|g\|_{L_q(\mathbb{R}^N_+)};$$

$$\|\nabla^2 K_0 g\|_{L_q(\mathbb{R}^N_+)} \leq C\|\nabla g\|_{L_q(\mathbb{R}^N_+)}, \quad (4.7)$$
The following theorem is the main theorem of this subsection. Note that (4.1) is obtained immediately by (1.9) below if we assume the unique existence of the solution $u$ to (2.2) on $(0, T)$.

**Theorem 4.1.** Let $1 < p, q < \infty$ and $T \in (0, \infty]$. Define $b_m(\tilde{p}_m, \tilde{q}_m)$ by (2.18) for the decay rate $\sigma_m(q, r)$ and $\delta$ given by (1.3) and (2.21), respectively. For any $v_0 \in \mathcal{D}_{q, p}(\mathbb{R}^N_+)$ and right members $(F, G, G, H)$ defined on $(0, T)$ satisfying

$$< t >^b F \in L_p(0, T; L_q(\mathbb{R}^N_+)^N), \quad E_T[< t >^b G] \in H^1_p(\mathbb{R}; L_q(\mathbb{R}^N_+)^N),$$

$$E_T[< t >^b G] \in H^{1/2}_p(\mathbb{R}; L_q(\mathbb{R}^N_+)) \cap L_p(\mathbb{R}; H^1_q(\mathbb{R}^N_+)^N),$$

$$E_T[< t >^b H] \in H^{1/2}_p(\mathbb{R}; L_q(\mathbb{R}^N_+)) \cap L_p(\mathbb{R}; H^1_q(\mathbb{R}^N_+)^N),$$

with the compatibility condition

$$(G(t), \varphi)_{\mathbb{R}^N_+} = -(G(t), \nabla \varphi)_{\mathbb{R}^N_+} \text{ for any } \varphi \in \hat{H}^1_{q', 0}(\mathbb{R}^N_+), \quad (4.8)$$

the Stokes problem (2.4) admits unique solutions

$$U \in H^1_p(0, T; L_q(\mathbb{R}^N_+)^N) \cap L_p(0, T; H^2_q(\mathbb{R}^N_+)^N), \quad \Psi \in L_p(0, T; \hat{H}^1_{q, 0}(\mathbb{R}^N_+) + H^1_q(\mathbb{R}^N_+)),$$

Moreover, the solutions possess the estimate

$$[u]_{(0, T)} \leq C_b N_{\mathbb{R}^N_+} (F, G, G, H, v_0) \quad (4.9)$$

for $b \geq 0$, where the constant $C_b > 0$ is independent of $T$.

**Proof.** It suffices to construct a solution of (2.4) possessing the estimate

$$\| < t >^{b_2(\tilde{p}_2, \tilde{q}_2)} \partial_{t} U \|_{L^2_p(0, T; L^2_q(\mathbb{R}^N_+))} \leq C_b N_{\mathbb{R}^N_+} (F, G, G, H, v_0) + \| < t >^{b_2(\tilde{p}_2, \tilde{q}_2)} \partial_{t} K_0 G \|_{L^2_p(0, T; L^2_q(\mathbb{R}^N_+))},$$

$$\| < t >^{b_m(\tilde{p}_m, \tilde{q}_m)} \nabla^m U \|_{L^2_{p_m}(0, T; L^2_{q_m}(\mathbb{R}^N_+))} \leq C_b N_{\mathbb{R}^N_+} (F, G, G, H, v_0) + \| < t >^{b_m(\tilde{p}_m, \tilde{q}_m)} \nabla^m K_0 G \|_{L^2_{p_m}(0, T; L^2_{q_m}(\mathbb{R}^N_+))},$$

for any $m = 0, 1, 2$ and $(\tilde{p}_m, \tilde{q}_m)$ satisfying (2.19). For almost everywhere $t \in (0, T)$, because the compatibility condition (1.8) yields

$$|(G(t), \varphi)_{\mathbb{R}^N_+}| \leq \|G(t)\|_{L_q(\mathbb{R}^N_+)} \|\nabla \varphi\|_{L_q(\mathbb{R}^N_+)} \text{ for any } \varphi \in \hat{H}^1_{q', 0}(\mathbb{R}^N_+),$$

we have $G(t) \in \hat{H}^{-1}_{q', 0}(\mathbb{R}^N_+)$ and $\|G(t)\|_{\hat{H}^{-1}_{q', 0}(\mathbb{R}^N_+)} \leq \|G(t)\|_{L_q(\mathbb{R}^N_+)}$ and so, by Lemma 4.1, we have $\text{div} K_0 G = G$ and

$$\|K_0 G(t)\|_{L_q(\mathbb{R}^N_+)} \leq C \|G(t)\|_{\hat{H}^{-1}_{q', 0}(\mathbb{R}^N_+)} \leq C \|G(t)\|_{L_q(\mathbb{R}^N_+)},$$
\[ \| \nabla K_0 G(t) \|_{L_q(\mathbb{R}^N_+)} \leq C \| G(t) \|_{L_q(\mathbb{R}^N_+)}, \]
\[ \| \nabla^2 K_0 G(t) \|_{L_q(\mathbb{R}^N_+)} \leq C \| \nabla G(t) \|_{L_q(\mathbb{R}^N_+)}. \] (4.11)

For the solutions \( U \) and \( \mathcal{Q} \) of the Stokes problem (2.4), if we set \( U = K_0 G + U_r \), \( U_r \) and \( \mathcal{Q} \) obey the system

\[
\begin{cases}
\partial_t U_r - \text{Div} S(U_r, \mathcal{Q}) = F_r, & \text{div } U_r = 0 \quad \text{in } \mathbb{R}^N_+ \times (0, T), \\
S(U_r, \mathcal{Q}) \nu = H_r, & \text{on } \partial \mathbb{R}^N_+ \times (0, T), \\
U_r|_{t=0} = v_0, & \text{in } \mathbb{R}^N_+, 
\end{cases}
\] (4.12)

where the right members \( F_r \) and \( H_r \) are defined by

\[ F_r = - \partial_t K_0 G + \text{Div} (\mu \mathcal{D}(K_0 G)), \quad H_r = H - \mu \mathcal{D}(K_0 G) \nu. \]

Note the right member \( v_0 \) of the initial condition does not change since \( K_0[G]|_{t=0} = K_0[G]_{t=0} = 0 \). Since (4.8) is valid for \((G, \mathcal{Q}) = (\partial_t G, \partial_t G)\), we similarly have

\[ \| \partial_t K_0 G(t) \|_{L_q(\mathbb{R}^N_+)} \leq C \| \partial_t G(t) \|_{L_q(\mathbb{R}^N_+)} \]

and then, this and (4.11) imply

\[ \| < t >^b F_r \|_{L_p(0, T; L_q(\mathbb{R}^N_+))} \leq C \| < t >^b (F, \partial_t G, \nabla G) \|_{L_p(0, T; L_q(\mathbb{R}^N_+))}, \]
\[ \| \partial_t^{1/2} E_T[< t >^b H_r] \|_{L_q(\mathbb{R}^N_+)} + \| E_T[< t >^b H_r] \|_{L_p(\mathbb{R}; H^1_q(\mathbb{R}^N_+))} \leq \| \partial_t^{1/2} E_T[< t >^b (H, G)] \|_{L_p(\mathbb{R}; L_q(\mathbb{R}^N_+))} + \| E_T[< t >^b (H, G)] \|_{L_p(\mathbb{R}; H^1_q(\mathbb{R}^N_+))}. \]

In the half-space, Assumptions 2.1 on the \( W^2_{\infty} \) domain is satisfied and, on Assumption 2.2, the unique solvability of the weak Dirichlet problem (2.3) is well-known. Also, by Proposition 1.1, the \( L_q-L_r \) estimates hold for the decay rate \( \sigma_m(q, r) \) and \( \sigma_m(q, r) \) satisfies the condition (C1) in Theorem 2.2. Thus, we can apply Theorem 2.2 to the system (4.12) and show that (4.12) admits unique solutions

\[ U_r \in H^1_p(0, T; L_q(\mathbb{R}^N_+)) \cap L_p(0, T; H^2_q(\mathbb{R}^N_+)), \quad \mathcal{Q} \in L_p(0, T; \tilde{H}^1_{q,0}(\mathbb{R}^N_+) + H^1_q(\mathbb{R}^N_+)), \]

which possesses the estimate

\[ \| < t >^{b_2(\beta_2, \alpha_2)} \partial_t U \|_{L^p_q(0, T; L^q_{\alpha_2}(\mathbb{R}^N_+))} \leq C N_{\alpha_2}(F, G, H, v_0) \]
\[ \leq C N_{\alpha_2}(F, G, H, v_0) \]

and, similarly, \[ \| < t >^{b_m(\beta_m, \alpha_m)} \nabla^m U \|_{L^p_m(0, T; L^q_{\alpha_m}(\mathbb{R}^N_+))} \leq C N_{\alpha_2}(F, G, H, v_0). \]

Combining this and \( U = K_0 G + U_r \) concludes the solvability of (2.4) and the estimates (4.10), which completes the proof. □
4.3 Estimate for the nonlinear terms in the half space

In this subsection, we prove \((4.2)\).

Let \(2 < p < \infty\), \(1 < q_0 < N < q_2 < \infty\), \(b > 1/p'\). Define \(b_m(\tilde{p}_m, \tilde{q}_m)\) by \((2.18)\) for the decay rate \(\sigma_m(q, r)\) and \(\delta > 0\) given by \((4.3)\) and \((2.21)\), respectively. We assume that the transformed problem \((2.2)\) admits a unique solution \(u\) on \((0, T)\) and \([u]_{(0,T)}\) is sufficiently small. It suffices to show

\[
N_{\mathbb{R}^N}(f(u), g(u), h(u), v_0) \leq C(I + [u]_{(0,T)}^2) \tag{4.13}
\]

and

\[
\| < t > ^{b_m(\tilde{p}_m, \tilde{q}_m)} \partial_t K_0 g(u) \|_{L_{\tilde{p}_2}(0,T;L_{\tilde{q}_2}(\mathbb{R}^N_+))} \leq C(I + [u]_{(0,T)}^2),
\]

\[
\| < t > ^{b_m(\tilde{p}_m, \tilde{q}_m)} \nabla^m K_0 g(u) \|_{L_{\tilde{p}_m}(0,T;L_{\tilde{q}_m}(\mathbb{R}^N_+))} \leq C(I + [u]_{(0,T)}^2) \tag{4.14}
\]

for \(m = 0, 1, 2\) and \((\tilde{p}_m, \tilde{q}_m)\) satisfying \((2.19)\). In fact, \((4.14)\) and the definition \((2.17)\) imply \([K_0 g]_{(0,T)} \leq C(I + [u]_{(0,T)}^2)\) and, by this and \((4.13)\), we conclude \((4.2)\).

Proof of \((4.13)\).

On account of \((3.48)\) in Remark \((3.2)\), if \(N = 3\), we cannot take \(q_0^3\) and \(q_0^4\) with \(1/q_0^3 + 1/q_0^4 = 1/q_0^s\) satisfying \((3.45)\). Instead, we define them so that

\[
\sigma_1(q_0, q_0^3) = 1 + \delta_0, \quad \sigma_1(q_0, q_0^4) = b + 1/p + \delta_0 \quad \text{with} \quad \delta_0 = \frac{1}{2} \left( \frac{N}{2q_0} - (b + 1/p) \right) \tag{4.15}
\]

and then, prove \((4.13)\) in the similar way as in \((3.4)\). We first state that, by the same proof, we have the estimates in Lemma \((4.2)\) except for the following estimate on the 0-th derivative of \(u\):

\[
\| < t > ^b u \|_{L_{\tilde{p}_0}(0,T;L_{\tilde{q}_0}(\Omega))} \leq C[u]_{(0,T)} \quad \text{if} \quad (\tilde{p}_0, \tilde{q}_0) \text{ satisfies } (2.19) \text{ and } \tilde{q}_0 \geq q_0^4
\]

and show that this estimate is valid if \(< t > ^b\) is replaced by \(< t > ^{b-1/2}\).

Lemma 4.2. Let \(q_0^3\) and \(q_0^4\) be the exponents given by \((4.15)\).

(a) There holds

\[
\| \nabla^m u \|_{L_{\infty}(0,T;L_{\tilde{q}_m}(\mathbb{R}^N_+))} \leq C[u]_{(0,T)}
\]

if \(m = 0, 1\) and \((\infty, \tilde{q}_m)\) satisfy \((2.19)\).

(b) There holds

\[
\| < t > ^b \partial_t u \|_{L_{\tilde{p}_2}(0,T;L_{\tilde{q}_2}(\mathbb{R}^N_+))} \leq C[u]_{(0,T)},
\]
\[ \begin{align*}
\| t \|_L^{m} u \|_{L_{\tilde{p}_m}(0,T;L_{\tilde{q}_m}(\mathbb{R}^N))} & \leq C[u](0,T) \quad (m = 1, 2), \\
\| t \|_L^{b^{-1/2}} u \|_{L_{\tilde{p}_0}(0,T;L_{\tilde{q}_0}(\mathbb{R}^N))} & \leq C[u](0,T),
\end{align*} \]

for \( m = 0, 1, 2 \) and \((\tilde{p}_m, \tilde{q}_m)\) satisfying (2.19) and \( \tilde{q}_m \geq q_04 \).

(c) There holds
\[
\begin{align*}
\left\| \int_0^t \nabla^m u(s) \, ds \right\|_{L_{\tilde{p}_0}(0,T;L_{\tilde{q}_0}(\mathbb{R}^N))} & \leq C[u](0,T)
\end{align*}
\]
if \( m = 1, 2 \) and \((p, \tilde{q}_m)\) satisfy (2.19) and \( \tilde{q}_m \geq \min\{q_04, q_03\} \).

(d) There holds \( \| W(\int_0^t \nabla u \, ds) \|_{L_{\infty}(0,T;L_{\infty}(\mathbb{R}^N))} \leq C \) for any polynomial \( W \).

Proof. We only need to prove the last estimate in (b). We obtain
\[
\begin{align*}
b_0(p, \tilde{q}_0) &= \min\{\sigma_0(q_0, q_04) - \frac{1}{p} - \delta, b\} \\
&= \min\{b + \frac{1}{p} + \delta_2 - \frac{1}{2} - \frac{1}{p} - \delta, b\} \geq b - \frac{1}{2} \quad (\tilde{p}_0 = 1/p) \\
b_0(\infty, \tilde{q}_0) &= \min\{\sigma_0(q_0, q_04), b\} \\
&= \min\{b + \frac{1}{p} + \delta_2 - \frac{1}{2} - b\} \geq b - \frac{1}{2} \quad (\tilde{p}_0 = \infty)
\end{align*}
\]
by (4.15). Thus,
\[
\| t \|_L^{b^{-1/2}} u \|_{L_{\tilde{p}_0}(0,T;L_{\tilde{q}_0}(\mathbb{R}^N))} \leq \| t \|_L^{b_0(\tilde{p}_0, \tilde{q}_0)} u \|_{L_{\tilde{p}_0}(0,T;L_{\tilde{q}_0}(\mathbb{R}^N))} \leq C[u](0,T)
\]
by the definition (2.18) of \( b_m(\tilde{p}_m, \tilde{q}_m) \), which implies the desired estimate. \( \square \)

The desired estimate (4.13) is obtained as follows. By the estimates (3.39) for \( f(u) \), (3.50) for \( \partial_t E_T [t > n g(u)] \), (3.53), (3.56) and (3.61) for \( (g(u), h(u)) \),
we have
\[
N_{\mathbb{R}^N_+}(f(u), g(u), h(u), v_0)
\leq C \sum_{i=0,2} \left( \left< t >^b \int_0^t \nabla u \otimes (\partial_t u, \nabla^2 u) \right|_{L_p(0,T;L_{q_i}(\mathbb{R}^N_+))} \right)
+ \sum_{m=1,2} \left< t >^b \int_0^t \nabla^m u \otimes \nabla u \right|_{L_p(0,T;L_{q_i}(\mathbb{R}^N_+))}
+ \left( bt < t >^b \int_0^t \nabla u \otimes u \right|_{L_p(0,T;L_{q_i}(\mathbb{R}^N_+))}
+ \left< t >^b \int_0^t \nabla^2 u \otimes \partial_t u \right|_{L_p(0,T;L_{q_0}(\mathbb{R}^N_+))}
+ \left< t >^b \int_0^t \nabla^2 u \otimes \partial_t u \right|_{L_p(0,T;L_{q_2}(\mathbb{R}^N_+))}
+ \sum_{m=0,1} \left< t >^b \nabla u \otimes \nabla^m u \right|_{L_p(0,T;L_{q_i}(\mathbb{R}^N_+))}\right).
\]

The 0-th derivative of \( u \) appears only in the terms
\[
\left< t >^b \int_0^t \nabla u \otimes u \right|_{L_p(0,T;L_{q_i}(\mathbb{R}^N_+))}
\] and the second one is estimated by \( C[u]_{[0,T]} \) from Lemma 4.2 (a) as in (4.20).

The estimate for the first term with \( i = 0 \) is shown from Lemma 4.2 as
\[
\left< t >^b \int_0^t \nabla u \otimes u \right|_{L_p(0,T;L_{q_i}(\mathbb{R}^N_+))}
\leq C \left( \int_0^t \nabla u \right|_{L_p(0,T;L_{q_0}(\mathbb{R}^N_+))} \cdot \left< t >^b \nabla u \right|_{L_p(0,T;L_{q_0}(\mathbb{R}^N_+))} \right)
\] and the estimate with \( i = 2 \) is obtained by replacing \( q_03 \) and \( q_04 \) with \( q_2 \) and \( \infty \) in this calculation. The other terms of the right-hand side in (4.16) are estimated by \( C[u]^2_{[0,T]} \) since we have the same estimates for \( \partial_t u, \nabla u \) and \( \nabla^2 u \) as in Section 3 see (3.40), (3.57), (3.42), (3.59), (3.60), (3.58). Then we have the desired estimate (4.13).

**Proof of (4.14).**

In the remainder of this paper, we prove that the additional term \([K_0g(u)]_{[0,T]}\) is harmless by showing the estimate (4.14).

We first show the first inequality and second inequality with \( m = 0 \) in (4.14). Since (4.8) with \((G, G) = (g(u), g(u))\) implies
\[
||K_0g(u)||_{L_q(\mathbb{R}^N_+)} \leq C \cdot ||g(u)||_{L_q(\mathbb{R}^N_+)} \text{ a.e. } t \in (0, T),
\]
by the definition (2.3) of the nonlinearities, Hölder’s inequality (3.38) and Lemma 4.2 (d), we have

\[
\| < t >^{b_0(\tilde{p}_0, \tilde{q}_0)} K_0 g(u) \|_{L_{\tilde{p}_0}(0,T; L_{\tilde{q}_0}(\mathbb{R}_t^N))} \\
\leq C \| < t >^{b_0(\tilde{p}_0, \tilde{q}_0)} g(u) \|_{L_{\tilde{p}_0}(0,T; L_{\tilde{q}_0}(\mathbb{R}_t^N))} \\
\leq C \left\| < t >^{b_0(\tilde{p}_0, \tilde{q}_0)} \int_0^t \nabla u \, ds \otimes u \right\|_{L_{\tilde{p}_0}(0,T; L_{\tilde{q}_0}(\mathbb{R}_t^N))}
\]

and, by (3.38) again and by Lemma 4.2 the right-hand side is estimated as

\[
\left\| < t >^{b_0(\tilde{p}_0, \tilde{q}_0)} \int_0^t \nabla u \, ds \otimes u \right\|_{L_{\tilde{p}_0}(0,T; L_{\tilde{q}_0}(\mathbb{R}_t^N))} \\
\leq C \left\| \int_0^t \nabla u \, ds \right\|_{L_{\infty}(0,T; L_{\infty}(\mathbb{R}_t^N))} \left\| < t >^{b_0(\tilde{p}_0, \tilde{q}_0)} u \right\|_{L_{\tilde{p}_0}(0,T; L_{\tilde{q}_0}(\mathbb{R}_t^N))} \leq C |u|^2(0,T). \tag{4.17}
\]

Similarly, since (4.8) with \((G, \mathbf{G}) = (\partial_t g(u), \partial_t \mathbf{g}(u))\) implies

\[
\| [\partial_t K_0 g(u)](t) \|_{L_q(\mathbb{R}_t^N)} \leq C \| [K_0 \partial_t g(u)](t) \|_{L_q(\mathbb{R}_t^N)} \leq C \| \partial_t g(u) \|_{L_q(\mathbb{R}_t^N)} \text{ a.e. } t \in (0,T),
\]

by (3.49)

\[
\left\| < t >^{b_2(\tilde{p}_2, \tilde{q}_2)} \partial_t g(u) \right\|_{L_{\tilde{p}_2}(0,T; L_{\tilde{q}_2}(\mathbb{R}_t^N))} \\
\leq C \left\| < t >^{b_2(\tilde{p}_2, \tilde{q}_2)} \partial_t g(u) \right\|_{L_{\tilde{p}_2}(0,T; L_{\tilde{q}_2}(\mathbb{R}_t^N))} \\
\leq C \left\| < t >^{b_2(\tilde{p}_2, \tilde{q}_2)} \nabla u \otimes u \right\|_{L_{\tilde{p}_2}(0,T; L_{\tilde{q}_2}(\mathbb{R}_t^N))} \\
+ C \left\| < t >^{b_2(\tilde{p}_2, \tilde{q}_2)} \int_0^t \nabla u \, ds \otimes \partial_t u \right\|_{L_{\tilde{p}_2}(0,T; L_{\tilde{q}_2}(\mathbb{R}_t^N))}.
\]

We can estimate the second term by \(|u|^2(0,T)\) in the same way as in (4.17). The estimate for the first term can be obtained by (3.51) with \(q_i = \tilde{q}_2\) combined with \(b_2(\tilde{p}_2, \tilde{q}_2) \leq b\) and (2.19):

\[
\left\| < t >^{b_2(\tilde{p}_2, \tilde{q}_2)} \nabla u \otimes u \right\|_{L_{\tilde{p}_2}(0,T; L_{\tilde{q}_2}(\mathbb{R}_t^N))} \leq \left\| < t >^b \nabla u \otimes u \right\|_{L_p(0,T; L_{q_2}(\mathbb{R}_t^N))} \leq C |u|^2(0,T).
\]

The second inequality with \(m = 1\) of (4.14) is proven as follows: by (4.11) with \(G = g(u)\), the definition (2.3) of the nonlinearities, Hölder’s inequality (3.38) and Lemma 4.2 (d),

\[
\left\| < t >^{b_1(\tilde{p}_1, \tilde{q}_1)} \nabla K_0 g(u) \right\|_{L_{\tilde{p}_1}(0,T; L_{\tilde{q}_1}(\mathbb{R}_t^N))} \\
\leq C \left\| < t >^{b_1(\tilde{p}_1, \tilde{q}_1)} g(u) \right\|_{L_{\tilde{p}_1}(0,T; L_{\tilde{q}_1}(\mathbb{R}_t^N))} \\
\leq C \left\| < t >^{b_1(\tilde{p}_1, \tilde{q}_1)} \int_0^t \nabla u \, ds \otimes \nabla u \right\|_{L_{\tilde{p}_1}(0,T; L_{\tilde{q}_1}(\mathbb{R}_t^N))}
\]

42
and the right-hand side is estimated by $C[u]^2_{(0,T)}$ in the same manner as in (4.14).

By (4.11) with $G = g(u)$, $b_2(\tilde{p}_2, \tilde{q}_2) \leq b_2(\tilde{p}_2, \tilde{q}_2)$, and estimates (3.42) and (3.40), the case $m = 2$ can be shown as

\[ \| t > b_2(\tilde{p}_2, \tilde{q}_2) \nabla^2 K_0 g(u) \|_{L_{p_2}(0,T;L_{q_2}(\mathbb{R}^N_+))} \]

\[ \leq C \sum_{i=0}^{2} \| t > b^i \nabla g(u) \|_{L_{p_i}(0,T;L_{q_i}(\mathbb{R}^N_+))} \]

\[ \leq C \left( \sum_{i=0}^{2} \left\| t > b^i \int_0^t \nabla u \cdot \nabla u \, ds \right\|_{L_{p}(0,T;L_{q}(\mathbb{R}^N_+))} + \left\| t > b^i \int_0^t \nabla u \cdot \nabla u \, ds \right\|_{L_{p}(0,T;L_{q}(\mathbb{R}^N_+))} \right) \]

\[ \leq C[u]^2_{(0,T)} . \]

To summarize, we obtain (4.14) and then, we can conclude the global well-posedness of transformed problem (2.2) and the decay property of the solution in $\mathbb{R}^N_+$ including $N = 3$.

5 Conclusion

In study, we have proven the global well-posedness for quasi-linear parabolic and hyperbolic-parabolic equation with non-homogeneous boundary conditions in unbounded domains, and provided a general framework to solve such problems. In fact, the free boundary problem treated in this paper is a typical problem for the quasilinear equations with non-homogeneous boundary condition, and we can continue to study in the case of two-phase problems such as incompressible-incompressible, incompressible-compressible, and compressible-compressible viscous fluid flows.
